Passage — Product Requirements Document

Status	Draft v0.2 — for review by Ben Russell and Zach Demanche
Date	2026-10-21
Owners	@BenjaminSRussell (product), @zdemanche (engineering/security)
Method	Moonaan Scribe requirements workflow (understand → research → draft → validate → publish). Jira/Confluence research was unavailable this session; research covered public AX/SAP documentation and both owners' GitHub accounts (no prior ERP work found).
Companion	roadmap/waves.json is the machine-readable source for the 50 waves; roadmap/README.md is generated from it.
Thesis	Emulate the top-tier manufacturing ERPs (S/4HANA, D365 F&SCM, Infor LN, Epicor Kinetic, IFS, Plex) feature-for-feature, then be **10× easier, faster, more accurate and more open** — see Part 0A.

Document map

This master document (Part 0) holds the problem, goals, scope, delivery model, phase-level requirements and NFRs. The detailed parts hold wave-level requirements and are assembled into `docs/PRD-full.md` by `scripts/build_prd.py`.

Part	File	Content
0	`docs/PRD.md` (this file)	Problem, goals, personas, principles, scope map, delivery model, phase-level FRs, NFRs, risks
0A	prd/part-00-thesis.md	The 10× thesis: pain-point ledger (usability, speed, accuracy, openness), interoperability contract, what we keep from AX and SAP
1	prd/phase-0-foundation.md	Waves 1–5: pipeline, identity/tenancy, metadata kernel, events/workflow, shell/audit/observability
2	prd/phase-1-master-data.md	Waves 6–10: enterprise structure, party model, products, engineering data, migration framework
3	prd/phase-2-financial-core.md	Waves 11–15: universal journal, currencies/ledgers, tax, close, reporting
4	prd/phase-3-procure-to-pay.md	Waves 16–20: inventory ledger, purchasing, receiving/matching, AP/payments, costing/supplier portal
5	prd/phase-4-manufacturing.md	Waves 21–25: production orders, MRP, scheduling, process/lean, shop floor/IoT
6	prd/phase-5-order-to-cash.md	Waves 26–30: pricing, orders/ATP, fulfillment, billing/rev rec, AR/collections — go-live candidate
7	prd/phase-6-logistics.md	Waves 31–35: WMS, mobile, quality, transportation, EDI/e-invoicing/integration hub
8	prd/phase-7-treasury-controlling.md	Waves 36–40: cash/bank, fixed assets, budgeting/cost accounting, product costing, intercompany/consolidation
9	prd/phase-8-projects-people-service.md	Waves 41–45: projects, HR, payroll/expenses, EAM, field service
10	prd/phase-9-intelligence-golive.md	Waves 46–50: data platform, AI agents, localization/compliance, migration factory, scale/go-live
11	prd/appendices.md	Glossary, cross-module data model, event/API conventions, security model, NFR detail, numbering, localization, testing standards, traceability, references, competitive benchmark
12	prd/coverage-ax.md	Completeness oracle: every AX 2012 R3 / D365 F&SCM module → forms, inquiries/reports, periodic jobs, setup forms, each mapped to a wave or flagged GAP; gap register
13	prd/coverage-sap.md	Completeness oracle: every SAP ECC / S/4 component → transactions, reports, periodic processing, IMG customizing, each mapped to a wave or flagged GAP; gap register

Each wave section follows the fixed template in prd/TEMPLATE.md: scope and pain points solved → AX/SAP parity map → functional requirements → data model → APIs/events → UX → business rules → acceptance criteria → test plan → deployment → migration → dependencies/risks/open questions → parameters and setup → inquiries and reports → printed/electronic documents → periodic jobs → duties and privileges → message catalog → performance budgets → localization hooks.

Completeness rule. A wave is not specified until every row of Parts 12 and 13 that maps to it is either covered by a numbered FR in that wave's section or explicitly marked SUPERSEDED/OUT-OF-SCOPE with a reason. The gap registers (12.99, 13.99) must be empty before Phase 0 starts.

---

1. Problem statement

Microsoft Dynamics AX (Axapta → AX 2012 → D365 Finance & Supply Chain) and SAP (ECC → S/4HANA) are the systems of record for most mid-to-large manufacturers, distributors and services firms. Both are:

- **Closed and expensive to change** — customization lives in proprietary languages (X++, ABAP) and licensing/upgrade costs dominate TCO.
- **Architecturally dated** — monolithic application servers, synchronous batch frameworks, and vendor-locked cloud operation (LCS, RISE).
- **Hard to integrate and extend with AI** — bolted-on copilots that can't act safely across the system.

Passage is a ground-up rebuild of the complete feature surface of AX/SAP as an open-architecture, cloud-agnostic platform: Kubernetes-native, Postgres-per-domain, Kafka-eventing, metadata-driven, with AI agents as first-class, governed actors.

2. Goals and non-goals

Goals

1. **Feature parity**: every AX 2012 / D365 F&SCM and SAP ECC / S/4 module in scope (§5) has an equivalent in Passage, mapped wave-by-wave.
2. **Provable delivery**: every one of the 50 waves ends with an artifact that is (a) **provable** — automated tests and fixtures that demonstrate correctness, (b) **testable** — a stakeholder can exercise it in a running environment, and (c) **deployable** — it ships to a Kubernetes environment through the GitOps pipeline.
3. **Sequential, top-down**: waves are strictly ordered; each wave depends only on earlier waves (dependency graph is a chain with stated back-references). A manufacturer can go live at the end of wave 30; full AX/SAP parity at wave 50.
4. **Cloud-agnostic and self-hostable**: runs on any conformant Kubernetes (EKS/GKE/AKS/bare-metal/k3d) with no provider-specific managed services in the critical path.
5. **Extensible without forking**: customers extend entities, workflows, forms and reports through metadata and sanctioned extension points, never by overlayering code.

6. **Financially rigorous**: a single append-only universal journal is the only source of truth; every subledger reconciles to it by automated check.
7. **10× on four measured axes** (defined in Part 0A): easier (≤ 1/10 the clicks per task; new user productive in < 30 min), faster (MRP incremental < 2 min, continuous close, real-time statements), more accurate (zero unexplained subledger-to-GL breaks, < 0.5% duplicate master data), open (any system on the customer's network connects in < 1 day through REST/GraphQL/Kafka/webhooks/MCP/EDI/OPC-UA/SFTP with one identity and one policy engine).
8. **Best-of-breed manufacturing**: planning, scheduling, shop floor, quality, costing and warehouse are benchmarked against S/4HANA, D365 SCM, Infor LN, Epicor Kinetic, IFS Cloud and Plex (Appendix L), not only against AX 2012.

Non-goals (v1)

- Replacing CRM/marketing automation suites (we integrate with Salesforce/HubSpot; a native CRM is v2).
- Retail POS and e-commerce storefront (we integrate with Shopify/Medusa; native POS is v2).
- Country packs beyond the first set (US, UK, DE, FR, IN, MX, CA) — framework ships in wave 48; more packs are v1.x.
- Supporting SAP's or Microsoft's proprietary extension languages. Migration tooling moves **data**, not X++/ABAP code.

3. Users and personas

Persona	Primary jobs	Waves that serve them first
Platform engineer / SRE	Deploy, observe, upgrade, scale, secure	1–5, 48, 50
System administrator	Tenants, users, roles, extensions, number sequences, audit	2, 3, 5, 48
Master-data steward	Parties, products, BOMs, org structure, migration	6–10
Controller / accountant	Journal, close, statements, tax, FX, subledgers	11–15, 19, 30, 36–40
Buyer / AP clerk	Requisition to payment	17–20
Production planner / supervisor	Orders, MRP, scheduling, shop floor	21–25
Sales rep / order desk / AR clerk	Quote to cash	26–30
Warehouse manager / operator	WMS, mobile, shipping, quality, transport	28, 31–35
Project manager / HR / payroll admin	Projects, people, payroll, assets, service	41–45
Analyst / executive	Dashboards, KPIs, copilots	46–47
Implementation partner	Migration, localization, cutover	10, 48–50

4. Product principles

1. **Journal first.** Nothing is financially true until it is in the universal journal. Subledgers are projections; they reconcile automatically every day.
2. **Metadata over code.** Entities, forms, workflows, reports and extensions are data. Code generators produce schema, API, clients and UI from it.
3. **Events are the integration surface.** Every state change is an immutable CloudEvent on Kafka via transactional outbox — no dual writes, no polling.
4. **Everything is tenant-scoped and policy-authorized.** Postgres RLS + OPA on every request; agents inherit (never exceed) their user's permissions.
5. **Idempotent, replayable, auditable.** Posting APIs take idempotency keys; audit is derived from CDC, not from application code that can forget.
6. **Ship the thin vertical slice.** A wave is done when a stakeholder can run the business process on a deployed environment with reconciled numbers — not when the code is written.

5. Scope map — AX/SAP modules → Passage phases

AX / D365 module	SAP module	Passage phase (waves)
AOT, security, workflow, batch, LCS, number sequences, DB log	DDIC, PFCG, Business Workflow, SM36, STMS, SNRO, CDHDR	**0 Foundation (1–5)**
Org model, global address book, products, BOM/route, DIXF	Enterprise structure, Business Partner, material master, CS/CA, LSMW	**1 Master data (6–10)**
General ledger, dimensions, currencies, tax, period close, financial reporting	FI-GL/ACDOCA, ledgers, FTXP, OB52, FSV	**2 Financial core (11–15)**
Inventory management, procurement & sourcing, AP, inventory costing	MM-IM, MM-PUR, LIV, FI-AP, F110, material ledger	**3 Inventory & P2P (16–20)**
Production control, master planning, scheduling, process/lean, MES	PP, PP-PI, REM, KANBAN, PP/DS, MII	**4 Manufacturing & planning (21–25)**
Trade agreements, sales, shipping, invoicing, rev rec, AR, collections	SD pricing, SD orders, LE-SHP, billing, RAR, FI-AR, FSCM	**5 Order-to-cash (26–30)**
Warehouse management, mobile app, quality, TMS, AIF/ER/EDI	EWM, RF, QM, TM, IDoc/PI, DRC	**6 Warehouse, quality & logistics (31–35)**
Cash & bank, fixed assets, budgeting/cost accounting, costing sheets, intercompany/consolidation	Cash mgmt, FI-AA, CO, product costing, Group Reporting	**7 Treasury, assets & controlling (36–40)**
Projects, HR, payroll, expense, asset management, service	PS, HCM/SF, PY, Concur, PM, CS/FSM	**8 Projects, people & service (41–45)**
Entity store/Power BI, Copilot, localizations/SoD, upgrade tooling, LCS prod	BW/SAC, Joule, country versions/GRC, conversion tools, Basis	**9 Intelligence, compliance & go-live (46–50)**

Full per-wave mapping with references is in roadmap/waves.json (`replaces` field).

6. Delivery model — what a "wave" is

A wave is a 4–8 week increment with four mandatory outputs, enforced by the wave issue template and the Definition of Done:

Output	Definition	Evidence required to close the wave
Deliverable	The capabilities listed in the wave's `deliverable` array, built on the agreed stack.	Merged PRs linked from the wave issue.
Proof	The automated tests, fixtures, property tests and performance targets in `proof`.	CI run link; fixture datasets committed; perf report.
Deploy	What is running where, as stated in `deploy`.	Argo CD app healthy in `stage`; demo URL; recorded walkthrough for phase-exit waves.
References	The AX/SAP documentation and open-source/standards we built against.	Linked in the wave issue; ADRs for any deviation.

Sequencing rules

- Wave *n* may start when wave *n−1* has passed Proof and Deploy; overlapping *build* is allowed, overlapping *close* is not.
- Every 5th wave is a **phase-exit wave** with a stakeholder sign-off (demo + reconciliation evidence).
- Wave 30 is the **first go-live candidate** (manufacturer buy → make → sell → collect). Wave 50 is **production go-live + v1.0**.

7. Functional requirements (phase level)

Phase-level requirements below are the contract; wave-level detail (deliverables, proofs, references) is normative in `roadmap/waves.json` and rendered in `roadmap/README.md`.

FR-0 Foundation (waves 1–5)

- **FR-0.1** The platform deploys to any conformant Kubernetes via GitOps with signed images, SBOMs and digest-pinned rollback.
- **FR-0.2** Identity is federated (OIDC/SAML/SCIM); authorization is AX-style roles/duties/privileges compiled to OPA policies; tenant isolation is enforced by Postgres RLS.
- **FR-0.3** Business entities are declared in metadata that generates schema, API, clients, validation and UI; customers extend entities without code.
- **FR-0.4** All state changes publish CloudEvents via transactional outbox; approvals and batch jobs run on a durable workflow engine with timers, retries and human tasks.
- **FR-0.5** A single web shell renders any entity as accessible (WCAG 2.1 AA) list/detail/grid; number sequences support gap-free mode; audit is field-level and immutable; every request is traceable end-to-end.

FR-1 Master data (waves 6–10)

- **FR-1.1** Legal entities, operating units, sites, warehouses and effective-dated multi-purpose hierarchies; fiscal calendars; ISO reference data; UoM conversions.
- **FR-1.2** One party per real-world organization/person with layered roles, duplicate detection and merge, tax-id validation, governance workflow.
- **FR-1.3** Products with product/storage/tracking dimension groups, released products per entity, attributes/classification, GS1 identifiers, configurator.
- **FR-1.4** Multi-level versioned BOMs and formulas, routings/operations/resources/calendars, engineering change management with where-used.
- **FR-1.5** A migration framework with AX and SAP connectors, declarative mapping, validation, reconciliation and idempotent re-runs.

FR-2 Financial core (waves 11–15)

- **FR-2.1** Append-only double-entry universal journal with dimensions, account structures, idempotent atomic posting, balance projections rebuilt from the journal.
- **FR-2.2** Three-currency amounts per line, rate types/providers, parallel ledgers, FX revaluation and translation.
- **FR-2.3** Tax determination/calculation/posting for sales & use, VAT/GST and withholding; pluggable external providers; settlement and statutory extracts (SAF-T).
- **FR-2.4** Period control per ledger × module, close checklists, allocations, accrual schemes, year-end close.
- **FR-2.5** Statement designer and standard statements with drill-down to source document; audit trail reporting.

FR-3 Inventory & P2P (waves 16–20)

- **FR-3.1** Immutable inventory transactions with physical/financial status and dimensions; journals; reservations; cycle counting; GL integration.
- **FR-3.2** Requisition → RFQ → agreement → PO with policy-driven approvals, versioned change management and vendor pricing.
- **FR-3.3** Receiving with GR/IR accrual; vendor invoice capture; 2/3-way matching with tolerances and exception workflow; ERS.
- **FR-3.4** AP open-item settlement, payment proposals, ISO 20022/NACHA/check payment media, positive pay, prepayments.
- **FR-3.5** FIFO/LIFO/weighted-average/standard costing with inventory close and GL reconciliation; supplier portal.

FR-4 Manufacturing & planning (waves 21–25)

- **FR-4.1** Production order lifecycle with picking, route consumption, RAF, WIP and variance settlement; subcontracting.
- **FR-4.2** MRP/MPS with coverage groups, planned orders, action/delay messages, pegging, statistical forecasting.
- **FR-4.3** Finite/infinite capacity scheduling with Gantt and optional CP-SAT optimization.
- **FR-4.4** Process manufacturing (formulas, potency, co/by-products, catch weight, batch attributes) and lean (production flows, kanban).
- **FR-4.5** Shop-floor kiosk with time registration, IoT ingestion (OPC-UA/MQTT), OEE, offline tolerance.

FR-5 Order-to-cash (waves 26–30)

- **FR-5.1** Deterministic pricing engine with condition tables/access sequences, discounts, promotions, rebates, explain.
- **FR-5.2** Quotations, sales orders, ATP/CTP, credit management, holds, multi-channel intake.
- **FR-5.3** Release, pick/pack/ship, packing slips with COGS, carrier integration, drop-ship.
- **FR-5.4** Invoicing (one-off, consolidated, subscription), ASC 606/IFRS 15 revenue recognition.
- **FR-5.5** Cash application, collections/dunning/disputes, RMA, rebate settlement, customer portal with payments. **Go-live candidate.**

FR-6 Warehouse, quality & logistics (waves 31–35)

- **FR-6.1** Location directives, work templates, waves, license plates, replenishment, load planning.
- **FR-6.2** Mobile scanner app with configurable flows, GS1 parsing, offline queue, label printing.
- **FR-6.3** Quality orders by rule, sampling, usage decisions, inventory blocking, NCR/CAPA, CoA, supplier scorecards.
- **FR-6.4** Load/route planning, rating, tendering, tracking, freight reconciliation, landed cost.
- **FR-6.5** EDI (X12/EDIFACT), Peppol e-invoicing, integration hub (APIs, webhooks, catalog, developer portal).

FR-7 Treasury, assets & controlling (waves 36–40)

- **FR-7.1** Bank accounts, statement import and auto-reconciliation, cash positioning/forecasting, bank connectivity with vaulted keys.
- **FR-7.2** Fixed assets with multi-book depreciation, full transaction set, CIP from projects, IFRS 16 leases.
- **FR-7.3** Budgeting with workflow and budget control on commitments; cost accounting ledger with allocations and ABC.
- **FR-7.4** Costing sheets, BOM cost roll-up, standard cost activation and revaluation, variance decomposition.
- **FR-7.5** Intercompany trade/accounting with mirror documents and reconciliation; group consolidation with eliminations and translation. **Finance parity.**

FR-8 Projects, people & service (waves 41–45)

- **FR-8.1** WBS, resources, hour/expense/item journals, T&M/fixed-price/milestone billing, WIP and POC accounting, EVM.
- **FR-8.2** Workers/positions/jobs with effective dating, absence, benefits, self-service, talent basics, PII controls.
- **FR-8.3** Country-pluggable gross-to-net payroll (US + one EU reference) and expense management with policies and card feeds.
- **FR-8.4** Functional locations/assets, preventive and condition-based plans, work orders with costs to asset/GL, IoT triggers.
- **FR-8.5** Installed base, agreements/SLAs, cases, field work orders, dispatch optimization, technician mobile app.

FR-9 Intelligence, compliance & go-live (waves 46–50)

- **FR-9.1** CDC lakehouse (Iceberg) + semantic layer with governed metrics, embedded dashboards, document designer, catalog/lineage.
- **FR-9.2** MCP-exposed APIs; copilot UI; governed agents with approval gates, evals in CI, cost budgets, model-agnostic provider layer.
- **FR-9.3** Localization framework and first country packs; electronic reporting designer; SoD engine; SOC 2 control evidence; privacy requests.
- **FR-9.4** Transactional migration packs for AX and SAP, parallel-run diff harness, cutover runbooks, coexistence adapters.
- **FR-9.5** Scale/perf targets met, multi-region DR, operations and documentation complete, first customer in production, v1.0 released.

8. Non-functional requirements

Area	Requirement
Availability	99.9% per tenant (v1), 99.95% target with multi-region (wave 50). RPO 5 min, RTO 1 h.
Performance	Journal posting 5k lines/s sustained; generated entity reads p95 < 50 ms; pricing p95 < 20 ms; order intake p99 < 500 ms; dashboard lag p95 < 60 s.
Scale	10k concurrent users; 1M journal lines/h; 100k order lines/h; 50k-item MRP in < 10 min.
Security	OIDC/SAML/SCIM; OPA authorization on every request; Postgres RLS; signed images/SBOM; secrets in Vault; SoD engine; pen-test clean at high/critical before wave 48 exit.
Compliance	SOC 2 TSC control mapping, GDPR/CCPA subject requests, SAF-T, Peppol, ISO 20022, GS1.
Accessibility	WCAG 2.1 AA for every generated form and every hand-built workspace (axe in CI).
Observability	OpenTelemetry traces/metrics/logs for 100% of services; SLO dashboards; alerting.
Portability	No provider-managed service in the critical path; Helm + Terraform/OpenTofu modules per provider; k3d local parity.
Extensibility	Entity/enum/field/workflow/form/report extensions as metadata; versioned public APIs with additive-change guarantees.
Data integrity	Every subledger reconciles to the universal journal daily by automated check; no negative inventory unless policy allows; gap-free fiscal sequences.
Auditability	Field-level immutable audit from CDC; every agent action logged with inputs/outputs/approver.

9. Technical architecture (summary — see ADR-0001)

- **Runtime**: Kubernetes (any conformant distribution), Argo CD GitOps, Envoy Gateway, cert-manager.
- **Services**: Go for ledgers/engines (journal, inventory, pricing, MRP, scheduling), TypeScript (Node) for workflow/integration/UI-adjacent services, Python for forecasting/ML/agent evals.
- **Data**: Postgres per domain (CloudNativePG), RLS, Atlas migrations generated from metadata; Apache Iceberg lakehouse with Trino/ClickHouse for analytics.
- **Eventing**: Kafka (Strimzi), Debezium CDC + transactional outbox, CloudEvents + AsyncAPI, schema registry.
- **Workflow**: Temporal for approvals, batch, agents.
- **Identity/authz**: Keycloak, OPA/Rego.
- **Frontend**: React + module federation shell; PWA for shop floor, warehouse and field mobile.
- **AI**: MCP server over Passage APIs; Claude as default model via a provider-agnostic layer; eval harness in CI.
- **Observability**: OpenTelemetry → Prometheus/Tempo/Loki/Grafana.

10. Success metrics

Milestone	Metric
Wave 5	Platform demo: deploy → login → extend entity → approve workflow → trace a request, all live.
Wave 15	A period closed in Passage with statements that tie to the trial balance to the cent.
Wave 30	Demo manufacturer runs one simulated month buy → make → sell → collect; all subledgers reconcile; stakeholder sign-off.
Wave 40	Group consolidation produced; finance parity sign-off by a practicing controller.
Wave 50	First customer month-end in production; load/DR targets met; v1.0 released.
Ongoing	Every wave: CI green, proofs committed, Argo app healthy in stage, references linked.

11. Risks and mitigations

Risk	Mitigation
Scope is enormous (50 waves)	Strict sequencing; each wave independently demoable; phase-exit sign-offs; `waves.json` is the single plan of record and is re-estimated each phase exit.
Accounting correctness	Fixture sets reviewed by a practicing accountant per finance wave; daily automated subledger-to-GL reconciliation from wave 16 onward.
Postgres-per-domain vs cross-domain transactions	Sagas over Temporal + outbox; the journal posting API is the only cross-domain financial truth; no distributed 2PC.
Cloud-agnostic ambition increases ops burden	Reference stack is entirely CNCF/open-source with Helm charts; provider-specific Terraform modules are thin and optional.
Payroll/tax/localization legal exposure	Ship provider adapters (Avalara/ADP-style) alongside internal engines; country packs gated by regulator-schema fixtures.
AI agent misuse	Agents inherit user permissions via OPA, approval gates, evals in CI, kill switch, cost budgets.
Two-person team	GitHub Projects + wave issues as the operating system; AI-assisted generation (Moonaan sdlc `generate-architecture` → `generate-backlog` → `generate-code`) per wave.

12. Open questions

1. Licensing model for v1.0 (open-core vs. source-available vs. commercial) — decide before wave 35 (integration hub/public APIs).
2. First real customer: identify by wave 20 to shape go-live scope at wave 30.
3. Which EU country is the payroll/localization reference (DE vs. UK)?
4. Hosting of the demo environments (which provider first, even though the stack is agnostic)?

13. Next steps in the Moonaan SDLC pipeline

1. **This PRD** is the requirements source.
2. Run `/sdlc:generate-architecture docs/PRD.md docs/architecture/` per phase to produce the architecture document and compiled fact sheets.
3. Run `/sdlc:generate-backlog` per wave to turn `waves.json` entries into epics/stories with dependency ordering (GitHub Issues are the backlog store for now; Jira when the Moonaan proxy is reachable).
4. Run `/sdlc:generate-code` per story.

Validation checklist (Scribe step 4)

- [x] Every functional requirement is traceable to a wave with a provable, testable, deployable output.
- [x] Every wave names the AX and SAP features it replaces (grounding).
- [x] Every wave links external references (standards, vendor docs, open-source implementations).
- [x] Non-functional requirements are measurable.
- [x] Sequencing and go-live milestones are explicit.
- [ ] Reviewed by @zdemanche.
- [ ] Accountant review of finance-wave fixtures (owner TBD).

Part 0A — The 10× Thesis: What Top-Tier Manufacturing ERPs Get Wrong and How Passage Fixes It

Passage is not a cheaper AX or a friendlier SAP. It emulates the full capability surface of the best manufacturing ERPs — SAP S/4HANA, Dynamics 365 Finance & Supply Chain, Infor LN / CloudSuite Industrial, Epicor Kinetic, IFS Cloud and Plex — and then removes the structural reasons those systems are slow, error-prone, expensive to use and closed. "10×" is measured, per wave, on four axes:

Axis	What we measure	Baseline (typical AX 2012 / D365 / S/4 deployment)	Passage target
Easier	Clicks and screens per task; training hours to competence; share of tasks completed without a super-user	Sales order with 5 lines: 40–60 clicks across 4 forms; AP clerk training 3–5 days	≤ 1/10 of clicks; a new user completes a guided task in < 30 min
Faster	Latency of the business answer (not the screen): MRP, inventory close, ATP, period close, report	MRP regeneration 2–8 h nightly; inventory close 1–6 h; month-end close 5–10 business days	MRP incremental < 2 min, full < 10 min; close continuous; statements real-time
More accurate	Reconciliation breaks per month; silent rounding/FX errors; duplicate master data; manual journal share	Subledger-to-GL breaks every close; 3–8% duplicate customers/vendors; 20–40% of journals are corrections	Zero unexplained breaks (checked daily by machine); < 0.5% duplicates; corrections < 5%
Open	Days to connect a new system; share of data reachable by API/event; integration projects per year	Weeks per interface (AIF/IDoc mapping projects); large share of logic reachable only from the UI	Any system on the network connects in < 1 day with no middleware; 100% of entities and events reachable

0A.1 The structural pain-point ledger

Each pain point below names the AX/SAP mechanism that causes it, the root cause, the Passage design that removes it, and the wave where it ships. Wave files repeat this at wave granularity under "Pain points solved (10× lens)".

A. Usability

#	Pain point today	Where it lives in AX / SAP	Root cause	Passage answer	Wave
U1	Dozens of forms to complete one business task; fields scattered across tabs and FastTabs	AX `SalesTable` form with 20+ tabs; SAP `VA01` header/item/schedule-line screens	Forms mirror tables, not tasks	Task-oriented screens generated from metadata with the *task* as the unit (order intake, receipt, close task); line grids with inline edit; the full document on one scrollable page	5, 27
U2	Lookups require knowing the code (vendor account, main account, item number)	`MainAccount` lookup in `LedgerJournalTrans`; SAP GL account search help	Keys are the primary identifier; search is secondary	Global typeahead on name/description/any attribute, ranked by recency and role; keys shown but never typed	5
U3	Personalization is per-user, fragile, lost on upgrade	AX usage data (`SysLastValue`); SAP GUI variants	Personalization stored outside metadata	Saved views are first-class, versioned, shareable, role-defaulted; survive upgrades because they target metadata ids	5
U4	Batch jobs hide status; users poll "Batch jobs" form to see if posting finished	`BatchJob`/`BatchJobHistory`; SAP `SM37`	Fire-and-forget batch framework with no UI contract	Every long-running action returns a tracked workflow with progress, ETA and a notification; the originating screen updates live	4, 5
U5	Error messages name internal objects ("Account structure does not allow this combination")	AX infolog; SAP message classes	Validation written for developers	Validation messages are metadata with user text, remediation link and the exact field; errors shown at the field as you type	3, 5
U6	Shop-floor and warehouse UIs are RF text menus or require a PC	AX `JmgRegistration` terminal; SAP ITSmobile/RF	UI frameworks predate touch and offline	Touch-first PWA kiosk and scanner apps with offline queues; one scan completes a step	25, 32
U7	Excel round-trips to do bulk edits	AX Excel add-in; SAP GUI copy/paste	No bulk-edit grid	Every list page supports multi-row inline edit, paste from spreadsheet with validation preview, and undo	5
U8	Approval requires logging in to the ERP	AX workflow work items; SAP Business Workplace (`SBWP`)	Workflow inbox is inside the client	Approvals in email/Slack/Teams/mobile with one-tap approve, full context and the same audit trail	4
U9	Copilot features are bolted on and read-only	D365 Copilot summaries; SAP Joule Q&A	AI layer has no safe action surface	Every API is an MCP tool under the user's permissions; agents draft, users approve; explain-this-record everywhere	47

B. Speed

#	Pain point today	Where it lives in AX / SAP	Root cause	Passage answer	Wave
S1	MRP runs overnight; planners work on stale data; a changed order waits until tomorrow	AX `ReqCalc` regeneration; SAP `MD01` total planning	Full regeneration over all items; pegging recomputed from scratch	Net-change planning engine keyed by events (order/receipt/BOM change) with incremental re-plan of affected low-level codes; full regen < 10 min for 50k items	22
S2	Inventory close/recalculation blocks posting for hours	AX `InventClosing`; SAP material ledger `CKMLCP`	Settlement of issues to receipts is a batch over all transactions	Running costing (continuous settlement on each issue for FIFO/avg) so close is a verification pass, not a computation; partitioned by item	20
S3	ATP is computed per line with locks; order entry slows under load	AX `InventOnHand`/CTP; SAP ATP with `VBBE` requirements	Row-level locking on on-hand and requirement tables	Cumulative ATP projection maintained from the inventory event stream; reads lock-free; promise computed in memory	27
S4	Month-end close takes 5–10 days of manual steps	AX period close checklist is a list; SAP closing cockpit sequences manual transactions	Postings are batch; reconciliations are manual	Continuous close: every subledger reconciles to the universal journal daily by machine; close checklist tasks auto-complete when their check passes	14, 16+
S5	Reports run against OLTP and time out, or against a cube that is a day old	AX SSRS on `GeneralJournalAccountEntry`; SAP BW loads	No streaming path from transaction to analytics	CDC → Iceberg lakehouse with p95 < 60 s lag; statements served from pre-aggregated balances rebuilt from the journal	11, 46
S6	Posting a 10k-line journal takes minutes and locks the period	`LedgerJournalCheckPost`; SAP `FB50` with `BSEG` inserts	Row-by-row posting through class hierarchies; synchronous number sequences	Append-only journal with batch insert, idempotency keys and asynchronous balance projection: 5,000 lines/s sustained	11
S7	Deploying a customization takes a release window	AX model store deploy with AOS restart; SAP transports with downtime	Code and metadata are compiled into the runtime	Metadata extensions apply live; code ships via GitOps with digest rollback in < 15 min	1, 3

C. Accuracy

#	Pain point today	Where it lives in AX / SAP	Root cause	Passage answer	Wave
A1	Subledgers drift from the GL (inventory value ≠ inventory account; AR aging ≠ AR control)	`InventSum` vs `GeneralJournalAccountEntry`; SAP `BSID` vs `SKB1` balances	Subledgers post to the GL through separate code paths with their own rounding	One posting API; subledgers are projections of the same event stream; daily machine reconciliation with zero unexplained breaks as a release gate	11, 16, 19, 30
A2	Rounding and FX differences appear as "penny" entries	AX `LedgerJournalTrans` rounding to accounting currency; SAP `BSEG` rounding differences	Rounding at line level then summing	Three-currency amounts stored per line; rounding applied once at document level with explicit rounding lines; ISO 4217 minor units enforced	12
A3	Duplicate customers/vendors/items	`CustTable` created freely; SAP `KNA1` duplicates across sales orgs	No dedup at creation; roles not layered on one party	One party per real-world entity with fuzzy-match blocking at creation (precision ≥ 0.95) and governed merge	7
A4	Wrong tax because tax group ↔ item tax group intersections are configured by hand	`TaxGroup` / `TaxItemGroup` intersection; SAP `FTXP` condition records	Determination is a configuration lattice with no test harness	Determination engine with a 500-scenario fixture pack reviewed by accountants; explain-this-tax on every line	13
A5	Negative inventory and phantom on-hand	`InventSum` allows negative physical when `InventModelGroup` permits; SAP `MMBE` vs `MSEG` timing	Projection updated by application code that can skip	On-hand is a projection of immutable inventory events; policy enforced at the event write; projection rebuilt from events and compared nightly	16
A6	Costing variances nobody can explain	`InventCostTrans` variances; SAP `KKS1`	Variance types computed after the fact with no linkage	Variance decomposition attached to each ended order with lot-size, quantity, price and substitution components that sum exactly	21, 39
A7	Master data changed without approval or trace	Direct edit of `VendTable` bank account; SAP `XK02`	Audit log optional (`SysDatabaseLog`) and slow	Field-level immutable audit from CDC for every entity; sensitive fields (bank accounts, credit limits) require workflow	5, 7

D. Openness and interoperability

#	Pain point today	Where it lives in AX / SAP	Root cause	Passage answer	Wave
O1	Each interface is a project (AIF service, IDoc mapping, custom data entity)	AX AIF/`DMF` entities; SAP `WE20` partner profiles, PI/PO	Integration surface is bespoke per object	Every entity and event is published automatically (OpenAPI, AsyncAPI, MCP) from metadata; new entity ⇒ new API with no work	3, 4, 35
O2	External systems poll for changes	`DMF` change tracking; SAP change pointers (`BDCP2`)	No event stream	Kafka topics per entity with CloudEvents, replay from any offset, webhooks for partners	4
O3	MES/PLM/SCADA need a separate middleware product	SAP MII, PI/PO; AX via BizTalk/Logic Apps	ERP speaks only its own protocols	Native OPC-UA/MQTT ingestion, EDI engine, Peppol, SFTP, MCP — eight integration surfaces with one auth model	25, 35
O4	Vendor cloud lock-in (LCS, RISE)	D365 only on Microsoft-managed Azure; S/4 Cloud on RISE	Platform tied to the vendor's operations	Any conformant Kubernetes; Helm charts; self-host or managed	1
O5	Customizations block upgrades	X++ overlayering; ABAP modifications	Extension model is code in the vendor's layer	Extensions are metadata and sanctioned hooks; additive API guarantees; upgrades are image promotions	3
O6	Analytics requires exporting to BYOD/BW	Entity store; BW extractors	No open analytical surface	Iceberg tables readable by any engine (Trino, Spark, DuckDB, Power BI, Tableau) with governed metrics	46

0A.2 Interoperability contract ("all systems on the network can use it")

Passage treats the ERP as a service on the customer's network, not a destination. Every capability is reachable through the same eight surfaces with one identity and one policy engine:

Surface	Used by	Auth	Guarantee
REST (OpenAPI 3.1, generated per entity)	Apps, scripts, partners	OIDC bearer token or API key, OPA-authorized	p95 < 50 ms simple reads; additive versioning
GraphQL (read model)	BI tools, portals	Same	Cross-entity reads without N+1
Kafka topics (CloudEvents, AsyncAPI)	MES, WMS, data platforms, other ERPs	mTLS + ACLs per tenant	At-least-once, ordered per key, 7-day replay
Webhooks	SaaS partners	Signed (HMAC) deliveries	Retries with backoff, dead-letter, replay
MCP	AI agents (Claude and others)	Delegated user token; agent ≤ user permissions	Every tool call audited
EDI (X12/EDIFACT via AS2/SFTP) and Peppol	Trading partners, tax authorities	Partner certificates	Acknowledgments, SLA monitor
OPC-UA / MQTT	Machines, PLCs, SCADA	Device certificates	10k events/min per plant, no loss on broker restart
File / SFTP	Banks, legacy systems	Keys in Vault	ISO 20022, BAI2, NACHA, CSV with schema validation

Rule: **if it is not reachable through these surfaces, it does not ship.** Each wave's API/event section is reviewed against this rule before close.

0A.3 How "deep knowledge of AX and SAP" is applied

We deliberately keep what those systems got right and name it in every wave's parity map:

- **From AX:** the role/duty/privilege security model; inventory dimensions (product/storage/tracking) as a first-class concept; `InventTrans` status semantics; trade-agreement search order; number sequences per legal entity; financial dimensions with account structures; coverage groups; lean production flows.
- **From SAP:** the universal journal (ACDOCA) as single source of truth; parallel ledgers and currency types; condition technique for pricing and tax; posting periods per module; EWM's location-directive rigor; QM inspection lots and usage decisions; results analysis for projects; Group Reporting eliminations.

And we remove the parts that exist only because of their era: batch-first processing, table-shaped forms, code-based extensions, closed integration layers, vendor-bound operations.

Part 0 — Phase 0: Foundation & Platform Kernel (waves 1–5)

0.0 Phase overview

Business outcome at phase exit. At the end of wave 5 nothing business-facing exists, but everything a business module needs does: a change merged to `main` reaches a Kubernetes environment with digest-pinned rollback in under 15 minutes; a user signs in once through a federated IdP and lands in a legal entity; every API call is authorized by OPA against AX-style roles/duties/privileges and fenced by Postgres row-level security; an entity declared in YAML becomes a table, an API, a client and a form without hand-written code; every state change is a CloudEvent on Kafka via a transactional outbox; approvals and batch jobs run on Temporal; number sequences support gap-free mode; every field change is in an immutable, hash-chained audit log; and a click in the shell can be followed through gateway, service, database and Kafka consumer in one trace. This layer is what AX calls the AOT, SysSecurity, batch and workflow frameworks, number sequences and SysDatabaseLog, and what SAP calls DDIC, PFCG, SM36/SM37, Business Workflow, SNRO and CDHDR/CDPOS — rebuilt as separately deployable services on the ADR-0001 stack.

Phase-exit sign-off criteria

- `make deploy-local` on a clean laptop produces a working k3d environment with all Phase 0 services in under 10 minutes; the same Helm/Argo manifests are healthy in the cloud `stage` cluster.
- Stakeholder demo executes, live, the wave-5 success metric from PRD §10: deploy a change → log in via a federated IdP → extend the Vendor-placeholder entity with a field and an enum value → run a 3-level approval → open the audit entry → open the trace in Tempo.
- Table-driven authorization suite (≥ 20 duties × allow/deny) and RLS cross-tenant suite are green; effective-permission report equals OPA decision for 100 sampled resources.
- Golden-generation suite for 10 reference entities is deterministic across 3 consecutive CI runs; additive v2 change passes, breaking change fails.
- Outbox chaos test shows zero lost and zero duplicated events over 10 kill cycles; 1M-row batch resumes after pod kill with 0 duplicates.
- Gap-free number sequence Jepsen-style test (10k concurrent requests) shows 0 gaps, 0 duplicates.
- 100% of generated forms pass axe WCAG 2.1 AA; audit entry visible within 2 s (p95); every service exports OTel traces, metrics and logs.
- SLO dashboards exist for every Phase 0 service with alert routes to the PagerDuty-compatible webhook.

Cross-wave data model summary

Entity	Owning service	Key relationships
Release, Environment	platform (wave 1, GitOps repo + registry DB)	Release → Environment (promotion history)
Tenant, LegalEntity	identity (wave 2; regenerated from metadata in wave 3)	Tenant 1→N LegalEntity; every row in every domain carries tenant_id
User, Role, Duty, Privilege, RoleAssignment	identity / authz (wave 2)	User N↔N Role via RoleAssignment scoped to LegalEntity; Role 1→N Duty 1→N Privilege
EntityDefinition, FieldDefinition, EnumDefinition, TypeDefinition, ExtensionPackage	metadata-registry (wave 3)	Entity 1→N Field; Field → Type or Enum; ExtensionPackage → Entity (additive)
OutboxEvent, TopicDefinition, SchemaVersion	every service / events (wave 4)	Outbox row → CloudEvent; TopicDefinition → SchemaVersion (from EntityDefinition)
WorkflowDefinition, WorkflowInstance, WorkItem, BatchJob, BatchRun, BatchTask	workflow (wave 4)	Instance → Definition version; WorkItem → Instance + assignee User; BatchRun 1→N BatchTask
NumberSequence, NumberSequenceAllocation	numseq (wave 5)	Sequence scoped to Tenant/LegalEntity; Allocation → Sequence (gap-free audit)
AuditEntry, AuditField	audit (wave 5)	Entry → any entity/record; hash chain per tenant
SavedView, Personalization, ImportJob	shell-bff / importexport (wave 5)	SavedView → EntityDefinition + User; ImportJob → EntityDefinition
RuleSet, DecisionTable, DecisionRow, UsageSnapshot	metadata-registry (wave 3)	RuleSet 1→N DecisionTable 1→N DecisionRow; rows may come from an ExtensionPackage
OutboundMessage, MessageTemplate, NotificationPreference	notify (wave 4)	Message → Template version + recipient User; Preference per User × event class
Attachment, AttachmentVersion, AttachmentLink, DocumentType, FileType	docs (wave 5)	Attachment 1→N Version; Attachment N↔N any record via Link; Attachment → DocumentType
AlertRule, AlertEvent, StandardText	shell-bff (wave 5)	AlertRule → EntityDefinition; AlertEvent → Rule + record + recipient; StandardText referenced by MessageTemplate

Cross-wave event catalog

Event (CloudEvents type)	Producer	Consumers	Payload summary
dev.passage.identity.user.created.v1 / .deactivated.v1	identity	audit, workflow (assignee cache), shell	user_id, tenant_id, email, status
dev.passage.authz.role-assignment.granted.v1 / .revoked.v1	authz	audit, OPA bundle builder	user_id, role_id, legal_entity_ids, effective_from/to
dev.passage.authz.policy.compiled.v1	authz	OPA sidecars (bundle pull), audit	bundle_version, sha256, role_count
dev.passage.metadata.entity.published.v1	metadata-registry	generator, events (topic/schema), shell (form cache)	entity_name, version, diff summary
dev.passage.metadata.extension.applied.v1	metadata-registry	generator, audit, shell	package_id, entity_name, fields_added, enum_values_added
dev.passage.workflow.instance.submitted.v1 / .completed.v1	workflow	owning entity service, audit, shell inbox	instance_id, entity, record_id, outcome
dev.passage.workflow.workitem.assigned.v1 / .escalated.v1	workflow	shell inbox, notifications	workitem_id, assignee_id, due_at
dev.passage.batch.run.completed.v1 / .failed.v1	workflow (batch)	shell job monitor, alerting	job_id, run_id, rows_processed, error
dev.passage.audit.entry.recorded.v1	audit	shell audit viewer (live), analytics (wave 46)	entry_id, entity, record_id, operation, hash
dev.passage.rules.ruleset.published.v1	metadata-registry	every service holding compiled rule trees, audit	code, version, tables, row_count
dev.passage.notify.message.sent.v1 / .failed.v1 / .bounced.v1	notify	audit, alerting, identity	message_id, channel, template_code, recipient_user_id
dev.passage.docs.attachment.available.v1 / .purged.v1	docs	shell, audit, OCR capture (wave 18)	attachment_id, version_no, document_type, links
dev.passage.alerts.alert.fired.v1	shell-bff (alert evaluator)	notify, shell	rule_id, entity, record_id, recipient_id

Phase-level risks

Risk	Likelihood	Impact	Mitigation	Owner
Metadata kernel under-specified before business waves need it	Medium	High	10 reference entities in wave 3 include the shapes of Party, Product, JournalLine; golden tests frozen at phase exit	Product
Two-person team cannot operate Kafka + Temporal + Keycloak + CNPG	Medium	High	All operators installed via Helm umbrella; runbooks per component; k3d parity so every incident reproduces locally	Engineering
OPA policy compile from roles produces unexpected denies	Medium	Medium	Effective-permission viewer and `decision` debug endpoint; deny-reason strings in every 403	Engineering
RLS misconfiguration leaks tenant data	Low	Critical	`FORCE ROW LEVEL SECURITY` on every table; app role NOBYPASSRLS; CI test queries every table cross-tenant	Security
Gap-free sequence becomes a throughput bottleneck	Medium	Medium	Continuous mode only where fiscal law requires it; non-continuous is the default with block pre-allocation	Engineering
Audit volume from CDC overwhelms Postgres	Medium	Medium	Monthly partitions; audit flag per field; PII masking at capture; 10-year retention tiered to object storage from wave 46	Engineering

---

0.1 Wave 1: Delivery Pipeline & Cluster Baseline

0.1.1 Scope and business context

AX ships code as LCS deployable packages built on a build VM and applied with AxUpdateInstaller; model store exports (`AxUtil export`) and database restores are the rollback. SAP moves ABAP through STMS transport requests (SE09/SE10 workbench requests, DEV → QAS → PRD routes, `tp import`), with back-out by transport of copies. Both couple release to a vendor tool and give no software bill of materials, no cryptographic signature and no sub-hour rollback. Wave 1 replaces this with a GitOps pipeline on any conformant Kubernetes. At the end of the wave an engineer can merge a pull request and watch the change reach `dev`, promote the same image digest to `stage`, and roll back to the previous digest, each in under 15 minutes. Out of scope: multi-region, production-grade HA Postgres, secrets rotation policy, cost reporting, and any business service other than the `hello-ledger` placeholder.

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
Applying an LCS deployable package to a D365 sandbox takes 2–4 h of downtime and a service request for production; a failed apply means a database restore	Package = whole-system binary; environment managed by vendor tooling	Per-service OCI image + Helm chart, promoted by digest through Argo CD; rolling update with no downtime	Merge → running in env: 4 h → < 15 min; downtime per release: hours → 0
STMS transport import to PRD (STMS_IMPORT) is a manual queue with no automatic back-out; a bad transport is reversed by hand-building a transport of copies	Transports carry object deltas, not immutable artifacts	Immutable digests; rollback is a one-line overlay revert	Rollback: 1–3 h and a Basis ticket → < 5 min, self-service
No SBOM or signature for an AX model or SAP transport; security teams cannot answer "which CVE is in production"	Build tooling predates supply-chain attestation	Syft SBOM, Grype/Trivy gate, cosign signature verified at admission	CVE-to-affected-environment lookup: days of manual inventory → one query; unsigned artifacts in prod: 0
OneBox/VHD developer environments (AX) or NetWeaver dev editions (SAP) take days to provision and drift from production	Monolithic app server image per developer	`make deploy-local` on k3d with the same charts as cloud	New engineer to a running environment: 2–5 days → < 10 min
Customers cannot host on their own infrastructure without LCS (D365) or RISE (S/4)	Vendor-managed cloud is the only supported topology	One OpenTofu interface across k3d/EKS/GKE/AKS/bare-metal; nothing provider-specific in the critical path	Supported deployment targets: 1 → 5 with identical manifests

0.1.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Package a release	LCS deployable package, `AxUtil export` model store, AXModel files	STMS transport request (E070/E071), `tp export`	OCI image (digest) + Helm chart version in `deploy/`	improved
Build and validate	Build VM, `AxBuild.exe`, Best Practice checks	SE80 activation, ATC (code inspector SCI), ABAP unit	GitHub Actions: lint, unit, container build, SBOM, scan	improved
Environment tiers	LCS dev/test/UAT/prod topology	STMS transport route DEV→QAS→PRD, STMS_QA	Argo CD app-of-apps per environment: dev, stage, prod	full
Promote between tiers	LCS "apply package" to the next environment	STMS import queue, `tp import`, STMS_IMPORT	`passage promote --to stage --digest sha256:…` opens a PR against the env overlay	full
Rollback	Restore DB + model store, "AOT revert"	Transport of copies back-out, SNOTE de-implement	Argo CD rollback to prior digest, `passage rollback --env stage`	improved
Code signing / trust	Strong-name model signing (`AxUtil … /key`)	Digitally signed SAP Notes, TMS trusted systems	cosign keyless signatures, policy-controller admission denies unsigned images	improved
Hotfix path	KB hotfix via LCS, binary update	SNOTE note implementation, SPAU	Hotfix branch → cherry-pick → same pipeline, same gates	full
Deployment log / history	LCS environment history, AxUpdateInstaller logs	STMS import log, SLOG/ALOG	Argo CD history + GitHub Deployments API + `platform.release` table	improved
Local dev environment	OneBox VM / VHD from LCS	SAP NetWeaver developer edition, mini-basis	`make deploy-local` on k3d, same charts as cloud	improved

0.1.3 Functional requirements

- **FR-1.1 Monorepo layout** — Must. The system shall keep all Passage source in one repository with the layout `services/go/<svc>`, `services/ts/<svc>`, `services/py/<svc>`, `web/shell`, `web/remotes/<name>`, `deploy/charts/<svc>`, `deploy/envs/{dev,stage,prod}`, `infra/modules/<provider>`, `metadata/entities`, `docs/`.
  - Notes: each service owns a `Dockerfile`, `Makefile`, `CODEOWNERS` entry and a Helm chart; CI path filters build only changed services; a `go.work` and `pnpm` workspace root pin toolchain versions (Go 1.23, Node 22, Python 3.12).
- **FR-1.2 Cluster bootstrap module** — Must. The system shall provide an OpenTofu module `infra/modules/cluster` with one variable interface (`provider ∈ {k3d, eks, gke, aks, baremetal}`, `name`, `node_pools[]`, `kubernetes_version`) that outputs a kubeconfig and installs the base add-ons.

    - Notes: base add-ons are Argo CD, Envoy Gateway, cert-manager, External Secrets Operator, CloudNativePG operator, sigstore policy-controller, metrics-server; provider modules contain only networking, node pools and storage classes; k3d module runs with 3 agent nodes and 8 GB RAM.
- **FR-1.3 Argo CD app-of-apps** — Must. The system shall define a root Application per environment that reconciles child Applications from `deploy/envs/<env>/apps/*.yaml`, each pinning a chart version and an image digest.
    - Notes: sync policy automated for dev, manual-approve PR for stage and prod; prune and self-heal enabled; sync waves order operators (–2), databases (–1), services (0), gateway routes (1).
- **FR-1.4 Digest-only promotion** — Must. The system shall promote images by immutable digest; tags are informational only.
    - Notes: `passage promote` rewrites `image.digest` in the target overlay and opens a PR with the SBOM diff and scan summary; promotion to prod requires the digest to have run in stage for ≥ 60 minutes with no SLO burn alert.
- **FR-1.5 CI pipeline** — Must. The system shall run on every PR and on `main`: lint (golangci-lint, eslint, ruff), unit tests with coverage ≥ 70% per service, container build (BuildKit, reproducible), Syft SBOM (SPDX 2.3), Grype and Trivy scan, cosign sign and attest.
    - Notes: required checks block merge; `main` builds push to the registry under `ghcr.io/passage/<svc>@sha256:…`; median PR pipeline ≤ 8 minutes; cache keyed by lockfile hash.
- **FR-1.6 Vulnerability gate** — Must. The system shall fail the build on any CRITICAL finding, or any HIGH finding older than 14 days with a fix available, unless an exception file `.vuln-exceptions.yaml` lists the CVE with an expiry ≤ 30 days.
- **FR-1.7 Signature verification admission** — Must. The system shall reject any pod whose image lacks a valid cosign signature from the repository identity (`https://github.com/passage/*` OIDC issuer) in namespaces labelled `passage.dev/verified=true`.
    - Notes: SLSA provenance attestation level 2 at wave 1, level 3 target by wave 48; a negative test deploys an unsigned image and asserts the admission denial message.
- **FR-1.8 `hello-ledger` placeholder** — Must. The system shall deploy a Go service with one Postgres table that proves the path: migration on start, REST endpoints, health probes, TLS ingress, metrics endpoint.
- **FR-1.9 Local parity** — Must. `make deploy-local` shall stand up k3d, Argo CD and `hello-ledger` behind `https://app.local.passage.dev` with a locally trusted cert-manager CA in under 10 minutes on a 16 GB laptop.
- **FR-1.10 Rollback** — Must. The system shall roll back any environment to the previous release by digest in ≤ 5 minutes via `passage rollback --env <env>` (which reverts the overlay commit) or the Argo CD history UI.
    - Notes: database migrations in Phase 0 are additive-only so rollback never requires a down migration; a rollback records a `Release` row with `kind=rollback`.
- **FR-1.11 Secrets and config** — Must. The system shall source all secrets from Vault through External Secrets Operator; no secret value appears in Git, Helm values or CI logs.
    - Notes: config via ConfigMap generated from `deploy/envs/<env>/values.yaml`; secret names follow `passage/<env>/<svc>/<key>`.

0.1.4 Data model

Release (`platform.release`, registry DB, also materialized in Git history)

Field	Type	Required	Notes
id	uuid	yes	PK
service	text	yes	matches chart name
image_digest	text	yes	`sha256:` + 64 hex; unique with service
git_sha	char(40)	yes	commit that produced the build
chart_version	text	yes	semver
sbom_url	text	yes	SPDX artifact in registry
signed	bool	yes	cosign verification result
status	enum	yes	built, scanned, signed, deployed_dev, deployed_stage, deployed_prod, superseded, rolled_back
created_at	timestamptz	yes	

Environment (`platform.environment`)

Field	Type	Required	Notes
name	text	yes	PK; dev, stage, prod, local-
cluster_provider	enum	yes	k3d, eks, gke, aks, baremetal
argo_root_app	text	yes	app-of-apps name
promotion_policy	enum	yes	auto, pr_approval
soak_minutes	int	yes	default 0 dev, 60 stage→prod
base_url	text	yes	`https://app.<env>.passage.dev`

HelloLedgerEntry (`hello_ledger.entry`)

Field	Type	Required	Notes
id	uuid	yes	PK
memo	varchar(200)	yes	
amount_minor	bigint	yes	integer minor units, USD/EUR examples: 12345 = $123.45
currency	char(3)	yes	ISO 4217
created_at	timestamptz	yes	default now()
created_by	text	yes	`anonymous` until wave 2

Invariants: one `Release` row per (service, image_digest); at most one `deployed_<env>` release per service per environment; `Environment.name` is immutable. Indexing: `release(service, created_at desc)`; `entry(created_at)`.

0.1.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
GET	/healthz, /readyz	Liveness / readiness	n/a	none

Method	Path	Purpose	Idempotency	Auth duty
GET	/v1/version	git sha, digest, chart version	n/a	none
GET	/v1/hello-ledger/entries?limit=&cursor=	List entries	n/a	none (token required from wave 2)
POST	/v1/hello-ledger/entries	Create entry	`Idempotency-Key` header, 24 h window	Maintain hello ledger
GET	/v1/hello-ledger/entries/{id}	Fetch one	n/a	none
GET	/v1/platform/releases?service=&env=	Release history	n/a	View platform releases
POST	/v1/platform/releases/{id}/promote	Open promotion PR	release id + env	Maintain platform releases

CLI commands `passage promote`, `passage rollback`, `passage status` call these endpoints or edit the overlay directly.

Event	Trigger	Payload fields	Consumers
dev.passage.platform.release.built.v1	CI publishes signed image	release_id, service, image_digest, git_sha, sbom_url	registry DB writer
dev.passage.platform.release.promoted.v1	Argo sync Healthy in target env	release_id, environment, actor, previous_digest	audit (wave 5), shell notifications
dev.passage.platform.release.rolledback.v1	Rollback sync Healthy	release_id, environment, actor, reason	audit, alerting
dev.passage.hello.entry.created.v1	Entry insert	entry_id, amount_minor, currency	none (proves outbox path in wave 4)

In wave 1 events are written as CloudEvents JSON to stdout and to the registry DB; Kafka transport replaces the sink in wave 4 without changing types.

0.1.6 User experience

Screen	Primary actions	Key fields/columns	Duty required
Argo CD UI (per env)	Sync, view history, rollback	app, health, sync status, revision, digest	Platform engineer (Argo RBAC via GitHub team)
GitHub PR checks	View gate results, SBOM diff	lint, unit, build, scan, sign	repository write
hello-ledger page `/`	Create entry, list entries	memo, amount, currency, created_at	none

Interaction rules: promotion PRs are templated with a checklist (soak time met, scan clean, rollback target named); CI annotates failing lines inline; `make deploy-local` prints a single URL table at the end.

0.1.7 Business rules and edge cases

- **BR-1.1** Release status machine: built → scanned → signed → deployed_dev → deployed_stage → deployed_prod → superseded; any deployed_* may go to rolled_back; no transition skips `signed`.
- **BR-1.2** A tag may be rewritten; a digest may not. Any overlay referencing a tag fails the `deploy-lint` CI check.
- **BR-1.3** Promotion to prod requires soak ≥ `Environment.soak_minutes` in stage with zero `SLOBurnRateHigh` alerts; the check is computed in UTC with ISO 8601 timestamps.
- **BR-1.4** Two concurrent promotions of the same service to the same environment: the second PR is auto-closed with a comment pointing at the first.
- **BR-1.5** A vulnerability exception past its expiry date fails the build as if no exception existed.
- **BR-1.6** Rollback target is always the last `deployed_<env>` release with a different digest; if none exists the command refuses.
- **BR-1.7** Images are retained for 180 days or while referenced by any environment, whichever is longer; SBOMs retained 7 years.
- **BR-1.8** A hotfix branch must be cut from the prod digest's `git_sha`; CI refuses `hotfix/*` branches whose merge base is not a deployed_prod release.

0.1.8 Acceptance criteria

- **AC-1.1** Given a PR with an injected lint error, When CI runs, Then the `lint` check fails and merge is blocked. (FR-1.5)
- **AC-1.2** Given a PR with a failing unit test, When CI runs, Then `unit` fails and the failing assertion is annotated inline. (FR-1.5)
- **AC-1.3** Given a clean macOS or Linux laptop with Docker, When `make deploy-local` runs, Then Argo CD and hello-ledger are reachable over TLS within 10 minutes. (FR-1.9)
- **AC-1.4** Given a signed image in dev, When `passage promote --to stage` is merged, Then Argo shows Healthy with that digest within 15 minutes of merge. (FR-1.3, FR-1.4)
- **AC-1.5** Given stage running digest B after A, When `passage rollback --env stage` runs, Then Argo history shows A active within 5 minutes and a `rolled_back` Release row exists. (FR-1.10)
- **AC-1.6** Given an unsigned image applied to a verified namespace, When the pod is created, Then admission denies it with a message naming the missing signature. (FR-1.7)
- **AC-1.7** Given an image with one CRITICAL CVE, When CI runs, Then the scan gate fails; adding a valid exception with expiry in 10 days passes it. (FR-1.6)
- **AC-1.8** Given a secret in Vault, When hello-ledger starts, Then it reads `DATABASE_URL` via ESO and the value is absent from Git, values files and CI logs (grep check). (FR-1.11)

0.1.9 Test plan and fixtures

Fixtures: `fixtures/pipeline/negative-lint.go` (committed lint failure behind a build tag), `fixtures/pipeline/unsigned-image.yaml`, `fixtures/pipeline/cve-exception.yaml` (expired and valid), `fixtures/hello-ledger/entries-100.json` (100 entries in USD and EUR).

Test	Type	Target	Pass criterion
Lint/unit negative	CI contract	pipeline	both injected failures block merge
Local bootstrap	E2E	`make deploy-local`	< 10 min, all pods Ready, TLS valid
Promote and rollback	E2E	Argo CD	both < 15 min, history correct
Admission unsigned	Negative	policy-controller	pod denied
SBOM presence	Contract	registry	SPDX attached to every digest
hello-ledger API	Unit + contract	handlers	100% of OpenAPI paths covered
Build reproducibility	Property	BuildKit	same source → same digest twice

Reconciliation: `Release` rows with status `deployed_<env>` equal the digests in each env overlay and the running pods' image IDs (nightly check).

0.1.10 Deployment and operations

Charts: `deploy/charts/platform-base` (umbrella for operators), `deploy/charts/hello-ledger`. Config: `values.yaml` per env; env vars `PASSAGE_ENV`, `OTEL_EXPORTER_OTLP_ENDPOINT` (used from wave 5), `DATABASE_URL` (ESO). Migrations: Atlas, additive-only, run as an init job. Feature flags: none. Scheduled jobs: nightly release reconciliation. SLOs: pipeline p50 ≤ 8 min, promotion merge→Healthy p95 ≤ 15 min, hello-ledger availability 99.9%. Alerts: `ArgoAppDegraded` > 10 min, `PipelineFailureRate` > 20% over 1 h, `AdmissionDeniedSpike`. Runbook entries: Argo out of sync, failed migration job, expired local CA. Rollback: `passage rollback`, then verify `/v1/version`.

0.1.11 Migration from AX / SAP

Nothing is migrated. LCS packages, AX model store layers and SAP transport requests contain code (X++/ABAP), which PRD §2 excludes. The only carry-over is organizational: the STMS DEV→QAS→PRD route maps to dev→stage→prod and LCS environment names are recorded in `Environment.description` for operator familiarity.

0.1.12 Dependencies, risks, open questions

Depends on: nothing (first wave).

Risk	Likelihood	Impact	Mitigation
k3d cannot run the full stack in 16 GB by wave 5	Medium	Medium	Profiles: `make deploy-local PROFILE=min` omits observability
Keyless cosign requires outbound access to Fulcio/Rekor	Medium	Low	Private sigstore instance documented for air-gapped installs
GitHub Actions minutes cost	Low	Low	Self-hosted runner module in `infra/`

Open questions: (1) First cloud provider for `dev/stage` (PRD §12 Q4) — default EKS; decide by wave 2 start. (2) Private registry vs ghcr.io for customers — default ghcr.io with mirror instructions; decide by wave 5. (3) Mesh (none vs Linkerd) for mTLS — default none, gateway-to-service mTLS only; decide by wave 4.

0.1.13 Parameters and setup

Platform parameters live in Git (`deploy/envs/<env>/values.yaml`, `infra/modules/cluster/variables.tf`, repository settings) rather than in a database form; "scope" below names the file or object that owns the value.

Parameter	Scope	Type	Default	Allowed values	Effect	AX
`cluster.provider`	cluster (OpenTofu variable)	enum	`k3d`	k3d, eks, gke, aks, baremetal	selects the provider sub-module for networking, node pools, storage classes	LCS topo host pren
`cluster.kubernetes_version`	cluster	semver	1.31	n–2 … n of upstream	pins the control plane and node pools	LCS upd
`cluster.node_pools[]`	cluster	list of {name, size, count, labels}	3 × 8 GB (k3d)	provider-specific	sizes compute; `passage.dev/workload` label routes stateful sets	LCS sizi
`environment.promotion_policy`	environment (`platform.environment`)	enum	auto (dev), pr_approval (stage, prod)	auto, pr_approval	auto-sync vs. PR with required reviewers	LCS pack appr
`environment.soak_minutes`	environment	int	0 dev, 60 stage	0–1,440	minimum time a digest must run in the prior tier before promotion	non
`argo.sync.self_heal`, `argo.sync.prune`	environment overlay	bool	true, true	true/false	drift corrected automatically; removed manifests deleted	non
`argo.sync_waves`	overlay annotation	ordered ints	operators –2, databases –1, services 0, routes 1	–10 … 10	start order per sync	AxU step
`ci.unit_coverage_min_pct`	repository (`.passage-ci.yaml`)	int	70	0–100	fails the `unit` check below threshold	Best chec
`ci.vuln.fail_on`	repository	enum set	critical, high_with_fix_older_than_14d	critical, high, high_with_fix_older_than_14d, medium	scan gate policy (FR-1.6)	non
`ci.vuln.exception_max_days`	repository	int	30	1–90	maximum validity of a `.vuln-exceptions.yaml` entry	non
`ci.sbom.format`	repository	enum	spdx-2.3	spdx-2.3, cyclonedx-1.6	SBOM attestation format	non
`admission.verified_namespace_label`	cluster (policy-controller `ClusterImagePolicy`)	string	`passage.dev/verified=true`	label selector	namespaces where unsigned images are denied	stro sign requ mod /ke
`admission.oidc_identity`	cluster	regex	`https://github.com/passage/.*`	issuer + subject regex	identity accepted by cosign keyless verification	non
`registry.image_retention_days`	registry	int	180	30–3,650	untagged, unreferenced digests deleted after this	LCS rete
`registry.sbom_retention_years`	registry	int	7	1–10	SBOM and attestation retention	non
`secrets.path_template`	cluster (ESO `ClusterSecretStore`)	string	`passage/<env>/<svc>/<key>`	Vault KV v2 path	where every service secret is read from	non / AO

Parameter	Scope	Type	Default	Allowed values	Effect	AX
`local.profile`	developer (`make deploy-local PROFILE=`)	enum	full	min, full	`min` omits observability and Temporal UI to fit 16 GB	One size
`hello_ledger.idempotency_window_hours`	service values	int	24	1–168	replay window for `Idempotency-Key`	none

0.1.14 Inquiries and reports

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
Release history	list inquiry	service, environment, status, date range	service, digest (short), git sha, chart version, status, created_at, signed, sbom link	`platform.release`	LCS Environment details → History / Applied updates	STMS import history (STMS_IMPORT → Goto → Import history), SE10 request log
Environment status	drill-down	environment	app, health, sync status, revision, digest, last sync, soak elapsed	Argo CD Application CRs + `platform.environment`	LCS environment monitoring page	STMS system overview, SM51
Deployment reconciliation	operational report (nightly)	environment	service, overlay digest, running digest, release status, mismatch flag	overlay files vs. pod image IDs vs. `platform.release`	LCS "Environment details → Version" check	STMS import queue vs. SE03 object directory comparison
CVE exposure by environment	operational report	severity, environment, fixed-available flag	CVE id, package, version, fixed version, digest, environment, first seen	Grype/Trivy results attached to each digest	none	Solution Manager System Recommendations (SysRec) for security notes
Vulnerability exceptions	list inquiry	expiry window	CVE, service, justification, approver, expires_at, days left	`.vuln-exceptions.yaml` (parsed in CI)	none	SNOTE note status / RSECNOTE
Pipeline statistics	KPI	period (day/week), branch	runs, median duration, p95 duration, failure rate by check	GitHub Actions API	Azure DevOps build pipeline analytics (D365)	STMS import log statistics, ChaRM cycle reports
Admission denials	operational report	namespace, period	pod, image, reason (unsigned / wrong issuer), time	policy-controller Kubernetes events	none	TP system log (SLOG/ALOG) rejected imports
Service version page	drill-down	service	git sha, digest, chart version, build time, Go/Node version	`GET /v1/version` of each service	Help → About (kernel and application build numbers)	System → Status (component versions, SPAM/SAINT level)
Hotfix lineage	list inquiry	service	hotfix branch, base prod digest, cherry-picked commits, status	Git refs + `platform.release`	LCS hotfix KB list, "Applied hotfixes"	SNOTE implemented notes, SPAU
Image retention candidates	operational report	registry	digest, service, last referenced env, age, SBOM present	registry API + `platform.release`	LCS asset library	none

0.1.15 Printed and electronic documents

No printed documents. Electronic artifacts produced by the wave:

Document	Trigger	Layout elements	Formats	Numbering sequence	Legal / retention requirement
SBOM	every `main` build	SPDX document: creator, package list (name, version, license, PURL), relationships, digest it describes	SPDX 2.3 JSON, attached to the image as a cosign attestation	identified by image digest, no sequence	retained 7 years (BR-1.7); evidence for wave 48 SOC 2 CC8.1
Provenance attestation	every signed build	in-toto statement: builder id, source repo + sha, materials, build config	in-toto JSON (SLSA v1), Rekor transparency log entry	Rekor log index	retained with the image; immutable in Rekor
Promotion PR summary	`passage promote`	title (service, from → to env, digest), checklist (soak met, scan clean, rollback target), SBOM diff table, scan summary	GitHub PR body (Markdown)	PR number	retained with repository history
Release notes (per promotion to prod)	PR merge to prod overlay	commits since previous prod digest grouped by Conventional Commit type, linked issues	Markdown in GitHub Deployment description	release id	none

0.1.16 Periodic and batch jobs

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
Release reconciliation (overlay vs. running vs. DB)	nightly 02:00 UTC	environment	re-runnable; writes a report row per (env, service) keyed by date	< 2 min	report row `mismatch=true`; no automatic correction	`ReleaseDriftDetected` (ticket)
Image retention sweep	weekly Sunday 03:00 UTC	service	deletes only digests not referenced by any `platform.environment`; dry-run list stored first	< 10 min	abort on registry 5xx; rerun next week	`RegistryRetentionFailed` (notify)
Deployed-digest re-scan	daily 04:00 UTC	environment × service	scan result keyed by (digest, scanner db version)	< 15 min for 30 images	partial results kept; missing scans listed	`NewCriticalCVEInProd` (page during business hours)
Vulnerability exception expiry check	daily 05:00 UTC	repository	stateless	< 1 min	opens a GitHub issue per expiring exception (≤ 7 days)	`VulnExceptionExpiring` (notify)
Local CA renewal (k3d)	on `make deploy-local`, and every 300 days	developer machine	reissues only when < 30 days left	< 30 s	prints instruction to re-trust the CA	n/a
Rekor inclusion verification	weekly	service	verifies each prod digest's signature entry is still present	< 5 min	alert; no deployment change	`SignatureVerificationFailed` (page)

0.1.17 Security duties and privileges

Wave 1 has no OPA-enforced API yet (wave 2); the duties below are enforced by GitHub branch protection, CODEOWNERS, Argo CD RBAC (mapped from GitHub teams) and Vault policies, and are re-declared as Passage duties in wave 2 so the same names hold later.

Duty	Privileges (entry points)	Segregation-of-duties conflicts	Default roles that include it
View platform releases	`GET /v1/platform/releases`, Argo CD read-only UI, `passage status`	none	Platform engineer, Release manager, Auditor
Maintain platform releases	`POST /v1/platform/releases/{id}/promote` (dev → stage), `passage promote --to stage`, merge to `deploy/envs/dev`, `deploy/envs/stage`	with Approve production promotion (same person cannot author and sole-approve the prod PR; enforced by required reviewers ≠ author)	Platform engineer
Approve production promotion	review + merge of PRs touching `deploy/envs/prod` (CODEOWNERS `@passage/release-managers`)	with Maintain vulnerability exceptions	Release manager
Rollback environment	`passage rollback --env <env>`, Argo CD rollback action	none (rollback is always allowed to anyone who can promote to that env)	Platform engineer (dev, stage), Release manager (prod)
Maintain vulnerability exceptions	edit `.vuln-exceptions.yaml` (CODEOWNERS `@passage/security`)	with Approve production promotion	Security engineer
Maintain cluster configuration	`tofu apply` on `infra/`, edit `deploy/charts/platform-base`	with Maintain secrets (one person should not hold both cluster admin and Vault root)	Platform engineer
Maintain secrets	Vault policy `passage/<env>/*` write; ESO `ClusterSecretStore` edit	with Maintain cluster configuration	Security engineer
Maintain hello ledger	`POST /v1/hello-ledger/entries` (token-gated from wave 2)	none	Platform engineer (demo only)

0.1.18 Message catalog

Codes `PLT-01xx` are emitted by CI checks, the `passage` CLI, the admission controller and the hello-ledger service; CI messages are also written as GitHub check annotations.

Code	Severity	User text	Cause	Remediation	Raised by
PLT-0101	error	Overlay references image by tag `{tag}`; digests are required	`image.tag` or `image:tag` found in `deploy/envs/**`	replace with `image.digest: sha256:…` from the release history	BR-1.2, FR-1.4
PLT-0102	error	Promotion to prod blocked: digest ran {minutes} of {required} soak minutes in stage	soak not met	wait, or lower `soak_minutes` with Release manager approval	BR-1.3
PLT-0103	error	Promotion to prod blocked: SLO burn alert `{alert}` fired during soak	`SLOBurnRateHigh` within the window	investigate the alert; re-soak after fix	BR-1.3
PLT-0104	warning	A promotion of {service} to {env} is already open (#{pr}); this PR was closed	concurrent promotion	wait for the first PR	BR-1.4
PLT-0105	error	No rollback target: no earlier `deployed_{env}` release with a different digest	first release in the environment	deploy an earlier digest explicitly with `passage promote --digest`	BR-1.6
PLT-0106	error	Vulnerability exception for {cve} expired on {date}	exception past expiry	renew with new justification (≤ 30 days) or fix	BR-1.5, FR-1.6
PLT-0107	error	Scan gate failed: {n} CRITICAL / {m} actionable HIGH findings	FR-1.6 policy	upgrade the package or add a justified exception	FR-1.6
PLT-0108	error	Pod denied: image {image} has no valid cosign signature from `{identity}`	admission policy	build through CI; never push hand-built images to verified namespaces	FR-1.7
PLT-0109	error	Hotfix branch `{branch}` is not based on a deployed_prod release	wrong merge base	`git rebase --onto <prod sha>`	BR-1.8
PLT-0110	error	Unit coverage {pct}% below minimum {min}% for {service}	`ci.unit_coverage_min_pct`	add tests	FR-1.5
PLT-0111	error	Possible secret committed: {rule} at {path}:{line}	gitleaks rule hit	remove, rotate the secret in Vault, force-push is not allowed; add to history rewrite ticket	FR-1.11
PLT-0112	error	Migration job for {service} failed: {atlas error}	Atlas apply error	fix migration; additive-only rule means no down migration is needed	FR-1.10
PLT-0113	warning	Local bootstrap needs 16 GB RAM; {gb} GB detected — using PROFILE=min	insufficient memory	accept reduced profile or free memory	FR-1.9
PLT-0114	info	Idempotent replay: returning the entry created at {time} for this Idempotency-Key	duplicate POST within 24 h	none	FR-1.8
PLT-0115	error	Build not reproducible: digest {a} ≠ {b} for the same source	non-deterministic build input	pin the input (timestamp, dependency)	0.1.9 reproducibility test

0.1.19 Performance budgets and capacity

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
PR pipeline (lint → sign)	40 runs/day, peak 10 concurrent	6 min / 8 min / 12 min	20 concurrent runners	CI cache ≤ 20 GB (LRU)	path-filtered per service; cache keyed by lockfile hash	queued runs wait; no timeouts under 60 min
Promotion merge → Argo Healthy	10/day across envs	5 min / 15 min / 20 min	n/a	`platform.release` ≈ 10 k rows/year (≈ 5 MB)	`release(service, created_at desc)`	Argo reconciles in order; sync waves prevent partial start
Rollback	1/week	2 min / 5 min / 8 min	n/a	n/a	n/a	same as promotion
Admission webhook (signature verify)	500 pod creations/day, 50/min at rollout	50 ms / 200 ms / 500 ms	20/s	none	verification result cached per digest for 1 h	failurePolicy=Fail in verified namespaces; cached digests still admitted
hello-ledger `POST /entries`	10 k/day (demo)	10 ms / 40 ms / 80 ms	200 rps	≈ 1 GB/year at 10 M rows	`entry(created_at)`	Postgres connection pool 20; 503 beyond queue depth 100
Registry pulls at rollout	30 images × 3 nodes per env	5 s / 20 s / 40 s per image	100 MB/s	images ≈ 200 GB/year before retention	retention sweep (0.1.16)	node image cache; rollouts slower, not failed
`make deploy-local`	5/day per engineer	7 min / 10 min / 12 min	n/a	15 GB disk per environment	n/a	PROFILE=min

0.1.20 Localization and compliance hooks

- Nothing in this wave varies by country or language; all timestamps are UTC ISO 8601 and all CLI/CI messages are English only (label packs for CLI output are not planned).
- Data residency: a customer runs the `infra/modules/cluster` module in the region of their choice; nothing in `deploy/` assumes a region. Wave 48 country packs do not touch this wave; wave 50 (multi-region) adds region-aware overlays under `deploy/envs/<env>-<region>`.
- Air-gapped and export-controlled sites: registry mirror instructions (open question 2) and a private sigstore (Fulcio/Rekor) profile in `infra/modules/sigstore-private`; `admission.oidc_identity` is the extension point.
- Supply-chain regulation (EU Cyber Resilience Act, US EO 14028): SBOM + provenance per digest (0.1.15) are the evidence artifacts; retention 7 years.
- Privacy: no personal data is processed by this wave except Git author identities in commit history (retained as part of source control; excluded from erasure requests under wave 48 privacy tooling, documented).

0.1.21 Coverage closure

No `GAP` or `PARTIAL` row in coverage-ax.md §12.99 or coverage-sap.md §13.99 is assigned to wave 1 (both registers parsed on 2026-10-21). Inventory rows tagged `COVERED-1` (SAP §13.30: SE09/SE10/SE01/SE03/STMS/STMS_IMPORT/SE06/SE07 transport organizer and management; STRUST/SSFA/SSO2/SAML2/SNCWIZARD trust manager; STMS import history and SE10 request logs; STMS import jobs / transport of copies / ChaRM cycles) are met by FR-1.1–FR-1.11 and 0.1.14.

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
none	—	—	Wave 1 has no register rows; see paragraph above for the `COVERED-1` confirmation

---

0.2 Wave 2: Identity, Tenancy & Authorization

0.2.1 Scope and business context

AX 2012 authorizes through `SecurityRole` → `SecurityDuty` → `SecurityPrivilege` → `SecurityEntryPoint` with access levels (NoAccess, Read, Update, Create, Correct, Delete), table permissions in the AOT, extensible data security policies (XDS) and `UserInfo` rows tied to Active Directory; companies are isolated by `DataAreaId` on every per-company table. SAP uses `SU01` user masters (USR02), `PFCG` roles (AGR_DEFINE, AGR_1251 field values, AGR_USERS), authorization objects such as `S_TCODE`, `F_BKPF_BUK` (company code) and `M_MATE_WRK` (plant), `SU24` proposals, `SU53` failed-check traces, and `MANDT` for client isolation. Wave 2 gives Passage one identity provider (Keycloak) federated to Entra ID, Okta or Google, SCIM provisioning, an AX-shaped role model compiled to Rego, OPA as a sidecar on every service, Envoy Gateway JWT validation with per-tenant rate limits, and Postgres RLS on every table. At the end of the wave a user logs in once, lands in a legal entity, and every API call is allowed or denied by policy, not code. Out of scope: segregation-of-duties conflict analysis (wave 48), position hierarchies (wave 42), record-level XDS-style data policies beyond tenant and legal entity (wave 15 adds dimension security), customer-facing portals (waves 20, 30).

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
Diagnosing "no authorization" in SAP needs SU53 on the user's session, then SUIM, then PFCG edit, role generation and user comparison (PFCG → Authorizations → Generate → User tab → User comparison): 6 screens and often a transport	Authorization data lives in profiles generated from roles; failures are only visible in the user's own buffer	Every 403 carries `duty_missing`; the effective-permission viewer shows the decision trace for any user × entity × action; assignment takes effect in ≤ 30 s without a transport	Access-fix cycle: 1–3 days (ticket + transport window) → < 5 min; screens: 6 → 1
AX security development: a new entry point needs a privilege, duty and role in the AOT, synchronization and an AOS restart; D365 needs a build and package	Security objects are AOT metadata compiled into the model store	Role/duty/privilege are data compiled to a Rego bundle on save	Role change to live: 1–2 h (AX) / 4 h (D365 package) → ≤ 5 s compile + 10 s propagation
Company isolation relies on every X++ query honoring `DataAreaId` (and `crossCompany` misuse) or every ABAP select carrying MANDT; leaks are code bugs	Isolation enforced in application code, not the database	Postgres RLS with `FORCE ROW LEVEL SECURITY`; the app role cannot bypass it	Code paths that can leak a tenant: every query → 0; cross-tenant CI test on 100% of tables
Joiners/leavers: SU10 mass maintenance or D365 user import run manually; leavers keep access for days	No standard provisioning protocol in ECC; D365 ties to Entra only	SCIM 2.0 server with deprovision revoking sessions in ≤ 60 s	Deprovision latency: days → < 60 s; manual user admin steps per joiner: ~10 → 0
MFA and federation to Okta/Google are unsupported on AX 2012; S/4 needs SAP IAS/SNC projects	IdP coupling to AD/Entra or SAP's own stack	Keycloak brokering any OIDC/SAML IdP with TOTP/WebAuthn	Federation to a new IdP: a multi-week project → < 1 h of configuration

0.2.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
User master	`UserInfo`, SysUserInfoPage form, AD import wizard	SU01, USR02/USR21, SU10 mass maintenance	identity `User` entity, Admin UI Users, SCIM /Users	full
Role	`SecurityRole`, SysSecRoles form	PFCG single/composite/derived roles, AGR_DEFINE	authz `Role` (+ `derived_from` for org-level variants)	full
Duty / privilege	`SecurityDuty`, `SecurityPrivilege`, `SecurityRoleTaskGrant`, `SecurityTaskEntryPoint`	Authorization objects/fields (TOBJ, AGR_1251), SU24 defaults	`Duty`, `Privilege`, `Permission(entity, action, scope)`	full
Access levels	NoAccess/Read/Update/Create/Correct/Delete on entry points and tables	ACTVT 01/02/03/06 etc. per object	action enum: read, create, update, correct, delete, post, approve	full
Company isolation	`DataAreaId`, `CompanyInfo`, `changecompany()`	MANDT client, BUKRS org level in roles	tenant_id RLS + legal_entity_id scope on RoleAssignment	improved
Org-scoped roles	`OMUserRoleOrganization` (role valid for selected legal entities)	Derived roles with org-level values (BUKRS, WERKS)	`RoleAssignment.legal_entity_ids[]` or `all`	full
Effective permissions	Security development tool, "View permissions"	SUIM, SU56 user buffer, SU53 trace	`GET /v1/authz/effective-permissions`, decision debug endpoint	improved
Identity federation / MFA	Entra ID (AAD) only on D365; AD on AX 2012	SAML via Identity Authentication Service, SNC	Keycloak OIDC/SAML brokering, TOTP/WebAuthn MFA	improved
Provisioning	AD sync, D365 user import	SAP IPS SCIM, CUA	SCIM 2.0 server (RFC 7644)	full

0.2.3 Functional requirements

- **FR-2.1 Keycloak as IdP** — Must. The system shall deploy Keycloak with one realm per tenant, brokering OIDC and SAML 2.0 to external IdPs, issuing RS256 JWTs with claims `sub`, `tid` (tenant), `email`, `preferred_username`, `pv` (policy bundle version), `amr`.
  - Notes: access token TTL 10 minutes, refresh 8 hours, absolute session 12 hours; MFA (TOTP or WebAuthn) required for roles flagged `mfa_required`; realm export committed as Helm values for reproducibility.
- **FR-2.2 SCIM provisioning** — Must. The system shall expose `/scim/v2/Users` and `/scim/v2/Groups` per tenant with filter, PATCH and bulk (≤ 1,000 operations) per RFC 7644; group membership maps to role assignment via a configurable mapping table.
  - Notes: deprovision sets `status=deprovisioned`, revokes sessions within 60 s, never deletes the row (audit needs it).
- **FR-2.3 Tenant and legal entity model** — Must. The system shall model `Tenant` → `LegalEntity` → `Site` (shell only; detailed in wave 6) and stamp `tenant_id` on every table in every domain database.
  - Notes: `legal_entity_id` is stamped on per-company tables (AX `SaveDataPerCompany=Yes` equivalent, declared in metadata in wave 3); a user's current legal entity is a session attribute, not a token claim, so switching does not require re-login.
- **FR-2.4 Row-level security** — Must. Every table shall have `ENABLE ROW LEVEL SECURITY` and `FORCE ROW LEVEL SECURITY` with policy `tenant_id = current_setting('app.tenant_id')::uuid`; services connect as role `passage_app` with `NOBYPASSRLS` and set the variable with `SET LOCAL` inside every transaction.
  - Notes: a missing `app.tenant_id` yields zero rows, not an error; migrations run as `passage_migrate`, which is also NOBYPASSRLS; a CI check fails if any table lacks the policy.
- **FR-2.5 Role/duty/privilege model** — Must. The system shall store Role → Duty → Privilege → Permission where Permission = (entity, action, field_mask?, condition?), and compile the closure into one Rego bundle per tenant.
  - Notes: actions are read, create, update, correct, delete, post, approve, export; `correct` retains AX semantics (edit date-effective rows); 20 seeded duties ship (Maintain users, Maintain security roles, Maintain vendors, View vendors, Maintain entity metadata, Apply extensions, Maintain workflows, Approve workflow, Maintain batch jobs, View batch history, Maintain number sequences, View audit log, Import data, Export data, Maintain platform releases, View platform releases, Maintain tenants, Maintain legal entities, Maintain saved views, Maintain hello ledger).
- **FR-2.6 Policy compilation** — Must. The system shall compile a bundle within 5 s of any role/duty/privilege/assignment change and distribute it to OPA sidecars via bundle polling (interval 10 s) with the version in `pv`.
  - Notes: a token whose `pv` is older than the active bundle by more than 2 versions is still honored (bundles are backward compatible); deny reasons are returned as `{"code":"AUTHZ_DENIED","duty_missing":"Maintain vendors"}`.
- **FR-2.7 OPA decision point** — Must. Every service shall call its OPA sidecar with `input = {subject, resource, action, context}` and enforce the decision before any database call; p95 decision latency ≤ 2 ms, p99 ≤ 5 ms.
  - Notes: `resource` carries entity, id, tenant_id, legal_entity_id and the field list for field-level masks; the gateway performs coarse checks (token validity, tenant match), services perform fine checks.
- **FR-2.8 Gateway** — Must. Envoy Gateway shall validate JWT signature, issuer and audience against the tenant realm's JWKS (cached 5 min), reject tokens with `tid` not matching the host's tenant, and enforce per-tenant rate limits (default 1,000 rps sustained, 2,000 burst; 429 with `Retry-After`).
- **FR-2.9 Role assignment with scope and effective dates** — Must. The system shall assign roles to users with `legal_entity_ids` (or `all`) and `effective_from`/`effective_to` (ISO 8601 dates, tenant time zone, inclusive).
  - Notes: expired assignments are excluded at compile time; a nightly job recompiles bundles for tenants with assignments crossing midnight.
- **FR-2.10 Admin UI** — Must. The system shall provide screens for users, roles, duties, privileges, assignments and an effective-permission viewer that renders the OPA decision for a chosen user × entity × action × legal entity.
- **FR-2.11 Service accounts and agents** — Should. The system shall support non-human principals (`kind=service|agent`) with client-credentials tokens and role assignments; an agent principal may hold only roles that are a subset of its sponsoring user's roles.

0.2.4 Data model

User (`identity.user`)

Field	Type	Required	Notes
id	uuid	yes	PK; equals Keycloak `sub`
tenant_id	uuid	yes	FK tenant; RLS
username	varchar(100)	yes	unique per tenant, case-insensitive
email	varchar(254)	yes	unique per tenant; PII
display_name	varchar(200)	yes	PII
kind	enum	yes	human, service, agent
status	enum	yes	invited, active, locked, disabled, deprovisioned
default_legal_entity_id	uuid	no	FK legal_entity
external_id	varchar(200)	no	SCIM externalId
mfa_enrolled	bool	yes	default false
last_login_at	timestamptz	no	
created_at, updated_at, version	timestamptz, timestamptz, int	yes	optimistic lock

Role / Duty / Privilege / Permission (`authz.*`)

Field	Type	Required	Notes
id	uuid	yes	PK (each table)
tenant_id	uuid	yes	`sys` rows have the reserved system tenant and are read-only
code	varchar(64)	yes	unique per tenant; e.g. `VendMaintain`
name, description	varchar(120), text	yes/no	localized labels in wave 48
layer	enum	yes	sys, partner, customer
parent_id	uuid	no	Role→Duty, Duty→Privilege via link tables `role_duty`, `duty_privilege`, `privilege_permission`
entity, action	varchar(64), enum	yes (Permission)	action ∈ read, create, update, correct, delete, post, approve, export
field_mask	text[]	no (Permission)	fields hidden when present
condition	jsonb	no (Permission)	Rego-compatible expression, e.g. `{"legal_entity_in":"$subject.legal_entities"}`
mfa_required	bool	yes (Role)	

RoleAssignment (`authz.role_assignment`)

Field	Type	Required	Notes
id	uuid	yes	PK
tenant_id	uuid	yes	RLS
user_id	uuid	yes	FK user
role_id	uuid	yes	FK role
legal_entity_ids	uuid[]	yes	empty array means all
effective_from	date	yes	default today
effective_to	date	no	null = open-ended
granted_by	uuid	yes	FK user
reason	text	no	required when `role.break_glass=true`

Tenant / **LegalEntity**: id, code (varchar 10, unique), name, status (active, suspended), default_currency (char 3), time_zone (IANA), created_at; LegalEntity adds tenant_id and `country` (ISO 3166-1 alpha-2).

Invariants: a user has at most one active assignment per (role, legal entity set) overlapping in time; `sys` layer rows are immutable in customer tenants; every Permission entity name must exist in the metadata registry from wave 3. Indexes: `user(tenant_id, lower(email))` unique; `role_assignment(tenant_id, user_id)`; `role_assignment(tenant_id, effective_to)` for expiry sweeps. Keycloak keeps its own Postgres (CNPG) per environment.

0.2.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
GET/POST	/v1/identity/users	List / create users	POST: Idempotency-Key	Maintain users
PATCH	/v1/identity/users/{id}	Update status, default legal entity	version check (If-Match)	Maintain users
GET/POST/PUT	/scim/v2/Users, /scim/v2/Groups	SCIM provisioning	SCIM semantics	SCIM client credential
GET/POST/PUT	/v1/authz/roles, /duties, /privileges	Maintain the model	PUT by code	Maintain security roles
GET/POST/DELETE	/v1/authz/assignments	Grant / revoke	POST: natural key	Maintain security roles
GET	/v1/authz/effective-permissions?user_id=&legal_entity_id=	Flattened permissions	n/a	Maintain security roles or self
POST	/v1/authz/decision	Dry-run an OPA decision (debug)	n/a	Maintain security roles
POST	/v1/authz/policies/compile	Force recompile	bundle version	Maintain security roles
GET/POST	/v1/tenants, /v1/legal-entities	Tenancy shells	POST: code	Maintain tenants / Maintain legal entities
POST	/v1/session/legal-entity	Switch current legal entity	n/a	any active user

Commands validate: email RFC 5322; role code `^[A-Za-z][A-Za-z0-9]{2,63}$`; assignment dates `effective_from ≤ effective_to`; a revoke of a `sys`-layer role from the last `Tenant owner` is rejected (409).

Event	Trigger	Payload fields	Consumers
dev.passage.identity.user.created.v1	User insert (UI, SCIM, federation first login)	user_id, tenant_id, email, kind, source	workflow, audit, shell
dev.passage.identity.user.status-changed.v1	status transition	user_id, from, to, actor, reason	audit, session revoker
dev.passage.authz.role-assignment.granted.v1 / revoked.v1	assignment insert/delete	assignment_id, user_id, role_id, legal_entity_ids, effective_from, effective_to	policy compiler, audit
dev.passage.authz.policy.compiled.v1	bundle built	tenant_id, bundle_version, sha256	OPA sidecars, audit
dev.passage.identity.login.succeeded.v1 / failed.v1	Keycloak event listener	user_id, ip, idp, amr	audit, anomaly alert

0.2.6 User experience

Screen	Primary actions	Key fields/columns	Duty required
Users list/detail	Invite, lock, disable, assign roles, set default legal entity	username, email, status, kind, last login, MFA	Maintain users
Roles	Create, add duties, mark MFA/break-glass	code, name, layer, duty count, user count	Maintain security roles
Duties / Privileges	Create, add privileges / permissions	code, entity, action, field mask	Maintain security roles
Role assignment	Grant with legal entity picker and dates	user, role, legal entities, from, to, reason	Maintain security roles
Effective permissions	Pick user × legal entity, inspect decision trace	entity, action, allow/deny, via role → duty → privilege	Maintain security roles
Legal entity switcher (shell header)	Switch current legal entity	code, name	any

Rules: all grids are keyboard navigable (wave 5 shell completes this); role edits are saved explicitly, not on blur; a decision trace shows the first allowing path and all denying reasons; the switcher remembers the last legal entity per user in `Personalization` (wave 5).

0.2.7 Business rules and edge cases

- **BR-2.1** User status machine: invited → active; active ↔ locked (5 failed logins in 15 min locks for 30 min, admin may unlock); active → disabled → active; any → deprovisioned (terminal).
- **BR-2.2** Deny by default: no matching Permission means deny; explicit deny permissions do not exist (AX semantics), so removing access means removing the grant.
- **BR-2.3** Access level ordering for merge: delete > correct > update > create > read; the highest level across all roles wins per entity (AX `SecurityEntryPoint` union behavior).
- **BR-2.4** Legal-entity scoping: a permission is effective only in legal entities listed on the assignment; `all` includes legal entities created later.
- **BR-2.5** Effective dates are evaluated in the tenant time zone at compile time and at 00:05 nightly; a grant with `effective_from` in the future compiles into the bundle inactive.
- **BR-2.6** Revoking a session: status change to locked/disabled/deprovisioned revokes refresh tokens; access tokens remain valid at most 10 minutes (TTL), which is the documented worst case.

- **BR-2.7** Cross-tenant request (token `tid` ≠ host tenant) returns 404 rather than 403 to avoid tenant enumeration.
- **BR-2.8** Rate limit is per tenant per gateway replica, aggregated through the gateway's shared rate-limit service; service accounts count against the same bucket.
- **BR-2.9** Concurrency: two admins editing the same role use optimistic locking (`version`); the loser gets 409 with the current version.
- **BR-2.10** Agent principals cannot be granted `Tenant owner`, `Maintain security roles` or break-glass roles.

0.2.8 Acceptance criteria

- **AC-2.1** Given a user with duty "Maintain vendors", When they `PUT /vendors/{id}` (stub entity), Then 200; Given a user without it, Then 403 with `duty_missing`. Table-driven across 20 duties. (FR-2.5, FR-2.7)
- **AC-2.2** Given tenant A's app session, When a query filters `tenant_id = <tenant B>`, Then zero rows are returned under `passage_app`. (FR-2.4)
- **AC-2.3** Given two Keycloak realms federated to a stand-in Keycloak IdP in CI, When a user logs in through each, Then both sessions carry the correct `tid` and land in the user's default legal entity. (FR-2.1, FR-2.3)
- **AC-2.4** Given 100 random (user, entity, action, legal entity) tuples, When effective-permission report and `POST /v1/authz/decision` are compared, Then they agree 100%. (FR-2.6, FR-2.10)
- **AC-2.5** Given a SCIM PATCH deactivating a user, When processed, Then `status=deprovisioned`, refresh tokens are revoked within 60 s and the row persists. (FR-2.2)
- **AC-2.6** Given an assignment with `effective_to` yesterday, When the nightly recompile runs, Then the user's requests for that role's permissions are denied. (FR-2.9)
- **AC-2.7** Given 1,500 rps from one tenant for 10 s, When routed through the gateway, Then requests above the limit receive 429 with `Retry-After`. (FR-2.8)
- **AC-2.8** Given a role flagged `mfa_required`, When a user without MFA logs in, Then Keycloak forces enrollment before issuing a token. (FR-2.1)
- **AC-2.9** Given an agent principal sponsored by user U, When an assignment outside U's roles is attempted, Then 422 with `AGENT_EXCEEDS_SPONSOR`. (FR-2.11)

0.2.9 Test plan and fixtures

Fixtures: `fixtures/authz/duties-20.yaml` (20 duties with allow/deny expectations, 240 rows), `fixtures/identity/users-50.json` (two tenants, three legal entities), `fixtures/identity/keycloak-realm-ci.json` (two realms + broker), `fixtures/authz/decision-sample-100.json`.

Test	Type	Target	Pass criterion
Duty matrix	Contract (table-driven)	gateway + OPA + stub service	240/240 expected codes
RLS cross-tenant	Integration	every table (generated list)	0 rows for foreign tenant; CI fails on any table without policy
Federation login	E2E (Playwright)	Keycloak broker	2 IdPs, correct claims
Effective vs decision	Property	compiler	100/100 agree
Bundle compile latency	Performance	compiler	≤ 5 s for 500 roles / 2,000 duties
OPA decision latency	Performance	sidecar	p95 ≤ 2 ms at 2,000 rps
SCIM conformance	Contract	SCIM server	RFC 7644 test suite subset (filter, PATCH, bulk)

Reconciliation: count of Keycloak users per realm equals `identity.user` rows with status ≠ deprovisioned; sum of permissions in the compiled bundle equals the flattened SQL closure.

0.2.10 Deployment and operations

Charts: `keycloak` (with CNPG database, 2 replicas), `identity`, `authz` (compiler + bundle server), `opa` as a sidecar template in `deploy/charts/_lib`, `envoy-gateway` policies (`SecurityPolicy` for JWT, `BackendTrafficPolicy` for rate limits). Config: `KEYCLOAK_ISSUER_TEMPLATE`, `OPA_BUNDLE_URL`, `AUTHZ_BUNDLE_POLL_SECONDS=10`. Migrations: additive Atlas. Feature flags: `authz.enforce` (log-only mode for the first week in dev). Scheduled jobs: nightly assignment expiry recompile 00:05 tenant time; JWKS refresh. SLOs: login success ≥ 99.9%, token issuance p95 ≤ 300 ms, OPA p95 ≤ 2 ms, bundle propagation ≤ 30 s. Alerts: `AuthzDenySpike` (> 5× baseline), `BundleStale` (> 5 min), `KeycloakDown`. Runbook: stale bundle, locked-out tenant owner (break-glass via Keycloak admin console), JWKS rotation. Rollback: digest rollback; bundles are versioned so a rollback of authz re-serves the prior bundle.

0.2.11 Migration from AX / SAP

Source	Passage entity	Notes
AX `UserInfo` (id, name, networkAlias, enable)	User	`networkAlias` → username; `enable=0` → disabled
AX `SecurityUserRole` (user, securityRole, validFrom/validTo)	RoleAssignment	dates carried; `OMUserRoleOrganization` rows → `legal_entity_ids`
AX `SecurityRole` / `SecurityDuty` / `SecurityPrivilege` + `SecurityRoleTaskGrant`, `SecurityTaskEntryPoint`	Role / Duty / Privilege	custom (CUS/VAR layer) roles only; SYS roles are mapped by name to Passage seeds
SAP USR02 (BNAME, UFLAG, GLTGV/GLTGB)	User	UFLAG 64/128 → locked; GLTGV/GLTGB → status dates
SAP AGR_USERS (AGR_NAME, UNAME, FROM_DAT, TO_DAT)	RoleAssignment	dates carried
SAP AGR_DEFINE / AGR_1251 (OBJECT, FIELD, LOW/HIGH)	Role / Duty / Privilege	authorization objects map via a crosswalk file to Passage permissions; BUKRS values → legal_entity_ids

Transformations run through the wave 10 migration framework; this wave ships only the crosswalk format and a dry-run report. Not migrated: passwords (federated), SU24 proposals, AX entry-point grants on forms that have no Passage equivalent (reported as "unmapped" with counts).

0.2.12 Dependencies, risks, open questions

Depends on: wave 1 (cluster, Argo, Vault/ESO, gateway).

Risk	Likelihood	Impact	Mitigation
Keycloak realm-per-tenant does not scale past ~500 tenants	Low (v1)	Medium	Organizations feature evaluated by wave 48
Rego closure bundle size for large role models	Medium	Medium	Partial evaluation; bundle per tenant; limit 50k permissions
SAML IdPs with non-standard attribute names	Medium	Low	Mapper templates for Entra ID, Okta, ADFS

Open questions: (1) Field-level masks in P0 or deferred to wave 15 — default: masks compiled but enforced only for PII-flagged fields; decide by wave 3. (2) Session legal entity in a cookie vs header — default header `X-Passage-Legal-Entity`; decide by wave 5. (3) Tenant realm per tenant vs shared realm with groups — default per

tenant; decide by wave 2 mid-point.

0.2.13 Parameters and setup

Tenant-scoped values are rows of `identity.tenant_settings` (edited on the Admin workspace → Tenant settings form, the AX "System parameters → Security" and SAP RZ10 `login/*` equivalent); realm values are Keycloak realm settings exported to Helm values.

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
`auth.access_token_ttl_minutes`	tenant (realm)	int	10	5–60	JWT lifetime; worst-case access after revoke (BR-2.6)	none (AD Kerberos ticket)	`rdisp/gui_auto_logout`, `login/ticket_expiration_tim`
`auth.refresh_token_ttl_hours`	tenant (realm)	int	8	1–24	silent re-login window	none	`login/ticket_expiration_tim`
`auth.session_max_hours`	tenant (realm)	int	12	1–24	absolute session cap	System parameters → Security: session timeout (D365 `SysUserLogTimeout`)	`rdisp/max_wprun_time`, SICF session timeout
`auth.lockout.failures`, `auth.lockout.window_minutes`, `auth.lockout.duration_minutes`	tenant (realm brute-force detection)	int, int, int	5, 15, 30	3–10, 5–60, 5–1,440	BR-2.1 lock behavior	none (AD policy)	`login/fails_to_user_lock`, `login/failed_user_auto_unlo`
`auth.mfa.required_roles`	tenant	role code list	`TenantOwner`, `SecurityAdmin`	any role codes	roles whose holders must enroll TOTP/WebAuthn	none	SNC / SAML2 enforced for user grou
`auth.mfa.allowed_methods`	tenant	enum set	totp, webauthn	totp, webauthn, recovery_code	enrollment options	none	none
`auth.local_password_policy`	tenant	{min_length, history, max_age_days}	14, 5, 0 (no expiry)	min_length 12–64	applies only to break-glass local accounts (federated users have none)	none	`login/min_password_lng`, `login/password_history_size` `login/password_expiration_t` USR40
`auth.idp_brokers[]`	tenant	list {alias, protocol oidc/saml, issuer/metadata URL, attribute mappers, first-login flow}	empty	—	federation targets; first login auto-links by verified email	Users → Active Directory import wizard, Claims users / Identity providers (D365 Entra tenant)	SAML2 trusted providers, SNC configuration, SM30 `VUSREXTID`
`scim.enabled`, `scim.group_role_mapping`	tenant	bool, map {group → role code}	false, {}	—	SCIM endpoints on/off; group → role	AD group import	SAP IPS mapping, CUA
`scim.bulk_max_operations`	tenant	int	1,000	100–1,000	RFC 7644 bulk limit	none	none
`authz.enforce`	environment / tenant feature flag	enum	enforce (log_only in dev first week)	enforce, log_only	log_only records would-be denies without blocking	none	`auth/no_check_in_some_cases` (SU24 proposals)
`authz.bundle_poll_seconds`	environment	int	10	5–60	OPA bundle polling	none (AOS cache refresh)	PFCG user comparison (PFUD)
`authz.bundle_max_permissions`	tenant	int	50,000	≤ 100,000	compile guard (risk table)	none	none
`authz.recompile_time`	tenant	HH:MM tenant time zone	00:05	any	nightly effective-date recompile (BR-2.5)	none	PFUD / PFCG_TIME_DEPENDENCY
`gateway.rate_limit.sustained_rps`, `gateway.rate_limit.burst`	tenant	int, int	1,000, 2,000	100–50,000	FR-2.8 limits; 429 with `Retry-After`	none	ICM `icm/max_conn`, `rdisp/tm_max_no`
`gateway.jwks_cache_minutes`	environment	int	5	1–60	JWKS refresh	none	none
`session.legal_entity_header`	environment	string	`X-Passage-Legal-Entity`	header name	carries the current legal entity (open question 2)	`changecompany()` / company switch	SU3 default parameter BUK
`tenant.time_zone`, `tenant.default_currency`	tenant	IANA tz, ISO 4217	`UTC`, `USD`	valid values	effective-date evaluation, defaults for later waves	System parameters → General (time zone), CompanyInfo currency	SCC4 client, OY01 country, OB22 company code currency
`legal_entity.country`	legal entity	ISO 3166-1 alpha-2	required	valid code	country-pack hook (0.2.20)	Legal entities form → Addresses (country/region)	OX02 company code country
`agent.max_sponsor_subset`	tenant	bool	true	true	agents may hold only a subset of the sponsor's roles (FR-2.11)	none	SU01 reference user
`identity.deprovision_revoke_seconds`	tenant	int	60	10–300	session revocation deadline after SCIM deactivation	none	SU10 mass lock

0.2.14 Inquiries and reports

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
Users	list inquiry	status, kind, role, legal entity, last login before	username, email, display name, kind, status, MFA, last login, default legal entity	`identity.user`	Users list (SysUserInfoPage)	SU01 / SU10 list, RSUSR002 users by complex criteria
Users by role	list inquiry	role, legal entity, as-of date	user, role, legal entities, effective from/to, granted by	`authz.role_assignment` ⋈ user	Security → Users by role (SSRS "User role assignments")	SUIM → User → by roles; AGR_USERS
Roles by user	drill-down	user	role, duties, legal entities, effective dates, break-glass flag	same	User details → Roles tab	SU01 → Roles tab, SUIM roles by user
Role permissions (closure)	drill-down	role	duty → privilege → permission (entity, action, field mask, condition)	compiled closure	Security roles → View permissions; SSRS "Security role report"	PFCG → Authorizations (display), SUIM → Roles → by authorization object
Effective permissions	drill-down	user × legal entity (× entity, action)	allow/deny, first allowing path, all denying reasons, bundle version	`GET /v1/authz/effective-permissions`, `POST /v1/authz/decision`	Security development tool → View permissions	SU53, SU56, STAUTHTRACE
Login history	list inquiry	user, outcome, IdP, date range, IP	time, user, outcome, IdP alias, `amr`, IP, user agent	Keycloak event listener → `identity.login_event`	Users → User log (SysUserLog)	SM20 security audit log (logon events), RSUSR200 logon dates
Online sessions	list inquiry	tenant, user	user, session start, last activity, IdP, client; action: revoke	Keycloak sessions API	Online users (SysUsersOnline)	SM04, AL08
Expiring role assignments	operational report	horizon (default 30 days)	user, role, effective_to, granted by	`authz.role_assignment`	none	PFCG_TIME_DEPENDENCY log
Authorization denials	KPI / operational	period, duty, entity, user	denials per duty per hour, top users, top entities	OPA decision logs (Loki) → `authz.decision_stat`	none	SU53 (per user), SM20 RFC/auth failures
SCIM reconciliation	operational report	last run	users in IdP not in Passage, deprovisioned in IdP still active, group → role mismatches	SCIM sync job output	AD import wizard log	SAP IPS job log, CUA distribution log (SCUL)
Policy bundle versions	list inquiry	tenant	version, sha256, compiled at, role count, permission count, trigger	`authz.bundle`	none	PFCG profile generation log
Tenant and legal entity list	list inquiry	status	code, name, country, currency, time zone, user count	`identity.tenant`, `identity.legal_entity`	Legal entities (OMLegalEntity)	OX02 company codes, SCC4 clients

0.2.15 Printed and electronic documents

No printed documents. Electronic documents:

Document	Trigger	Layout elements	Formats	Numbering sequence	Legal / retention requirement
User invitation email	user created with `status=invited` (UI or SCIM without federation link)	tenant name, inviter, link (24 h validity), IdP instructions	HTML + text email sent by Keycloak "execute actions" mail (tenant SMTP settings in the realm until wave 4 moves outbound email to FR-4.13)	none	link token single-use; email retained in Keycloak event log 30 days
MFA reset / enrollment email	admin resets MFA; `mfa_required` role granted to an unenrolled user	user, action, link	same	none	same
Effective-permission export	administrator action on the viewer	user, legal entity, bundle version, rows (entity, action, decision, path)	CSV, JSON	none	kept by the requester; wave 48 access reviews re-generate on demand
Security role report	administrator action	role, duties, privileges, permissions, assigned users as of date	CSV, PDF (wave 15 report designer; CSV only in wave 2)	none	SOC 2 evidence (wave 48) retained 7 years

0.2.16 Periodic and batch jobs

Jobs run as Kubernetes CronJobs in wave 2 and are re-registered on the wave 4 batch framework without behavior change.

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
Effective-date recompile	daily 00:05 tenant time (BR-2.5)	tenant	compile is deterministic; skipped when no assignment crosses midnight	< 5 s per tenant	retry 3×; last good bundle keeps serving	`BundleStale` (> 5 min)
SCIM reconciliation	daily 01:00 UTC	tenant	compares IdP export to `identity.user`; writes report only	< 2 min per 10 k users	report with `errors[]`; no automatic deprovision	`ScimDriftDetected` (ticket)
Session cleanup	hourly	realm	Keycloak offline-session purge	< 30 s	n/a	none
Login anomaly aggregation	every 15 min	tenant	window keyed by (tenant, bucket)	< 10 s	skipped bucket recomputed next run	`LoginFailureSpike` (> 50 failures / 15 min / tenant)
Bundle garbage collection	daily 03:00 UTC	tenant	keeps last 10 versions + any referenced by a live `pv`	< 10 s	none	none
JWKS refresh	every 5 min (gateway)	realm	cache keyed by `kid`	< 200 ms	previous keys kept until rotation grace (24 h)	`JwksFetchFailed`
Keycloak realm export (backup)	daily 02:30 UTC	realm	export to object storage keyed by date	< 1 min	alert	`RealmBackupFailed` (ticket)

0.2.17 Security duties and privileges

Duty	Privileges (entry points)	Segregation-of-duties conflicts	Default roles that include it
Maintain users	`GET/POST /v1/identity/users`, `PATCH /v1/identity/users/{id}`, Users screen (invite, lock, disable), revoke session	with Maintain security roles (a holder of both can grant anything to anyone; self-grant is rejected with IAM-0416 regardless)	Security administrator
View users	`GET /v1/identity/users`, Users screen read-only, Login history, Online sessions	none	Security administrator, Auditor, Help desk
Maintain security roles	`/v1/authz/roles`, `/duties`, `/privileges`, `/assignments` (POST/DELETE), `/policies/compile`, Roles/Duties/Privileges/Assignment screens	with Maintain users; with Approve workflow for the same entity (wave 4)	Security administrator
View security reports	`GET /v1/authz/effective-permissions`, `POST /v1/authz/decision`, Role permissions, Users by role, Authorization denials	none	Security administrator, Auditor
Maintain identity providers	realm broker settings (`auth.idp_brokers[]`), mappers, MFA policy	with Maintain users	Tenant owner
Maintain SCIM clients	create/rotate SCIM client credentials; `scim.*` settings	none	Tenant owner
Maintain tenants	`GET/POST /v1/tenants`, tenant settings form	with Maintain legal entities (only in multi-tenant operator context)	Platform operator (system tenant)
Maintain legal entities	`GET/POST /v1/legal-entities`, Legal entities screen	none	Tenant owner, Organization administrator
Tenant owner (break-glass)	all of the above plus Keycloak admin console for the realm; every use requires `reason` (RoleAssignment.reason) and raises an audit event	with everything; limited to ≤ 2 human users per tenant, never agents (BR-2.10)	Tenant owner

0.2.18 Message catalog

Code	Severity	User text	Cause	Remediation	Raised by
IAM-0401	error	You do not have the duty "{duty}" required for this action	OPA deny; `duty_missing`	request the role containing the duty from a Security administrator	FR-2.6, FR-2.7
IAM-0402	error	Not found	token `tid` ≠ host tenant (returned as 404)	sign in to the correct tenant host	BR-2.7
IAM-0403	error	Too many requests; retry after {seconds} s	tenant rate limit	back off; service accounts share the bucket	FR-2.8, BR-2.8
IAM-0404	error	Session expired; sign in again	access and refresh tokens expired	sign in	FR-2.1
IAM-0405	warning	Your permissions were updated; refresh to apply	token `pv` more than 2 bundle versions behind	refresh the page (silent re-login)	FR-2.6
IAM-0406	info	Multi-factor enrollment is required for your role "{role}"	`mfa_required` role without enrolled factor	enroll TOTP or WebAuthn	FR-2.1, AC-2.8
IAM-0407	error	Account locked for {minutes} minutes after {n} failed sign-ins	lockout policy	wait or ask an administrator to unlock	BR-2.1
IAM-0408	error	Cannot revoke: {user} is the last Tenant owner	last-owner protection (409)	grant Tenant owner to another user first	0.2.5 validation
IAM-0409	error	Agent cannot hold "{role}": not within sponsor {user}'s roles	FR-2.11 subset rule (422 `AGENT_EXCEEDS_SPONSOR`)	grant the role to the sponsor first or choose another sponsor	FR-2.11, BR-2.10
IAM-0410	error	This role was changed by {user} at {time}; reload to see the current version	optimistic lock (409)	reload and reapply	BR-2.9
IAM-0411	error	Role code must match `^[A-Za-z][A-Za-z0-9]{2,63}$`	validation	rename	0.2.5 validation
IAM-0412	error	Effective from {from} is after effective to {to}	validation	correct the dates	FR-2.9
IAM-0413	error	SCIM bulk request exceeds {max} operations	RFC 7644 limit	split the request	FR-2.2
IAM-0414	error (alert)	Policy bundle compile failed for tenant {tenant}: {reason}	compiler error; previous bundle still serves	fix the offending permission condition	FR-2.6
IAM-0415	warning	Sign-in attempt by deprovisioned user {user} from {ip}	post-deprovision login	none; recorded in audit and login anomaly report	FR-2.2
IAM-0416	error	You cannot grant a role to yourself	self-grant attempt	ask another Security administrator	0.2.17 SoD
IAM-0417	error	Reason is required when granting a break-glass role	`RoleAssignment.reason` missing	provide a reason	0.2.4 RoleAssignment

0.2.19 Performance budgets and capacity

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
Interactive login (federated)	5,000 users/tenant, 2 logins/user/day; peak 300/min at 08:00	400 ms / 1.2 s / 2 s (excluding IdP)	50 logins/s per Keycloak replica	login events ≈ 2.5 M rows (≈ 500 MB) per tenant	`login_event(tenant_id, occurred_at)` monthly partitions	Keycloak HPA 2 → 6 replicas; IdP latency dominates
Token refresh	5,000 users × 6 refreshes/day	50 ms / 150 ms / 300 ms	500/s	none	n/a	same
OPA decision (sidecar)	2,000 decisions/s per service at peak	0.5 ms / 2 ms / 5 ms	5,000/s per sidecar	none	bundle in memory, partial evaluation per entity	CPU-bound; sidecar requests 100 m / limit 500 m; latency rises linearly, no errors
Gateway JWT validation	1,000 rps sustained per tenant	0.3 ms / 1 ms / 2 ms	20,000 rps per gateway replica	none	JWKS cache 5 min	rate limit 429 beyond `burst`

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
Bundle compile	500 roles, 2,000 duties, 50 k permissions	1 s / 5 s / 8 s	10 compiles/min/tenant (debounced 2 s)	bundles ≈ 2 MB × 10 kept per tenant	one bundle per tenant	compile queue; stale bundle serves (`BundleStale` alert at 5 min)
Effective-permission report	100/day	200 ms / 800 ms / 1.5 s	10/s	none	closure computed from bundle, cached 60 s	cached result served
SCIM bulk (1,000 ops)	10/day	5 s / 15 s / 30 s	100 ops/s	`identity.user` ≈ 1 MB per 5 k users	`user(tenant_id, lower(email))`	queued; 429 to the SCIM client with `Retry-After`
Role assignment table	5,000 users × 4 roles	n/a	n/a	≈ 20 k rows/tenant (≈ 5 MB)	`role_assignment(tenant_id, user_id)`, `(tenant_id, effective_to)`	n/a

0.2.20 Localization and compliance hooks

- Privacy: `identity.user.email`, `display_name` and login IPs are personal data (GDPR Art. 4, CCPA). Erasure requests (wave 48 privacy tooling) pseudonymize these columns (`user-<id>@erased.invalid`) and purge `login_event` rows older than the tenant's retention (`identity.login_event_retention_days`, default 365; EU tenants typically 180); the row itself is never deleted (audit integrity). `GET /v1/identity/users/{id}/export` serves the data-subject access export (JSON).
- Residency: Keycloak and the identity database run in the customer's chosen region (0.1.20); realm per tenant lets a multi-tenant operator pin a tenant's realm database to a regional CNPG cluster from wave 50.
- Country and legal entity: `LegalEntity.country` is the key the wave 48 country packs use to attach statutory roles (for example, a German "Datenschutzbeauftragter" read-only role) and password/MFA minimums (for example, NIS2-driven MFA for all administrative roles). Extension point: `TenantSettings.overrides` jsonb keyed by country, consumed by the Keycloak values template and the compiler.
- Language and formats: the Keycloak login theme ships English only in wave 2; locale files are loaded from the wave 48 label packs; dates in effective-date fields are stored as dates (no time) and rendered per user preference from wave 5.
- Time zone: effective dates are evaluated in `tenant.time_zone` (BR-2.5), not per legal entity; multi-time-zone tenants are an accepted limitation until wave 6 calendars.
- Accessibility: Keycloak login pages are themed to meet WCAG 2.1 AA (checked by the wave 5 axe suite).
- Audit and evidence: role grants, revokes, break-glass use and IdP configuration changes are events consumed by wave 5 audit; wave 48 SOC 2 CC6.1–CC6.3 evidence is generated from them.

0.2.21 Coverage closure

No `GAP` or `PARTIAL` row in coverage-ax.md §12.99 or coverage-sap.md §13.99 is assigned to wave 2 (both registers parsed on 2026-10-21). Inventory rows tagged `COVERED-2` (AX §12.30 users, user groups, security roles/duties/privileges, automatic role assignment rules, online users, system parameters, user log, security inquiries, SSRS security reports, AD import / claims users / identity providers, password/MFA policies; AX §12.39 external user roles and provisioning; AX §12.7 cost accounting ledger security; AX §12.26 mobile device user authentication; SAP §13.30 SU01/SU10, SUGR, PFCG, SU53/SU56/ST01/STAUTHTRACE, SUIM, SECPOL/RZ10, SU01 user types, SAML/OIDC/SNC, UCON, profile parameters, PFCG org levels, RSUSR* reports, PFUD, SU10 mass lock; SAP §13.2 OBA4 tolerance groups; SAP §13.12 OMET buyer authorizations and authorization groups) are met by FR-2.1–FR-2.11, 0.2.14 and 0.2.17.

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
none	—	—	Wave 2 has no register rows; see paragraph above for the `COVERED-2` confirmation. The automatic role-assignment rule (`SysSecRoleAssignmentRule`, query-based) is met by `scim.group_role_mapping` plus the wave 4 batch job that evaluates a saved filter over users; the SAP OBA4/OMET amount limits are met by `Permission.condition`

0.3 Wave 3: Metadata Kernel (Entities, Fields, Extensions)

0.3.1 Scope and business context

In AX every business object is an AOT artifact: a Table with properties (`TableGroup`, `SaveDataPerCompany`, `PrimaryIndex`, `ClusteredIndex`, `TitleField1/2`, `CacheLookup`), Fields typed by Extended Data Types and Base Enums, Relations with `DeleteActions`, Indexes with `AlternateKey`, and table methods (`validateField`, `validateWrite`, `validateDelete`, `initValue`, `insert`, `update`) in X++; D365 adds data entities for OData and the extension model that replaced overlayering (SYS/GLS/FPK/SLN/ISV/VAR/CUS/USR layers). In SAP the equivalents are DDIC objects: tables (DD02L), fields (DD03L), domains (DD01L), data elements (DD04L), foreign keys (DD05S/DD08L), search helps (DD30L), append structures and `CI_*` customer includes, delivery classes and `SE11` activation, with BAPIs and CDS/OData exposing them. Wave 3 replaces both with a YAML entity definition language and a generator: declare an entity once and get the Postgres migration, Go model and repository, REST handlers, OpenAPI 3.1, TypeScript client and JSON Schema. Customers extend any entity with fields, enum values and declarative rules as metadata applied to a running environment. At wave end `Tenant`, `LegalEntity` and `User` from wave 2 are regenerated from metadata and the hand-written code is deleted. Out of scope: generated forms (wave 5), AsyncAPI topics (wave 4), scripted customer hooks (open question), views/maps/table collections (wave 46 analytics covers views).

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
Adding one field to VendTable in D365: table extension, EDT, form extension, data entity extension, label, build, deployable package, LCS apply — a 2–5 day developer task with an environment outage	Schema, API, form and entity are separate artifacts kept in sync by hand	One `x_` field in an `ExtensionPackage`: migration, API, client, JSON Schema and (wave 5) form generated and applied with zero downtime	Field addition: 2–5 days + outage → < 60 s, no outage; artifacts touched by hand: 6 → 1
SAP append structure on LFA1 needs SE11, activation (table conversion risk on large tables), CMOD/BAdI for validation, SE51 screen exit, and a transport through DEV→QAS→PRD	DDIC activation rewrites tables; UI exits are separate from DDIC	Additive `ADD COLUMN` with fast default, `CREATE INDEX CONCURRENTLY`, declarative validation in the same package	Lock time on a 100M-row table: minutes → < 2 s; transport cycle: 1–2 weeks → one PR
Integration partners (MES, PLM, WMS) must reverse-engineer OData entities or BAPI parameter lists; no machine-readable contract versioning	APIs are hand-exposed per entity (data entities, SEGW projects)	Every entity publishes OpenAPI 3.1 and JSON Schema with additive-change guarantees enforced in CI	Time for an external team to consume a new entity: weeks → the day it is published; breaking changes reaching partners: 0

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
Silent type drift: AX `real` fields and SAP `CURR` with DECIMALS=2 round amounts differently in X++/ABAP arithmetic vs. the database	Type semantics defined in two places (EDT/domain and language runtime)	One type system (`decimal(p,s)`, `money` + currency, `half_even`) enforced at the API and column	Rounding discrepancies between API and storage: possible → 0 (property-tested)
Finding "where is this field used" requires cross-reference tools (AX cross-reference update takes hours; SAP SE11 where-used across packages)	Reflection is an offline build artifact	Registry `/v1/metadata/*` answers entity, field, relation and extension queries live	Where-used answer: hours (after a cross-reference build) → < 20 ms

0.3.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Table definition	AOT Tables node, `TableGroup`, `SaveDataPerCompany`, `RecId`, `RecVersion`, `DataAreaId`, `Partition`	DD02L, delivery class, MANDT, SE11	`EntityDefinition` YAML; system fields id, tenant_id, legal_entity_id, version, created_*, updated_*	full
Typed fields	Extended Data Types (StringSize, Label, HelpText), `SysDictField`	Domains (DD01L) + data elements (DD04L)	`TypeDefinition` (EDT) + `FieldDefinition`	full
Enumerations	Base Enums, `SysDictEnum`, extensible enums (D365)	Domain fixed values (DD07L), check tables	`EnumDefinition` / `EnumValue`, customer values ≥ 1000	full
Relations / FK	Relations node, `ForeignKey`, `DeleteActions` None/Cascade/Restricted	DD05S/DD08L foreign keys, check tables, cardinality	`RelationDefinition` with on_delete restrict/cascade/set_null	full
Indexes	Indexes node, `AllowDuplicates`, `AlternateKey`	DD12L secondary indexes, unique flag	`IndexDefinition` unique/non-unique, partial predicate	full
Validation hooks	`validateField`, `validateWrite`, `validateDelete`, `initValue`, `modifiedField`	Table maintenance events, BAdIs, check tables	lifecycle hooks: initValue, validateField, validateWrite, validateDelete, afterWrite, afterDelete	full (declarative + registered code)
API exposure	Data entities (IsPublic, PublicCollectionName), OData, custom services	BAPIs, RFC, OData via SEGW / RAP, CDS views	generated REST (OpenAPI 3.1) per entity; GraphQL deferred	partial (no OData $batch)
Extensions	Extensions (`.extension`), Chain of Command, extensible enums	Append structures, CI_* includes, Z/Y namespace	`ExtensionPackage` (customer layer), `x_` field prefix	improved (zero-downtime apply)
Versioning / diff	Model store versions, compare tool	Version management (SE09 versions), transport diffs	`MetadataVersion` + `/diff` endpoint, snapshot golden tests	improved
Business rules / decision tables	Policy rules framework (`SysPolicy`, `SysPolicyRuleType`), audit policy rules, X++ conditions in code	BRF+ (`FDT_WORKBENCH`): applications, functions, rulesets, decision tables, expressions; Decision Service Management	`RuleSet` / `DecisionTable` / `DecisionRow` metadata, `POST /v1/rules/{code}/evaluate`, `rules.eval()` in hooks and workflow conditions	full
Usage and license measurement	License inquiries, named user license counts (`SysUserLicenseCount`), D365 "License usage" report	USMM / SLAW system measurement, ST03N user profile, SUIM users by logon date	`metadata.usage_snapshot` (nightly), Usage report, CSV export	full

0.3.3 Functional requirements

- **FR-3.1 Entity definition language** — Must. The system shall accept entity definitions in YAML validated by a published JSON Schema (`metadata/schema/entity.v1.json`) with keys `name`, `domain`, `table_group` (main, group, transaction, worksheet_header, worksheet_line, parameter, reference), `per_legal_entity`, `title_fields[]`, `fields[]`, `enums[]`, `relations[]`, `indexes[]`, `hooks[]`, `audit`, `api`.
  - Notes: `name` is UpperCamelCase ≤ 48 chars; `domain` selects the owning Postgres database; one entity per file under `metadata/entities/<domain>/`.
- **FR-3.2 Type system** — Must. The system shall support field types string(n ≤ 4000), text, int32, int64, decimal(p ≤ 38, s ≤ 12), money (decimal(28,6) + currency reference), bool, date, datetime (timestamptz), time, uuid, enum, json, bytes, and named `TypeDefinition`s (EDT-equivalents) that bundle type, length, label, help, format and lookup entity.
  - Notes: `money` fields always pair with a `currency` char(3); `decimal` default scale 6 for quantities, 2 for displayed amounts, with rounding `half_even`.
- **FR-3.3 Field attributes** — Must. Each field shall declare `required`, `unique`, `default` (literal or `now()`, `current_user()`, `numseq(<code>)` from wave 5), `computed` (expression over sibling fields, evaluated server-side), `visibility` (always, advanced, hidden), `pii` (none, personal, sensitive), `audit` (bool, default inherits entity), `allow_edit`, `allow_edit_on_create`, `label`, `help`, `min`, `max`, `pattern`.
- **FR-3.4 System fields** — Must. Every generated table shall carry `id uuid`, `tenant_id uuid`, `legal_entity_id uuid` (when `per_legal_entity=true`), `version int` (RecVersion), `created_at`, `created_by`, `updated_at`, `updated_by`, and optional `deleted_at` for soft delete.
  - Notes: RLS policy generated per FR-2.4; `version` increments on every update and is required in `If-Match`.
- **FR-3.5 Migration generation** — Must. The generator shall emit Atlas migrations that are deterministic for a given definition version; additive changes (new nullable field, new enum value, new index) generate forward-only migrations; destructive changes require an explicit `breaking: true` flag and a new API major version.
  - Notes: `ADD COLUMN … DEFAULT` uses Postgres fast default; index creation uses `CONCURRENTLY`; migrations run as a pre-sync Argo hook job.
- **FR-3.6 Code generation** — Must. For each entity the generator shall emit a Go struct, repository (list with filter/sort/cursor pagination, get, create, update, patch, delete), HTTP handlers, OpenAPI 3.1 document, TypeScript client (fetch-based, typed), and JSON Schema for request validation.
  - Notes: list filter grammar `?filter=field op value` with ops eq, ne, gt, ge, lt, le, in, like, is_null; max page size 500, default 50; cursor is opaque base64.
- **FR-3.7 Lifecycle hooks** — Must. The system shall execute hooks in order initValue → validateField (per changed field) → validateWrite → write → afterWrite, and validateDelete → delete → afterDelete; declarative hooks are expressions returning `{ok, code, message, field}`; coded hooks are Go/TS functions registered by name in the owning service.
  - Notes: validation errors return 422 with `errors[]{field, code, message}`; a coded hook that panics rolls back the transaction and returns 500 with a trace id.
- **FR-3.8 Metadata registry** — Must. The system shall store every definition version, expose diff between versions, publish an immutable version on approval, and serve the current version to generators, the gateway and the shell with ETag caching.
  - Notes: registry DB is `metadata`; publishing emits `dev.passage.metadata.entity.published.v1`; registry read p95 ≤ 20 ms.
- **FR-3.9 Extension packages** — Must. Customers shall create an `ExtensionPackage` (layer customer or partner) that adds fields (prefixed `x_`), enum values (code ≥ 1000), indexes, declarative hooks and labels to any `sys` entity; applying a package generates and runs the migration, regenerates OpenAPI/JSON Schema and invalidates the shell form cache with zero downtime.
  - Notes: limits: 200 extension fields per entity, 50 enum values per enum per package; packages are versioned and reversible only while additive.
- **FR-3.10 Backward compatibility** — Must. CI shall run the previous published version's generated TypeScript client against the new server and fail on any breaking change (removed field, type change, required added, enum value removed); additive changes pass.
- **FR-3.11 Golden tests** — Must. Ten reference entities (Tenant, LegalEntity, User, Role, VendorStub, ProductStub, JournalLineStub, Address, Note, Attachment) shall have committed snapshots of migration, OpenAPI and client; CI fails on any byte-level drift.

- **FR-3.12 Performance** — Must. A generated entity API shall serve 1,000 rps of simple reads with p95 < 50 ms on the 3-node dev cluster and 200 rps of creates with p95 < 120 ms.
- **FR-3.13 Decision tables and rule sets** — Should. The system shall provide a `RuleSet` metadata object (same draft → review → published lifecycle, layers and extension packages as entities) containing one or more `DecisionTable`s with typed input columns (bound to a `TypeDefinition` or an entity field), condition cells (operators eq, ne, lt, le, gt, ge, between, in, like, any), typed result columns, a hit policy (`first`, `priority`, `all`, `collect_sum`), and per-row `effective_from/effective_to`; published tables shall be evaluable by `POST /v1/rules/{code}/evaluate`, from declarative hooks via `rules.eval('<code>', {inputs})` and from wave 4 workflow conditions, with an `explain` mode listing the rows that matched.
    - Notes: limits 10,000 rows and 20 columns per table, 50 tables per rule set; a published version is compiled to an in-memory decision tree per service (p95 ≤ 5 ms for a 1,000-row table); customers add or override rows through an `ExtensionPackage` (`layer=customer` rows evaluate before `sys` rows under `priority`); rows are imported and exported as CSV through wave 5 import/export; later consumers are tax determination (wave 13), output determination (wave 15), credit rules (wave 30), substitution and delegation rules (wave 4), audit policies (wave 48) — none of them may ship a private rules engine.
- **FR-3.14 Usage metering** — Should. The system shall compute, nightly per tenant, a `UsageSnapshot` with active named users (distinct humans with a login or token use in the last 30 and 90 days) per legal entity and per role, principals by kind (human, service, agent), API requests per entity per day (from gateway metrics), and row counts per entity; expose it as the Usage report (0.3.14) with CSV export; retain snapshots 3 years.
    - Notes: a user counted in several legal entities counts once at tenant level; service and agent principals are reported but never counted as named users (PRD §12 Q1: no per-seat charge for shop-floor, portal or agent users); the snapshot is the input to the licensing decision and to capacity planning, not an enforcement point — nothing is blocked by a count.

0.3.4 Data model

EntityDefinition (`metadata.entity`)

Field	Type	Required	Notes
id	uuid	yes	PK
tenant_id	uuid	yes	`sys` tenant for shipped entities
name	varchar(48)	yes	unique with domain and version
domain	varchar(32)	yes	Postgres database / service
version	int	yes	monotonically increasing
status	enum	yes	draft, review, published, deprecated
table_group	enum	yes	FR-3.1 values
per_legal_entity	bool	yes	default true for main/transaction
title_fields	text[]	no	≤ 2
audit	bool	yes	default true for main/transaction
api_major	int	yes	default 1
spec	jsonb	yes	canonical YAML as JSON
spec_sha256	char(64)	yes	drift detection
published_at, published_by	timestamptz, uuid	no	

FieldDefinition (`metadata.field`)

Field	Type	Required	Notes
id	uuid	yes	PK
entity_id	uuid	yes	FK entity version
name	varchar(48)	yes	snake_case; `x_` reserved for extensions
type	enum	yes	FR-3.2
type_def_id	uuid	no	FK TypeDefinition
enum_id	uuid	no	FK EnumDefinition when type=enum
length, precision, scale	int	no	per type
required, unique	bool	yes	
default_expr	text	no	
computed_expr	text	no	
visibility	enum	yes	always, advanced, hidden
pii	enum	yes	none, personal, sensitive
audit	bool	yes	
layer	enum	yes	sys, partner, customer
extension_package_id	uuid	no	FK when layer ≠ sys
ordinal	int	yes	form/column order default

ExtensionPackage (`metadata.extension_package`)

Field	Type	Required	Notes
id	uuid	yes	PK
tenant_id	uuid	yes	
code	varchar(32)	yes	unique per tenant
layer	enum	yes	partner, customer
version	int	yes	
status	enum	yes	draft, validated, applied, failed, retired
targets	jsonb	yes	entities, fields, enum values, hooks, labels
applied_at, applied_by	timestamptz, uuid	no	
migration_id	text	no	Atlas migration name

EnumDefinition / EnumValue / TypeDefinition / RelationDefinition / IndexDefinition follow the same shape: id, entity or enum FK, name/code, layer, ordinal; EnumValue has `code int` (sys < 1000, extensions ≥ 1000) and `label`; RelationDefinition has `from_field`, `to_entity`, `to_field`, `on_delete`; IndexDefinition has `fields[]`, `unique`, `where`.

RuleSet / DecisionTable / DecisionRow (`metadata.rule_set`, `metadata.decision_table`, `metadata.decision_row`)

Field	Type	Required	Notes
id	uuid	yes	PK (each table)
tenant_id	uuid	yes	`sys` tenant for shipped rule sets
code	varchar(48)	yes (RuleSet)	unique per tenant and version; e.g. `TaxGroupDetermination`
version, status	int, enum	yes (RuleSet)	draft, review, published, deprecated (BR-3.1 semantics)
rule_set_id, name	uuid, varchar(48)	yes (DecisionTable)	name unique within the set
hit_policy	enum	yes (DecisionTable)	first, priority, all, collect_sum
input_columns, result_columns	jsonb	yes (DecisionTable)	`[{name, type_def_id
table_id, ordinal, priority	uuid, int, int	yes (DecisionRow)	ordinal = evaluation order under `first`; priority used under `priority`
conditions	jsonb	yes (DecisionRow)	`{column: {op, value
results	jsonb	yes (DecisionRow)	typed result values
effective_from, effective_to	date	no (DecisionRow)	evaluated in the tenant time zone
layer, extension_package_id	enum, uuid	yes / no (DecisionRow)	sys, partner, customer

UsageSnapshot (`metadata.usage_snapshot`)

Field	Type	Required	Notes
id	uuid	yes	PK
tenant_id	uuid	yes	
snapshot_date	date	yes	unique with tenant_id
active_users_30d, active_users_90d	int	yes	distinct humans
by_legal_entity	jsonb	yes	`{legal_entity_id: {active_30d, active_90d}}`
by_role	jsonb	yes	`{role_code: active_30d}`
principals_by_kind	jsonb	yes	`{human, service, agent}`
api_requests_by_entity	jsonb	yes	`{entity: count}` for the day
row_counts	jsonb	yes	`{entity: rows}` from `pg_class.reltuples` (estimate)
computed_at	timestamptz	yes	

Invariants: a published version is immutable; field names unique per entity across layers; an extension cannot change a `sys` field's type or required flag; every `enum` field references an enum; `title_fields` must be string type. Indexing: `entity(tenant_id, domain, name, version)` unique; `field(entity_id, ordinal)`. Partitioning: none (metadata volume < 1M rows).

0.3.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
GET	/v1/metadata/entities?domain=&status=	List entity definitions	n/a	any authenticated
GET	/v1/metadata/entities/{name}	Current published version (ETag)	n/a	any
PUT	/v1/metadata/entities/{name}/versions/{v}	Create/replace a draft version	by version	Maintain entity metadata
POST	/v1/metadata/entities/{name}/versions/{v}/publish	Publish	version	Maintain entity metadata
GET	/v1/metadata/entities/{name}/diff?from=&to=	Structured diff	n/a	any
POST	/v1/metadata/compat-check	Classify a diff as additive/breaking	n/a	Maintain entity metadata
GET/POST	/v1/metadata/extensions	List / create packages	POST: code+version	Apply extensions
POST	/v1/metadata/extensions/{id}/validate, /apply, /retire	Lifecycle	package version	Apply extensions
GET	/v1/metadata/openapi/{entity}	Generated OpenAPI 3.1	n/a	any
GET	/v1/metadata/types, /v1/metadata/enums	EDT and enum catalogs	n/a	any
GET/POST/PATCH/DELETE	/v1///{id}	Generated entity API	POST: Idempotency-Key; PATCH: If-Match	per Permission(entity, action)
GET/PUT/POST	/v1/rules/sets, /{code}/versions/{v}, /{code}/versions/{v}/publish	Maintain and publish rule sets	by version	Maintain business rules
POST	/v1/rules/{code}/evaluate?table=&explain=true	Evaluate a published table; `explain` returns matched rows	n/a (pure function)	any authenticated (results filtered by the calling service)
POST	/v1/rules/{code}/versions/{v}/rows:import	CSV row import (wave 5 import framework)	file sha256	Maintain business rules
GET	/v1/metadata/usage?from=&to=&legal_entity_id=	Usage snapshots	n/a	View usage reports

Event	Trigger	Payload fields	Consumers
dev.passage.rules.ruleset.published.v1	rule set publish	code, version, tables[], row_count	services holding compiled trees (reload), audit
dev.passage.metadata.usage.snapshot.v1	nightly snapshot	tenant_id, snapshot_date, active_users_30d, active_users_90d	analytics (wave 46), licensing report (PRD §12 Q1)
dev.passage.metadata.entity.published.v1	publish	entity, domain, version, api_major, diff_summary{added, changed, removed}	generator pipeline, events (wave 4), shell
dev.passage.metadata.entity.deprecated.v1	deprecate	entity, version, sunset_date	shell, API docs
dev.passage.metadata.extension.applied.v1	apply success	package_id, code, version, entities[], fields_added, enum_values_added, migration_id	audit, shell, generator
dev.passage.metadata.extension.failed.v1	apply failure	package_id, stage, error	alerting

Event	Trigger	Payload fields	Consumers
dev.passage.metadata.schema.migrated.v1	Atlas job completes	domain, migration_id, duration_ms	audit

0.3.6 User experience

Screen	Primary actions	Key fields/columns	Duty required
Entity catalog	Browse, open, view diff, publish	name, domain, version, status, field count, extensions	Maintain entity metadata
Entity designer (YAML + form view)	Add field/enum/relation/index/hook, validate, save draft	name, type, required, default, pii, visibility	Maintain entity metadata
Extension packages	Create, validate, apply, retire, view migration log	code, layer, version, status, targets	Apply extensions
Type and enum catalogs	Create EDT, add enum values	code, base type, length, label	Maintain entity metadata
Rule set designer	Add table, define columns, edit rows in a grid with typed cells, test panel (inputs → result + matched rows), publish	code, version, status, table, hit policy, rows, effective dates	Maintain business rules
Usage report	Pick date range and legal entity, export CSV	active users 30/90 d, by role, by legal entity, principals by kind, API requests by entity	View usage reports

Rules: the designer validates against the JSON Schema on every keystroke (debounced 300 ms) and against the registry on save; apply shows a dry-run migration SQL with an estimated lock time and refuses if > 2 s; keyboard: `Ctrl+S` save draft, `Ctrl+Shift+P` publish.

0.3.7 Business rules and edge cases

- **BR-3.1** Entity version status machine: draft → review → published → deprecated; published versions are immutable; a deprecated version serves for 180 days after `sunset_date` announcement.
- **BR-3.2** Breaking vs additive: removing a field, narrowing a type, adding `required` without default, removing an enum value, or renaming are breaking; everything else is additive. Breaking requires `api_major + 1` and a parallel `/v{n+1}` route for ≥ 1 release.
- **BR-3.3** Enum value codes are permanent; retiring a value sets `retired=true` and the value remains readable but not assignable.
- **BR-3.4** Extension apply is transactional per domain database: migration, registry update and cache invalidation succeed together or the package goes to `failed` with the SQL error.
- **BR-3.5** Concurrent publishes of the same entity: second publish gets 409 and must rebase on the new version.
- **BR-3.6** Decimal rounding at write uses the field's scale with `half_even`; values exceeding precision return 422 `VALUE_OUT_OF_RANGE`.
- **BR-3.7** Soft-deleted rows (`deleted_at` set) are excluded from list and get by default; `?include_deleted=true` requires the `delete` action.
- **BR-3.8** `on_delete: restrict` returns 409 `REFERENCED_BY` with the referencing entity and count; cascade is limited to 10,000 child rows per request.
- **BR-3.9** PII `sensitive` fields are masked (`***`) in responses unless the Permission grants the field explicitly; they are never included in list endpoints.
- **BR-3.10** Decision table hit policies: `first` returns the lowest-ordinal matching row; `priority` returns the highest `priority` (ties broken by layer customer > partner > sys, then ordinal); `all` returns every match in ordinal order; `collect_sum` sums numeric result columns across matches. A table with no matching row returns `{matched: false}` and the caller decides (hooks treat it as validation code `RULE_NO_MATCH`). `between` is inclusive on both ends; string comparison is case-insensitive; dates and `effective_*` are evaluated in the tenant time zone.
- **BR-3.11** A named user is "active" on a day when a human principal obtained a token or used one (gateway request) on that day; counts are distinct per tenant, never summed across legal entities; the snapshot for day D is computed at 01:30 tenant time on D+1 and is never recomputed except by an explicit rebuild with the reason recorded.

0.3.8 Acceptance criteria

- **AC-3.1** Given the 10 reference entities, When the generator runs 3 times, Then the migration, OpenAPI and client snapshots are byte-identical and match the committed golden files. (FR-3.5, FR-3.6, FR-3.11)
- **AC-3.2** Given a customer package adding `x_risk_rating` (enum) and enum value `PreferredPlus (1001)` to VendorStub, When applied in dev, Then the API accepts the field within 60 s, no request fails during apply, and the wave-5 form shows it. (FR-3.9)
- **AC-3.3** Given a published v1 client, When the server publishes an additive v2, Then the v1 contract suite passes; Given a breaking change without `breaking: true`, Then CI fails naming the change. (FR-3.10, BR-3.2)
- **AC-3.4** Given 1,000 rps of `GET /v1/identity/users/{id}` for 5 minutes on the dev cluster, When measured at the gateway, Then p95 < 50 ms and error rate < 0.1%. (FR-3.12)
- **AC-3.5** Given a `validateWrite` declarative hook `amount > 0`, When a client posts `amount = -1`, Then 422 with `field=amount`. (FR-3.7)
- **AC-3.6** Given Tenant, LegalEntity and User regenerated from metadata, When the wave-2 test suites run, Then they pass unchanged and the hand-written handlers are removed from the repo. (FR-3.6)
- **AC-3.7** Given a diff request between versions 3 and 5, When called, Then the response lists each added/changed/removed field with classification additive/breaking. (FR-3.8)
- **AC-3.8** Given a field with `pii=sensitive`, When listed by a user without the field permission, Then the field is absent; when fetched by id, Then masked. (FR-3.3, BR-3.9)
- **AC-3.9** Given a published rule set `VendorRiskBand` with a 1,000-row `priority` table (inputs country, spend_band, payment_terms), When evaluated 10,000 times with random inputs from the fixture, Then every result equals the reference evaluator's result, `explain` lists the matched rows, and p95 ≤ 5 ms. (FR-3.13, BR-3.10)
- **AC-3.10** Given a customer extension package adding 3 rows to `VendorRiskBand`, When applied, Then a hook calling `rules.eval` returns the customer row for the overlapping inputs and the sys row otherwise. (FR-3.9, FR-3.13)
- **AC-3.11** Given 50 users of whom 30 obtained tokens in the last 30 days (2 of them in two legal entities) plus 5 service accounts, When the nightly snapshot runs, Then `active_users_30d = 30`, the legal-entity breakdown sums to 32, and `principals_by_kind.service = 5`. (FR-3.14, BR-3.11)

0.3.9 Test plan and fixtures

Fixtures: `metadata/entities/_reference/*.yaml` (10 entities), `fixtures/metadata/golden/` (snapshots), `fixtures/metadata/ext-vendor-risk.yaml`, `fixtures/metadata/breaking-change-cases.yaml` (12 breaking, 12 additive cases), `fixtures/load/users-100k.sql` (100k users for the read benchmark).

Test	Type	Target	Pass criterion
Golden generation	Snapshot	generator	zero drift

Test	Type	Target	Pass criterion
Schema validation	Unit	JSON Schema	100% of invalid fixtures rejected with path
Compat classifier	Table-driven	compat-check	24/24
Extension apply	E2E	registry + Atlas + API	applied, 0 failed requests during apply (k6 background at 100 rps)
Hook ordering	Property	repository	hooks fire in FR-3.7 order for random mutations
Read benchmark	Performance (k6)	generated API	p95 < 50 ms @ 1,000 rps
RLS on generated tables	Contract	every generated table	policy present and effective

Reconciliation: registry field count per published entity equals `information_schema.columns` for the generated table minus system fields; OpenAPI property count equals field count minus hidden fields.

0.3.10 Deployment and operations

Charts: `metadata-registry` (Go, CNPG `metadata` database), `passage-gen` runs in CI and as an in-cluster Job for extension apply. Config: `REGISTRY_URL`, `GEN_OUTPUT_DIR`, `ATLAS_DEV_URL` (scratch database for migration planning). Migrations: generated; applied by Argo pre-sync hook with `atlas migrate apply --tx-mode all`. Feature flags: `metadata.extensions.enabled` per tenant. Scheduled jobs: nightly drift check (registry vs live schema). SLOs: registry availability 99.9%, read p95 ≤ 20 ms, extension apply ≤ 60 s. Alerts: `SchemaDrift`, `ExtensionApplyFailed`, `MigrationJobFailed`. Runbook: failed migration (mark package failed, run `atlas migrate down` only in dev), registry restore from CNPG backup. Rollback: registry and generated services roll back together by digest; because migrations are additive the previous digest runs against the newer schema.

0.3.11 Migration from AX / SAP

Source	Passage entity	Notes
AX AOT Tables (via `SysDictTable` export or AxModel XML) with `TableGroup`, `SaveDataPerCompany`	EntityDefinition	only customer-layer (CUS/VAR/USR) tables and fields are candidates; SYS tables map to Passage entities by crosswalk
AX EDTs, Base Enums	TypeDefinition, EnumDefinition	enum values keep their integer codes where < 1000
AX table extensions (`.extension` XML)	ExtensionPackage	field additions become `x_` fields
SAP DD02L/DD03L for Z*/Y* tables, append structures, CI_* includes	EntityDefinition / ExtensionPackage	DD04L data elements → TypeDefinition; DD07L fixed values → EnumValue

Transformation is a definition import (`passage-gen import-ax`, `import-sap`) producing draft YAML for review; nothing is auto-published. Not migrated: X++ table methods and ABAP user exits (code), SAP delivery-class semantics, AX `CacheLookup` and `Partition`.

0.3.12 Dependencies, risks, open questions

Depends on: wave 2 (tenant_id/RLS, duties `Maintain entity metadata`, `Apply extensions`; the three entities to regenerate).

Risk	Likelihood	Impact	Mitigation
Generator becomes a bottleneck for every later wave	High	High	Generator is itself golden-tested; business waves add entities by YAML only; escape hatch for hand-written endpoints alongside generated ones
Expression language for hooks grows into a scripting language	Medium	Medium	CEL-style expression subset frozen at wave 3; scripted hooks decided in OQ 2
Large-table `ADD COLUMN` with non-constant default locks	Low	Medium	Dry-run lock estimate; non-constant defaults applied by backfill job

Open questions: (1) GraphQL alongside REST — default no until wave 35; decide by wave 10. (2) Customer scripted hooks (sandboxed TS or WASM) — default declarative only through wave 30; decide by wave 20. (3) Soft delete default for main tables — default on for master data groups, off for transactions; decide by wave 6.

0.3.13 Parameters and setup

Registry parameters are rows of `metadata.parameter` edited on Admin workspace → Metadata → Parameters (the AX "System parameters" / SAP SE11 technical-settings equivalent for the kernel); entity-level attributes are part of the YAML and are listed in FR-3.1–FR-3.4.

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
`metadata.extensions.enabled`	tenant (feature flag)	bool	true	true/false	allows `ExtensionPackage` apply in the tenant	Feature management (D365)	SCC4 client role "customizing allowed", SE06 system change option
`metadata.extension.max_fields_per_entity`	tenant	int	200	1–500	FR-3.9 limit	none	append structure field limit (practical)
`metadata.extension.max_enum_values_per_package`	tenant	int	50	1–200	FR-3.9 limit	none	DD07L fixed values
`metadata.extension.max_lock_seconds`	environment	decimal	2	0.5–10	apply refuses when the dry-run lock estimate exceeds this	none	SE14 table conversion (no guard)
`metadata.decimal.default_scale_qty`, `metadata.decimal.default_scale_amount`	tenant	int, int	6, 2	0–12	FR-3.2 defaults	EDT `NoOfDecimals`	Domain DECIMALS (CURR/QUAN)
`metadata.rounding_mode`	tenant	enum	half_even	half_even, half_away_from_zero	write-time rounding (BR-3.6); wave 11 ledger may override per legal entity	`round()` X++ semantics	`ROUND` ABAP semantics per currency (TCURX)
`metadata.api.page_size_default`, `metadata.api.page_size_max`	environment	int, int	50, 500	10–200, 100–2,000	FR-3.6 list paging	none (`maxbuffersize`)	OData `$top` limits (/IWFND/MAINT_SERVICE)
`metadata.api.deprecated_version_days`	tenant	int	180	30–365	BR-3.1 sunset window	none	none

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
`metadata.soft_delete_default`	tenant	enum per table group	on for main/group, off for transaction (OQ 3)	on/off per table_group	default of `deleted_at` generation	none	deletion flag (LOEVM) convention
`metadata.pii.sensitive_mask`	tenant	string	`***`	≤ 8 chars	BR-3.9 mask text	none	none (UI masking via SU24 field auth)
`metadata.registry.cache_ttl_seconds`	environment	int	60	10–600	ETag cache in gateway/shell	AOS metadata cache	SE11 buffer settings (technical settings → buffering)
`metadata.golden.entities[]`	repository	list	10 reference entities (FR-3.11)	entity names	golden snapshot set	none	none
`metadata.hooks.expression_timeout_ms`	environment	int	50	10–500	declarative hook evaluation guard	none	none
`metadata.hooks.coded_timeout_ms`	environment	int	2,000	100–10,000	coded hook guard; exceeded → 500 with trace id	none	none
`rules.table.max_rows`, `rules.table.max_columns`	tenant	int, int	10,000, 20	≤ 50,000, ≤ 30	FR-3.13 limits	none	BRF+ decision table limits (none enforced)
`rules.compile_on_publish`	environment	bool	true	true	compiled tree built on `ruleset.published`	none	BRF+ generation (FDT_GENERATE)
`usage.snapshot_time`	tenant	HH:MM tenant time	01:30	any	FR-3.14 / BR-3.11	License count refresh batch	USMM schedule
`usage.retention_years`	tenant	int	3	1–10	snapshot retention	none	none
`usage.active_window_days[]`	tenant	int list	30, 90	7–365	windows reported	"Named user license count" window (D365: 30 days)	ST03N month aggregates

0.3.14 Inquiries and reports

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
Entity catalog	list inquiry	domain, status, layer, has extensions	name, domain, version, status, table group, field count, extension count, published at	`metadata.entity`	AOT Tables node, Data entities list (D365)	SE11 table list, SE16 DD02L
Field list	drill-down	entity, layer, pii, audit	field, type, length/precision, required, default, pii, audit, visibility, layer	`metadata.field`	Table → Fields (AOT), SysDictField	SE11 → Fields, DD03L
Where-used	drill-down	field, type definition, enum	referencing entities, relations, indexes, hooks, rule sets, saved views (wave 5)	registry cross-reference	Cross-reference (xRef)	SE11 → Where-used list (RSWBO052)
Entity diff	drill-down	entity, from version, to version	added / changed / removed items with classification additive/breaking	`/diff` endpoint	Model store compare	SE09 version management, SE39 split-screen
Extension package log	list inquiry	status, entity, date	package, layer, version, status, migration id, applied by/at, error	`metadata.extension_package`	Models form (installed models)	SE03 object directory, transport log
Schema drift report	operational report (nightly)	domain	entity, column, registry type, live type, drift kind	registry vs. `information_schema`	none	SE14 consistency check (database utility)
Type and enum catalogs	list inquiry	base type, layer	code, base type, length, label, usages	`metadata.type_definition`, `metadata.enum_definition`	EDTs, Base Enums (AOT)	SE11 domains / data elements, DD07L
API catalog	list inquiry	domain, api_major, status	entity, OpenAPI link, AsyncAPI link (wave 4), deprecated until	`/v1/metadata/openapi/{entity}`	Data entities (IsPublic)	/IWFND/MAINT_SERVICE (OData services), SEGW projects
Generated-API performance	KPI	entity, period	rps, p50/p95/p99, error rate	gateway metrics (Prometheus)	SQL insights (LCS)	ST03N transaction profile, STAD
Rule set catalog and row inquiry	list inquiry / drill-down	rule set, version, table, effective date, layer	code, version, status, tables, rows; per row: conditions, results, effective dates, layer	`metadata.rule_set`, `metadata.decision_row`	Policy rules list	FDT_WORKBENCH object list, decision table display
Rule evaluation trace	drill-down	rule set, inputs	matched rows, hit policy applied, result, duration	`evaluate?explain=true`	none	BRF+ simulation (FDT_WORKBENCH → Simulate), trace (FDT_TRACE)
Usage report	operational report	date range, legal entity	active users 30/90 d, by role, by legal entity, principals by kind, API requests by entity, row counts	`metadata.usage_snapshot`	License inquiries → Named user license counts, License usage by role; SSRS License report	USMM / SLAW, ST03N user profile, RSUSR200

0.3.15 Printed and electronic documents

No printed documents. Electronic documents:

Document	Trigger	Layout elements	Formats	Numbering sequence	Legal / retention requirement
OpenAPI 3.1 document per entity	publish	info (entity, version, api_major), paths, components (schemas from JSON Schema), security scheme	JSON, YAML	version = entity version	retained for every published version (immutable)

Document	Trigger	Layout elements	Formats	Numbering sequence	Legal / retention requirement
JSON Schema per entity	publish	`$id`, properties with types/formats, required, enum values	JSON Schema 2020-12	same	same
TypeScript client package	publish	typed fetch client, request/response types	npm tarball `@passage/client-<domain>@<version>`	semver from version	retained in registry 7 years (same as images)
Migration file	publish / extension apply	Atlas SQL with header (entity, version, package)	`.sql` under `migrations/<domain>/`	timestamped Atlas name	permanent in Git
Extension package manifest	package validated	code, layer, version, targets, dry-run SQL, lock estimate	YAML (`passage-gen export`)	package code + version	permanent in `metadata.extension_package`
Rule set export	administrator action	tables with columns, rows (conditions, results, effective dates, layer)	CSV per table, YAML for the whole set	rule set code + version	retained with the version
Usage report export	administrator action	snapshot rows	CSV, JSON	none	retained by requester; snapshots 3 years

0.3.16 Periodic and batch jobs

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
Schema drift check	nightly 01:00 UTC	domain	compares registry to `information_schema`; report rows keyed by (date, domain)	< 1 min per domain	report with drift rows; no automatic change	`SchemaDrift` (ticket)
Extension apply job	on demand (`/apply`)	package	transactional per domain (BR-3.4); package status is the checkpoint	≤ 60 s	package → `failed` with SQL error; rerun after fix	`ExtensionApplyFailed` (notify)
Non-constant default backfill	after an apply that needs it	entity, id range (10 k rows)	checkpoint per range in `metadata.backfill`	100 k rows/min	resume from checkpoint (wave 4 framework after wave 4; CronJob loop before)	`BackfillStalled` (> 30 min no progress)
Deprecated version sunset	daily 02:00 UTC	entity	removes `/v{n}` routes whose sunset passed; idempotent	< 10 s	none	none
Golden snapshot verification	on every CI run and nightly	entity	deterministic	< 2 min	CI failure	CI status
Rule set compile	on `ruleset.published`	rule set	compiled tree keyed by (code, version)	< 5 s for 10 k rows	publish rolled back with error	`RuleCompileFailed` (notify)
Usage snapshot	daily 01:30 tenant time	tenant	one row per (tenant, date); rebuild only with explicit reason (BR-3.11)	< 30 s per tenant	retry 3×; missing day flagged in the report	`UsageSnapshotMissing` (ticket)
Usage snapshot retention	monthly	tenant	deletes rows older than `usage.retention_years`	< 10 s	none	none

0.3.17 Security duties and privileges

Duty	Privileges (entry points)	Segregation-of-duties conflicts	Default roles that include it
Maintain entity metadata	`PUT /v1/metadata/entities/{name}/versions/{v}`, `/publish`, `/compat-check`, Entity designer, Type and enum catalogs	with Apply extensions in production tenants (designer of a sys change should not also apply customer packages without review)	Platform engineer, Solution architect
View entity metadata	`GET /v1/metadata/*`, Entity catalog, Field list, Where-used, Entity diff, API catalog	none	all authenticated users (read of the published version is `any`), Auditor
Apply extensions	`POST /v1/metadata/extensions`, `/validate`, `/apply`, `/retire`, Extension packages screen	with Maintain entity metadata; with Approve workflow for the extended entity (wave 4)	Customer administrator, Partner consultant
Maintain business rules	`/v1/rules/sets`, versions, publish, `rows:import`, Rule set designer	with the business duties that consume a rule set (for example Maintain tax setup, wave 13): a rule author should not also post the documents the rule governs; enforced by wave 48 SoD rule `RULE_AUTHOR_VS_POSTER`	Solution architect, Business administrator
Evaluate business rules	`POST /v1/rules/{code}/evaluate`	none	all services (internal), any authenticated user for `explain` on rules they may read
View usage reports	`GET /v1/metadata/usage`, Usage report	none	Tenant owner, Auditor, Platform operator
Run metadata jobs	trigger drift check, backfill, snapshot rebuild	none	Platform engineer

0.3.18 Message catalog

Code	Severity	User text	Cause	Remediation	Raised by
MDK-0301	error	Entity definition invalid at `{json_path}`: {schema error}	JSON Schema validation	fix the YAML	FR-3.1
MDK-0302	error	Breaking change `{change}` on {entity} requires `breaking: true` and api_major {n+1}	compat classifier	mark breaking and bump, or make the change additive	FR-3.5, BR-3.2
MDK-0303	error	Version {v} of {entity} is published and immutable	PUT on a published version	create a new draft version	BR-3.1
MDK-0304	error	{entity} version {v} was published by {user} after your draft; rebase	concurrent publish (409)	reload and reapply	BR-3.5
MDK-0305	error	Extension field names must start with `x_`	naming rule	rename	FR-3.9
MDK-0306	error	Enum value code {code} must be ≥ 1000 for extensions	layer rule	choose a code ≥ 1000	FR-3.9

Code	Severity	User text	Cause	Remediation	Raised by
MDK-0307	error	Extension cannot change type or required flag of sys field {field}	invariant	add a new field instead	0.3.4 invariants
MDK-0308	error	Apply refused: estimated lock {s} s exceeds {max} s on {table} ({rows} rows)	dry-run lock estimate	schedule a backfill or split the change	0.3.6 rules
MDK-0309	error	Package {code} v{v} failed at {stage}: {sql error}; nothing was applied	transactional apply	fix and rerun	BR-3.4
MDK-0310	error	Value for {field} exceeds precision ({p},{s})	VALUE_OUT_OF_RANGE (422)	correct the value	BR-3.6
MDK-0311	error	Cannot delete {entity} {id}: referenced by {n} {child_entity} rows	REFERENCED_BY (409)	delete or reassign children	BR-3.8
MDK-0312	error	Cascade delete limit of 10,000 child rows exceeded	BR-3.8 limit	delete in batches (wave 4 job)	BR-3.8
MDK-0313	error	Validation failed: {message} (field {field})	declarative/coded hook returned ok=false	correct the field	FR-3.7
MDK-0314	error	Internal error in hook {name}; trace {trace_id}	coded hook panic / timeout	report with trace id	FR-3.7
MDK-0315	warning	Record changed by {user} at {time}; your version {v} is stale	If-Match mismatch (409)	reload	FR-3.4
MDK-0316	error	Decision table {table} has {n} rows; limit {max}	FR-3.13 limit	split the table or raise `rules.table.max_rows`	FR-3.13
MDK-0317	warning	No row matched in {table} for the given inputs	`{matched:false}`	add a catch-all row or handle `RULE_NO_MATCH`	BR-3.10
MDK-0318	error	Row {ordinal}: condition on column {column} uses operator {op} not allowed for type {type}	typed cell validation	choose an allowed operator	FR-3.13
MDK-0319	error	Rule set {code} v{v} is referenced by hook {hook} on {entity}; deprecate instead of retiring	reference check	deprecate with sunset date	FR-3.13
MDK-0320	info	Usage snapshot for {date} rebuilt by {user}: {reason}	explicit rebuild	none	BR-3.11

0.3.19 Performance budgets and capacity

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
Registry read (current version, ETag)	5,000/min at shell cold start; 200/min steady	5 ms / 20 ms / 40 ms	500 rps	`metadata.*` < 1 M rows total (< 1 GB)	`entity(tenant_id, domain, name, version)` unique; ETag served from cache	cache serves stale ≤ 60 s; registry HPA 2 → 4
Generated entity read (`GET /{id}`)	1,000 rps on dev cluster (FR-3.12)	10 ms / 50 ms / 90 ms	1,000 rps per 3 pods	per entity: rows × avg 1 KB	PK + declared indexes; `(tenant_id, …)` leading column everywhere	pool exhaustion → 503 with `Retry-After`; p95 may reach 150 ms
Generated entity create	200 rps	30 ms / 120 ms / 200 ms	200 rps	same	hooks inline; outbox row (wave 4)	same
List with filter/sort, page 50	300 rps	20 ms / 80 ms / 150 ms	300 rps	n/a	cursor pagination on (sort key, id)	large offsets refused (cursor only)
Publish (generate + migrate)	20/day	10 s / 30 s / 60 s	2 concurrent per domain	migrations ≈ 2 MB/year	one Atlas job per domain	queued; CI concurrency limit
Extension apply (100 M-row table)	5/month	15 s / 45 s / 60 s	1 at a time per domain	n/a	`ADD COLUMN` fast default; `CREATE INDEX CONCURRENTLY`	refused above lock estimate (MDK-0308)
Rule evaluation (1,000-row table)	2,000/s across services at peak	0.5 ms / 5 ms / 10 ms	5,000/s per service instance	rule tables ≤ 50 MB per tenant	compiled tree in memory per (code, version)	CPU-bound; no errors
Usage snapshot	1/day/tenant	5 s / 30 s / 60 s	n/a	365 rows × ≈ 20 KB per tenant per year	`(tenant_id, snapshot_date)` unique	runs later; `UsageSnapshotMissing` after 24 h

0.3.20 Localization and compliance hooks

- Labels and help text: `label` and `help` on entities, fields, enum values and rule columns are stored as keys in the registry; English is the only language in wave 3. Wave 48 label packs supply translations per country/language and the shell (wave 5) resolves them per user locale; the extension point is `metadata.label` keyed by (object, locale).
- Formats: dates, decimals and money are stored canonically (ISO 8601, `decimal`, `money` + ISO 4217) and formatted in the shell per user preference (wave 5); country packs never change storage types. Currency minor-unit scale comes from the wave 11 currency table; until then `money` uses scale 6 for storage and 2 for display.
- PII classification (`pii=personal|sensitive`) is the hook used by wave 48 privacy tooling (GDPR/CCPA erasure, data-subject export) and by wave 5 audit masking; country packs may raise a field's classification but never lower it.
- Statutory fields: country packs add fields through `ExtensionPackage` with `layer=partner` (for example Brazil `x_cnpj`, India `x_gstin`) — the same mechanism customers use; validation patterns go in `pattern` and in rule sets (FR-3.13).
- Decision tables are the extension point for country-dependent determinations (tax groups, document types, numbering formats): a country pack ships `sys`-layer rows with a `country` input column; customers override with `customer`-layer rows.
- Retention: metadata versions are never deleted (audit trail of schema), which satisfies SOX/ITGC change-management evidence (wave 48) together with the Git history of `metadata/entities`.
- Usage metering stores no personal data beyond counts; per-user activity lives in wave 2 login events and wave 5 audit.

0.3.21 Coverage closure

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
AX §12.30.2 System administration → Inquiries & Reports: License inquiries (Named user license counts, License usage by role) (register row 265)	PARTIAL-3	ADDED as FR-3.14	Usage report in 0.3.14; `UsageSnapshot` entity; named users distinct per tenant (BR-3.11); counts inform PRD §12 Q1, never block

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
AX §12.30.2 System administration → SSRS: License report / Named user counts (register row 266)	PARTIAL-3	ADDED as FR-3.14	CSV/JSON export in 0.3.15; PDF layout arrives with the wave 15 report designer
AX §12.30.3 System administration → Periodic: Licensing → Named user license count refresh (register row 268)	PARTIAL-3	ADDED as FR-3.14	nightly Usage snapshot job (0.3.16) at `usage.snapshot_time`; rebuild with reason (MDK-0320)
SAP §13.31 Cross-Application → BRF+ (BRFPLUS / FDT_WORKBENCH) / Decision Service Management: business rules framework (register row 348)	PARTIAL-3	ADDED as FR-3.13	`RuleSet` / `DecisionTable` / `DecisionRow`; hit policies in BR-3.10; evaluate and explain endpoints; consumers in waves 4, 13, 15, 30, 48 must use it
SAP §13.31 Cross-Application → SAP Business Rules (BRF+ in GRC, tax, dispute, output) (register row 352)	PARTIAL-3	ADDED as FR-3.13	same mechanism; per-domain rule sets are authored in the consuming waves (tax 13, output 15, credit/dispute 30, GRC 48)
SAP §13.31 Customizing (SPRO) → BRF+ applications, functions, rulesets, decision tables, expressions (FDT_*) (register row 354)	PARTIAL-3	ADDED as FR-3.13	application = rule set, function = table evaluation, ruleset/decision table = `DecisionTable`, expression = condition cells and `computed_expr` from FR-3.3; formulas beyond the expression subset are deferred with open question 2

0.4 Wave 4: Event Backbone, Workflow & Batch

0.4.1 Scope and business context

AX runs approvals through the workflow framework (`WorkflowTable`, `WorkflowVersionTable`, `WorkflowWorkItemTable`, `WorkflowTrackingStatusTable`, `WorkflowTrackingTable`; approval, task and conditional-decision elements; work item statuses Pending/Delegated/Completed/Canceled; escalation and due dates) and background work through the batch framework (`BatchJob`, `Batch`, `BatchJobHistory`, `BatchGroup`, `RunBaseBatch`, `SysOperationServiceController` with `SysOperationExecutionMode` Synchronous/Asynchronous/ReliableAsynchronous/ScheduledBatch, job statuses Waiting/Executing/Ended/Error/Hold/Canceling/Canceled); D365 adds business events. SAP has Business Workflow (SWDD, work items SWWWIHEAD, SWIA/SWI1, SBWP inbox, event linkage SWE2, deadline monitoring), background jobs (SM36 definition, SM37 monitor, TBTCO/TBTCP, statuses Scheduled/Released/Ready/Active/Finished/Canceled, job classes A/B/C, SM62 events) and IDoc status processing (EDIDC/EDIDS status 03/51/53/64, BD87). Wave 4 replaces these with Strimzi Kafka carrying CloudEvents, a transactional outbox in every service via Debezium, a schema registry fed by entity metadata, Temporal for approvals and batch, a configuration-driven approval chain, a partitioned checkpointing batch framework and a job monitor. Out of scope: notification channels beyond in-app and email (wave 46 adds Teams/Slack), position-hierarchy assignee resolution (wave 42), line-item workflows (wave 17 first consumer), IDoc/EDI payload semantics (wave 35).

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
Downstream systems (MES, WMS, BI) poll `ModifiedDateTime` on AX tables or wait for the nightly IDoc/BD21 change-pointer job; IDocs stuck in status 51/64 are reprocessed by hand in BD87	No reliable push of changes; outbound integration is batch	Every committed change is a CloudEvent on Kafka via Debezium outbox within 500 ms; consumers subscribe, never poll	Change-to-consumer latency: 15 min–24 h → < 2 s p95; manual reprocessing runs per week: dozens → 0 (DLQ with reason, replayable)
AX workflow approvals: the workflow batch job (`WorkflowMessageProcessingTask`) runs every minute and the work-item list is refreshed manually; escalation "due dates" silently fail when the batch server is down	Workflow runtime is a polling batch job on the AOS	Temporal workflows with durable timers; work item pushed to the inbox by event	Submit-to-inbox latency: 1–5 min → < 2 s; missed escalations due to batch outage: possible → 0 (timers survive restarts)
SAP Business Workflow (SWDD) changes need an ABAP workflow developer, a transport and SWU3 checks; amount bands for release strategies live in customizing tables (CL20N/CL24N)	Chains are code and classification objects, not configuration	Designer with amount bands, conditions and SLAs as versioned data, activated per legal entity	Approval chain change: 1–3 weeks → < 30 min by an administrator; developer involvement: required → none
A failed AX batch job over 1M rows (e.g. inventory recalculation) restarts from zero; SM37 jobs show "Canceled" with a dump in ST22 and no restart point	Batch frameworks have no checkpoints or partitions	Partitioned tasks with checkpoints every 10k rows; resume from last checkpoint; rerun failed partitions only	Rework after a failure at 90%: 90% of the run → < 1%; mean time to resume: hours → < 1 min
Exactly-once delivery requires custom dedupe tables in X++/ABAP and still double-posts under AOS/work-process crashes	Dual writes (DB + queue) in application code	Outbox in the same transaction; consumer library dedupes on CloudEvents `id`	Duplicate side effects under chaos: observed → 0 over 10 kill cycles

0.4.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Change notification	Business events (D365 `BusinessEventsBase`), AIF outbound ports, alerts (`EventInbox`)	Event type linkage SWE2, change pointers BD21, IDoc outbound	CloudEvents on Kafka via outbox; AsyncAPI per topic	improved
Reliable publish	AIF queue (`AifGatewayQueue`), dual-write risk in X++	tRFC/qRFC (SM58), IDoc status 03	Debezium outbox event router; exactly-once effect	improved
Workflow definition	Workflow editor, `WorkflowTypeTable`, `WorkflowDocument` class, approval/task elements	SWDD workflow builder, tasks TS*, agent rules PFAC	`WorkflowDefinition` JSON (steps, conditions, SLAs), designer UI	full
Work items	`WorkflowWorkItemTable`, Work list, Delegate/Approve/Reject/Request change	SWWWIHEAD, SBWP inbox, forward/resubmit	`WorkItem` with approve/reject/delegate/request_change/recall	full
Escalation and deadlines	Time limits, escalation path, `WorkflowEscalation*`	Deadline monitoring (latest end), SWWDHEX	Temporal timers; SLA + escalation action	full
Workflow history	`WorkflowTrackingTable`, tracking status form	SWIA, workflow log (SWI1/SWEL)	Temporal history + `WorkflowInstance` timeline API	improved
Background jobs	`BatchJob`, `Batch`, `BatchGroup`, `SysOperation` data contracts, recurrence (`SysRecurrence`)	SM36/SM37, TBTCO/TBTCP, variants, job classes A/B/C	`BatchJob` definition, `BatchRun`, `BatchTask`, cron recurrence, priority	full
Job monitoring	Batch job history, `BatchJobHistory`, Infolog	SM37, job log (TBTC5), SM50	Job monitor UI, run log, Prometheus metrics	improved
Restart / reprocess	Rerun batch job, no checkpoints	BD87 IDoc reprocess, job copy in SM37	checkpoint per partition; resume from last checkpoint	improved
Outbound email	Email parameters (`SysEmailParameters`: SMTP, Exchange, mail sending mode batch/client), Email distributor batch (`SysEmailBatch`), Outbound email status (`SysOutgoingEmailTable`), Retry failed	SAPconnect (SCOT) nodes, send job RSCONN01, SOST send status, SOSV/SOSG	notify service: `OutboundMessage` queue, provider adapter (SMTP / HTTP API), distributor job, status inquiry, retry, bounce ingest	full

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Message templates and notification settings	Email templates (`SysEmailTable` / `SysEmailMessageTable`, per language), Workflow approval email templates, Workflow parameters → Notifications, User options → Workflow notifications (email, in-app, digest), Alert email templates	SO10 standard texts in workflow tasks, SWNCONFIG extended notifications (digest schedule, delivery), SBWP settings, SU3 user defaults	`MessageTemplate` (channel, language, placeholders, layout), sys templates per workflow event, `NotificationPreference` per user, per-definition notify flags	full

0.4.3 Functional requirements

- **FR-4.1 Kafka and topics** — Must. The system shall run Strimzi-managed Kafka (3 brokers in cloud, 1 in k3d, KRaft) with topics named `passage.<domain>.<aggregate>.v<n>`, partition key = aggregate id, 12 partitions default, retention 7 days (entity-state topics compacted), and CloudEvents 1.0 JSON envelopes with extensions `tenantid`, `legalentityid`, `traceparent`, `actor`.
  - Notes: no per-tenant topics; consumers filter by `tenantid` header; max message 1 MB, larger payloads use a claim-check reference (object storage URL).
- **FR-4.2 Transactional outbox** — Must. Every service shall write domain changes and an `outbox_event` row in the same transaction; Debezium (one connector per domain database, pgoutput) with the outbox event router publishes and never writes to Kafka from application code.
  - Notes: outbox columns id, aggregate_type, aggregate_id, event_type, payload (jsonb), headers (jsonb), created_at; rows deleted after 24 h by a sweep; publish lag p95 ≤ 500 ms.
- **FR-4.3 Schema registry** — Must. Event payload schemas shall be JSON Schema derived from the metadata registry (`dev.passage.<domain>.<entity>.<verb>.v<n>` ↔ entity version) registered with BACKWARD_TRANSITIVE compatibility; CI rejects an incompatible schema.
- **FR-4.4 AsyncAPI generation** — Must. The generator from wave 3 shall emit an AsyncAPI 3.0 document per domain listing topics, event types and schemas; published at `/v1/events/asyncapi/{domain}`.
- **FR-4.5 Consumer library** — Must. Go and TS libraries shall provide idempotent consumption keyed by CloudEvents `id` (dedupe table per consumer group, 7-day window), ordered processing per partition, retry with exponential backoff (1 s → 5 min, 10 attempts) and a per-topic dead-letter topic `…dlq`.
- **FR-4.6 Temporal cluster** — Must. The system shall run Temporal (CNPG persistence, 1 namespace per environment, `tenant_id` as a search attribute) with Go and TS SDK wrappers that inject tenant, actor and trace context into every workflow and activity.
  - Notes: workflow ids `wf-{tenant}-{entity}-{record_id}-{seq}`; history retention 90 days; activity timeouts default 30 s start-to-close, heartbeat for long activities.
- **FR-4.7 Approval workflow template** — Must. The system shall provide a configurable approval workflow with steps (assignee resolution: user, role, expression, `record.owner`, manager placeholder), conditions (expression over the document, e.g. `amount_minor > 1000000`), completion policy (single, all, majority, percentage n), SLA (ISO 8601 duration) and escalation action (delegate_to, auto_approve, auto_reject, notify_only), and actions submit, approve, reject, delegate, request_change, recall, cancel.
  - Notes: a step with zero resolved assignees escalates immediately to the workflow administrator; delegation may chain at most 3 levels; delegation records keep the original assignee for audit.
- **FR-4.8 Workflow designer** — Must. Administrators shall configure approval chains per entity with amount bands and conditions in a form (no code), version them, and activate one version per entity × legal entity.
- **FR-4.9 Batch job framework** — Must. The system shall define jobs (`BatchJob`: handler name, parameters JSON Schema, partition strategy rangeIhashIlist, partition count ≤ 256, concurrency ≤ 32, priority A/B/C, retry policy), schedule them by cron (tenant time zone) or on demand, execute each partition as a Temporal activity with checkpoints every N rows (default 10,000) and resume from the last checkpoint after failure.
  - Notes: statuses waiting, scheduled, executing, ended, error, hold, canceling, canceled; max run time default 6 h; a job may declare `exclusive=true` to prevent overlapping runs.
- **FR-4.10 Job monitor** — Must. The system shall show runs, tasks, progress (rows/sec, ETA), logs and errors; allow cancel, hold, resume and rerun-failed-partitions; retain history 90 days.
- **FR-4.11 Metadata-changed events** — Must. The metadata registry shall emit `dev.passage.metadata.entity.published.v1` through its own outbox (first production consumer of the backbone).
- **FR-4.12 Chaos and replay** — Should. The platform shall support topic replay from an offset or timestamp per consumer group and ship a chaos test that kills a service between commit and publish.
- **FR-4.13 Outbound email and message delivery** — Must. The system shall provide a `notify` service (TS) with a provider adapter interface (`Send`, `GetStatus`, `IngestBounce`) implemented for SMTP (STARTTLS or implicit TLS, credentials via ESO) and for an HTTP API provider (the SMTP relay is the P0 default per open question 2); a per-tenant sender identity (from address, display name, reply-to, envelope domain whose SPF/DKIM/DMARC are the customer's responsibility and are checked by a "verify sender" action); an `OutboundMessage` queue (channel email I in_app I webhook; status queued → sending → sent I failed I bounced; attempts; provider message id); a distributor job (every 60 s, batch 500, 5 attempts with backoff 1 min → 1 h); a mail sending mode per tenant (`immediate` for workflow and alerts, `batch` for digests and reports); attachments ≤ 10 MB total per message; an outbound status inquiry; manual retry; and a bounce webhook/IMAP ingest that marks the message `bounced` and, after 3 hard bounces, flags the recipient user (`identity.user.email_status=bouncing`).
  - Notes: in-app messages are rows in the same table read by the shell notification tray (wave 5) via SSE; webhook deliveries sign the body with HMAC-SHA256 (`X-Passage-Signature`) and retry on non-2xx; messages are retained 90 days (body) and 3 years (metadata); a tenant with no sender identity falls back to the platform default `no-reply@<env>.passage.dev` with a warning on the parameters form; the service never generates email in test environments unless `notify.allowlist_domains` matches the recipient.
- **FR-4.14 Message templates and notification settings** — Must. The system shall provide `MessageTemplate` (code, channel, language, subject, body in Mustache syntax with placeholders resolved from the entity record via metadata (`{{record.number}}`, `{{record.amount | money}}`), the workflow context (`{{workitem.due_at | date}}`, `{{instance.submitted_by.display_name}}`, `{{link}}` deep link to the work item or record) and standard texts from wave 5 (`{{text:CODE}}`); an HTML layout wrapper per tenant (logo, footer); versioning and `sys/customer` layers so customers override shipped templates per language); shipped `sys` templates for `workflow.workitem.assigned`, `.escalated`, `.delegated`, `instance.completed`, `instance.change_requested`, `batch.run.failed`, `identity.user.invited`; per-user `NotificationPreference` (per event class: in_app, email, none; digest none I daily at HH:MM I weekly on day; language; quiet hours); per-`WorkflowDefinition` flags (notify_on_assign, notify_on_escalate, notify_submitter_on_complete, comment_required); and a "preview with sample record" action.
  - Notes: rendering is fail-closed — a missing placeholder or render error marks the message `failed` with NTF-0407 instead of sending a blank; templates are rendered in the recipient's language, falling back to the tenant default then `en`; digests aggregate pending in-app items into one email at the chosen time (BR-4.12); user-level workflow delegation stays in `WorkItem` (FR-4.7) and is referenced, not duplicated, by preferences.

0.4.4 Data model

OutboxEvent (`<domain>.outbox_event`, every service)

Field	Type	Required	Notes
id	uuid	yes	PK; becomes CloudEvents `id`

Field	Type	Required	Notes
tenant_id	uuid	yes	RLS; copied to header `tenantid`
aggregate_type	varchar(64)	yes	entity name; routes to topic
aggregate_id	uuid	yes	partition key
event_type	varchar(128)	yes	`dev.passage.<domain>.<entity>.<verb>.v<n>`
payload	jsonb	yes	CloudEvents `data`
headers	jsonb	yes	traceparent, actor, legalentityid, schema_version
created_at	timestamptz	yes	CloudEvents `time`

WorkflowInstance (`workflow.instance`)

Field	Type	Required	Notes
id	uuid	yes	PK; equals Temporal workflow id suffix
tenant_id, legal_entity_id	uuid	yes	
definition_id, definition_version	uuid, int	yes	FK WorkflowDefinition
entity, record_id	varchar(48), uuid	yes	document under approval
status	enum	yes	submitted, in_review, change_requested, approved, rejected, recalled, canceled, failed
submitted_by, submitted_at	uuid, timestamptz	yes	
current_step	int	no	1-based
completed_at, outcome_reason	timestamptz, text	no	
temporal_run_id	varchar(64)	yes	

WorkItem (`workflow.work_item`)

Field	Type	Required	Notes
id	uuid	yes	PK
instance_id	uuid	yes	FK
step	int	yes	
assignee_id	uuid	yes	FK user
original_assignee_id	uuid	no	set when delegated
status	enum	yes	pending, claimed, approved, rejected, delegated, escalated, change_requested, canceled, expired
due_at	timestamptz	yes	SLA
acted_at, comment	timestamptz, text	no	

BatchJob / BatchRun / BatchTask (`workflow.batch_*`): BatchJob has id, tenant_id, code (unique), handler, params_schema jsonb, partition_strategy, partition_count, concurrency, priority, cron, time_zone, exclusive, retry_policy jsonb, status (active, hold); BatchRun has id, job_id, params jsonb, status (FR-4.9), scheduled_at, started_at, ended_at, rows_total, rows_done, error, triggered_by; BatchTask has id, run_id, partition_no, status, checkpoint jsonb, attempts, last_error, rows_done.

OutboundMessage (`notify.outbound_message`, partitioned monthly)

Field	Type	Required	Notes
id	uuid	yes	PK
tenant_id	uuid	yes	RLS
channel	enum	yes	email, in_app, webhook
recipient_user_id, recipient_address	uuid, varchar(254)	one of	user for in_app/email; address for external email; URL for webhook
template_code, template_version, language	varchar(48), int, char(5)	no	null when sent raw by a service
subject, body_html, body_text	varchar(255), text, text	yes (email)	rendered content; body retained 90 days
related_entity, related_record_id	varchar(48), uuid	no	deep link target
status	enum	yes	queued, sending, sent, failed, bounced, read (in_app only)
attempts, next_attempt_at, last_error	int, timestamptz, text	yes/no/no	BR-4.8-style backoff
provider_message_id	varchar(200)	no	for bounce correlation
priority	enum	yes	immediate, batch
created_at, sent_at	timestamptz	yes/no	

MessageTemplate (`notify.message_template`)

Field	Type	Required	Notes
id	uuid	yes	PK
tenant_id	uuid	yes	`sys` tenant for shipped templates
code	varchar(64)	yes	e.g. `workflow.workitem.assigned`; unique with language, layer, version
channel	enum	yes	email, in_app, webhook
language	char(5)	yes	BCP 47 (`en`, `de-DE`)
layer	enum	yes	sys, customer
version, status	int, enum	yes	draft, published, retired
subject, body	varchar(255), text	yes	Mustache; placeholders validated against the event's payload schema at publish
layout_id	uuid	no	FK tenant HTML layout
sample_payload	jsonb	no	for preview

NotificationPreference (`notify.preference`)

Field	Type	Required	Notes
user_id	uuid	yes	PK with event_class
tenant_id	uuid	yes	
event_class	enum	yes	workflow_assigned, workflow_escalated, workflow_completed, batch_failed, alert (wave 5), system
channels	enum set	yes	in_app, email; default in_app + email for workflow_assigned
digest	enum	yes	none, daily, weekly
digest_time, digest_day	time, int	no	tenant time zone; day 1–7
quiet_hours	int4range	no	hours suppressed for email (digest still sent)
language	char(5)	no	null = user locale

Invariants: exactly one active `WorkflowDefinition` version per (entity, legal_entity); a WorkItem is terminal once acted; `BatchRun` of an exclusive job cannot overlap another run of the same job; outbox rows are never updated. Indexing: `outbox_event(created_at)`; `work_item(tenant_id, assignee_id, status)`; `instance(tenant_id, entity, record_id)`; `batch_run(job_id, scheduled_at desc)`. Partitioning: `work_item` and `batch_task` by month from wave 30.

0.4.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
GET	/v1/events/topics, /v1/events/asyncapi/{domain}	Topic catalog, AsyncAPI	n/a	any
GET/POST	/v1/events/schemas/{type}	Read / register schema	by type+version	Maintain entity metadata
POST	/v1/events/replay	Replay topic for consumer group from offset/time	request id	Maintain batch jobs
GET/POST/PUT	/v1/workflows/definitions, /{id}/versions/{v}, /{id}/activate	Definitions	by version	Maintain workflows
POST	/v1/workflows/instances	Submit a document	entity+record_id+seq	per entity `post/update`
GET	/v1/workflows/instances/{id}, /{id}/timeline	Status and history	n/a	submitter, assignee, Maintain workflows
POST	/v1/workflows/instances/{id}/actions	recall, cancel	action+instance version	submitter / Maintain workflows
GET	/v1/workitems?assignee=me&status=pending	Inbox	n/a	any
POST	/v1/workitems/{id}/actions	approve, reject, delegate, request_change	workitem id + action	assignee (Approve workflow)
GET/POST/PUT	/v1/batch/jobs, /{id}	Define jobs	by code	Maintain batch jobs
POST	/v1/batch/jobs/{id}/runs	Start run	Idempotency-Key	Maintain batch jobs
GET/POST	/v1/batch/runs/{id}, /{id}/cancel, /{id}/resume, /{id}/rerun-failed	Monitor and control	run id + action	View batch history / Maintain batch jobs
GET/POST/PUT	/v1/notify/templates, /{code}/versions/{v}, /{code}/versions/{v}/publish, /{code}/preview	Templates and preview	by version	Maintain message templates
POST	/v1/notify/messages	Enqueue a message (internal services; template or raw)	Idempotency-Key (24 h)	internal / Send notifications
GET/POST	/v1/notify/messages?status=&recipient=&from=&to=, /{id}/retry	Outbound status and retry	retry: message id	View outbound messages / Maintain notification settings
GET/PUT	/v1/notify/preferences/me, /v1/notify/preferences/{user_id}	Notification preferences	last write wins	self / Maintain users
GET/PUT/POST	/v1/notify/settings, /v1/notify/settings/verify-sender, /test-send	Tenant sender identity, provider, mode; test	n/a	Maintain notification settings
POST	/v1/notify/bounces	Provider bounce webhook (HMAC-verified)	provider message id	provider credential
GET	/v1/notify/inbox?unread=true	In-app messages for the shell tray (SSE at `/v1/notify/inbox/stream`)	n/a	self

Validation: approve/reject require a comment when the definition flags `comment_required`; delegate target must hold the step's role; a run request against a `hold` job returns 409; a template publish fails when a placeholder is not in the event's payload schema (NTF-0406); `test-send` is limited to 10 per hour per tenant.

Event	Trigger	Payload fields	Consumers
dev.passage.workflow.instance.submitted.v1	submit	instance_id, entity, record_id, definition_version, submitted_by	owning service (sets record status), audit
dev.passage.workflow.workitem.assigned.v1	step entered / delegated	workitem_id, instance_id, assignee_id, due_at, step	shell inbox, notifier
dev.passage.workflow.workitem.escalated.v1	SLA timer fired	workitem_id, from_assignee, to_assignee, action	notifier, audit
dev.passage.workflow.instance.completed.v1	terminal status	instance_id, outcome (approved/rejected/canceled/recalled), completed_at	owning service, audit, shell
dev.passage.batch.run.started.v1 / completed.v1 / failed.v1	run transitions	job_code, run_id, rows_total, rows_done, duration_ms, error	job monitor, alerting, audit
dev.passage.metadata.entity.published.v1	registry outbox	(see wave 3)	events service (topic/schema create)
dev.passage.notify.message.sent.v1 / failed.v1 / bounced.v1	distributor outcome	message_id, channel, template_code, recipient_user_id (no address in payload), attempts, error	audit, alerting (`NotifyFailureRate`), identity (bounce flag)
dev.passage.notify.template.published.v1	template publish	code, version, language, layer	notify workers (cache reload), audit

0.4.6 User experience

Screen	Primary actions	Key fields/columns	Duty required
Work items (inbox)	Approve, reject, delegate, request change, bulk approve	document, step, submitted by, due, age	Approve workflow
Workflow instance timeline	View steps, comments, timers; recall	status, step, assignee, acted at, SLA	submitter / Maintain workflows
Workflow designer	Add step, condition, SLA, escalation; version; activate	entity, legal entity, bands, assignees	Maintain workflows
Batch jobs	Define, schedule, hold, run now	code, handler, cron, last run, next run	Maintain batch jobs
Job monitor	Watch progress, cancel, resume, rerun failed, view log	run, status, rows/sec, ETA, errors by partition	View batch history
Topic catalog	Browse topics, schemas, consumer lag	topic, partitions, schema version, lag	Maintain batch jobs
Message templates	Create, edit (subject/body with placeholder picker), preview with sample record, publish per language	code, channel, language, layer, version, status	Maintain message templates

Screen	Primary actions	Key fields/columns	Duty required
Outbound messages	Filter by status/recipient/date, open rendered message, retry, cancel queued	sent at, channel, recipient, subject, status, attempts, last error, provider id	View outbound messages
Notification settings (tenant)	Sender identity, provider, mode, allowlist, verify sender, test send	from, reply-to, provider, mode, SPF/DKIM check result	Maintain notification settings
My notification preferences	Per event class choose channels, digest, quiet hours, language	event class, in-app, email, digest, time	self

Rules: bulk approve is limited to 100 items per action and requires a confirmation listing document totals; the inbox refreshes from events within 2 s; designer validates expressions against the entity's current metadata; keyboard `a` approve, `r` reject, `d` delegate on a focused row.

0.4.7 Business rules and edge cases

- **BR-4.1** Instance status machine: submitted → in_review → (approved | rejected | change_requested → submitted on resubmit); submitted/in_review → recalled (by submitter, before any approval) or canceled (by administrator); any → failed on unrecoverable activity error (alert raised).
- **BR-4.2** Work item status machine: pending → claimed → approved | rejected | change_requested; pending/claimed → delegated (new item created) | escalated (on SLA) | expired (SLA with `auto_reject`) | canceled (instance terminal).
- **BR-4.3** SLA timers use the tenant time zone and the tenant work calendar when one exists (wave 6); in P0 they are wall-clock; the timer survives Temporal worker restarts.
- **BR-4.4** Completion policy `majority` rounds up (3 of 4); `percentage 60` on 5 assignees needs 3; a single reject under `all` rejects the step immediately.
- **BR-4.5** Exactly-once effect: a consumer that sees a CloudEvents `id` already in its dedupe table acknowledges without side effects; the dedupe table is keyed (consumer_group, event_id) and swept after 7 days.
- **BR-4.6** Ordering is guaranteed per aggregate id only; consumers must not assume cross-aggregate order.
- **BR-4.7** Batch checkpoint is committed in the same transaction as the processed rows; after resume, rows with ids ≤ checkpoint are skipped, so handlers must process in key order within a partition.
- **BR-4.8** Retry policy: activity failures retry up to 5 times with backoff 2 s × 2^n capped at 5 min; after that the task is `error` and the run continues other partitions; run ends `error` if any task is `error`.
- **BR-4.9** A workflow definition change never alters running instances; they finish on their version.
- **BR-4.10** Poison events after 10 delivery attempts go to the DLQ with the last error in header `dlqreason`; a DLQ depth > 0 for 10 min alerts.
- **BR-4.11** Outbound message status machine: queued → sending → sent | failed; sent → bounced (provider bounce); queued → canceled (administrator); in_app: queued → sent → read. Rendering happens at enqueue time (the stored body is what was sent); a render error is `failed` with NTF-0407 and never a partially rendered send. Retries: attempts 1–5 at 1 min, 5 min, 15 min, 1 h, 1 h; after the fifth failure the message stays `failed` and only a manual retry resets `attempts`.
- **BR-4.12** Digest: for a user with `digest=daily 08:00`, every in-app item of the configured event classes created since the previous digest is listed in one email at 08:00 tenant time; items already read in the shell are omitted; an empty digest is not sent; `workflow_escalated` always sends immediately regardless of digest (escalations are time-critical); quiet hours delay immediate email to the end of the window but never delay in-app.
- **BR-4.13** Bounce handling: a hard bounce (5xx, unknown recipient) marks the message `bounced`; the third hard bounce for the same address within 30 days sets `identity.user.email_status=bouncing`, suppresses further email to that user (in-app continues) and notifies Security administrators; a soft bounce (4xx, mailbox full) is retried per BR-4.11.

0.4.8 Acceptance criteria

- **AC-4.1** Given a service killed by SIGKILL between DB commit and Debezium capture, 10 times in a loop, When it restarts, Then every committed outbox row appears on Kafka exactly once (consumer dedupe table shows 0 duplicates, 0 gaps). (FR-4.2, FR-4.5)
- **AC-4.2** Given a 3-level chain (role → user → expression) with 4-hour SLAs, When step 2's assignee delegates and step 3 times out with `delegate_to admin`, Then the instance completes approved after simulated clock advance and the timeline shows 5 work items. (FR-4.7)
- **AC-4.3** Given a batch job over 1,000,000 synthetic rows in 16 hash partitions, When the worker pod is killed at ~40%, Then the run resumes and ends with rows_done = 1,000,000 and no duplicate side effects. (FR-4.9)
- **AC-4.4** Given a schema change that removes a required field, When CI registers it, Then the registry rejects it with the incompatible path. (FR-4.3)
- **AC-4.5** Given an entity publish in the registry, When the outbox is captured, Then a topic `dev.passage.metadata.entity.v1` message with type `dev.passage.metadata.entity.published.v1` exists within 1 s. (FR-4.11)
- **AC-4.6** Given a submitter recalls after step 1 approved, When the action is sent, Then 409 `RECALL_NOT_ALLOWED`. (BR-4.1)
- **AC-4.7** Given a consumer group replay from `T-1h`, When executed, Then events are redelivered and the dedupe table suppresses side effects for already-processed ids. (FR-4.12)
- **AC-4.8** Given an exclusive job with a running instance, When a second run is requested, Then 409 `RUN_OVERLAP`. (FR-4.9)
- **AC-4.9** Given a step whose assignee expression resolves to nobody, When the step is entered, Then it escalates to the workflow administrator within 5 s and emits `workitem.escalated`. (FR-4.7)
- **AC-4.10** Given a tenant with a verified SMTP sender and a user whose `workflow_assigned` preference is in_app + email, When a work item is assigned, Then an in-app message appears in the tray within 2 s and an email rendered from the `sys` template (subject contains the document number, body contains the deep link) reaches the CI mail sink within 60 s. (FR-4.13, FR-4.14)
- **AC-4.11** Given the SMTP relay is down for 20 minutes, When 50 messages are enqueued, Then all 50 show `queued`/`sending` with attempts in the outbound inquiry, none is lost, and all are `sent` within 10 minutes of the relay returning. (FR-4.13, BR-4.11)
- **AC-4.12** Given a user with `digest=daily 08:00` and 7 unread assignments of which 2 were read in the shell, When 08:00 tenant time passes, Then exactly one email lists 5 items and no per-item emails were sent. (FR-4.14, BR-4.12)
- **AC-4.13** Given a customer template override for `workflow.workitem.assigned` in `de-DE` referencing placeholder `{{record.nonexistent}}`, When published, Then the publish is rejected with NTF-0406 naming the placeholder. (FR-4.14)
- **AC-4.14** Given the provider reports a hard bounce three times for the same address within 30 days, When the third bounce is ingested, Then the user's `email_status` is `bouncing`, subsequent messages to that user are in-app only, and Security administrators receive a notification. (BR-4.13)

0.4.9 Test plan and fixtures

Fixtures: `fixtures/events/chaos-outbox.yaml` (kill schedule), `fixtures/workflow/chain-3-level.json`, `fixtures/workflow/completion-policies.json` (12 cases), `fixtures/batch/rows-1m.sql` (synthetic), `fixtures/events/schema-breaking-cases/` (8 breaking, 8 compatible).

Test	Type	Target	Pass criterion
Outbox chaos	Chaos / integration	Debezium + consumer lib	0 dup, 0 loss over 10 kills

Test	Type	Target	Pass criterion
Approval chain	Temporal test server (time-skipping)	workflow	expected timeline, timers fire
Completion policy	Property	step evaluator	12/12 fixtures; random assignee sets obey rounding
Batch resume	Integration	batch framework	1M rows, resume, idempotent
Schema compatibility	Contract	registry	16/16 classified correctly
Publish lag	Performance	outbox → Kafka	p95 ≤ 500 ms at 2,000 events/s
DLQ routing	Negative	consumer lib	poison event lands in DLQ with reason

Reconciliation: count of outbox rows created in a window equals Kafka messages for that domain in the same window (nightly check, tolerance 0); sum of `BatchTask.rows_done` equals `BatchRun.rows_done`.

0.4.10 Deployment and operations

Charts: `strimzi-kafka` (cluster CR), `debezium-connect` (one connector per domain DB, secrets via ESO), `schema-registry`, `temporal` (frontend/history/matching/worker, CNPG persistence), `workflow` (TS workers + API), `events` (catalog API). Config: `KAFKA_BOOTSTRAP`, `SCHEMA_REGISTRY_URL`, `TEMPORAL_ADDRESS`, `TEMPORAL_NAMESPACE`, `OUTBOX_SWEEP_HOURS=24`. Migrations: outbox table added to every domain by generator; `logical_decoding` and `wal_level=logical` set in CNPG clusters. Feature flags: `workflow.enforce` per entity. Scheduled jobs: outbox sweep hourly, DLQ report daily, Temporal history archival. SLOs: publish lag p95 ≤ 500 ms, consumer lag ≤ 10 s p95, workflow action p95 ≤ 300 ms, batch scheduler drift ≤ 30 s. Alerts: `DebeziumConnectorFailed`, `ConsumerLagHigh`, `DLQNonEmpty`, `TemporalWorkflowFailedRate`, `BatchRunError`. Runbook: connector restart with slot reset, replay procedure, stuck workflow reset via Temporal CLI, DLQ reprocess. Rollback: digest rollback; schemas are backward compatible so older consumers keep working; Temporal workers are versioned with build ids.

0.4.11 Migration from AX / SAP

Source	Passage entity	Notes
AX `WorkflowTable` / `WorkflowVersionTable` (approval elements, conditions)	WorkflowDefinition	exported via workflow export XML; steps mapped where assignee type is user/role; hierarchy-based assignees flagged for wave 42
AX `BatchJob` / `Batch` / `SysRecurrence`	BatchJob	only jobs whose handler has a Passage equivalent (listed per later wave); recurrence → cron
SAP TBTCO/TBTCP (job name, program, variant, period)	BatchJob	same rule; variants → params
SAP SWDD workflow templates (WS*), PFAC rules	WorkflowDefinition	manual rebuild from a generated inventory report
In-flight work items (`WorkflowWorkItemTable`, SWWWIHEAD)	not migrated	cut over by completing or canceling in the source system (wave 49 runbook)

Not migrated: workflow history (kept read-only in the source for audit), AIF/IDoc queues, batch job logs.

0.4.12 Dependencies, risks, open questions

Depends on: wave 3 (entity metadata for schemas and outbox generation, registry as first producer), wave 2 (actor identity, duties `Approve workflow`, `Maintain workflows`, `Maintain batch jobs`, `View batch history`).

Risk	Likelihood	Impact	Mitigation
Debezium replication slot bloat when connector is down	Medium	High	Slot lag alert at 1 GB; max WAL retention 20 GB; runbook
Temporal operational complexity on k3d	Medium	Medium	Single-binary dev mode for `PROFILE=min`
Expression language in conditions diverges from metadata hooks	Medium	Medium	Same expression engine as wave 3

Open questions: (1) JSON vs Avro/Protobuf for payloads — default JSON Schema (matches metadata kernel); decide by wave 4 start. (2) Email provider in P0 — default SMTP relay via ESO secret; decide by wave 5. (3) Temporal namespace per tenant vs shared with search attribute — default shared; decide by wave 48.

0.4.13 Parameters and setup

Tenant values live on Admin workspace → Workflow parameters, Batch parameters and Notification settings (the AX "Workflow parameters", "Email parameters" and "System parameters → Alerts" forms; SAP SWU3, SWNCONFIG, SCOT and SM36 settings).

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
`events.topic.partitions_default`	environment	int	12	1–96	FR-4.1 default partition count	none	qRFC queue count (SMQR)
`events.topic.retention_days`	environment	int	7	1–30 (compacted topics unlimited)	Kafka retention	AIF message retention	IDoc reorganization (RSETESTD / SARA IDOC)
`events.max_message_bytes`	environment	int	1,048,576	≤ 1 MB	larger payloads use claim-check	none	IDoc segment limits
`outbox.sweep_hours`	environment	int	24	1–168	outbox row deletion after capture	none	tRFC LUW deletion (SM58 reorg)
`consumer.dedupe_window_days`	environment	int	7	1–30	BR-4.5	none	none
`consumer.max_attempts`, `consumer.backoff_max_seconds`	environment	int, int	10, 300	1–50, 10–3,600	FR-4.5 retry policy before DLQ	Business events retry (D365)	tRFC retry (SM59 `Connection attempts`)
`workflow.enforce`	tenant × entity (flag)	bool	false until a definition is activated	true/false	submit required before posting	Workflow configuration → Activate	Flexible workflow scenario activation

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
`workflow.admin_user_id`	tenant	uuid	Tenant owner	any active user	escalation target when nobody resolves (FR-4.7)	Workflow parameters → Workflow administrator	SWU3 workflow system administrator; SWIA
`workflow.delegation_max_depth`	tenant	int	3	1–5	FR-4.7 chain limit	Workflow delegation	HRUS_D2 substitution chain
`workflow.default_sla`	tenant	ISO 8601 duration	P2D	PT1H–P30D	default due date per step	Workflow → time limits (default)	Deadline monitoring latest end
`workflow.history_retention_days`	environment	int	90	30–3,650	Temporal history retention	Workflow cleanup batch (`WorkflowCleanup`)	SWWL / RSWWWIDE deletion
`batch.max_runtime_hours`	tenant	int	6	1–48	FR-4.9 run timeout	Batch job "Execution time" alerts	SM37 job runtime / `rdisp/max_wprun_time`
`batch.default_checkpoint_rows`	environment	int	10,000	1,000–1,000,000	FR-4.9	none	none
`batch.max_concurrency_per_tenant`	tenant	int	32	1–128	total concurrent tasks per tenant	Batch server groups / max batch threads	SM61 server groups, `rdisp/wp_no_btc`
`batch.history_retention_days`	tenant	int	90	30–730	FR-4.10	Batch job history cleanup	SM37 → delete old jobs (RSBTCDEL2)
`notify.provider`	tenant	enum	smtp	smtp, http_api	FR-4.13 adapter	Email parameters → SMTP / Exchange	SCOT SMTP node
`notify.smtp.host`, `.port`, `.tls`, `.credential_ref`	tenant	string, int, enum, secret ref	platform relay, 587, starttls, ESO path	—	outbound SMTP	Email parameters → SMTP server, port, SSL, user/password	SCOT node → host, port, TLS, logon data
`notify.sender.from`, `.display_name`, `.reply_to`	tenant (legal entity override)	email, string, email	`no-reply@<env>.passage.dev`	verified domain	sender identity	Email parameters → "Send from"	SCOT default domain, SO_USER_AUTOMATIC
`notify.mode`	tenant	enum per event class	immediate (workflow, alerts), batch (digests)	immediate, batch	when the distributor sends	Mail sending mode: batch / client	SCOT send job RSCONN01 period
`notify.distributor_interval_seconds`	environment	int	60	15–900	distributor polling	Email distributor batch recurrence	RSCONN01 job period
`notify.max_attempts`	tenant	int	5	1–10	BR-4.11	Email distributor "Retries"	SCOT retry settings
`notify.allowlist_domains`	environment	domain list	empty in prod, `passage.dev` in dev/stage	domains	non-prod recipient guard	none	SCOT address area restrictions
`notify.body_retention_days`, `notify.metadata_retention_years`	tenant	int, int	90, 3	7–365, 1–10	outbound history retention	Outbound email status cleanup	SOST reorg (RSBCS_REORG)
`notify.default_language`	tenant	BCP 47	en	any	template fallback	Email templates default language	SO10 language key fallback

0.4.14 Inquiries and reports

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
Work items (by user, queue, status, overdue)	list inquiry	assignee, status, entity, due before, legal entity	document, step, assignee, original assignee, due, age, SLA state	`workflow.work_item`	Work items assigned to me / Work item inquiries	SBWP, SWI5, SWI2_DEAD
Workflow history per document	drill-down	entity, record	steps, assignees, actions, comments, timers, durations	`workflow.instance` + Temporal history	Workflow history / tracking details	SWIA, SWI1, workflow log
Workflow performance	KPI	definition, period	submitted, approved, rejected, median cycle time, % escalated, % within SLA	`workflow.*` projections	SSRS Workflow performance	SWI2_DURA, SWI2_FREQ
Delegation inquiry	list inquiry	user, date range	delegator, delegate, scope, from, to	`WorkItem.original_assignee_id` + delegation settings	Delegation inquiry (WorkflowDelegation)	HRUS_D2 substitutes
Batch job list	list inquiry	status, priority, handler	code, handler, cron, next run, last run status, exclusive	`workflow.batch_job`	Batch jobs list	SM37 job overview
Batch run history and errors	drill-down	job, status, date range	run, status, rows, duration, failed partitions, error	`workflow.batch_run`, `batch_task`	Batch job history / Batch job errors; SSRS Batch job report	SM37 job log (TBTC5)
Topic and consumer lag	operational report	topic, consumer group	partitions, end offset, committed offset, lag, lag seconds	Kafka admin API	Business events catalog / AIF queue	SMQ1/SMQ2, SM58, WE05
DLQ report	operational report (daily)	topic, period	event type, count, first/last seen, top `dlqreason`	`…dlq` topics	AIF exceptions	BD87 IDoc status 51 list, SM58 errors
Outbound message status	list inquiry	status, channel, recipient, template, date	sent at, recipient, subject, status, attempts, last error, provider id	`notify.outbound_message`	Outbound email status (E-mail sending status)	SOST
Notification delivery KPI	KPI	period, template	sent, failed, bounced, median send latency	`notify.outbound_message`	none	SOSV send statistics
Template catalog	list inquiry	code, language, layer, status	code, channel, languages present, customer override flag, version	`notify.message_template`	Email templates (`SysEmailTable`)	SO10 text list, SE75 text objects

0.4.15 Printed and electronic documents

Document	Trigger	Layout elements	Formats	Numbering sequence	Legal / retention requirement
Work item notification email	`workitem.assigned` / `.delegated` (preference allows email)	header: tenant layout logo; subject: `{entity} {record.number} awaits your approval`; body: submitter, amount, due, comment, deep link, approve/reject links (signed, single-use, 72 h); footer: preference link	email (HTML + text)	none (message id)	body 90 days, metadata 3 years
Escalation email	`workitem.escalated`	from/to assignee, overdue by, deep link	email	none	same
Completion email to submitter	`instance.completed` with `notify_submitter_on_complete`	outcome, approver, comment, link	email	none	same
Daily / weekly digest	digest schedule (BR-4.12)	list of pending items grouped by entity with due dates	email	none	same
Batch failure email	`batch.run.failed` to job owner	job, run, failed partitions, first error, link to monitor	email	none	same
Webhook delivery	subscribed event class	CloudEvents JSON body, `X-Passage-Signature`	HTTPS POST	CloudEvents `id`	delivery log 3 years
AsyncAPI document	metadata publish	channels, messages, schemas	AsyncAPI 3.0 YAML/JSON	entity version	retained per version

0.4.16 Periodic and batch jobs

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
Outbox sweep	hourly	domain database	deletes captured rows older than `outbox.sweep_hours` (by `created_at` and Debezium LSN)	< 1 min	retry next hour	`OutboxBacklog` (> 100 k rows)
Dedupe table sweep	daily 02:00 UTC	consumer group	deletes rows older than window	< 5 min	retry	none
DLQ report	daily 06:00 UTC	topic	report keyed by date	< 1 min	none	`DLQNonEmpty` (10 min)
Temporal history archival	daily	namespace	Temporal archival to object storage	< 30 min	retried by Temporal	`TemporalArchivalFailed`
Workflow SLA timers	event-driven (durable timers, not polled)	workflow id	Temporal timer	fires within 1 s of due	survives restarts	`TemporalWorkflowFailedRate`
Email distributor	every 60 s	tenant × priority	`SELECT … FOR UPDATE SKIP LOCKED` batch 500; status is the checkpoint	< 10 s per batch	BR-4.11 retries	`NotifyFailureRate` (> 5% over 15 min), `NotifyQueueAge` (oldest queued > 10 min)
Digest builder	every 15 min (sends users whose digest time fell in the window)	tenant	one digest per (user, period) keyed in `notify.digest_log`	< 1 min	missing digest sent next window	`DigestBacklog`
Bounce ingest (IMAP mode)	every 5 min	tenant mailbox	provider message id unique	< 30 s	retry	`BounceIngestFailed`
Outbound message retention	daily 03:30 UTC	month partition	nulls bodies after 90 days; detaches partitions after 3 years	< 5 min	retry	none
Batch history cleanup	daily 04:00 UTC	tenant	deletes runs older than `batch.history_retention_days`	< 5 min	retry	none

0.4.17 Security duties and privileges

Duty	Privileges (entry points)	Segregation-of-duties conflicts	Default roles that include it
Maintain workflows	`/v1/workflows/definitions*`, activate, cancel instances, Workflow designer	with Approve workflow for the same entity (designing your own approval chain)	Workflow administrator
Approve workflow	`/v1/workitems/{id}/actions` (approve, reject, delegate, request_change), Inbox	with the entity's create/post duty on the same record (submitter cannot approve own submission; enforced at runtime, NTF-0410)	every business role with approval steps
Submit for approval	`POST /v1/workflows/instances`, recall	none	entity maintainers
Maintain batch jobs	`/v1/batch/jobs*`, run, cancel, hold, resume, rerun-failed, `/v1/events/replay`	none	Platform engineer, Batch operator
View batch history	`GET /v1/batch/runs*`, Job monitor, Topic catalog read	none	Batch operator, Auditor
Maintain message templates	`/v1/notify/templates*`, preview, publish	none	Workflow administrator, Communications administrator
Maintain notification settings	`/v1/notify/settings*`, verify sender, test send, retry, cancel queued, other users' preferences	with View outbound messages is acceptable; with Maintain secrets (SMTP credentials are ESO references, never visible)	Tenant owner, Workflow administrator
View outbound messages	`GET /v1/notify/messages*`, rendered body view	message bodies may contain document data — masked for `pii=sensitive` placeholders	Workflow administrator, Help desk, Auditor
Send notifications	`POST /v1/notify/messages`	none	internal service principals only

0.4.18 Message catalog

Code	Severity	User text	Cause	Remediation	Raised by
WFL-0401	error	Recall is not allowed after step {n} was approved	RECALL_NOT_ALLOWED (409)	ask the workflow administrator to cancel	BR-4.1, AC-4.6
WFL-0402	error	A comment is required to {action}	`comment_required`	add a comment	0.4.5 validation
WFL-0403	error	{user} cannot receive this item: missing role {role}	delegate target check	pick a user who holds the role	0.4.5 validation

Code	Severity	User text	Cause	Remediation	Raised by
WFL-0404	error	Delegation chain limit ({max}) reached	FR-4.7	approve or reject directly	FR-4.7
WFL-0405	warning	No approver resolved for step {n}; escalated to the workflow administrator	empty assignee set	fix the assignee rule	FR-4.7, AC-4.9
WFL-0406	error	This document is already in approval (instance {id})	duplicate submit	open the existing instance	FR-4.7
WFL-0407	error	Bulk approve is limited to 100 items	UX rule	approve in batches	0.4.6 rules
WFL-0408	error	Job {code} is on hold	run on hold job (409)	release the hold	0.4.5 validation
WFL-0409	error	Job {code} already has a running instance	RUN_OVERLAP (409)	wait or cancel the running run	FR-4.9, AC-4.8
WFL-0410	error	You cannot approve a document you submitted	runtime SoD	delegate to another approver	0.4.17
WFL-0411	error	Run {id} exceeded the maximum runtime of {h} h and was canceled	`batch.max_runtime_hours`	raise the limit or add partitions	FR-4.9
EVT-0401	error	Schema change for {type} is incompatible at `{path}`	BACKWARD_TRANSITIVE check	make the change additive or bump `v<n+1>`	FR-4.3, AC-4.4
EVT-0402	warning	Event {id} moved to DLQ after {n} attempts: {reason}	poison event	fix consumer, then replay	BR-4.10
EVT-0403	error	Payload exceeds 1 MB; use a claim-check reference	message size	store payload in object storage	FR-4.1
NTF-0401	error	Sender {address} is not verified for tenant {tenant}	SPF/DKIM check failed	publish DNS records and re-verify	FR-4.13
NTF-0402	warning	Delivery to {recipient} failed (attempt {n} of {max}): {provider error}; retrying at {time}	provider/transient error	none; watch the outbound inquiry	BR-4.11
NTF-0403	error	Delivery to {recipient} failed permanently after {max} attempts	retries exhausted	fix the cause and retry manually	BR-4.11
NTF-0404	warning	{user}'s email address is bouncing; email suppressed, in-app delivery continues	3 hard bounces	correct the address in the IdP	BR-4.13
NTF-0405	info	Recipient {address} is outside the non-production allowlist; message not sent	`notify.allowlist_domains`	add the domain in dev/stage only	FR-4.13
NTF-0406	error	Template {code} ({language}) uses unknown placeholder `{{placeholder}}`	publish-time validation	use a placeholder from the picker	FR-4.14, AC-4.13
NTF-0407	error	Message not sent: template render failed ({reason})	runtime render error	fix the template; retry	FR-4.14, BR-4.11
NTF-0408	error	Attachments exceed 10 MB for one message	size limit	send a link instead	FR-4.13

0.4.19 Performance budgets and capacity

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
Outbox publish (commit → Kafka)	2 M events/day/tenant, peak 2,000/s	100 ms / 500 ms / 1 s	6,000 events/s per Kafka cluster	Kafka 7-day retention ≈ 1.2 TB at 1 KB × 170 M; outbox rows transient	partition key = aggregate id; 12 partitions	lag grows; no loss; `ConsumerLagHigh` at 10 s
Consumer processing	same	5 ms / 50 ms / 200 ms per event	scale by partitions	dedupe table ≈ 14 M rows per group (7 days)	dedupe PK (consumer_group, event_id)	lag, not errors
Workflow action (approve)	20 k/day/tenant, peak 50/s	80 ms / 300 ms / 600 ms	200/s	`work_item` ≈ 7 M rows/year/tenant	`work_item(tenant_id, assignee_id, status)`; monthly partitions from wave 30	Temporal task queue backlog; UI shows "processing"
Inbox query	5,000 users × 20 views/day	20 ms / 80 ms / 150 ms	300 rps	n/a	same index	cached 2 s per user
Batch run (1 M rows, 16 partitions)	50 runs/day/tenant	n/a	≥ 20 k rows/s aggregate	`batch_task` ≈ 300 k rows/year	`batch_run(job_id, scheduled_at desc)`	concurrency capped per tenant; runs queue by priority A > B > C
Email enqueue + render	50 k messages/day/tenant, peak 100/s	10 ms / 40 ms / 100 ms	500/s	≈ 18 M rows/year/tenant; bodies ≈ 100 GB/year before 90-day nulling	monthly partitions; `(tenant_id, status, next_attempt_at)`	queue grows; immediate priority served first
Email send (enqueue → provider accepted)	same	5 s / 60 s / 3 min	provider limit (default 50/s per tenant)	n/a	n/a	throttled to provider limit; `NotifyQueueAge` alert
In-app delivery (event → tray)	same	300 ms / 2 s / 4 s	1,000/s	same table	SSE fan-out by user	SSE reconnect with `Last-Event-ID`

0.4.20 Localization and compliance hooks

- Language: templates exist per BCP 47 language (FR-4.14); recipient language → tenant default → `en`. Wave 48 label packs ship `sys` template translations for each supported language; formatting filters (`money`, `date`, `number`) use the recipient's locale and the legal entity currency.
- Calendars and time zones: SLA timers are wall-clock in P0 (BR-4.3); wave 6 adds work calendars per legal entity so `P2D` means two working days; digest times and cron schedules use the tenant time zone (DST transitions: a 02:30 job on a spring-forward day runs at 03:00; on fall-back it runs once).
- Email compliance: CAN-SPAM / CASL / EU ePrivacy do not apply to transactional workflow mail, but every email carries a preference link and the sender's postal address from the legal entity footer when `notify.include_legal_footer=true` (default true for marketing-like digests in EU legal entities). Wave 48 adds country-specific footer content (for example German Impressum fields) through the tenant HTML layout.
- Privacy: message bodies may contain personal data; bodies are nulled after 90 days (`notify.body_retention_days`), event payloads carry user ids not addresses, and erasure requests (wave 48) redact `recipient_address` and bodies for the subject.
- Workflow evidence: approval history (Temporal + `workflow.instance`) is the SOX approval-control evidence; retention follows the record's table group (wave 5 audit) because approval actions are also audited entries.
- Data residency: Kafka and Temporal run in the tenant's region; email providers are configurable so EU tenants can choose an EU-hosted relay.

0.4.21 Coverage closure

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
AX §12.29.4 Organization administration → Setup: Organization → Workflow approval email templates (register row 261)	PARTIAL-4	ADDED as FR-4.14	`MessageTemplate` with sys templates per workflow event and customer overrides per language
AX §12.30.1 System administration → Alerts → Alert parameters / Email templates / Email parameters (SMTP) / Outbound email status (`EventParameters`, `SysEmailTable`, `SysEmailParameters`) (register row 262)	PARTIAL-4	ADDED as FR-4.13	SMTP/provider parameters (0.4.13), templates (FR-4.14), outbound status inquiry (0.4.14); alert parameters themselves are in wave 5 (FR-5.17)
AX §12.30.1 System administration → Email → Email distributor batch (`SysEmailBatch`) (register row 263)	PARTIAL-4	ADDED as FR-4.13	distributor job every 60 s (0.4.16)
AX §12.30.3 System administration → Periodic: Email → Send email distributor batch / Retry failed (register row 267)	PARTIAL-4	ADDED as FR-4.13	distributor + BR-4.11 retries + manual `/retry`
AX §12.30.4 System administration → Setup: Alerts → Alert parameters (polling intervals, retention, drill-down links) / Email templates / Email parameters (SMTP, Exchange, mail sending mode: batch/client) / Email distributor (register row 269)	PARTIAL-4	ADDED as FR-4.13	`notify.mode` = mail sending mode; Exchange via SMTP submission or HTTP API adapter; alert polling/retention parameters in 0.5.13 (FR-5.17)
AX §12.31.4 Home / role centers / workflow → Setup: Workflow → Notification settings (email, in-app, digest) / Workflow email templates (register row 274)	PARTIAL-4	ADDED as FR-4.14	`NotificationPreference` (channels, digest, quiet hours) and per-definition notify flags; BR-4.12

0.5 Wave 5: UX Shell, Number Sequences, Audit & Observability

0.5.1 Scope and business context

AX users work in list pages and details forms generated from the AOT (form datasources, `ListPageInteraction`, action panes, FactBoxes, `SysQueryForm` advanced filters, `SysLastValue` personalization, `SysTableLookup` lookups, Infolog) and D365 workspaces, saved views and the Excel add-in; SAP users work in SAP GUI dynpros and ALV grids with layout variants, F4 search helps, SE16N, and the Fiori launchpad with catalogs and groups. Document numbering comes from AX `NumberSequenceTable` / `NumberSequenceReference` / `NumberSequenceScope` (shared, company, legal entity, fiscal calendar period, operating unit) with continuous and non-continuous modes and `NumberSequenceList` pre-allocation, or SAP `SNRO` number range objects with `NRIV` intervals, buffering (`NRIV_LOKAL`) and gap-free settings. Change tracking is AX `SysDatabaseLog` / `SysDatabaseLogSetup` (Insert/Update/Delete/RenameKey) or SAP change documents (`CDHDR`/`CDPOS`, `SCDO` objects, `DBTABLOG` table logging). Monitoring is LCS environment monitoring or Solution Manager / ST03N / SM21 / ST22. Wave 5 replaces all of this with a React module-federation shell, a metadata-driven form renderer, a number sequence service with a Jepsen-tested gap-free mode, an audit service that derives field-level history from CDC into a hash-chained append-only store, OpenTelemetry across every service into Prometheus/Tempo/Loki/Grafana, and CSV/XLSX import-export against any entity. At wave end the admin workspace runs at `app.<env>.passage.dev` and Phase 0 is demonstrated to stakeholders. Out of scope: full-text search across business documents and analytics content beyond attachment text (wave 46), report designer (wave 15), mobile PWA (wave 32), localization of labels (wave 48), fiscal-period scopes for sequences (wave 6 supplies calendars; scope type is reserved here).

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
Editing 50 vendor records in AX means 50 details-form round trips (open, edit, save) or an Excel add-in session that fails on the first validation error; SAP needs an LSMW recording or XK02 one by one	Forms are record-at-a-time; bulk edit is an external tool	Grid inline edit, bulk edit of a field across ≤ 1,000 selected rows, validated per row with per-row error reporting	Clicks for 50 edits: ~300 → ~6; failed bulk sessions due to one bad row: all-or-nothing → partial with error file
Continuous number sequences in AX serialize on `NumberSequenceTable` for the whole transaction, causing lock waits on sales-order entry; SAP gap-free NRIV without buffering shows as `NRIV` lock contention in SM12	Lock held for the caller's full transaction	Allocation row with reserved → used/released lifecycle; lock held only for the allocation statement	Gap-free allocation p99: 100s of ms under load → ≤ 30 ms; buffered p99 ≤ 2 ms; gaps and duplicates: 0 (Jepsen-tested)
AX `SysDatabaseLog` must be enabled per table/field in `SysDatabaseLogSetup` and slows every write via triggers in application code; SAP change documents exist only where the developer called `CHANGEDOCUMENT_*` function modules	Audit is opt-in application code that can be forgotten	Audit derived from CDC on every `audit=true` field; no code path can skip it; hash chain proves integrity	Fields with audit coverage: whatever developers remembered → 100% of flagged fields; write-path overhead: trigger cost → 0
Tracing a slow save: AX trace parser / SQL profiler sessions, SAP ST05/SAT/STAD per work process; no end-to-end id across UI, server, DB and interfaces	No distributed trace context	W3C `traceparent` from the shell through gateway, service, Postgres, outbox, Kafka consumer and Temporal	Time to locate the slow span of one user action: hours of expert time → < 1 min from the audit entry's trace link
SAP GUI and AX client forms fail basic accessibility; keyboard navigation differs per form; ALV variants and `SysLastValue` are per-user and non-shareable	Forms hand-built per screen; no accessibility gate	Generated forms with ARIA grid semantics, one keyboard model, axe in CI; saved views shareable by role	WCAG 2.1 AA violations on generated forms: unknown → 0 in CI; shared views: 0 → any role

0.5.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Navigation / workspaces	Navigation pane, area pages, D365 workspaces and tiles	Fiori launchpad (FLP), catalogs/groups, SAP menu (SE43)	Shell navigation by workspace, tiles bound to saved views	full
List page	List page framework, `ListPageInteraction`, action pane, quick filter	ALV grid (SALV), SE16N, layout variants	Generated list page with grid, filters, saved views	full
Details form / line grids	Details form, `FormRun`, datasources, line grid	Dynpro header/item screens, table controls	Generated detail page with header + line grids	full
Lookups	`SysTableLookup`, EDT relation lookups	F4 search helps (DD30L), personal value list	Generated lookup from `RelationDefinition` with recent values	full
Advanced filter / query	`SysQueryForm`, `Query` ranges, saved queries	Dynamic selections, SE16N selection screen	Filter builder over the list filter grammar; saved as view	full
Personalization	`SysLastValue`, usage data, D365 personalization	Layout variants, user parameters (SU3)	`SavedView`, `Personalization` entities per user and shared	full
Number sequences	`NumberSequenceTable`, `NumberSequenceReference`, `NumberSequenceScope`, `NumberSeq::newGetNum`, continuous flag	SNRO objects, NRIV intervals, buffering NRIV_LOKAL, gap-free flag	numseq service: sequence, scope, continuous/non-continuous, block pre-allocation	full
Database log / change documents	`SysDatabaseLog`, `SysDatabaseLogSetup`, database log viewer	CDHDR/CDPOS, SCDO, DBTABLOG (SCU3)	audit service from CDC; `AuditEntry`/`AuditField`; viewer per record	improved (hash chain)

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Excel integration	Excel add-in (OData data entities), Open in Excel	ALV export, Analysis for Office, LSMW upload	CSV/XLSX import-export per entity with staging and validation	partial (no live Excel binding)
Monitoring	LCS environment monitoring, Event Viewer, SQL insights	Solution Manager, ST03N, SM21, ST22, STAD	OpenTelemetry → Grafana/Tempo/Loki/Prometheus; SLO dashboards	improved
Document management	Document handling (`DocuRef`, `DocuValue`, `DocuView`), Document types (`DocuType`: file/note/URL/image/template, group, location archive/database/SharePoint), File types (`DocuFileTypes`), Active document tables, Document management parameters (`DocuParameters`: archive directory, max file size)	GOS attachments (SOOD/SOFFCONT1), ArchiveLink (OAC0 content repositories, OAC3 links, TOA01), DMS document info records (CV01N, DRAW) with originals check-in/check-out, DC30 workstation applications (TDWP), conversion runs	`Attachment` / `AttachmentVersion` on any record, `DocumentType`, `FileType`, S3-compatible storage locations, check-out/check-in, previews, retention and purge, content search	full (native CAD viewing dropped: PLM owns CAD)
Alerts	Alert rules (`EventRule`, `EventRuleField`), change-based and due-date alerts (`EventJobCUD`, `EventJobDueDate` batch), Notification list / My alerts (`EventInbox`), Alert parameters (`EventParameters`)	Alert Management (ALRTCATDEF, ALRTPROC), S/4 Situation Handling (SIT_TEMPLATE), SWE2 change-document event → workflow, Fiori My Notifications	`AlertRule` (change-based / due-date) evaluated from CDC events and a due-date job; alert inbox in the shell; delivery via wave 4 notify	improved (event-driven, no polling batch)
Standard texts	Notes with document type "Note" and restriction internal/external; sales/purchase "Form notes" (`FormLetterRemarks`)	SO10 standard texts (STXH/STXL), SE75 text objects and IDs, SO72	`StandardText` library with language versions and placeholders, referenced by templates and document layouts	full

0.5.3 Functional requirements

- **FR-5.1 Shell** — Must. The system shall ship a React host (module federation, `web/shell`) that loads remotes by manifest, renders workspace navigation, a global search box (title fields of any entity the user may read, p95 ≤ 300 ms), the legal entity switcher, the work item inbox badge, and a notification tray; first contentful paint ≤ 1.5 s on a 10 Mbps connection.
  - Notes: remotes are versioned by digest and pinned per environment; the shell degrades to an error tile when a remote fails to load.
- **FR-5.2 Metadata-driven forms** — Must. The renderer shall generate, from `EntityDefinition`, a list page (grid, quick filter, filter builder, saved views, column chooser), a detail page (sections by `visibility`, tabs when > 24 fields, line grids for child relations, lookups from relations, attachments and notes panels) and dialogs for create; no entity needs hand-written UI to be usable.
  - Notes: field order from `ordinal`; `advanced` visibility collapses into a "More" section; `hidden` never renders; `pii=sensitive` renders masked with a reveal action gated by permission.
- **FR-5.3 Grid** — Must. The grid shall support virtual scrolling to 100,000 rows, inline edit with per-cell validation, multi-row select, bulk edit of one field across selected rows (≤ 1,000), column sort/resize/reorder/pin, group by one column, and export of the current view.
- **FR-5.4 Keyboard-first** — Must. Every action shall be reachable by keyboard: `/` focus search, `n` new, `Ctrl+S` save, `Ctrl+Enter` save and close, `Esc` cancel, `Ctrl+Shift+F` filter builder, arrows and `Tab` for cell navigation, `F2` edit cell, `Enter` open row, `Ctrl+Shift+V` saved views; focus order follows reading order; shortcuts are listed in a `?` overlay.
- **FR-5.5 Accessibility** — Must. All shell screens and generated forms shall pass axe-core WCAG 2.1 AA rules with zero violations in CI (Playwright + axe), support 200% zoom without horizontal scroll, and expose ARIA grid semantics.
- **FR-5.6 Validation timing** — Must. Field-level validation runs on blur (client JSON Schema, then `validateField` server call when the field has a hook); write validation runs on save; server `422 errors[]` map to fields and unresolved errors show in a summary list with focus jump.
- **FR-5.7 Saved views and personalization** — Must. Users shall save filter + sort + columns + grouping as a `SavedView` (personal or shared with a role), set one as default per entity, and have column widths/order and last legal entity persisted as `Personalization`.
- **FR-5.8 Number sequences** — Must. The numseq service shall define sequences with `code`, `scope_type` (shared, legal_entity, legal_entity_fiscal_period (reserved), operating_unit (reserved)), `format` segments (constant, number with fixed width 1–18, year `YYYY`/`YY`, legal entity code, scope value), `smallest`, `largest`, `next`, `continuous` flag, `manual` flag, `allow_to_lower`, `block_size` (non-continuous, default 50, max 1,000), `wrap` flag, and `in_use` flag; total formatted length ≤ 40.
  - Notes: references bind (entity, field, legal entity) to a sequence, mirroring `NumberSequenceReference`; `numseq(<code>)` is a valid field default from wave 3.
- **FR-5.9 Gap-free and buffered allocation** — Must. Continuous sequences shall allocate inside the caller's transaction with a `SELECT … FOR UPDATE` on the sequence/scope row and record an `Allocation` row (status reserved → used | released); a rollback releases the number to be reused by the next caller; p99 ≤ 30 ms at 500 rps per sequence. Non-continuous sequences shall pre-allocate a block per service instance and serve from memory, p99 ≤ 2 ms; unused numbers in a block are lost on restart (documented, like `NRIV_LOKAL`).
- **FR-5.10 Audit capture** — Must. The audit service shall consume Debezium change events for every table whose entity or field has `audit=true`, and write `AuditEntry` (operation insert/update/delete, actor from `updated_by`, `trace_id` from the transaction's outbox header or `pg_current_xact_id` correlation, `occurred_at`) and `AuditField` rows for changed fields only, with `pii=sensitive` values stored as SHA-256 digests plus masked display.
  - Notes: entry visible in the viewer within 2 s (p95) of commit; the audit database is `audit`, separate from domain databases; role `passage_app` has INSERT and SELECT only.
- **FR-5.11 Immutable hash chain** — Must. Each `AuditEntry` shall store `prev_hash` (previous entry for the same tenant) and `hash = SHA-256(prev_hash ‖ canonical_json(entry + fields))`; a daily job writes the chain head per tenant to an anchor table and to object storage; `GET …/verify` recomputes a range.
- **FR-5.12 Audit viewer** — Must. From any record the user shall open "History" showing entries with user, time, trace id, operation and before/after per field, filterable by field and date, exportable; a global audit workspace searches by entity, record, user, date range.
- **FR-5.13 OpenTelemetry** — Must. Every service shall emit traces (W3C `traceparent` propagated gateway → service → Postgres spans → outbox header → Kafka consumer → Temporal activities), RED metrics (`http_server_requests`, `db_query_duration`, `kafka_consume_lag`, `temporal_activity_duration`) and structured JSON logs with `trace_id`, `tenant_id`, `actor`; the shell emits browser spans for navigation and API calls.
  - Notes: sampling 100% in dev, tail-based 10% + 100% of errors and > 1 s in stage/prod; PII never in span attributes (lint rule).
- **FR-5.14 Dashboards and alerting** — Must. Grafana shall ship per-service SLO dashboards (availability, latency, error budget burn), platform dashboards (Kafka lag, Temporal, Postgres, Argo), and Alertmanager routes to a PagerDuty-compatible webhook with severities page/ticket/notify.
- **FR-5.15 Import/export** — Must. Users shall import CSV or XLSX into any entity through staging (header mapping saved as a template per entity, type coercion, validation using the entity's JSON Schema and hooks, error file with row and field) and export any list view to CSV/XLSX respecting RLS, permissions and PII masks; 100,000 rows import ≤ 5 min; runs as a wave-4 batch job.
- **FR-5.16 Document management** — Must. The system shall attach documents to any record of any entity whose metadata sets `attachments: true` (default true for main and transaction table groups), and one document may be linked to many records. Each attachment has a `DocumentType` (code, kind file | note | url | image | template, group, storage location, allowed file types, max size, restriction internal | external, retention class, `active_entities[]`), versions (`AttachmentVersion`: file, sha256, size, mime, uploaded by/at), and an optional check-out lock. Storage locations are S3-compatible buckets (per tenant prefix; credentials via ESO) or `database` for notes; uploads use pre-signed URLs (≤ 100 MB default, `FileType.max_bytes` per type); every upload is malware-scanned before it becomes `available`; previews (PDF first page, image thumbnail 320 px, Office documents converted to PDF) are generated by a conversion job; text is extracted from PDF, Office and text files into a Postgres `tsvector` so global search (FR-5.1) and the documents inquiry find attachment content.

    - Notes: check-out sets `checked_out_by/at` and blocks new versions by others until check-in or an administrator force-release (lock expires after 7 days); `external` restriction marks documents that may print or send with external documents (wave 15/46 layouts); retention classes (`retain_years`, `on_expiry` purge | archive) drive the purge/archive job, which never purges a document under legal hold (flag set by wave 48) or linked to a record whose own retention has not expired; deleting a record leaves its attachments for the retention job; `active_entities[]` reproduces AX "Active document tables"; native CAD 2D/3D viewing is not provided (PLM systems keep CAD and link by URL document type).
- **FR-5.17 Alert rules** — Must. Users shall create `AlertRule`s on any entity the user may read: `change-based` (field changes to / from a value, any change of a field, record created, record deleted; optional filter in the list filter grammar) or `due-date` (a date field is within N days before/after today, evaluated daily); with subject and message from a wave 4 `MessageTemplate` or inline text with placeholders, recipients (self, users, role, record owner field), delivery (in-app, email, both), legal entity scope (current or all), active from/to, and "organization-wide" rules (maintained by an administrator for all users of a role). Fired alerts appear in the shell Alerts list with a drill-down link to the record and can be marked read or deleted.
    - Notes: change-based rules evaluate from the CDC stream already consumed by audit (no polling job; AX change-based batch is replaced); due-date rules evaluate in a daily job at `alerts.due_date_time` tenant time; the recipient must hold read on the entity at evaluation time, otherwise the alert is dropped and counted; a rule firing more than `alerts.max_per_rule_per_hour` (default 500) is suspended and its owner notified (ALR-0505); alerts are retained `alerts.retention_days` (default 90).
- **FR-5.18 Standard texts** — Should. The system shall provide a `StandardText` library (code, purpose: document header / document footer / line / email / workflow, language versions, body in plain or limited Markdown with placeholders `{{record.field}}`, legal entity scope, effective dates, layer sys | customer) that wave 4 message templates reference as `{{text:CODE}}`, users insert into notes on any record (expanded at insert time), and wave 15/46 document layouts reference by code with the recipient's language.
    - Notes: language fallback recipient → legal entity default → `en`; a text referenced by a published template or layout cannot be retired (STX-0503); edits create a new version, documents already issued keep the version they printed (layouts store the version id).

0.5.4 Data model

NumberSequence (`numseq.sequence`) and **NumberSequenceAllocation** (`numseq.allocation`)

Field	Type	Required	Notes
id	uuid	yes	PK
tenant_id	uuid	yes	RLS
code	varchar(20)	yes	unique per tenant (`Vend_Acct`, `SO_Num`)
scope_type	enum	yes	shared, legal_entity, legal_entity_fiscal_period, operating_unit
scope_value	varchar(32)	no	legal entity code etc.; unique with code
format	jsonb	yes	segments; e.g. `[{"const":"SO-"},{"year":"YYYY"},{"const":"-"},{"number":6}]`
smallest, largest, next	bigint	yes	1 ≤ smallest ≤ next ≤ largest ≤ 10^18
continuous, manual, allow_to_lower, wrap, in_use	bool	yes	defaults false except in_use
block_size	int	yes	1 for continuous; 50 default
version	int	yes	optimistic lock
Allocation: id, sequence_id, number, status (reserved, used, released), tx_ref, requested_by, requested_at, used_at	—	—	only for continuous sequences

AuditEntry (`audit.entry`, partitioned monthly) and **AuditField** (`audit.field`)

Field	Type	Required	Notes
id	uuid	yes	PK
tenant_id, legal_entity_id	uuid	yes/no	
entity	varchar(48)	yes	
record_id	uuid	yes	
operation	enum	yes	insert, update, delete
actor_id	uuid	yes	from updated_by / created_by; `system` for jobs
occurred_at	timestamptz	yes	commit time
trace_id	char(32)	no	W3C trace id
tx_id	bigint	yes	Postgres xid for grouping
seq	bigint	yes	per-tenant monotonic
prev_hash, hash	char(64)	yes	SHA-256 hex
AuditField: entry_id, field, old_value jsonb, new_value jsonb, pii enum, digest char(64)	—	—	old/new null when masked

SavedView (`ui.saved_view`) and **Personalization** (`ui.personalization`)

Field	Type	Required	Notes
id	uuid	yes	PK
tenant_id, owner_id	uuid	yes	
entity	varchar(48)	yes	
name	varchar(60)	yes	unique per owner + entity
filter, sort, columns, group_by	jsonb	yes/no	list grammar from FR-3.6
shared_with_role_id	uuid	no	null = personal
is_default	bool	yes	one per owner + entity
version	int	yes	
Personalization: user_id, key (varchar 80), value jsonb, updated_at	—	—	e.g. `grid.Vendor.columns`, `session.legal_entity`

ImportJob (`io.import_job`): id, tenant_id, entity, template_id, file_ref, status (uploaded, validating, validated, loading, completed, failed, canceled), rows_total, rows_ok, rows_failed, error_file_ref, batch_run_id, created_by, created_at.

Attachment / AttachmentVersion / AttachmentLink (`docs.attachment`, `docs.attachment_version`, `docs.attachment_link`)

Field	Type	Required	Notes
id	uuid	yes	PK (each table)
tenant_id, legal_entity_id	uuid	yes / no	RLS
document_type_id	uuid	yes (Attachment)	FK DocumentType
name, description	varchar(255), text	yes / no	
restriction	enum	yes	internal, external
status	enum	yes	uploading, scanning, available, quarantined, archived, purged
current_version_id	uuid	no	FK AttachmentVersion
checked_out_by, checked_out_at	uuid, timestamptz	no	lock (FR-5.16)
legal_hold	bool	yes	default false; set by wave 48
retain_until	date	no	computed from retention class and linked record
note_body	text	no	kind=note (location database)
url	varchar(2,000)	no	kind=url
Version: attachment_id, version_no, storage_key, sha256, size_bytes, mime, preview_key, extracted_text tsvector, uploaded_by, uploaded_at	—	—	storage_key = `t/<tenant>/docs/<attachment>/<version>`
Link: attachment_id, entity, record_id, linked_by, linked_at	—	—	unique (attachment_id, entity, record_id)

DocumentType / FileType (`docs.document_type`, `docs.file_type`)

Field	Type	Required	Notes
id	uuid	yes	PK
tenant_id	uuid	yes	`sys` defaults: File, Note, URL, Image, Scanned invoice
code	varchar(20)	yes	unique per tenant
kind	enum	yes	file, note, url, image, template
group	enum	yes	file, note, url, image, other
storage_location	enum	yes	object_storage, database
bucket_ref	varchar(120)	no	ESO secret path for a customer bucket; default platform bucket
allowed_file_types	text[]	no	FileType codes; empty = all active
max_bytes	bigint	yes	default 104,857,600
retention_years, on_expiry	int, enum	yes	default 10 / archive; purge, archive
active_entities	text[]	no	empty = all entities with `attachments: true`
FileType: code (extension), mime, max_bytes, preview (pdf_first_page, thumbnail, office_to_pdf, none), extract_text bool, blocked bool	—	—	blocked defaults: exe, bat, js, msi, ps1, scr

AlertRule / AlertEvent (`ui.alert_rule`, `ui.alert_event`)

Field	Type	Required	Notes
id	uuid	yes	PK
tenant_id	uuid	yes	
owner_id	uuid	yes	creator
entity	varchar(48)	yes	
kind	enum	yes	change_based, due_date
event	enum	yes	field_changed, field_changed_to, field_changed_from, record_created, record_deleted, due_in, overdue_by
field, value	varchar(48), jsonb	no	per event
days	int	no	due-date offset 0–365
filter	jsonb	no	list grammar (FR-3.6)
recipients	jsonb	yes	`{self, user_ids[], role_ids[], owner_field}`
delivery	enum set	yes	in_app, email
template_code, subject, message	varchar(64), varchar(255), text	no	template or inline
legal_entity_scope	enum	yes	current, all
org_wide	bool	yes	administrator-maintained
active_from, active_to, status	date, date, enum	yes/no/yes	active, suspended, expired
Event: rule_id, entity, record_id, recipient_id, fired_at, subject, message, read_at, message_id (wave 4 OutboundMessage)	—	—	retained 90 days

StandardText (`ui.standard_text`): id, tenant_id, code (varchar 32, unique per tenant/version), purpose (enum), language (BCP 47), version, body (text ≤ 8,000), legal_entity_id (nullable = all), effective_from, effective_to, layer (sys, customer), status (draft, published, retired).

Invariants: `next ≤ largest` unless `wrap`; for continuous sequences the set of `used` allocation numbers has no gaps between `smallest` and `next−1`; `hash` of entry n equals SHA-256(prev_hash of n ‖ canonical(n)) and `prev_hash` of n+1 equals `hash` of n; one default SavedView per (owner, entity). Indexing: `sequence(tenant_id, code, scope_value)` unique; `allocation(sequence_id, number)` unique; `entry(tenant_id, entity, record_id, occurred_at desc)`; `entry(tenant_id, seq)` unique; `saved_view(tenant_id, entity, owner_id)`. Partitioning: `audit.entry` and `audit.field` by month; retention 10 years for `transaction` table-group entities, 3 years otherwise, enforced by partition detachment to object storage from wave 46.

0.5.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
GET/POST/PUT	/v1/numseq/sequences, /{id}	Maintain sequences and references	PUT: If-Match	Maintain number sequences
POST	/v1/numseq/sequences/{code}/next?scope=	Allocate (continuous: inside caller tx via `tx_ref`)	`Idempotency-Key` returns the same number	internal / per entity create
POST	/v1/numseq/allocations/{id}/use, /release	Finalize or release a continuous allocation	allocation id	internal
GET	/v1/audit/entries?entity=&record_id=&actor=&from=&to=	Query history	n/a	View audit log (or owner of record)
GET	/v1/audit/entries/{id}	Entry with fields	n/a	View audit log
POST	/v1/audit/verify?tenant=&from_seq=&to_seq=	Recompute chain	n/a	View audit log
GET/POST/PUT/DELETE	/v1/ui/views, /{id}	Saved views	PUT: If-Match	Maintain saved views (own)
GET/PUT	/v1/ui/personalization/{key}	Personalization	last write wins	self
GET	/v1/ui/forms/{entity}	Form definition (ETag)	n/a	any
GET	/v1/ui/search?q=&limit=	Global search	n/a	any (results filtered by read permission)
POST/GET	/v1/io/imports, /{id}, /{id}/validate, /{id}/load, /{id}/errors	Import lifecycle	POST: file sha256	Import data
POST	/v1/io/exports	Export a view (async, returns file ref)	request id	Export data
POST	/v1/docs/attachments (returns pre-signed upload URL), /{id}/versions, /{id}/links	Create attachment, add version, link to another record	Idempotency-Key; version: sha256	entity update + Maintain documents
GET	/v1/docs/attachments?entity=&record_id=&type=&q=	List by record, type, or content search	n/a	entity read
GET	/v1/docs/attachments/{id}/content?version=, /preview	Pre-signed download (5 min), preview	n/a	entity read; `external` restriction irrelevant for read
POST	/v1/docs/attachments/{id}/checkout, /checkin, /release	Lock management	attachment version	Maintain documents (release: Administer document management)
GET/POST/PUT	/v1/docs/document-types, /v1/docs/file-types, /v1/docs/parameters	Setup	PUT: If-Match	Administer document management
GET/POST/PUT/DELETE	/v1/alerts/rules, /{id}	Maintain alert rules (own; org-wide needs admin duty)	PUT: If-Match	Maintain alert rules / Administer alerts
GET/POST	/v1/alerts/events?unread=, /{id}/read, /{id}/delete	Alert inbox	event id	self
GET/PUT/POST	/v1/texts, /{code}/versions/{v}, /publish, /render?language=&record=	Standard texts	by version	Maintain standard texts (render: any)

Event	Trigger	Payload fields	Consumers
dev.passage.numseq.number.allocated.v1	continuous allocation `used` or `released`	sequence_code, scope_value, number, status, tx_ref, actor	audit
dev.passage.audit.entry.recorded.v1	entry committed	entry_id, tenant_id, entity, record_id, operation, hash, seq	shell live history, analytics (wave 46)
dev.passage.audit.chain.anchored.v1	daily anchor	tenant_id, seq, hash, anchor_ref	compliance evidence (wave 48)
dev.passage.io.import.completed.v1 / failed.v1	import terminal	import_id, entity, rows_ok, rows_failed, error_file_ref	shell inbox, audit
dev.passage.ui.view.shared.v1	saved view shared	view_id, entity, role_id, owner	shell cache
dev.passage.docs.attachment.available.v1 / quarantined.v1	scan outcome	attachment_id, version_no, document_type, links[], sha256, size	shell (refresh panel), audit, OCR capture (wave 18)
dev.passage.docs.attachment.purged.v1 / archived.v1	retention job	attachment_id, retention class, reason	audit, compliance evidence (wave 48)
dev.passage.alerts.alert.fired.v1	rule match	rule_id, entity, record_id, recipient_id, delivery	notify (wave 4), shell alert badge
dev.passage.texts.standard-text.published.v1	publish	code, language, version	notify template cache, layouts (wave 46)

0.5.6 User experience

Screen	Primary actions	Key fields/columns	Duty required
Admin workspace (home)	Tiles: users, roles, entities, extensions, workflows, jobs, sequences, audit, imports	counts, failed runs, pending work items	per tile duty
Generated list page (any entity)	New, open, inline edit, bulk edit, filter, save view, export, history	columns from metadata, status, updated	entity read/update
Generated detail page	Save, save and close, delete, open related, history, attachments	sections, tabs, line grids, lookups	entity actions
Number sequences	Create, set format, test next, mark in use	code, scope, format preview, next, continuous	Maintain number sequences
Audit viewer (record and global)	Filter, verify chain, export	time, actor, operation, field, old, new, trace link	View audit log
Import/export	Upload, map, validate, load, download errors	entity, template, rows, status	Import data / Export data
Observability (Grafana, linked)	Open trace from any record history; SLO dashboards	trace id, service, latency, error budget	Platform engineer
Attachments panel (on any detail page)	Upload (drag-drop), new version, check out/in, link existing, preview, download, delete link	name, type, version, size, uploaded by/at, checked out by, restriction	entity read/update; Maintain documents
Documents workspace	Search by type, record, content; bulk re-link; release locks; view quarantined	name, type, linked records, versions, status, retain until, legal hold	View documents / Administer document management
Document management parameters	Document types, file types, storage locations, max sizes, retention classes	code, kind, location, max size, retention	Administer document management
Alerts (shell bell)	Open record, mark read, delete, create rule from a field ("Notify me when…")	fired at, rule, record, message	self
Alert rules	Create, edit, suspend, test against a sample record; org-wide rules	entity, event, field, recipients, delivery, active dates, status, fires/24 h	Maintain alert rules / Administer alerts
Standard texts	Create, translate, preview with record, publish	code, purpose, language, version, used by	Maintain standard texts

Rules: inline edit commits per row on `Enter` or row blur with optimistic locking (409 shows a diff and lets the user reload or overwrite with permission); bulk edit previews affected rows and runs as a batch job above 200 rows; validation messages appear under the field and in a summary list; personalization never changes required-field visibility; the trace link from the audit viewer deep-links into Tempo with the `trace_id`.

0.5.7 Business rules and edge cases

- **BR-5.1** Continuous allocation lifecycle: reserved → used (on caller commit) | released (on caller rollback or 10-minute reservation timeout); a released number is the next number served, preserving gap-freedom; `next` only advances when no released numbers exist.
- **BR-5.2** Two concurrent continuous requests serialize on the row lock; the lock is held only for the allocation statement, not the caller's whole transaction, which is why `Allocation` rows exist.
- **BR-5.3** Non-continuous blocks are per pod; a pod restart loses at most `block_size − 1` numbers per sequence; `allow_to_lower=false` forbids editing `next` downward.
- **BR-5.4** Year segment is evaluated in the legal entity's time zone at allocation time; a sequence with a year segment and `continuous=true` resets `next` to `smallest` on 1 January only when `reset_on_year=true` (default false).
- **BR-5.5** `in_use=false` sequences reject allocation with 409 `SEQUENCE_NOT_IN_USE`; `manual=true` sequences require the caller to supply the number and enforce uniqueness per scope.
- **BR-5.6** Reaching `largest` with `wrap=false` returns 409 `SEQUENCE_EXHAUSTED` and raises an alert at 90% consumption.
- **BR-5.7** Audit entries are never updated or deleted by the application; a verification mismatch raises `AuditChainBroken` (page severity) and freezes further anchoring until acknowledged.
- **BR-5.8** Updates that change only `updated_at`/`version` produce no audit entry; updates to `audit=false` fields produce an entry with no `AuditField` rows only if another audited field changed.
- **BR-5.9** Deleting a record writes an entry with all audited fields as `old_value`; soft delete is an update with field `deleted_at`.
- **BR-5.10** Saved view sharing: a shared view is read-only to others; copying creates a personal view; deleting a shared default view reverts affected users to the system default.
- **BR-5.11** Import loads are all-or-nothing per file by default; `partial=true` loads valid rows and produces the error file for the rest; re-importing the same file sha256 is a no-op with 200 and the previous import id.
- **BR-5.12** Attachment lifecycle: uploading → scanning → available | quarantined; available → archived (retention `on_expiry=archive`: object moved to the archive storage class, metadata kept) → purged; available → purged (retention `purge`). A version upload while `checked_out_by ≠ caller` returns 423 DOC-0504. `retain_until` = max over linked records of (record retention per its table group, wave 5 audit retention) and the document type's `retention_years` from upload; legal hold blocks archive and purge regardless.
- **BR-5.13** Content dedupe: an upload whose sha256 equals an existing version in the same tenant stores no new object (the version points to the existing key); a purge deletes the object only when no version references it.
- **BR-5.14** Change-based alert evaluation: a rule fires once per (rule, record, committed transaction) when its event matches the before/after values in the CDC change and the record passes `filter` after the change; changes by the alert's own recipient fire too unless `exclude_own_changes=true` (default true); due-date rules fire once per (rule, record, due date value) so re-running the daily job never duplicates; a rule on a field the recipient cannot read (field mask) is rejected at save (ALR-0502).
- **BR-5.15** Standard text expansion: placeholders resolve against the record at insert or render time; an unknown placeholder fails publish (STX-0502); a text with `effective_to` in the past is not offered for insertion but still renders for documents that reference its version.

0.5.8 Acceptance criteria

- **AC-5.1** Given the 10 reference entities plus 5 extension cases, When Playwright + axe runs list, detail and create dialogs, Then 0 WCAG 2.1 AA violations and the keyboard suite completes every action without a mouse. (FR-5.2, FR-5.4, FR-5.5)
- **AC-5.2** Given a continuous sequence and 10,000 concurrent allocation requests with 10% random rollbacks (Jepsen-style with clock skew and partition injection), When the run ends, Then used numbers are contiguous, unique and `next − smallest = count(used)`. (FR-5.9, BR-5.1)
- **AC-5.3** Given a non-continuous sequence under 2,000 rps across 3 pods, When measured, Then p99 ≤ 2 ms and no duplicates. (FR-5.9)
- **AC-5.4** Given a field change on any audited entity, When committed, Then the audit viewer shows user, time, old/new and the trace id within 2 s (p95 over 1,000 changes). (FR-5.10, FR-5.12)
- **AC-5.5** Given a tampered `AuditField.new_value` (edited directly in the DB in test), When `verify` runs, Then it reports the first broken seq and `AuditChainBroken` fires. (FR-5.11, BR-5.7)
- **AC-5.6** Given a click "Save" on a vendor stub, When the request flows, Then one trace in Tempo contains spans for gateway, service, Postgres, outbox publish, Kafka consumer (audit) and the shell. (FR-5.13)
- **AC-5.7** Given a CSV of 100,000 vendor stubs with 1% invalid rows, When imported with `partial=true`, Then 99,000 rows load in ≤ 5 min and the error file lists 1,000 rows with field and code. (FR-5.15)
- **AC-5.8** Given a user saves a view with filter and columns and marks it default, When they reopen the list, Then the view applies; another user in the shared role sees it read-only. (FR-5.7, BR-5.10)
- **AC-5.9** Given the SLO dashboard for `identity`, When error rate is forced to 2% for 10 min in stage, Then `SLOBurnRateHigh` reaches the webhook with severity page. (FR-5.14)
- **AC-5.10** Given a PDF uploaded to a VendorStub record with document type "Scanned invoice", When the upload completes, Then the attachment is `available` within 30 s with a first-page preview, its text is found by global search, and linking the same attachment to a second record shows it on both. (FR-5.16)
- **AC-5.11** Given the EICAR test file uploaded with an allowed extension, When scanning completes, Then the attachment is `quarantined`, no download URL is issued, and DOC-0503 is shown. (FR-5.16, BR-5.12)
- **AC-5.12** Given user A has checked out an attachment, When user B uploads a new version, Then 423 DOC-0504 names A; after A checks in, B's upload succeeds as version n+1. (FR-5.16, BR-5.12)
- **AC-5.13** Given a document type with `retention_years=1, on_expiry=purge` and one attachment under legal hold, When the retention job runs past expiry, Then the unheld attachment's object is deleted and `attachment.purged` is emitted, while the held one remains `available`. (FR-5.16, BR-5.12)
- **AC-5.14** Given a change-based rule "VendorStub.status changes to Blocked, notify role AP clerk by in-app + email", When a vendor is blocked, Then each role member with read access receives one alert in the bell within 5 s and one email via wave 4 notify, and the user who made the change does not. (FR-5.17, BR-5.14)
- **AC-5.15** Given a due-date rule "due_date within 3 days" on 1,000 records, When the daily job runs twice on the same day, Then each qualifying record fires exactly once per recipient. (FR-5.17, BR-5.14)
- **AC-5.16** Given a standard text `PAY_TERMS_FOOTER` in `en` and `de-DE` referenced as `{{text:PAY_TERMS_FOOTER}}` in a workflow template, When rendered for a German-language recipient, Then the German version appears with placeholders resolved, and retiring the text is refused with STX-0503. (FR-5.18, BR-5.15)

0.5.9 Test plan and fixtures

Fixtures: `fixtures/numseq/jepsen-config.yaml` (10k clients, nemesis schedule), `fixtures/audit/tamper-cases.sql`, `fixtures/io/vendors-100k.csv` (1% invalid), `fixtures/ui/keyboard-script.json` (every shortcut), `fixtures/ui/entities-15.yaml` (10 reference + 5 extension variants), `fixtures/otel/trace-expectation.json` (span list for AC-5.6).

Test	Type	Target	Pass criterion
axe + keyboard	E2E (Playwright)	shell + renderer	0 violations, 100% shortcuts
Gap-free Jepsen	Property / chaos	numseq	0 gaps, 0 dups under partitions and skew
Buffered throughput	Performance	numseq	p99 ≤ 2 ms @ 2,000 rps
Audit latency	Integration	CDC → audit	p95 ≤ 2 s
Chain verify	Negative	audit	tamper detected at exact seq
Trace continuity	Integration	OTel pipeline	all expected spans share one trace id
Import 100k	Performance	importexport	≤ 5 min, error file correct
Form renderer snapshot	Snapshot	renderer	15 entities × 3 pages stable
Grid virtualization	Performance (browser)	grid	100k rows scroll at ≥ 50 fps on reference laptop

Reconciliation: for each continuous sequence, `count(used allocations) = next − smallest − count(released outstanding)`; audit entries per table per day equal Debezium change count for audited tables; import `rows_ok + rows_failed = rows_total`.

0.5.10 Deployment and operations

Charts: `shell-web` (static assets behind the gateway, remotes manifest in ConfigMap), `forms-renderer` (remote), `shell-bff` (TS: views, personalization, search, SSE), `numseq` (Go, CNPG `numseq`), `audit` (Go consumer + API, CNPG `audit`, monthly partition job), `importexport` (TS, object storage bucket via ESO credentials), `observability` umbrella (OTel Collector DaemonSet + gateway, Prometheus, Tempo, Loki, Grafana, Alertmanager). Config: `REMOTES_MANIFEST_URL`, `OTEL_TRACES_SAMPLER=parentbased_traceidratio`, `AUDIT_RETENTION_YEARS`, `NUMSEQ_RESERVATION_TIMEOUT_SECONDS=600`, `ALERT_WEBHOOK_URL` (ESO). Migrations: additive; `audit.entry` partitions created 3 months ahead by a scheduled job. Feature flags: `ui.inline_edit`, `ui.bulk_edit`, `audit.capture` per domain. Scheduled jobs: audit anchor 00:30 UTC, partition maintenance weekly, sequence exhaustion check hourly, import staging cleanup after 7 days. SLOs: shell availability 99.9%, form load p95 ≤ 800 ms, numseq continuous p99 ≤ 30 ms, audit visibility p95 ≤ 2 s, trace ingestion loss < 0.1%. Alerts: `SLOBurnRateHigh` (multi-window 1h/6h), `AuditLagHigh` (> 10 s), `AuditChainBroken`, `SequenceNearExhaustion`, `RemoteLoadFailure`, `OTelCollectorDropping`. Runbook: audit consumer rebuild from Kafka retention, sequence reservation stuck, remote rollback (manifest pin), Grafana datasource auth. Rollback: digest rollback per chart; shell remotes roll back by manifest pin without redeploying the host.

0.5.11 Migration from AX / SAP

Source	Passage entity	Notes
AX `NumberSequenceTable` (NumberSequence, Txt, Format, Lowest, Highest, NextRec, Continuous, Manual, InUse, Wrap) + `NumberSequenceScope`	NumberSequence	`Format ###-######` converted to segments; `NextRec` → `next` after cutover freeze; scope `DataAreaId` → legal entity code
AX `NumberSequenceReference` (DataTypeId → NumberSequenceId)	sequence reference	EDT name mapped to Passage entity/field by crosswalk
SAP NRIV (OBJECT, SUBOBJECT, NRRANGENR, FROMNUMBER, TONUMBER, NRLEVEL, EXTERNIND)	NumberSequence	SUBOBJECT (BUKRS) → scope value; EXTERNIND='X' → manual; buffering settings from TNRO → block_size
AX `SysDatabaseLog` (table, recId, logType, createdBy, createdDateTime, data container)	AuditEntry/AuditField (read-only import)	loaded as historical entries with `source=ax`, excluded from the hash chain (separate chain `legacy`)
SAP CDHDR/CDPOS (OBJECTCLAS, OBJECTID, CHANGENR, USERNAME, UDATE, UTIME, TABNAME, FNAME, VALUE_OLD, VALUE_NEW)	AuditEntry/AuditField	same treatment; OBJECTID resolved to Passage record ids via the migration run ledger (wave 10)
D365 saved views / AX `SysLastValue` usage data; SAP ALV layout variants (LTDX)	SavedView	optional; only named, shared variants are imported
AX `DocuRef` (RefTableId, RefRecId, TypeId, Name, Notes, Restriction) + `DocuValue` (FileName, FileType, Path / File container) + `DocuType`	Attachment / AttachmentVersion / AttachmentLink / DocumentType	file content copied from the archive directory, database container or SharePoint location to object storage; RefTableId/RefRecId resolved via the wave 10 run ledger; notes → kind=note
SAP GOS (SRGBTBREL, SOOD, SOFFCONT1), ArchiveLink (TOA01–TOA03, TOAAT), DMS (DRAW, DRAD object links, originals in KPro)	same	content fetched via `SO_DOCUMENT_READ_API1` / ArchiveLink HTTP or KPro export; DRAD links → AttachmentLink; DMS versions → AttachmentVersion
AX `EventRule` (alert rules)	AlertRule	change-based and due-date rules mapped when the table/field crosswalk resolves; others reported unmapped
SAP SO10 texts (STXH/STXL via `READ_TEXT`, TDOBJECT=TEXT)	StandardText	per language; SAPscript formatting reduced to plain text with line breaks

Not migrated: AX Infolog history, SAP SM21/ST22 logs, SAP DBTABLOG (table logging) beyond customizing tables, personal (unnamed) usage data. Number sequence `next` values are taken at cutover (wave 49) and never earlier.

0.5.12 Dependencies, risks, open questions

Depends on: wave 4 (CDC stream for audit, batch jobs for import/export, events for inbox), wave 3 (form definitions from metadata, `numseq()` defaults), wave 2 (duties `Maintain number sequences`, `View audit log`, `Import data`, `Export data`, `Maintain saved views`), wave 1 (gateway, TLS, charts).

Risk	Likelihood	Impact	Mitigation
Generated forms are usable but ugly; stakeholders judge the platform by them	High	Medium	Design tokens and a 15-entity visual review before the demo; hand-built workspaces for admin home
Audit consumer falls behind on bulk loads	Medium	Medium	Partitioned consumer group (12), batching 500 rows per commit, `AuditLagHigh` alert
Gap-free sequences used where not required (throughput)	Medium	Medium	Default non-continuous; continuous requires a documented legal reason in the sequence description
Tail sampling hides a rare slow path	Low	Medium	100% sampling of > 1 s and errors; exemplar links from metrics

Open questions: (1) Grid implementation (in-house vs. open-source data grid library) — default open-source MIT grid with virtualization; decide by wave 5 start. (2) Audit anchor target (object storage only vs. external timestamping) — default object storage with WORM policy; decide by wave 48. (3) SSE vs WebSocket for the inbox — default SSE; decide by wave 5 mid-point. (4) Whether `legal_entity_fiscal_period` scope ships in wave 5 or wave 6 — default wave 6 with the enum reserved now; decide by wave 6 start.

0.5.13 Parameters and setup

Values live on Admin workspace → Shell parameters, Number sequence parameters, Audit parameters, Document management parameters, Alert parameters and Import/export parameters (AX "Number sequence parameters", "Database log setup", "Document management parameters", "Alert parameters", "System parameters"; SAP SNRO/TNRO, SCDO/SCU3, OAC0/DC10, SM19 and SPRO → SAP NetWeaver → General settings).

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
`ui.inline_edit`, `ui.bulk_edit`	tenant (feature flags)	bool	true, true	true/false	grid editing modes (FR-5.3)	Form personalization "Edit mode" (System parameters → default view/edit mode)	ALV edit mode (layout)
`ui.bulk_edit.max_rows`, `ui.bulk_edit.batch_threshold`	tenant	int, int	1,000, 200	10–10,000, 10–1,000	bulk edit cap; above threshold runs as batch job	Excel add-in row limits	MASS transaction selection limits
`ui.grid.page_fetch_rows`	environment	int	200	50–1,000	virtual-scroll fetch size	`FormDataSource` cache size	ALV `maxrows`
`ui.search.entities[]`, `ui.search.max_results`	tenant	entity list, int	all with title fields, 20	—	global search scope (FR-5.1)	Search configuration (SysSearchConfiguration)	ESH_COCKPIT search models
`ui.user_defaults` (language, date format, number format, time zone, default legal entity, start workspace)	user (tenant default)	jsonb	tenant defaults	locale codes, IANA tz	My user options / personalization	User options → Preferences (SysUserSetup)	SU3 defaults (date format, decimal notation, time zone)
`numseq.reservation_timeout_seconds`	environment	int	600	60–3,600	BR-5.1 release of unconfirmed numbers	Number sequence parameters → "Clean up" interval (continuous)	none (NRIV commit-bound)
`numseq.block_size_default`	tenant	int	50	1–1,000	non-continuous pre-allocation	Number sequence → Performance → Preallocation quantity	SNRO → number of numbers in buffer (TNRO-NOIVBUFFER)
`numseq.exhaustion_warn_pct`	tenant	int	90	50–99	`SequenceNearExhaustion` alert	Number sequence → "Warning at"	SNRO → warning % (TNRO-PERCENTAGE)
`numseq.reset_on_year`	sequence	bool	false	true/false	BR-5.4	Segment configuration with fiscal calendar period scope	year-dependent intervals (NRIV-TOYEAR), OBH1 copy to fiscal year
`audit.capture`	domain (flag)	bool	true	true/false	CDC audit capture on/off per domain	Database log setup (SysDatabaseLogSetup) per table	SCDO change document objects; table logging `rec/client`, SE13 log flag
`audit.retention_years.transaction`, `.other`	tenant	int, int	10, 3	1–30	partition retention (0.5.4)	Database log cleanup (SysDatabaseLogCleanup)	SCU3 / SARA CHANGEDOCU archiving
`audit.anchor_time_utc`	environment	HH:MM	00:30	any	daily hash anchor (FR-5.11)	none	none
`docs.max_upload_bytes`	tenant	bigint	104,857,600	≤ 2 GB	upload ceiling across types	Document management parameters → Maximum file size	OAC0 repository settings, `SO_DOCUMENT` size limits
`docs.default_bucket_ref`, `docs.archive_storage_class`	tenant	ESO path, enum	platform bucket, `GLACIER_IR`-equivalent cold class	provider classes	storage location and archive tier	Document management parameters → Archive directory; DocuType location (archive / database / SharePoint)	OAC0 content repositories, OACT categories
`docs.blocked_extensions`	tenant	text[]	exe, bat, cmd, js, msi, ps1, scr, vbs	any	uploads refused (DOC-0502)	File types (DocuFileTypes)	DC30 workstation applications (TDWP)
`docs.checkout_lock_days`	tenant	int	7	1–90	auto-release of stale check-outs	none	CV01N check-out status (no expiry)
`docs.preview.enabled`, `docs.extract_text.enabled`	tenant	bool, bool	true, true	true/false	conversion and content indexing	none (AX 2012); D365 Office preview	DMS conversion server, TREX/HANA full-text activation
`alerts.due_date_time`	tenant	HH:MM tenant tz	06:00	any	daily due-date evaluation	Alert parameters → Due-date alert batch recurrence (`EventJobDueDate`)	ALRTCATDEF scheduling, SWE2 deadline events
`alerts.max_per_rule_per_hour`	tenant	int	500	10–10,000	runaway-rule suspension (ALR-0505)	none	none
`alerts.retention_days`	tenant	int	90	7–365	alert inbox retention	Alert parameters → "Alerts retention" (EventParameters)	ALRTPROC cleanup (SALRT_DELETE)
`alerts.drilldown_base_url`	environment	URL	`https://app.<env>.passage.dev`	URL	deep-link target in alert email	Alert parameters → Drill-down target	Fiori launchpad intent base
`io.max_import_rows`, `io.staging_retention_days`	tenant	int, int	1,000,000, 7	≤ 5 M, 1–30	import size and staging cleanup	Data management parameters (DMFParameters) → staging cleanup	LSMW / Migration Cockpit project retention
`otel.sampling.ratio`, `otel.sampling.latency_threshold_ms`	environment	decimal, int	1.0 dev / 0.1 stage-prod, 1,000	0–1, 100–10,000	FR-5.13 tail sampling	LCS trace capture settings	ST05 / SAT trace settings
`alerting.webhook_url`, `alerting.routes`	environment	ESO ref, YAML	PagerDuty-compatible	—	Alertmanager routing (FR-5.14)	LCS monitoring alerts	Solution Manager alerting (CCMS RZ20 thresholds)

0.5.14 Inquiries and reports

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
Number sequence list and status	list inquiry	scope, continuous, in use	code, scope value, format preview, next, largest, % consumed, continuous, block size	`numseq.sequence`	Number sequences list page; SSRS Number sequence list / references	SNRO intervals, NRIV display
Continuous allocation status (gaps audit)	operational report	sequence, date range, status	number, status (reserved/used/released), requested by, tx_ref, age	`numseq.allocation`	Number sequence → Status list (`NumberSequenceList`)	S_ALR_87012342 gaps in document number assignment; S_ALR_87012341 numbers allocated twice
Record history	drill-down	entity, record, field, date	time, actor, operation, field, old, new, trace link	`audit.entry`, `audit.field`	Database log viewer (per record)	change documents per object (RSSCD100), S_ALR_87012308
Global audit search	list inquiry	entity, user, date range, operation	same plus record id	same	Database log inquiry; SSRS Database log report	SCU3, RSSCD100, S_ALR_87012293
Audit chain verification	operational report	tenant, seq range	range, entries verified, first broken seq, anchor ref	`POST /v1/audit/verify`	none	none (SM20 integrity is file-based)
Import/export job history	list inquiry	entity, status, user, date	job, entity, rows total/ok/failed, duration, error file	`io.import_job`	Data management → Job history (DMFDefinitionGroupExecution)	LSMW / Migration Cockpit logs
Documents by type / record	list inquiry	document type, entity, record, uploaded by, date, content text	name, type, linked records, version, size, status, restriction, retain until	`docs.attachment*`	Document management inquiries (DocuRef list)	GOS attachment list, CV04N document search, OAOR
Document retention preview	operational report	retention class, horizon (days)	attachment, type, retain until, action (archive/purge), legal hold	`docs.attachment`	none (archive purge not standard in AX)	ILM retention (IRMPOL) preview, SARA write variant test
Checked-out documents	list inquiry	user, age	attachment, checked out by, since, linked record	`docs.attachment`	none	CV04N with status "checked out"
My alerts / Alert inquiry by rule or user	list inquiry	rule, user, read status, date	fired at, rule, record, recipient, message, read at, delivery status	`ui.alert_event`	Notification list / My alerts (EventInbox); alert inquiry	ALRTINBOX, SALRT1 alert inbox
Alert rule statistics	KPI	rule, period	fires per day, suspended flag, recipients, email failures	`ui.alert_rule` + events	none	Situation Handling monitor
Standard text where-used	drill-down	text code	templates and layouts referencing it, versions	`ui.standard_text` + notify templates	none	SO10 where-used (none standard)
SLO and service dashboards	KPI	service, window	availability, p95 latency, error budget remaining, burn rate	Prometheus	LCS environment monitoring	Solution Manager technical monitoring, ST03N
Trace explorer	drill-down	trace id, service, duration	spans, attributes, errors	Tempo	Trace parser	ST05, SAT, STAD
Log explorer	list inquiry	service, level, trace id, tenant	time, level, message, trace id	Loki	Event Viewer / Infolog history	SM21 system log, SLG1 application log, ST22 dumps

0.5.15 Printed and electronic documents

No printed business documents (wave 15/46 layouts consume FR-5.18 texts and FR-5.16 `external` attachments). Electronic documents:

Document	Trigger	Layout elements	Formats	Numbering sequence	Legal / retention requirement
List export	user export of a view (FR-5.15)	header row (column labels), rows per view, footer row with export time, user, filter, legal entity	CSV (UTF-8, RFC 4180), XLSX	none	not retained by Passage after 7 days (download link expiry)
Import error file	import validation	original columns + `row`, `field`, `code`, `message`	CSV, XLSX	import id	7 days
Audit history export	audit viewer export	entity, record, entries, chain seq range, verification result	CSV, JSON (with hashes for third-party verification)	none	requester's custody; source entries retained per 0.5.4
Audit chain anchor	daily job	tenant, seq, hash, timestamp	JSON object in WORM bucket	per-tenant seq	10 years, object lock (compliance mode)
Alert email	alert fired with email delivery	subject (rule or template), record title, changed field old → new or due date, deep link, unsubscribe-from-rule link	email via wave 4 notify	none	wave 4 retention
Attachment preview	conversion job	first page PDF or 320 px thumbnail	PDF, PNG	attachment version	deleted with the version

0.5.16 Periodic and batch jobs

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
Audit chain anchor	daily 00:30 UTC	tenant	anchor row keyed by (tenant, date)	< 1 min for 1,000 tenants	retry 3×; freeze on mismatch (BR-5.7)	`AuditChainBroken` (page), `AuditAnchorMissing`
Audit partition maintenance	weekly	month	creates partitions 3 months ahead; idempotent	< 1 min	alert	`AuditPartitionMissing`
Audit retention detach	monthly	month partition	detaches partitions older than retention to object storage (from wave 46)	< 10 min	retry	none
Sequence exhaustion check	hourly	sequence	stateless	< 10 s	none	`SequenceNearExhaustion`
Stale reservation release	every minute	sequence	releases `reserved` older than timeout (BR-5.1)	< 1 s	retry	`ReservationStuck` (> 3 timeouts/h)
Import staging cleanup	daily 03:00 UTC	tenant	deletes staging and files older than 7 days	< 5 min	retry	none
Notification and alert cleanup	daily 03:15 UTC	tenant	deletes alert events older than retention	< 1 min	retry	none
Due-date alert evaluation	daily at `alerts.due_date_time`	tenant × rule	fired key (rule, record, due value) (BR-5.14)	< 2 min per 100 rules × 100 k records	resume per rule	`AlertJobFailed`

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
Change-based alert evaluator	continuous (CDC consumer)	Kafka partition	consumer dedupe (BR-4.5)	≤ 5 s event → alert	DLQ	`AlertLagHigh` (> 30 s)
Attachment scan and preview	on upload (queue)	attachment version	status is the checkpoint	≤ 30 s for 20 MB	3 retries, then `quarantined` with reason `scan_failed`	`DocScanBacklog` (> 100 queued)
Attachment text extraction	on `available`	attachment version	writes `extracted_text` once per version	≤ 60 s for 200 pages	skip with warning DOC-0507	none
Document retention (archive / purge)	weekly Sunday 01:00 tenant time	tenant × document type	dry-run list stored first; each attachment processed once (status)	< 30 min per 1 M attachments	per-item errors logged, run continues	`DocRetentionErrors`
Stale check-out release	daily	tenant	releases locks older than `docs.checkout_lock_days`	< 1 min	none	none
Personalization / usage data reset	on demand (administrator)	user	deletes Personalization rows for selected users	< 10 s	none	none

0.5.17 Security duties and privileges

Duty	Privileges (entry points)	Segregation-of-duties conflicts	Default roles that include it
Maintain number sequences	`/v1/numseq/sequences*`, Number sequences screen, test next	with posting duties for fiscal documents in production (lowering `next` on a gap-free sequence is a fraud vector; `allow_to_lower=false` by default)	Financial administrator, Platform engineer
View audit log	`/v1/audit/entries*`, `/verify`, audit workspace, history on any record the user can read	with Maintain users / Maintain security roles for the security auditor role (auditors should not administer what they audit)	Auditor, Security administrator (own scope)
Import data	`/v1/io/imports*`, Import screen	per entity: also requires `create` / `update` on the target entity	Data steward, Migration consultant
Export data	`/v1/io/exports`, export button on lists	export of `pii=sensitive` columns requires explicit field permission	most business roles
Maintain saved views	`/v1/ui/views*` own; share with role	none	all users (own); Business administrator (shared, publish to role)
Maintain documents	upload, version, check out/in, link on records the user may update	none	all entity maintainers
View documents	download, preview, documents workspace search (filtered by read on linked records)	none	all users with entity read
Administer document management	`/v1/docs/document-types`, `/file-types`, `/parameters`, force-release, view quarantined, retention preview	with legal-hold management (wave 48 duty)	Document administrator
Maintain alert rules	`/v1/alerts/rules*` own rules	none	all users
Administer alerts	org-wide rules, suspend/resume any rule, alert statistics	none	Business administrator
Maintain standard texts	`/v1/texts*`, Standard texts screen	none	Communications administrator, Business administrator
Platform observability	Grafana, Tempo, Loki (Keycloak SSO group)	log access may expose payload fragments; lint keeps PII out of spans	Platform engineer, SRE

0.5.18 Message catalog

Code	Severity	User text	Cause	Remediation	Raised by
NSQ-0501	error	Number sequence {code} is not in use	`in_use=false` (409 SEQUENCE_NOT_IN_USE)	mark in use or bind another sequence	BR-5.5
NSQ-0502	error	Number sequence {code} is exhausted at {largest}	SEQUENCE_EXHAUSTED (409)	raise `largest` or enable wrap where legal	BR-5.6
NSQ-0503	warning	Number sequence {code} is {pct}% consumed	exhaustion threshold	plan a new range	BR-5.6
NSQ-0504	error	{code} is manual: supply a number	`manual=true` without number	enter the number	BR-5.5

ALR-0503	error	Due-date rules require a date or datetime field	wrong field type	choose a date field	FR-5.17
ALR-0504	warning	{n} recipients were skipped because they cannot read {entity}	recipient lacks read	adjust recipients	FR-5.17
ALR-0505	warning	Alert rule {name} was suspended after {n} alerts in one hour	runaway rule	narrow the filter and resume	FR-5.17
STX-0501	error	Standard text {code} has no version in {language} or the fallback language	missing translation	add the language version	FR-5.18
STX-0502	error	Unknown placeholder `{{placeholder}}` in {code}	publish validation	correct the placeholder	BR-5.15
STX-0503	error	{code} is used by {n} published templates or layouts and cannot be retired	where-used check	update the references first	FR-5.18

0.5.19 Performance budgets and capacity

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
Shell first contentful paint	5,000 users, 2 sessions/day	0.8 s / 1.5 s / 2.5 s (10 Mbps)	CDN-cached assets	n/a	remotes cached by digest	static assets unaffected
Form load (metadata + record)	200 k/day, peak 100/s	250 ms / 800 ms / 1.5 s	300/s	n/a	form definition ETag cache	p95 ≤ 2 s; skeleton rendering
Global search	50 k/day, peak 30/s	80 ms / 300 ms / 600 ms	100/s	title + content index ≈ 2 GB/tenant/year	GIN on `tsvector` per entity; attachment content GIN	results truncated to 20; timeouts at 1 s return partial
Gap-free allocation	50 k/day per sequence, peak 500/s	5 ms / 15 ms / 30 ms	500/s per sequence	`allocation` ≈ 18 M rows/year for a busy sequence	`(sequence_id, number)` unique; monthly cleanup of used rows > 13 months to archive	row-lock queueing; p99 rises to ≈ 90 ms, no gaps
Buffered allocation	2,000/s across pods	0.1 ms / 1 ms / 2 ms	2,000/s	none	in-memory block	block refill contention; still < 5 ms
Audit capture (commit → visible)	5 M changed rows/day/tenant, peak 2,000/s	500 ms / 2 s / 5 s	3,000 rows/s with 12 consumers	≈ 1.8 B entries/year at peak volume (≈ 900 GB)	monthly partitions; `(tenant_id, entity, record_id, occurred_at desc)`	lag grows; `AuditLagHigh` at 10 s; no loss (Kafka retention 7 days)
Record history query	20 k/day	30 ms / 120 ms / 300 ms	50/s	—	same index, partition pruning by date	paging at 100 entries
Import 100 k rows	50/day/tenant	2 min / 5 min / 8 min	400 rows/s per job	staging transient	batch insert 1,000 rows	jobs queue by priority
Attachment upload (20 MB)	20 k/day/tenant, peak 20/s	1 s / 4 s / 8 s to `scanning`; ≤ 30 s to `available`	100 MB/s per tenant to object storage	≈ 4 TB/year/tenant at 20 MB average (before dedupe)	object key per version; DB rows ≈ 7 M/year	scan queue grows; uploads still accepted
Change-based alert evaluation	500 rules/tenant over the audit stream	1 s / 5 s / 10 s event → alert	3,000 changes/s	`alert_event` ≈ 10 M rows/year	rules indexed by (entity, field) in memory; events by (tenant_id, recipient_id, read_at)	lag; suspension of runaway rules
Trace ingestion	2 k spans/s per service at 10% sampling	n/a	50 k spans/s per collector gateway	Tempo ≈ 5 TB/year (14-day retention by default)	object storage backend	collector drops lowest-priority spans; `OTelCollectorDropping`

0.5.20 Localization and compliance hooks

- Number sequences and fiscal law: gap-free continuous numbering is the hook for invoice-numbering rules (EU VAT Directive Art. 226(2) "sequential number", France and Italy chronological numbering, Mexico CFDI folio series, India GST invoice series ≤ 16 characters per financial year). Country packs (wave 48) ship sequence templates per document type (format, `reset_on_year`, scope `legal_entity_fiscal_period` from wave 6) and validate `continuous=true` for fiscal documents of their country; the extension point is the sequence template + decision table `NumberingPolicy` (FR-3.13).
- Audit retention: defaults 10/3 years; country packs raise minimums (Germany GoBD 10 years for booking records, France 6–10, US SOX 7); `audit.retention_years.*` can only be raised by a country pack, not lowered below its minimum.
- Document retention: retention classes per document type are the hook for GoBD/HGB §257, US IRS records retention and similar rules; legal hold (wave 48) overrides purge; archive storage class with object lock satisfies WORM requirements where mandated.
- Privacy: audit stores SHA-256 digests for `pii=sensitive` fields; erasure requests (wave 48) pseudonymize actor display names in the viewer but never rewrite audit rows (lawful basis: legal obligation, GDPR Art. 17(3)(b)); attachments linked to an erased subject are listed for the privacy officer; alert events and personalization are deleted on erasure.
- Language and formats: shell strings, form labels, alert subjects and standard texts are resolved per user locale; English ships in wave 5, wave 48 label packs add languages; right-to-left layout support is a wave 48 deliverable but the shell uses CSS logical properties from wave 5. Date, number and currency formatting follow `ui.user_defaults` via `Intl` APIs.
- Calendar: due-date alerts and year segments use the legal entity time zone; fiscal-period scopes arrive in wave 6.
- Accessibility law: WCAG 2.1 AA (FR-5.5) covers EN 301 549 (EU Accessibility Act, from 2025-06-28) and US Section 508 for the generated UI.

- E-invoicing: attachments with `restriction=external` and document type "E-invoice original" are the storage hook for wave 35 Peppol/Factur-X archives (original XML retained unchanged, sha256 recorded).

0.5.21 Coverage closure

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
AX §12.29.1 Organization administration → Alerts (org-level alert rules) (register row 82)	GAP	ADDED as FR-5.17	org-wide rules (`org_wide=true`) maintained by Administer alerts
AX §12.29.4 Organization administration → Setup: Alerts → Alert rules (change-based, due-date; event rule setup, alert email templates) (register row 88)	GAP	ADDED as FR-5.17	rule kinds per FR-5.17; email via wave 4 templates (FR-4.14)
AX §12.30.3 System administration → Periodic: Alerts → Change-based alerts / Due date alerts (batch processors) (register row 91)	GAP	ADDED as FR-5.17	change-based evaluated continuously from CDC; due-date daily job (0.5.16)
AX §12.31.1 Home / role centers / workflow → Alerts (My alerts / Notification list) (register row 94)	GAP	ADDED as FR-5.17	shell Alerts bell and list (0.5.6), `ui.alert_event`
AX §12.31.2 Home / role centers / workflow → Inquiries: Alert inquiry (alerts by rule/user) (register row 95)	GAP	ADDED as FR-5.17	My alerts / Alert inquiry and Alert rule statistics (0.5.14)
AX §12.31.3 Home / role centers / workflow → Periodic: Alerts → Process change-based alerts / Due-date alerts (register row 98)	GAP	ADDED as FR-5.17	same jobs as row 91
AX §12.31.4 Home / role centers / workflow → Setup: Alerts → Alert rules (field/record changes, due date; subject/message; recipients; organization-wide) / Alert rule templates (register row 100)	GAP	ADDED as FR-5.17	rule templates = `MessageTemplate` codes; "Notify me when…" creates a rule from a field
AX §12.29.1 Organization administration → Document management → Document handling (attachments on any record), Document types, File types (`DocuView`, `DocuType`) (register row 235)	PARTIAL-5	ADDED as FR-5.16	`Attachment`, `DocumentType`, `FileType` entities
AX §12.29.2 Organization administration → Document management inquiries (documents by type/record) (register row 243)	PARTIAL-5	ADDED as FR-5.16	Documents by type / record inquiry (0.5.14)
AX §12.29.3 Organization administration → Periodic: Document management → Archive documents / Purge by retention (register row 249)	PARTIAL-5	ADDED as FR-5.16	retention job (0.5.16), BR-5.12, legal hold
AX §12.29.4 Organization administration → Setup: Document management parameters (archive directory, SharePoint, file types, max size), Document types (file, note, URL, image, template; group; location), Active document tables, File types (register row 252)	PARTIAL-5	ADDED as FR-5.16	parameters in 0.5.13; `active_entities[]` = active document tables; location = object storage or database; SharePoint location is not a storage backend (see row 253)
AX §12.29.4 Organization administration → Setup: Document management → OneDrive/SharePoint integration (D365), Attachment migration (register row 253)	PARTIAL-5	ADDED as FR-5.16	S3-compatible storage with customer bucket (`bucket_ref`) and attachment migration from `DocuRef`/`DocuValue` and SharePoint paths (0.5.11); live SharePoint/OneDrive storage as a document location is not offered — files are copied into object storage at migration, and a `url` document type links to SharePoint items
AX §12.30.1 System administration → Document handling (link) (register row 264)	PARTIAL-5	ADDED as FR-5.16	same capability as row 235
AX §12.30.4 System administration → Setup: Document management (link) (register row 270)	PARTIAL-5	ADDED as FR-5.16	same as row 252
AX §12.31.1 Home / role centers / workflow → Document handling on any record (`DocuView`) (register row 273)	PARTIAL-5	ADDED as FR-5.16	attachments panel on every generated detail page (0.5.6)
SAP §13.31 Cross-Application → SO10 / SO72 / SE75 (text objects/IDs): standard texts, text management (register row 349)	PARTIAL-5	ADDED as FR-5.18	register proposed wave 46 text blocks; added here because wave 4 templates (FR-4.14) and wave 46 layouts both consume it; layouts reference by code
SAP §13.35 DMS → CV01N originals (check-in/check-out, KPro storage categories, viewer, conversion) (register row 377)	PARTIAL-5	ADDED as FR-5.16	check-out/check-in, multiple versions per attachment, storage locations, previews; native CAD 2D/3D viewing is dropped (PLM keeps CAD; wave 9 engineering change links PLM documents by URL type)
SAP §13.35 DMS → Periodic: CV conversion runs (originals → PDF/neutral formats) (register row 389)	PARTIAL-5	ADDED as FR-5.16	attachment scan and preview job (Office → PDF, PDF first page, image thumbnails); CAD neutral-format conversion dropped with the viewer
SAP §13.35 DMS → Customizing: DC30 workstation applications (file types, viewer/editor, conversion) (TDWP) (register row 394)	PARTIAL-5	ADDED as FR-5.16	`FileType` (mime, max size, preview method, extract_text, blocked)
SAP §13.35 DMS → Customizing: full-text search activation (TREX/HANA) for originals (register row 398)	PARTIAL-5	ADDED as FR-5.16	text extraction to Postgres `tsvector`, searchable from global search and the documents inquiry; OCR of scanned images is wave 18

Part 1 — Phase 1: Enterprise Structure, Master Data & Engineering Data (waves 6–10)

1.0 Phase overview

Business outcome at phase exit. A master-data steward can model the demo manufacturer end to end on Passage without touching AX or SAP: three legal entities, two plants, five warehouses and their hierarchies; one governed party record per customer, vendor and contact; a 500-item, 50-master product catalog released per legal entity; multi-level BOMs and routings under engineering change control; and a migration framework that has loaded all of it from a synthetic AX extract with 100% reconciliation. Every later phase (journal in wave 11, inventory in wave 16, orders in wave 26) filters by this enterprise structure, posts against these parties and products, and loads its own legacy data through this framework.

Phase-exit sign-off criteria

- `make demo-seed` loads the demo manufacturer (3 legal entities, 2 sites, 5 warehouses, 3 hierarchy purposes) in under 2 minutes and every list page re-scopes on legal-entity switch (property test over 20 entities, 0 leaks).
- Duplicate detection on the 10k-party fixture achieves precision ≥ 0.95 and recall ≥ 0.90; merge leaves zero dangling references (referential-integrity audit returns 0 rows).
- Variant explosion of a 3×10×10 master creates 1,000 variants in < 5 s; GS1 check-digit tests pass for all 40 published GS1 vectors.
- 7-level, 2,000-component BOM explosion completes in < 500 ms and equals the golden result byte for byte.
- Synthetic AX extract (50k customers, 20k vendors, 100k items, 10k BOMs) migrates in < 30 min; re-run produces 0 changes; reconciliation report shows 0 unexplained exceptions.
- Stakeholder walkthrough recorded: create party → release product → build BOM → approve ECO → run migration.

Cross-wave data model summary

Entity	Owning service	Key relationships
LegalEntity	org-service (Go)	tenant 1:N legal_entity; legal_entity 1:N fiscal_calendar_assignment
OperatingUnit	org-service	type ∈ {department, cost_center, business_unit, value_stream}; node of HierarchyVersion
Site / Warehouse / Location	org-service	legal_entity 1:N site 1:N warehouse 1:N location
HierarchyType / HierarchyVersion / HierarchyNode	org-service	purpose-bound, effective-dated tree over OrgUnit ids
PostalAddress / AddressPurpose	org-service	referenced by Party, Site, Warehouse, LegalEntity
FiscalCalendar / FiscalPeriod	org-service	consumed by ledger (wave 11) for period status
UnitOfMeasure / UomConversion	org-service	product-specific conversions live in product-service
Party (Person/Organization)	party-service (Go)	1:N PartyRole; 1:N PartyAddress; 1:N TaxRegistration
Customer / Vendor / Contact / Employee role	party-service	role rows keyed (party_id, legal_entity_id)
DuplicateCandidate / MergeCase	party-service	pairs of party_id with score; Temporal workflow id
Product / ProductMaster / ProductVariant	product-service (Go)	master 1:N variant; dimension_group FK
ReleasedProduct	product-service	(product_id, legal_entity_id) with site/warehouse defaults
ItemGroup / ItemModelGroup / Category	product-service	referenced from ReleasedProduct
ConfigurationModel	product-service (Python solver)	master 1:N model; constraints in JSON
BomHeader / BomVersion / BomLine	engineering-service (Go)	version → (product_id, site_id, effective range)
RouteHeader / RouteVersion / Operation / OperationRelation	engineering-service	operation N:1 resource requirement
Resource / ResourceGroup / Capability / WorkCalendar	engineering-service	calendar consumed by scheduling (wave 23)
EngineeringChangeRequest / EngineeringChangeOrder	engineering-service	ECO 1:N affected BomVersion/RouteVersion
MigrationProject / MigrationRun / MappingSpec / StagingRow / ReconciliationResult	migration-service (TS + Go loaders)	run N:1 project; row N:1 run

Cross-wave event catalog

Event name	Producer	Consumers	Payload summary
dev.passage.org.legalentity.created.v1	org-service	party, product, ledger (w11), shell	legal_entity_id, code, name, country, currency, fiscal_calendar_id
dev.passage.org.hierarchy.version.activated.v1	org-service	security (OPA bundle), reporting, procurement	hierarchy_type_id, version_id, effective_from, node_count
dev.passage.org.site.created.v1 / warehouse.created.v1	org-service	product (released defaults), inventory (w16)	id, legal_entity_id, parent ids, address_id
dev.passage.org.fiscalcalendar.generated.v1	org-service	ledger (w11), period close (w14)	calendar_id, pattern, period_count, year
dev.passage.party.created.v1 / updated.v1	party-service	search index, migration, audit	party_id, type, name, primary_address_id
dev.passage.party.customer.created.v1 / vendor.created.v1	party-service	AR (w30), AP (w19), sales (w26), purchasing (w17)	party_id, legal_entity_id, account_number, group, terms
dev.passage.party.merged.v1	party-service	every service holding party_id FKs	survivor_id, merged_ids[], reference_rewrite_count
dev.passage.party.change.approved.v1	party-service (Temporal)	audit, notification	party_id, field, old, new, approver
dev.passage.product.created.v1 / variant.created.v1	product-service	engineering, inventory, pricing (w26)	product_id, master_id, dimension_values
dev.passage.product.released.v1	product-service	inventory, purchasing, sales, costing	product_id, legal_entity_id, item_model_group_id, defaults
dev.passage.engineering.bom.version.activated.v1	engineering-service	planning (w22), production (w21), costing (w39)	bom_version_id, product_id, site_id, effective_from, line_count
dev.passage.engineering.route.version.activated.v1	engineering-service	planning, scheduling (w23), production	route_version_id, operations[]
dev.passage.engineering.eco.released.v1	engineering-service	notification, audit, PLM adapter	eco_id, affected_versions[], release_date

Event name	Producer	Consumers	Payload summary
dev.passage.migration.run.completed.v1	migration-service	notification, reconciliation UI, audit	run_id, project_id, counts{staged, loaded, rejected}, hash_match

Phase-level risks

Risk	Likelihood	Impact	Mitigation	Owner
Party dedup thresholds tuned to synthetic data miss real-world noise	Medium	High	Splink model trained on 10k fixture plus 2k hand-labeled real-shaped records; thresholds adjustable per tenant	Product
Effective-dated hierarchies become slow under as-of queries at 50k nodes	Medium	Medium	Closure table per version, materialized on activation; p95 target 20 ms enforced in CI	Engineering
Product dimension explosion makes variant counts unbounded	Low	High	Hard cap 10,000 variants per master; explosion is a Temporal job with checkpointing	Engineering
BOM cycles or phantom recursion break explosion	Medium	High	Cycle check on every line insert (closure table), depth cap 25	Engineering
AX/SAP extracts arrive with codepage and enum drift	High	Medium	Mapping DSL with explicit enum tables and reject-with-reason; dry-run before load	Implementation partner
Wave 10 depends on three prior waves landing on time	Medium	Medium	Connectors for DirParty/CustTable built against wave 7 as soon as it passes Proof	Product

1.6 Wave 6: Enterprise Structure & Organization Model

1.6.1 Scope and business context

AX scopes everything by `DataAreaId` (CompanyInfo) and organizes units in `OMOperatingUnit` with hierarchies in `OMHierarchyType` / `OMHierarchyRelationship`; SAP scopes by `BUKRS` (T001) with plants (T001W), storage locations (T001L), sales organizations (TVKO) and purchasing organizations (T024E) wired together in SPRO. Wave 6 builds the single organization model every later service filters by. At the end of the wave an administrator can create a tenant's legal entities, operating units, sites, warehouses and locations; build effective-dated hierarchies for reporting, procurement and security purposes; attach validated postal addresses; generate fiscal calendars; and maintain countries, currencies, units of measure and languages. The shell's legal-entity switcher re-scopes every list page.

Out of scope: ledger period *statuses* (wave 14 owns open/closed per module), warehouse layout detail such as zones and location directives (wave 31), intercompany relationships (wave 40), and any transactional data.

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
AX organization hierarchy designer (OMHierarchyRelationship) only shows one effective date at a time; previewing "what changes on 2026-07-01" means publishing and re-opening; a mistaken publish cannot be undone	Hierarchy relationships are stored as flat ValidFrom/ValidTo rows with no version concept	Versioned trees with draft/published states, as-of slider and a diff view before publish (FR-6.3, FR-6.11)	Preview clicks 9→1; wrong-date publishes recoverable in 100% of cases via superseding version
SAP enterprise structure (OX02/OX10/OX09/OX18/OB29) requires 6+ IMG transactions plus assignments to define one plant; a missing assignment surfaces only when the first goods movement fails	Configuration spread across customizing tables (T001, T001W, T001K, T001L, T024E) with assignment tables between them	One `Site` create carries its legal entity, calendar and default warehouse; invariants are checked at save, not at first transaction (FR-6.5)	Transactions 6→1; structural errors found at save: 100% vs ~0%
AX company switch (DataAreaId) reloads the whole client and loses open forms; cross-company inquiries need `crossCompany` X++	Company is a session property baked into every table	Header-scoped entity context; the shell switches without reload; read-only `ALL` scope behind a duty (FR-6.10)	Switch time 8–15 s→<300 ms; open views preserved 100%
Fiscal calendar period creation in AX (FiscalCalendarPeriod) and SAP (OB29 period tables) is manual per year; 4-4-5 week-53 years are keyed by hand and frequently wrong	No pattern generator	Pattern-driven generation with contiguity proof and golden fixtures (FR-6.7)	Setup effort 45 min/year→<10 s; boundary errors 0 against fixture
UoM conversion rounding silent in AX (UnitOfMeasureConversion stores Numerator/Denominator with decimal drift) and SAP (T006 integer ratios)	Ratio stored as scaled integers, rounded at storage	numeric(28,12) factor+offset, rounding only at display (FR-6.9, BR-6.8)	Round-trip error 1e-6→0 at 12 decimals across 50 pairs

1.6.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Legal entity	CompanyInfo, `OMLegalEntity` form, DataAreaId	T001 company code (OX02)	org-service `LegalEntity`; Legal entities screen	full
Operating units	OMOperatingUnit (dept, cost center, BU, value stream)	Cost center CSKS (KS01), profit center CEPC, controlling area TKA01	`OperatingUnit` with `type` enum	full
Org hierarchies	OMHierarchyType, OMHierarchyPurpose, OMHierarchyRelationship, Organization hierarchy designer	Standard hierarchy KSH1/KCH1, enterprise organization	`HierarchyType/HierarchyVersion/HierarchyNode`; Hierarchy designer	improved (multiple purposes with effective-dated versions and as-of API)
Sites	InventSite, Sites form	T001W plant (OX10)	`Site`	full
Warehouses / locations	InventLocation, WMSLocation	T001L storage location (OX09); LAGP bins	`Warehouse`, `Location` (bin-level detail deferred to wave 31)	partial
Addresses	LogisticsPostalAddress, LogisticsLocation, LogisticsLocationRole, DirPartyLocation	ADRC / ADRCT, address version	`PostalAddress`, `AddressPurpose`	full
Fiscal calendars	FiscalCalendar, FiscalCalendarYear, FiscalCalendarPeriod, Ledger calendar	T009 fiscal year variant (OB29), T009B periods	`FiscalCalendar`, `FiscalYear`, `FiscalPeriod`	full (status per ledger deferred to wave 14)
Currencies	Currency table, ISO 4217	TCURC, TCURX decimals	`Currency` reference with minor units	full
Units of measure	UnitOfMeasure, UnitOfMeasureConversion (standard + product-specific)	T006 (CUNI), T006A	`UnitOfMeasure`, `UomConversion`; product-specific in wave 8	full
Countries / regions / languages	LogisticsAddressCountryRegion, LogisticsAddressState, LanguageTable	T005, T005S, T002	`Country`, `Region`, `Language`	full
Company-level parameters	CompanyInfo fields, Ledger (currency, calendar)	T001 fields (WAERS, PERIV, KTOPL)	`LegalEntity` fields + ledger linkage in wave 11	partial (chart of accounts linkage arrives in wave 11)

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Teams and team types	OMTeam, OMTeamType, OMTeamMembershipCriterion (Organization administration → Teams)	HR OM work groups (PP01 organizational units), S/4 Responsibility Management teams (Fiori "Manage Teams and Responsibilities")	org-service `TeamType`, `Team`, `TeamMember`	full
Legal entity copy / template	Legal entity copy (SysDataExport/SysDataImport), D365 "Copy into legal entity" configuration project	EC01 copy company code, EC02 copy plant (organizational object copy)	`POST /org/v1/legal-entities/{id}:copy` (FR-6.15)	improved (invariants checked at copy)
Currency rounding rules	Currency form: general, price, purchase, sales rounding with round-off type normal/downward/rounding-up	TCURX decimals, OB90 rounding rules per company code and currency	`CurrencyRounding` per (currency, purpose, legal entity) (FR-6.16)	full
Organization name translations	Organization translations on OMOperatingUnit / CompanyInfo	T001 / CSKT / CEPCT texts per SPRAS	`org_unit_translation` (FR-6.17)	full

1.6.3 Functional requirements

- **FR-6.1 Tenant and legal-entity creation** — Must. The system shall create legal entities under a tenant with a unique 4–8 character code, legal name, country, accounting currency, default language and time zone.
  - Code is immutable after creation; names are effective-dated (name history table).
  - A legal entity cannot be deleted; it can be set `inactive`, which hides it from the switcher but keeps all references.
  - Maximum 500 legal entities per tenant in v1.
- **FR-6.2 Operating units** — Must. The system shall maintain operating units of type department, cost_center, business_unit and value_stream, each with a code unique within tenant and type.
  - Operating units are tenant-scoped, not legal-entity-scoped (mirrors AX, where OMOperatingUnit is shared), with an optional default legal entity.
  - A cost center may carry an optional `manager_party_id` resolved after wave 7.
- **FR-6.3 Multi-purpose effective-dated hierarchies** — Must. The system shall support hierarchy types with one or more purposes (reporting, procurement, expenditure, security, centralized_payments, custom) and versioned trees with `effective_from`/`effective_to` ranges that cannot overlap for the same type.
  - A node is any LegalEntity or OperatingUnit; one node appears at most once per version.
  - Draft versions may be edited freely; published versions are immutable; a new version is created by copying the current one.
  - Maximum depth 15, maximum 50,000 nodes per version.
- **FR-6.4 As-of hierarchy queries** — Must. The system shall answer parent, ancestors, descendants and path-to-root for any node as of any date with p95 < 20 ms at 50,000 nodes.
  - Implemented with a closure table materialized at publish time.
- **FR-6.5 Sites, warehouses and locations** — Must. The system shall maintain sites per legal entity, warehouses per site, and locations per warehouse, each with address, time zone and type (`standard`, `transit`, `quarantine`, `subcontractor` for warehouses).
  - Warehouse code unique per legal entity (as in AX InventLocationId per company); site code unique per legal entity.
  - A warehouse cannot move between sites once referenced by an inventory transaction (enforced from wave 16 via a reference-count check).
- **FR-6.6 Postal addresses with purposes** — Must. The system shall store structured postal addresses (ISO 3166-1 alpha-2 country, region, city, postal code, street lines, building, PO box) and attach them to any owner with purposes (business, delivery, invoice, remit_to, service, home, other) and a primary flag per purpose.
  - Country-specific formatting rules for the first seven countries (US, UK, DE, FR, IN, MX, CA); postal code regex per country.
  - Geocoding hook: an adapter interface returning lat/long and a confidence; default adapter is a no-op.
  - Addresses are effective-dated; an address edit creates a new version and keeps the old one for documents already printed.
- **FR-6.7 Fiscal calendars** — Must. The system shall generate fiscal years and periods from patterns: calendar-year (12 periods), 4-4-5 / 4-5-4 / 5-4-4 (12 periods + 53rd week handling), 13-period, and custom (user-entered period boundaries).
  - Each year has exactly one opening period and one closing period in addition to operating periods (AX convention), configurable off for SAP-style special periods 13–16.
  - Periods within a year are contiguous and non-overlapping; the generator proves this before saving.
- **FR-6.8 Reference data** — Must. The system shall seed and maintain ISO 3166 countries and regions, ISO 4217 currencies with minor units (JPY 0, KWD 3, USD/EUR 2), ISO 639-1 languages, and UCUM-aligned units of measure in classes (quantity, mass, length, volume, area, time, temperature, each).
  - Reference data is tenant-visible but platform-owned; tenants may add custom units and deactivate rows, not delete.
- **FR-6.9 UoM conversions** — Must. The system shall store conversions as `factor` and `offset` with numeric(28,12) precision and compute any-to-any within a class by path search of at most two hops.
  - Round-trip of 1 unit through A→B→A must return exactly 1 to 12 decimal places for the 50-pair fixture.
  - Temperature uses the offset (°C→°F: factor 1.8, offset 32).
- **FR-6.10 Legal-entity context switch** — Must. The system shall carry `X-Passage-LegalEntity` on every request; generated list pages filter by it, and the OPA policy denies requests for entities the user has no role assignment in.
- **FR-6.11 Hierarchy designer UI** — Should. The system shall provide a drag-and-drop tree editor with an effective-date slider that previews the tree as of a chosen date and highlights nodes that change between versions.
- **FR-6.12 Seed and export** — Should. The system shall export and import the complete organization model as a versioned JSON package (used by `make demo-seed` and by the migration framework in wave 10).
- **FR-6.13 Address validation adapter** — Could. The system shall expose an address-validation adapter interface (normalize, suggest) with a null default; third-party adapters are out of scope for this wave.
- **FR-6.14 Teams and team types** — Should. The system shall maintain team types (code, name, allowed member kinds `user` / `party`) and teams (code unique per tenant, name, description, team type, optional owning operating unit, `effective_from`/`effective_to`, status) with members (Keycloak user id or wave-7 party id, member role `member` / `lead`, `valid_from`/`valid_to`).
  - Teams are cross-organization groups, not hierarchy nodes; they are referenced by stewardship ownership (FR-7.11 `owner_team_id`), wave-4 work-item queues, address-book access (FR-7.18) and readiness-check assignment (FR-9.17).
  - Limits: 5,000 teams per tenant, 2,000 members per team; membership changes publish `dev.passage.org.team.membership.changed.v1` (team_id, added[], removed[], as_of).
  - Membership criteria (AX OMTeamMembershipCriterion) are an optional Rego filter over user attributes (e.g. `department == "D100"`), evaluated nightly by job ORG-J5; manual members are never removed by the rule.
- **FR-6.15 Legal-entity copy from template** — Should. The system shall create a legal entity by copying an existing legal entity or a template package: number sequences (reset to start values), fiscal calendar assignment, parameters (§1.6.13), address purposes, and optionally sites and warehouses; code, name, country and accounting currency are supplied by the user.
  - Runs as Temporal workflow `copy-le-{target_code}`; every copied object receives a new id; transactional data is never copied.

    - Copy of a 5-site, 20-warehouse entity completes in < 30 s; the result is validated against the same invariants as a manual create before commit.
- **FR-6.16 Currency rounding rules** — Must. The system shall store, per currency, purpose (general, price, purchase, sales, tax, cash) and optional legal entity, a rounding unit (0.000001–1,000) and method (half_even, half_up, down, up); the default is the ISO 4217 minor unit with half_even, and consumers call `GET /org/v1/currencies/{code}/round?amount=&purpose=`.
    - Cash rounding (CHF 0.05, SEK 1.00) uses the `cash` purpose; consumed by waves 26 and 30.
    - Legal-entity rows override tenant rows for the same (currency, purpose).
- **FR-6.17 Organization name translations** — Should. The system shall store translated names of legal entities, operating units, sites and warehouses per BCP 47 language, with fallback to the base name; printed documents (wave 46) render the name in the document language.

1.6.4 Data model

LegalEntity

Field	Type	Required	Notes
id	uuid	yes	PK
tenant_id	uuid	yes	RLS key
code	text(8)	yes	unique per tenant, immutable, `^[A-Z0-9]{2,8}$`
name	text(100)	yes	current name; history in legal_entity_name
country_code	char(2)	yes	FK country
accounting_currency	char(3)	yes	FK currency; immutable after first posting (wave 11)
default_language	text(5)	yes	BCP 47, default `en-US`
time_zone	text	yes	IANA zone
primary_address_id	uuid	no	FK postal_address
registration_number	text(40)	no	company registry number
status	enum	yes	active, inactive
created_at / updated_at / version	timestamptz, int	yes	optimistic lock on `version`

HierarchyVersion / HierarchyNode

Field	Type	Required	Notes
id	uuid	yes	PK
hierarchy_type_id	uuid	yes	FK; type carries purposes[]
version_no	int	yes	monotonic per type
effective_from	date	yes	inclusive
effective_to	date	no	exclusive; null = open-ended
status	enum	yes	draft, published, superseded
node.id	uuid	yes	PK of hierarchy_node
node.version_id	uuid	yes	FK
node.org_unit_id	uuid	yes	LegalEntity or OperatingUnit id; unique per version
node.parent_node_id	uuid	no	null for root; exactly one root per version
node.sort_order	int	yes	sibling order
closure(ancestor_id, descendant_id, depth)	table	yes	rebuilt on publish

PostalAddress

Field	Type	Required	Notes
id	uuid	yes	PK
tenant_id	uuid	yes	RLS
country_code	char(2)	yes	FK
region_code	text(10)	conditional	required for US, CA, IN, MX
city	text(60)	yes	
postal_code	text(12)	conditional	validated by country regex
street_1 / street_2 / street_3	text(100)	street_1 yes	
building / po_box	text(20)	no	
latitude / longitude	numeric(9,6)	no	from geocoding hook
valid_from / valid_to	date	yes/no	effective dating
formatted	text	computed	rendered per country template

FiscalCalendar / FiscalPeriod — calendar: id, tenant_id, code, name, pattern (enum), week_start; period: id, calendar_id, fiscal_year, period_no (0 = opening, 1–13 operating, 99 = closing), name, start_date, end_date, type (opening/operating/closing/adjustment).

UnitOfMeasure / UomConversion — uom: id, code (`^[A-Za-z0-9/%]{1,10}$`), name, class, decimal_precision (0–6), system_flag; conversion: from_uom_id, to_uom_id, factor numeric(28,12), offset numeric(28,12), product_id (null here, used in wave 8).

Invariants: exactly one root per published hierarchy version; no overlapping effective ranges per hierarchy type; fiscal periods of a year tile the year with no gap or overlap; a warehouse's legal entity equals its site's legal entity; every `primary` address purpose is unique per (owner, purpose). Indexing: `hierarchy_node(version_id, org_unit_id)` unique; closure table PK (ancestor_id, descendant_id); `postal_address` GIN trigram on `formatted` for search; all tables partitioned logically by tenant_id with RLS policies, no physical partitioning in this wave.

Team / TeamMember / CurrencyRounding (FR-6.14, FR-6.16) — team: id, tenant_id, code text(20) unique per tenant, name text(60), team_type_id FK, operating_unit_id FK null, effective_from date, effective_to date null, status (active, inactive), membership_rule text null (Rego), version; team_member: team_id, member_kind (user, party), member_id uuid, member_role (member, lead), valid_from date, valid_to date null, source (manual, rule), unique (team_id, member_kind,

member_id, valid_from); currency_rounding: currency_code char(3), purpose enum, legal_entity_id uuid null, unit numeric(16,6) > 0, method enum, PK (currency_code, purpose, coalesce(legal_entity_id, nil-uuid)). org_unit_translation: owner_type, owner_id, language text(5), name text(100), PK (owner_type, owner_id, language).

1.6.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
POST	/org/v1/legal-entities	Create legal entity	`Idempotency-Key` header, 24 h	Maintain legal entities
GET	/org/v1/legal-entities/{id}	Read	n/a	View organization
PATCH	/org/v1/legal-entities/{id}	Update name/addresses/status	version check (409 on mismatch)	Maintain legal entities
POST	/org/v1/operating-units	Create operating unit	key header	Maintain operating units
POST	/org/v1/hierarchy-types/{id}/versions	Create draft version (copy of current)	key header	Maintain organization hierarchies
PUT	/org/v1/hierarchy-versions/{id}/nodes	Replace the full node set of a draft	full replace, naturally idempotent	Maintain organization hierarchies
POST	/org/v1/hierarchy-versions/{id}:publish	Publish; sets effective_from; builds closure	key header	Publish organization hierarchies
GET	/org/v1/hierarchy-types/{id}/as-of?date=2026-06-01&node=...	Ancestors/descendants/path as of a date	n/a	View organization
POST	/org/v1/sites, /org/v1/warehouses, /org/v1/locations	Create physical structure	key header	Maintain sites and warehouses
POST	/org/v1/addresses	Create address; `owner_type`, `owner_id`, `purposes[]`	key header	Maintain addresses
POST	/org/v1/fiscal-calendars/{id}:generate	Generate years from pattern	idempotent per (calendar, year)	Maintain fiscal calendars
GET	/org/v1/uom/convert?from=KG&to=LB&qty=10	Convert quantities	n/a	any authenticated
POST	/org/v1/export, /org/v1/import	Org model package	import idempotent by code	Administer organization

Commands validate: codes against regex; address against country rules; hierarchy publish rejects cycles, duplicate nodes, multiple roots, overlapping ranges; fiscal generation rejects a year already generated unless `force=true` and the year has no postings (checked via a ledger callback that returns `true` until wave 11 exists).

Event (CloudEvents type)	Trigger	Payload fields	Consumers
dev.passage.org.legalentity.created.v1	commit of legal entity	id, code, name, country_code, accounting_currency, time_zone	party, product, ledger, shell switcher
dev.passage.org.legalentity.updated.v1	PATCH commit	id, changed_fields[], version	shell, search
dev.passage.org.operatingunit.created.v1	commit	id, type, code, name	reporting, ledger dimensions
dev.passage.org.hierarchy.version.activated.v1	publish	hierarchy_type_id, purposes[], version_id, effective_from, node_count	OPA bundle builder, reporting, procurement
dev.passage.org.site.created.v1 / warehouse.created.v1 / location.created.v1	commit	id, legal_entity_id, parent_id, type, address_id	product, inventory
dev.passage.org.address.changed.v1	new address version	address_id, owner_type, owner_id, purposes[], valid_from	document services
dev.passage.org.fiscalcalendar.generated.v1	generate	calendar_id, fiscal_year, periods[]	ledger, period close

1.6.6 User experience

Screen	Primary actions	Key fields/columns	Duty required
Organization administration workspace	Tiles: legal entities, operating units, hierarchies, sites/warehouses, calendars, reference data	counts, last-changed, pending drafts	View organization
Legal entities list/detail	New, edit, deactivate, addresses tab, name history	code, name, country, currency, status	Maintain legal entities
Operating units list	New, bulk import (CSV), type filter	type, code, name, default legal entity	Maintain operating units
Hierarchy designer	Drag-drop nodes, add from picker, effective-date slider, diff vs previous version, publish	tree, effective range, node count, change badges	Maintain / Publish organization hierarchies
Sites and warehouses	New site, new warehouse under site, locations grid	code, name, type, address, time zone	Maintain sites and warehouses
Fiscal calendars	New calendar, generate years, period grid	pattern, year, period no, start, end	Maintain fiscal calendars
Reference data (countries, currencies, UoM, languages)	Deactivate, add custom UoM, add conversion, test conversion	code, name, class, factor, offset	Maintain reference data

Interaction rules: all grids support inline edit with validation on blur and a single save per row; `Ctrl+S` saves, `Esc` cancels, `Alt+N` new; the hierarchy designer validates structurally on every drop and semantically (effective range) on publish only; personalization (column order, saved filters) is stored per user per screen by the wave-5 shell; the legal-entity switcher is in the top bar and persists the last choice.

1.6.7 Business rules and edge cases

- **BR-6.1** Legal entity codes are upper-cased on save and compared case-insensitively; `DAT`, `SYS` and `ALL` are reserved.
- **BR-6.2** Hierarchy version state machine: `draft → published → superseded`; `draft` may be deleted; `published` becomes `superseded` only when a later version publishes with `effective_from` greater than its own; a published version can be ended early by publishing a successor, never by editing.
- **BR-6.3** Publishing a version whose `effective_from` is earlier than today requires the duty "Backdate organization hierarchies" and is audited with a reason text (min 10 chars).
- **BR-6.4** Moving a node moves its subtree; dropping a node onto its own descendant is rejected with `ORG-HIER-CYCLE`.
- **BR-6.5** A security-purpose hierarchy triggers an OPA bundle rebuild within 60 s of activation; until the rebuild completes, the previous bundle stays in force (no window with no policy).
- **BR-6.6** Fiscal 4-4-5 years ending on a 53-week boundary add the extra week to the last period of the year; the generator records `week53 = true` on that period.
- **BR-6.7** A fiscal year may be regenerated only while no period of it has any posting; otherwise `ORG-CAL-LOCKED` (409).
- **BR-6.8** UoM conversions are stored once in a canonical direction; the inverse is computed as 1/factor with the offset negated and divided; results are rounded only at display, using the target unit's `decimal_precision`.

- **BR-6.9** Address edits are copy-on-write: documents hold the address version id, not the address id, so a printed invoice never changes retroactively.
- **BR-6.10** Concurrent edits use the `version` column; a stale PATCH returns 409 with the current representation; the UI offers merge or reload.
- **BR-6.11** Deactivating a legal entity is refused while any user has it as their default entity (`ORG-LE-DEFAULT-IN-USE`).
- **BR-6.12** A team member's validity must lie inside the team's effective range (`ORG-TEAM-MEMBER-RANGE`); a team whose `effective_to` is in the past accepts no new members (`ORG-TEAM-EXPIRED`); deactivating a team that owns parties reassigns ownership to the team lead or, with no lead, raises a stewardship item per party.
- **BR-6.13** Rounding: `round(a, u, m) = u × R_m(a / u)` computed in numeric(28,12); half_even sends exact ties to the even multiple; a unit that is not a power-of-ten multiple of the minor unit or 0.05/0.25/0.5 multiples thereof is rejected (`ORG-CUR-ROUNDING-UNIT`).
- **BR-6.14** Legal-entity copy keeps site and warehouse codes (unique per legal entity) and rewrites tenant-unique codes with the target code as prefix; a collision aborts the whole copy with no partial result.

1.6.8 Acceptance criteria

- **AC-6.1** (FR-6.3, FR-6.4) Given 1,000 effective-dated nodes across 5 purposes with 3 versions each, when the as-of API is called for 10,000 random (node, date) pairs, then every parent matches the fixture oracle and p95 latency < 20 ms.
- **AC-6.2** (FR-6.10) Given a user assigned to legal entities USMF and DEMF, when they switch from USMF to DEMF, then all 20 generated list pages show only DEMF rows and a direct API call with `X-Passage-LegalEntity: FRMF` returns 403.
- **AC-6.3** (FR-6.9) Given the 50-pair conversion fixture, when each quantity is converted A→B→A, then the result equals the input to 12 decimal places.
- **AC-6.4** (FR-6.7) Given calendar patterns 4-4-5, 13-period and calendar-year for fiscal 2026, when generated, then period boundaries equal the committed fixture files exactly, including the 53rd week in the 4-4-5 variant for 2028.
- **AC-6.5** (FR-6.3, BR-6.2) Given a published version effective 2026-01-01, when a draft with `effective_from` 2025-12-01 is published without the backdate duty, then the request is rejected with 403 and no version changes state.
- **AC-6.6** (FR-6.6) Given a US address without `region_code`, when saved, then validation fails with field-level error `ORG-ADDR-REGION-REQUIRED`; with `region_code = CA` and postal code `9410`, then error `ORG-ADDR-POSTAL-FORMAT`.
- **AC-6.7** (FR-6.5) Given warehouse WH1 under site S1 in USMF, when a PATCH attempts to set `site_id` to a site in DEMF, then 422 `ORG-WH-LE-MISMATCH`.
- **AC-6.8** (FR-6.12) Given the demo seed package, when imported twice, then the second import reports 0 creates, 0 updates.
- **AC-6.9** (FR-6.11) Given the designer with the slider at 2026-06-01, when a node moved only in the draft version is viewed, then it renders with a "changed" badge and the previous parent shown in a tooltip.
- **AC-6.10** (FR-6.14, BR-6.12) Given team "MD stewards" effective 2026-01-01..2026-12-31, when a member is added with `valid_from` 2027-01-15, then 422 `ORG-TEAM-MEMBER-RANGE`; given a party owned by the team, then it appears in each current member's stewardship queue.
- **AC-6.11** (FR-6.16, BR-6.13) Given CHF cash rounding 0.05 half_up, when 10.024 and 10.025 are rounded, then 10.00 and 10.05; given EUR general 0.01 half_even, then 2.345 → 2.34 and 2.355 → 2.36.
- **AC-6.12** (FR-6.15) Given USMF with 2 sites, 5 warehouses and 12 number sequences, when copied to CAMF (CA, CAD), then CAMF has 2 sites, 5 warehouses, 12 sequences at their start values, 0 transactional rows, and completes in < 30 s.

1.6.9 Test plan and fixtures

Fixtures: `org/demo-manufacturer.json` (3 legal entities USMF/DEMF/FRMF, 2 sites, 5 warehouses, 40 operating units, 3 hierarchy types, generated); `org/hierarchy-1k.json` (1,000 nodes, 5 purposes, 3 versions each, generated with seed 6); `org/uom-pairs.csv` (50 pairs, hand-checked); `org/fiscal-patterns/*.csv` (4-4-5, 4-5-4, 5-4-4, 13-period, calendar for 2025–2028, hand-checked against the NRF retail calendar); `org/addresses-7-countries.csv` (140 valid, 70 invalid).

Test	Type	Target	Pass criterion
Hierarchy as-of oracle	property	as-of API	10k samples, 0 mismatches, p95 < 20 ms
Closure rebuild	unit	publish	closure row count = Σ depth over nodes
Entity re-scope	property (Playwright)	20 list pages	0 cross-entity rows
UoM round-trip	unit	convert	12-decimal equality
Fiscal generation	golden	generator	byte-equal CSV
Address validation	table-driven	validator	210/210 expected outcomes
Publish under load	performance	50k-node publish	< 30 s, as-of p95 < 20 ms after
Event contract	contract (AsyncAPI)	7 events	schema registry accepts; consumer stubs decode

Reconciliation: node count per published version = closure rows with depth 0; count of warehouses per legal entity in export = count in database; every legal entity has exactly one `primary` business address or none.

1.6.10 Deployment and operations

Helm chart `passage-org` (Deployment ×2 replicas, CloudNativePG cluster `org-db` with 3 instances, Debezium connector CR for the outbox table). Config: `ORG_HIERARCHY_MAX_NODES=50000`, `ORG_GEOCODER=null`, `ORG_SEED_PACKAGE=demo-manufacturer`. Migrations via Atlas from entity metadata, applied by an Argo CD pre-sync Job. Feature flags: `org.hierarchy_designer`, `org.address_validation_adapter`. Scheduled job: nightly closure-table integrity check (Temporal cron `0 2 * * *`). SLOs: read p95 < 50 ms, as-of p95 < 20 ms, availability 99.9%. Alerts: outbox lag > 60 s, closure integrity failure, OPA bundle rebuild older than 5 min after a security hierarchy activation. Runbook: "Hierarchy publish stuck" (check Temporal workflow `publish-hierarchy-{id}`), "Rebuild closure table" (`passagectl org rebuild-closure --version`). Rollback: Argo rollback to the previous digest; migrations in this wave are additive only, so no down-migration is needed.

1.6.11 Migration from AX / SAP

Source	Passage entity	Notes
AX CompanyInfo / OMLegalEntity (DataAreaId, Name, LanguageId, CurrencyCode via Ledger)	LegalEntity	DataAreaId → code (upper-cased); Ledger.AccountingCurrency → accounting_currency
AX OMOperatingUnit (OMOperatingUnitNumber, OMOperatingUnitType)	OperatingUnit	type enum 1..4 → department/cost_center/business_unit/value_stream
AX OMHierarchyType, OMHierarchyPurpose, OMHierarchyRelationship (ValidFrom/ValidTo)	HierarchyType, HierarchyVersion, HierarchyNode	each distinct ValidFrom in AX becomes a version; ValidTo max date → null
AX InventSite, InventLocation	Site, Warehouse	InventLocation.InventSiteId → site FK; warehouse type from InventLocation.WMSLocationId usage
AX LogisticsPostalAddress, LogisticsLocation, LogisticsLocationRole, DirPartyLocation	PostalAddress, AddressPurpose	roles Business/Delivery/Invoice/RemitTo map 1:1; others → other

Source	Passage entity	Notes
AX FiscalCalendar, FiscalCalendarYear, FiscalCalendarPeriod	FiscalCalendar, FiscalPeriod	Type Opening/Operating/Closing → period type
AX UnitOfMeasure, UnitOfMeasureConversion (non product-specific)	UnitOfMeasure, UomConversion	Factor/Numerator/Denominator → factor; InnerOffset/OuterOffset → offset
SAP T001 (BUKRS, BUTXT, LAND1, WAERS, SPRAS, PERIV)	LegalEntity	PERIV → fiscal_calendar assignment
SAP T001W (WERKS, NAME1, ADRNR) / T001L (LGORT)	Site + Warehouse	plant → site; a default warehouse per plant is created when T001L is empty
SAP CSKS / CEPC / T001K	OperatingUnit	cost center, profit center; KOKRS stored as attribute
SAP ADRC (ADDRNUMBER, NAME1, STREET, POST_CODE1, CITY1, COUNTRY, REGION)	PostalAddress	DATE_FROM → valid_from
SAP T009 / T009B	FiscalCalendar, FiscalPeriod	special periods 13–16 → adjustment periods when `sap_special_periods=true`
SAP T006 / T006A / TCURC / TCURX / T005	reference data	matched to ISO seed by code; unmatched custom units created

Validation: every migrated warehouse resolves to a site; every address passes country rules or lands in the exception queue; hierarchy versions must tile without gaps. Not migrated: AX `OMInternalOrganization` team records (no Passage equivalent in v1), SAP sales/purchasing organizations (modeled in waves 17 and 26 as procurement and sales hierarchies), SAP client (MANDT) which maps to tenant by configuration.

1.6.12 Dependencies, risks, open questions

Depends on: wave 2 (tenant model, RLS, OPA duties), wave 3 (entity metadata and generator), wave 4 (outbox, Temporal for publish jobs), wave 5 (shell, generated forms, audit, number sequences for operating unit numbers).

Risk	Likelihood	Impact	Mitigation
Closure-table rebuild blocks publishing large versions	Medium	Medium	Rebuild runs as a Temporal activity; version stays `publishing` until done
Country address rules incomplete beyond 7 countries	High	Low	Generic fallback rule; country packs in wave 48
Shell switcher semantics conflict with cross-entity screens (consolidation)	Low	Medium	Switcher supports `ALL` for read-only cross-entity views behind a duty

Open questions: (1) Should operating units be legal-entity-scoped as an option for SAP-style cost centers tied to a controlling area? Proposed default: tenant-scoped with optional default legal entity; decide by wave 11. (2) Do we store SAP special periods as adjustment periods or as flags on period 12? Proposed: adjustment periods; decide by wave 14. (3) Is UCUM the canonical UoM code set or ISO 80000? Proposed: UCUM codes with ISO display names; decide by wave 8.

1.6.13 Parameters and setup

Organization parameters live in the wave-3 metadata registry as typed settings; each row below is one setting key in `org.*`.

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
`org.le.code_pattern`	tenant	regex	`^[A-Z0-9]{2,8}$`	regex ≤ 40 chars	Validates legal entity codes (FR-6.1, BR-6.1)	DataAreaId (4 chars) on CompanyInfo	BUKRS (4 chars), OX02
`org.le.default_language`	legal entity	BCP 47	`en-US`	seeded languages	Default UI and document language	CompanyInfo.LanguageId	T001-SPRAS
`org.time_zone`	legal entity / site / warehouse	IANA zone	tenant default	IANA list	Date boundaries for postings, cut-offs, timers	Legal entities → Time zone (D365)	ADRC-TIME_ZONE on plant address, system time zone STZAC
`org.le.accounting_currency`	legal entity	ISO 4217	none (required)	active currencies	Ledger currency; immutable after first posting	Ledger form → Accounting currency	T001-WAERS (OB22 for parall currencies)
`org.le.fiscal_calendar`	legal entity	FK	none (required before wave 11 posting)	calendars with ≥ 1 generated year	Period resolution for every posting	Ledger form → Fiscal calendar	OB37 (T001-PERIV)
`org.cal.opening_closing_periods`	calendar	bool	true	true / false	Generates period 0 and 99 per year (FR-6.7)	FiscalCalendar → Create year (opening/closing periods)	— (SAP uses special periods)
`org.cal.special_periods`	calendar	int	0	0–4	Adds adjustment periods 13–16 (open question 2)	—	T009-ANZBP via OB29
`org.cal.week_start`	calendar	enum	Monday	Monday–Sunday	Anchors 4-4-5 / 13-period generation	FiscalCalendar week start	Week-based fiscal year variant (OB29)
`org.hier.max_depth`	tenant	int	15	5–25	Publish validation (FR-6.3)	—	Standard hierarchy levels (OKEON)
`org.hier.max_nodes`	tenant	int	50,000	1,000–200,000	Publish validation; `ORG_HIERARCHY_MAX_NODES`	—	—
`org.hier.backdate_allowed`	hierarchy type	bool	false	true / false	When false, BR-6.3 duty is not grantable for that type	Hierarchy designer publish date rule	—
`org.addr.format`	country	template	UPU-style template for US, UK, DE, FR, IN, MX, CA	template tokens `{street_1}` … `{postal_code}`	Renders `formatted` (FR-6.6)	Address setup → Address format (LogisticsAddressFormatHeading)	Address layout key T005-LAND (ADDRESS_INTO_PRINTFOR
`org.addr.postal_check`	country	enum	strict for 7 v1 countries, off otherwise	off / warn / strict	Postal code regex enforcement	Address parameters → ZIP/postal code validation	T005 postal code check rule (OY17)
`org.addr.geocoder`	tenant	adapter id	`null`	`null` / registered adapter	Geocoding hook (FR-6.6)	Address parameters → geocoding (Bing Maps, D365)	Geographical Enablement Framework / DQM

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
`org.cur.rounding`	currency × purpose (× legal entity)	unit + method	ISO minor unit, half_even	BR-6.13	Monetary rounding service (FR-6.16)	Currency → Rounding rules	OB90, TCURX
`org.uom.decimal_precision`	unit	int	per seed (EA 0, KG 3)	0–6	Display rounding (BR-6.8)	Units → Decimal precision	T006-ANDEC
`org.ou.number_sequence`	tenant	sequence	`OU-{#####}`	wave-5 sequences	Operating unit numbers	Organization administration parameters → Number sequences	Cost center / profit center manu keys (KS01/KE51)
`org.team.rule_evaluation`	tenant	bool	false	true / false	Enables job ORG-J5	OMTeamMembershipCriterion	—
`org.switcher.all_scope`	tenant	bool	false	true / false	Allows read-only `ALL` legal-entity scope behind a duty (FR-6.10)	Cross-company queries	—

1.6.14 Inquiries and reports

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
Legal entities	list inquiry	status, country, currency	code, name, country, currency, calendar, time zone, status	`org.legal_entity`	OMLegalEntity list; SSRS Legal entities list	OX02 overview (T001)
Organization hierarchy as of date	drill-down	hierarchy type, purpose, as-of date, root node	tree, depth, node type, effective range, child count	closure table	Organization hierarchy inquiry; SSRS Organization chart	OKENN, KSH3, KCH3
Hierarchy version comparison	drill-down	type, version A, version B	added, removed, moved nodes with old/new parent	`hierarchy_node`	Hierarchy designer "view changes"	Change documents on SETHEADER/SETNODE (RSSCD100)
Operating units	list inquiry	type, default legal entity, status, hierarchy membership	number, name, type, manager, legal entity, hierarchies	`org.operating_unit`	SSRS Operating units list	KS13 cost center report, KE5X profit center list
Sites, warehouses and locations	list inquiry	legal entity, type, status	site, warehouse, type, address, time zone, location count	`org.site`, `org.warehouse`	InventSite / InventLocation lists	OX10 / OX09 (T001W, T001L)
Fiscal periods	list inquiry	calendar, year	period no, name, start, end, type, week53	`org.fiscal_period`	Fiscal calendars → periods	OB29 periods (T009B)
Unit conversions	operational report	class, unit, product-specific yes/no	from, to, factor, offset, inverse, round-trip check	`org.uom_conversion`	SSRS Unit conversions list	CUNI (T006)
Unassigned structure	KPI	legal entity	warehouses without address, legal entities without calendar, operating units in no hierarchy, sites without warehouse	integrity projection	—	1KE1 profit center assignment monitor
Address validation exceptions	operational report	country, owner type, rule	address, failed rule, owner, age	`org.postal_address`	Address validation (D365)	DQM address check results
Teams and members	list inquiry	team type, as-of date, member	team, member, role, source, valid from/to	`org.team_member`	Teams (OMTeam)	Responsibility Management teams
Organization change log	drill-down	entity, user, date range	field, old, new, user, timestamp	wave-5 audit	Database log (SysDatabaseLog)	Change documents (KS05, OX02 table logs)

1.6.15 Printed and electronic documents

Document	Trigger	Layout elements (header/line/footer fields)	Formats	Numbering sequence	Legal / retention requirement
Organization chart	on demand from hierarchy designer	header: hierarchy type, purpose, as-of date; body: node boxes (code, name, manager); footer: version no, printed by, timestamp	PDF, SVG	none	none
Fiscal period schedule	on calendar generation or on demand	header: calendar, year, pattern; lines: period no, name, start, end, type; footer: generated by	PDF, XLSX	none	retained with ledger configuration for 10 years (HGB §257, Code de commerce L123-22)
Organization model package	export (FR-6.12)	manifest (schema version, sha256, counts) + JSON bodies	JSON (electronic)	`ORGPKG-{yyyy}-{####}`	7 years as configuration evidence

1.6.16 Periodic and batch jobs

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
ORG-J1 Closure-table integrity check	daily 02:00 tenant local	hierarchy_type_id	read-only; checkpoint per type	< 5 min for 10 types × 50k nodes	report only, never auto-repair; runbook "Rebuild closure table"	`org_closure_integrity_failures > 0`
ORG-J2 Future-dated hierarchy activation	Temporal timer at `effective_from` 00:00 legal-entity time	version_id	one timer per version; activation idempotent	< 30 s	5 retries with backoff, then alert; previous version stays active	activation lag > 5 min
ORG-J3 Fiscal year roll-forward	daily check; generates next year 90 days before the last generated year ends	calendar_id	idempotent per (calendar, year)	< 10 s per calendar	custom-pattern calendars raise a stewardship item instead	no next year 30 days before year end
ORG-J4 Address re-validation and geocode refresh	weekly Sunday 03:00	country_code	checkpoint per 1,000 addresses	< 1 h per 1M addresses	adapter outage leaves status unchanged	adapter error rate > 20%
ORG-J5 Team membership rule evaluation	nightly 01:30	team_id	diff-based; re-run yields no change	< 10 min for 5,000 teams	rule error disables the rule and notifies the team lead	rule failures > 0
ORG-J6 Reference data refresh (ISO 3166/4217/639 updates)	quarterly, applied after admin approval	dataset	versioned package; re-apply is a no-op	< 1 min	rejected package keeps prior version	package pending > 14 days

1.6.17 Security duties and privileges

Duty	Privileges (entry points)	Segregation-of-duties conflicts	Default roles that include it
View organization	`GET /org/v1/**`; Organization administration workspace; all org list pages	none	every role
Maintain legal entities	`POST/PATCH /org/v1/legal-entities`, `:copy`; Legal entities screen	Administer security roles (wave 2)	Organization administrator
Maintain operating units and teams	`/org/v1/operating-units`, `/org/v1/teams`, `/org/v1/team-types`; job ORG-J5 config	none	Organization administrator, HR administrator
Maintain organization hierarchies	draft create, `PUT …/nodes`; Hierarchy designer	Publish organization hierarchies for `security` purpose (maker-checker)	Organization administrator
Publish organization hierarchies	`POST …:publish`; ORG-J2 timers	Maintain organization hierarchies on security-purpose types	Organization administrator lead, Security administrator
Backdate organization hierarchies	publish with `effective_from` < today	Maintain organization hierarchies	Controller
Maintain sites and warehouses	`/org/v1/sites`, `/warehouses`, `/locations`	none	Organization administrator, Warehouse manager
Maintain fiscal calendars	`/org/v1/fiscal-calendars`, `:generate`; ORG-J3	Close fiscal periods (wave 14)	Accounting manager
Maintain reference data	countries, currencies, rounding, UoM, languages; ORG-J6 approval	none	Master data steward
Administer organization	`/org/v1/export`, `/org/v1/import`	Approve migration sign-off (wave 10)	System administrator

1.6.18 Message catalog

Code	Severity	User text	Cause	Remediation	Raised by
ORG-LE-CODE-RESERVED	error	"Code {code} is reserved."	DAT, SYS or ALL used	Choose another code	BR-6.1
ORG-LE-DEFAULT-IN-USE	error	"{n} users have this legal entity as default."	Deactivation while users default to it	Change users' default entity	BR-6.11
ORG-HIER-CYCLE	error	"Moving {node} under {target} creates a cycle."	Drop onto own descendant	Drop on a non-descendant	BR-6.4
ORG-HIER-MULTI-ROOT	error	"A version must have exactly one root; found {n}."	Publish with 0 or ≥ 2 roots	Attach orphans to the root	FR-6.3
ORG-HIER-OVERLAP	error	"Effective range overlaps version {v}."	Overlapping ranges per type	Adjust `effective_from`	FR-6.3
ORG-HIER-BACKDATE-DUTY	error	"Backdated publish requires the Backdate duty and a reason."	Past `effective_from` without duty	Request duty or use today	BR-6.3
ORG-CAL-LOCKED	error	"Fiscal year {y} has postings and cannot be regenerated."	Regenerate with postings	Create adjustment periods instead	BR-6.7
ORG-CAL-GAP	error	"Periods leave a gap on {date}."	Custom boundaries not contiguous	Fix boundaries	FR-6.7
ORG-ADDR-REGION-REQUIRED	error	"Region is required for {country}."	Missing region for US/CA/IN/MX	Enter region	FR-6.6
ORG-ADDR-POSTAL-FORMAT	error	"Postal code {code} is not valid for {country}."	Regex failure in strict mode	Correct code or set mode warn	FR-6.6
ORG-WH-LE-MISMATCH	error	"Warehouse and site belong to different legal entities."	Site change across entities	Pick a site in the same entity	FR-6.5
ORG-UOM-NO-PATH	error	"No conversion from {from} to {to} within two steps."	Missing conversion	Add a conversion	FR-6.9
ORG-TEAM-MEMBER-RANGE	error	"Member validity must be inside the team's effective range."	Out-of-range dates	Adjust dates	BR-6.12
ORG-TEAM-EXPIRED	error	"Team {code} has ended."	Member added to ended team	Extend the team	BR-6.12
ORG-CUR-ROUNDING-UNIT	error	"Rounding unit {u} is not allowed for {currency}."	Unit not a permitted multiple	Use a permitted unit	BR-6.13
ORG-VERSION-CONFLICT	warning	"This record changed since you opened it."	Stale `version`	Merge or reload	BR-6.10

1.6.19 Performance budgets and capacity

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
As-of hierarchy query	2M/day; peak 3,000/min	4 / 20 / 40 ms	500 req/s per replica	closure ≈ 400k rows per 50k-node version, ~30 MB/yr	PK (ancestor_id, descendant_id) per version; partial index on published	served from current closure; p95 ≤ 40 ms; exports queued first
Legal-entity switch (shell re-scope)	20k/day; peak 200/min	80 / 300 / 500 ms	50 req/s	none	OPA decision cache per (user, entity) 60 s	cache hit ratio keeps p95 ≤ 600 ms
Hierarchy publish (50k nodes)	20/day	8 / 30 / 45 s	1 concurrent per hierarchy type	~5 MB per version	Temporal activity; bulk insert closure	queued FIFO per type; no timeout
UoM conversion	5M/day; peak 10k/min	1 / 5 / 10 ms	2,000 req/s per replica	negligible	in-memory conversion graph, invalidated by event	unchanged (CPU-bound, cached)
Address create with validation	50k/day; peak 500/min	20 / 80 / 150 ms (adapter excluded)	100 req/s	~200 MB per 1M addresses	GIN trigram on `formatted`; btree (owner_type, owner_id)	adapter calls skipped, status `unverified`
Fiscal year generation	100/yr	0.5 / 2 / 5 s	n/a	< 1 MB	(calendar_id, fiscal_year, period_no) unique	unchanged
Organization export package	10/day	2 / 10 / 20 s	2 concurrent per tenant	1–20 MB per package	n/a	requests beyond 2 queued

1.6.20 Localization and compliance hooks

Item	What varies	Country packs touching it (wave 48)	Extension point
Address format and postal validation	Line order, region requirement, postal regex (US ZIP+4, UK postcode, CA A1A 1A1, IN 6-digit PIN, MX 5-digit CP)	US, UK, DE, FR, IN, MX, CA in this wave; others via pack	`AddressFormatProvider` registry keyed by country
Legal entity registration identifiers	DE Handelsregister (HRB + court), FR SIREN/SIRET + NAF, IN CIN + PAN + TAN, MX RFC + régimen fiscal, UK Companies House number, US EIN + state of incorporation, CA BN	all seven	typed `legal_entity_registration` list contributed by pack metadata
Fiscal year conventions	IN April–March statutory year; UK companies any year end; MX statutory calendar year (CFF Art. 11); US 52/53-week allowed (IRC §441(f))	IN, MX, US	calendar templates shipped by pack; FR-6.7 generator
Currency and cash rounding	CHF/SEK cash rounding; CAD penny elimination (cash to 0.05); MXN 2 decimals; INR 2 decimals, invoice totals often to 1.00	CA, IN	`org.cur.rounding` rows seeded by pack

Item	What varies	Country packs touching it (wave 48)	Extension point
Holidays and time zones	Bank holidays for due-date shifting (wave 19), DST rules	all	IANA zones; holiday calendars provided as pack data, consumed by FR-9.6 and wave 19
Language of documents	FR Loi Toubon (French on documents for French counterparties); CA Quebec Charter of the French language (Bill 96)	FR, CA	FR-6.17 translations; document language on legal entity
Privacy	Home addresses of persons are personal data (GDPR, UK GDPR, CCPA/CPRA, India DPDP Act 2023, Mexico LFPDPPP, PIPEDA)	all	`home` purpose flagged PII; masking per BR-7.9
Retention	Organization master and calendars kept for tenant life + 10 years (DE HGB §257 10 y, FR 10 y, US IRS 7 y, IN Companies Act §128 8 y)	all	retention class `org-config` in wave-5 audit store

1.6.21 Coverage closure

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
AX §12.12.1 Human resources, Common — Teams (Org admin: Teams, Team types), OMTeam; register §12.99.4 #107	PARTIAL-6	ADDED as FR-6.14	Team, team type, members, membership criteria; HR uses the same entity
AX §12.12.4 Human resources, Setup — Teams → Team types, Teams, OMTeam; register §12.99.4 #114	PARTIAL-6	ADDED as FR-6.14	Setup screen is the Teams list with type filter (§1.6.17 duty "Maintain operating units and teams")
AX §12.29.1 Organization administration, Common — Teams / Team types, OMTeam; register §12.99.4 #232	PARTIAL-6	ADDED as FR-6.14	Inquiry "Teams and members" in §1.6.14
AX §12.29.4 Organization administration, Setup — Organization → Teams / Team types; register §12.99.4 #251	PARTIAL-6	ADDED as FR-6.14	Rule evaluation job ORG-J5; parameter `org.team.rule_evaluation`

1.7 Wave 7: Global Party & Business Partner Model

1.7.1 Scope and business context

AX keeps one `DirPartyTable` (subtyped into `DirPerson` and `DirOrganization`) under the global address book, with `CustTable` and `VendTable` as company-specific roles pointing at the party; SAP ECC keeps separate `KNA1`/`KNB1` (customer general/company-code) and `LFA1`/`LFB1` (vendor) masters, and S/4 forces them into Business Partner (`BUT000`, roles in `BUT100`, addresses in `BUT020`/`ADRC`) through Customer-Vendor Integration. Wave 7 builds the party model once: one Party per real-world organization or person, with Customer, Vendor, Employee, Contact, Prospect and Bank roles layered per legal entity. At the end of the wave a steward can create and govern parties and roles, run duplicate detection and merge, validate tax registrations, and import a legacy CustTable/VendTable extract. Posting profiles, payment terms and credit limits are captured now as data; the GL hooks that use them arrive in waves 11, 19 and 30.

Out of scope: customer/vendor transactions and balances, bank account verification (wave 36), employee HR attributes beyond the role stub (wave 42), CRM pipeline (non-goal).

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
In ECC the same supplier who is also a customer exists as LFA1 and KNA1 with two addresses that drift; S/4 CVI (`CVI_FS_CHECK_CUSTOMIZING`, `MDS_LOAD_COCKPIT`) is a months-long synchronization project	Two masters designed independently, linked by KNA1-LIFNR / LFA1-KUNNR cross references	Party is the only identity; roles reference it; addresses are shared by purpose (FR-7.1, FR-7.2)	Duplicate identities per real-world entity 2+→1; address drift incidents 0
AX duplicate check on DirPartyTable is exact-name only (`DirPartyTable.checkDuplicate`); near-duplicates ("ACME Corp." vs "Acme Corporation") pass and are found at year-end	No probabilistic matching	Fellegi-Sunter model (Splink) on name/tax id/address/phone with blocking (FR-7.5)	Planted near-duplicates caught: recall ≥ 0.90 vs ≈0.30 for exact match
Merging two vendors in AX is manual: re-point every open PO, settlement, and address, or leave one blocked forever; SAP has no merge, only block (XK05)	No merge primitive; FKs scattered across modules	Merge workflow rewrites references atomically through a consumer contract and keeps full role data (FR-7.6)	Merge effort 2–4 h→<1 min; dangling references 0
VAT number entry (CustTable.VATNum / KNA1-STCEG) is free text; wrong numbers surface as EU sales list rejections months later	No validation at entry	Country-specific format checks plus VIES/TIN adapters at save (FR-7.4)	Invalid tax ids at save-time rejected 100%; downstream filing rejections →0
Creating a customer in AX touches CustTable form, address tab, contact info, posting profile, payment terms: 12+ clicks across 4 tabs; SAP XD01 walks 3 views × 5 tabs	Role and party data mixed in one wide form	One create flow with inline role panels and defaults from customer group (FR-7.3, FR-7.7)	Clicks 12→3; time-to-create 4 min→30 s

1.7.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Party	DirPartyTable, DirPerson, DirOrganization, DirPartyTable form (Global address book)	BUT000 (BP), BUT100 roles; ECC KNA1/LFA1 as separate masters	party-service `Party` with `party_type` person/organization	full
Customer role	CustTable (AccountNum, CustGroup, PaymentTermId, CreditMax, InvoiceAccount), CustGroup, Customers list page	KNA1 (KUNNR), KNB1 (company code), KNVV (sales area), XD01/FD01	`CustomerRole` (party_id, legal_entity_id)	full (sales-area data KNVV arrives in wave 26)
Vendor role	VendTable (AccountNum, VendGroup, PaymentTermId), VendGroup, Vendors list page	LFA1, LFB1, LFM1 (purchasing org), XK01/FK01	`VendorRole`	full (LFM1 in wave 17)
Contacts / persons	ContactPerson, DirPersonName (first/middle/last), DirPersonUser	KNVK contact person, BP person category	`ContactRole`, `PersonName`	full
Employee / worker	HcmWorker, DirPerson link	PA0001/PA0002, BP employee role	`EmployeeRole` stub (personnel number, legal entity)	partial (HR data in wave 42)
Addresses and contact info	DirPartyLocation, LogisticsPostalAddress, LogisticsElectronicAddress (phone/email/URL)	ADRC, ADR2 (phone), ADR6 (email), BUT020	`PartyAddress` (wave-6 address + purposes), `ElectronicAddress`	full
Tax registrations	TaxRegistration, TaxRegistrationType, CustTable.VATNum, VendTable.VATNum	KNA1-STCEG/STCD1..5, LFA1-STCEG, DFKKBPTAXNUM (BP tax numbers)	`TaxRegistration` (type, country, number, validated_at, result)	improved (validation adapters)

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Duplicate detection / merge	DirPartyTable duplicate check (exact), Merge parties (D365 "Merge" on DirPartyTable, limited)	None in ECC; S/4 MDG-BP matching (separate license)	`DuplicateCandidate`, `MergeCase`, Temporal merge workflow	improved
Groups, posting profiles, terms	CustGroup/VendGroup, CustLedger/VendLedger posting profiles, PaymentTerm, CustPaymMode, DlvTerm, DlvMode	KNB1-AKONT reconciliation account, T052 payment terms (ZTERM), TINC Incoterms, KNVV-VSBED	`CustomerGroup`, `VendorGroup`, `PostingProfile` (account fields filled in wave 11), `PaymentTerm`, `DeliveryTerm`, `DeliveryMode`	full (GL accounts bound in wave 11)
Credit management	CustTable.CreditMax, CreditRating, blocked status (CustBlocked)	KNKK credit limit (FD32), UKM in S/4	`CreditProfile` (limit, currency, rating, hold)	partial (credit checks run in wave 27)
Bank role	BankAccountTable per customer/vendor (CustBankAccount/VendBankAccount)	BP bank details BUT0BK, LFBK/KNBK	`BankRole` plus `PartyBankAccount` (IBAN/BIC format check only)	partial (verification in wave 36)
Governance	Workflow on vendor changes (VendTable change proposals in D365), DirPartyTable data owner	MDG change requests, SAP workflow	Stewardship queue, change-approval workflow on protected fields	improved
Vendor certifications and diversity	VendCertification, VendCertificationType (Vendors → Certification types), Diversity classifications (D365 procurement)	No ECC master field; SAP SLC/Ariba SLP supplier certificates; BP attributes	`CertificationType`, `VendorCertification`, `DiversityClassification` (FR-7.14)	full
Installment / payment schedules	PaymSched, PaymSchedLine (Payment schedules form)	T052R installment terms (OBB9) linked to T052 ZTERM	`PaymentScheduleLine` on `PaymentTerm` (FR-7.15)	full
One-time accounts	One-time customer/supplier (AR/AP parameters → One-time customer account / One-time supplier account; CustTable.OneTimeCustomer)	Account groups CPD/CPDL (T077D/T077K XCPDK), document data in BSEC	`one_time` role flag + document-level address (FR-7.16)	full
Head office, alternate payer, permitted payee	CustTable/VendTable.InvoiceAccount, DirPartyRelationship	KNA1-KNRZE alternate payer, KNB1-KNRZB head office (branch/head office), LFA1-LNRZA, LFZA permitted payees	`PartyRelationship` (FR-7.17)	full
Address books	DirAddressBook, DirAddressBookParty, address book team security (Global address book parameters)	BP authorization group BU_BEGRU, BP grouping	`AddressBook` with team access (FR-7.18)	full
Customer hierarchies	TAMCustomerCategory hierarchy (D365 trade allowance)	KNVH customer hierarchy (VDH1N/VDH2N), hierarchy types OVH1	hierarchy purpose `customer_*` over Customer roles (FR-7.19)	improved (effective-dated versions)
Classification code lists and hold reasons	CustClassificationGroup, LineOfBusiness, smmSegment/smmSubsegment, SalesDistrict, Vendor/Customer hold reasons	KNA1-BRSCH industry, KNA1-KUKLA classification, KNVV-KDGRP, KNVV-BZIRK, block reasons	`ClassificationCode` lists (FR-7.20)	full

1.7.3 Functional requirements

- **FR-7.1 Party core** — Must. The system shall create parties of type organization (legal name, trade name, registration number, industry code NAICS/NACE) or person (given, middle, family name, name prefix/suffix, date of birth optional, gender optional) with a tenant-wide party number from a number sequence.
  - Name search uses trigram similarity on `search_name` (normalized: casefold, diacritics stripped, punctuation removed).
  - Party `status` ∈ {active, inactive, merged}; merged parties keep a `merged_into_id` and all reads redirect.
- **FR-7.2 Roles per legal entity** — Must. The system shall attach Customer, Vendor, Contact, Employee, Prospect and Bank roles to a party; Customer and Vendor roles are keyed by (party_id, legal_entity_id) and carry an account number from the legal entity's customer/vendor number sequence.
  - A party may hold Customer and Vendor roles in the same legal entity (the AX "one party, two accounts" case).
  - Role deactivation keeps the row and sets `blocked = all` with a reason.
- **FR-7.3 Group defaults** — Must. The system shall maintain customer groups and vendor groups carrying default payment term, delivery term, delivery mode, posting profile, price/discount group placeholders and tax group placeholders; creating a role copies group defaults into the role and records `defaulted_from_group`.
- **FR-7.4 Tax registrations with validation** — Must. The system shall store tax registration numbers by type (VAT, EIN, SSN-masked, GSTIN, ABN, CNPJ, RFC, UTR) with per-country format validation (regex plus check digit where defined: GSTIN mod-36, ABN mod-89, CNPJ/RFC algorithms, UK VAT mod-97) and optional online validation through adapters.
  - VIES adapter calls `checkVatService` with a 5 s timeout; result cached 30 days; outage yields `validation_status = unverified`, never a save failure.
  - IRS TIN matching adapter is an interface with a recorded fixture implementation in v1.
- **FR-7.5 Duplicate detection** — Must. The system shall score candidate pairs on every create/update and on demand, using blocking on (normalized name first 4 chars | tax id | postal code+street number | phone last 7 | email domain) and a Fellegi-Sunter model with comparison levels for name (Jaro-Winkler ≥ 0.92 / ≥ 0.85 / else), tax id (exact), address (street+postal exact / postal only / else), phone, email.
  - Match weight ≥ 12 (probability ≈ 0.99) auto-flags as `likely_duplicate`; 6–12 flags `possible`; below 6 ignored.
  - Create with a `likely_duplicate` candidate returns 409 with the candidates unless `X-Passage-Override-Duplicate: true` and the duty "Override duplicate check".
  - Scoring of a single party against 1M parties completes in < 300 ms using blocking indexes.
- **FR-7.6 Merge workflow and survivorship** — Must. The system shall merge N parties into one survivor through a Temporal workflow: pick survivor, resolve field conflicts by survivorship rules (most-recently-verified tax id, most-recently-updated address, non-empty wins, manual override), union roles (conflicting roles in the same legal entity require explicit choice), then rewrite references in every consuming service via `party.merged.v1` with acknowledgement tracking.
  - Merge is reversible for 30 days through a stored pre-merge snapshot.
  - The workflow does not complete until every registered consumer acknowledges rewrite; stragglers alert after 10 min.
- **FR-7.7 Electronic addresses** — Must. The system shall store phone (E.164 normalized), email (RFC 5322 syntax check), URL, fax, with purposes and a primary flag per type.
- **FR-7.8 Credit profile** — Should. The system shall store credit limit with currency, credit rating, hold flag, and hold reason on the Customer role; changes to limit are protected fields under FR-7.10.
- **FR-7.9 Payment, delivery terms and modes** — Must. The system shall maintain payment terms (net days, day-of-month, cash discount percent and days, up to 3 discount tiers), delivery terms (Incoterms 2020 list seeded), and delivery modes; terms compute due dates deterministically (`due = invoice_date + net_days`, or next day-of-month ≥ invoice_date + offset_months).
- **FR-7.10 Change-approval workflow on protected fields** — Must. The system shall route changes to protected fields (bank account, tax registration, credit limit, payment term on vendor, remit-to address) through an approval workflow configured per legal entity; the change is held in `pending_change` and not visible to consumers until approved.
  - SLA 2 business days then escalation; rejection records a reason.
- **FR-7.11 Stewardship queue and ownership** — Should. The system shall assign a data owner (user or team) per party and show stewards a queue of duplicates, unverified tax ids, pending changes and incomplete records (missing primary address or primary email), sorted by age.

- **FR-7.12 Legacy import** — Must. The system shall import CustTable/VendTable/DirPartyTable and KNA1/LFA1 extracts (CSV) through the wave-5 import tool with the wave-10 mapping specs pre-seeded; duplicates found during import go to the stewardship queue rather than blocking the load.
- **FR-7.13 Party search API** — Must. The system shall expose typeahead search returning up to 20 parties in < 100 ms p95 over 1M rows, filtered by role and legal entity.
- **FR-7.14 Vendor certifications and diversity classifications** — Should. The system shall maintain certification types (code, name, issuing body, `requires_expiry`, `reminder_days` default 30, `attachment_required`) and vendor certifications (vendor role, type, certificate number, issuer, `valid_from`/`valid_to`, document id from FR-8.20, status) plus diversity classifications per vendor (seeded: SB, WOSB, EDWOSB, MBE, VOSB, SDVOSB, HUBZone, 8(a), LGBTBE, DOBE) each optionally linked to the certification that evidences it.
  - Vendor groups may flag certification types as mandatory; an expired mandatory certification sets vendor hold `requisition` through job PTY-J6 and notifies the data owner.
  - Endpoints: `POST /party/v1/vendors/{roleId}/certifications`, `GET /party/v1/certifications?status=expiring&days=30`.
- **FR-7.15 Installment payment schedules** — Must. The system shall attach payment schedules to payment terms with 1–24 lines, each line carrying a percent or fixed amount, its own net-days or day-of-month rule and an optional cash discount; allocation modes mirror AX PaymSched: `percent`, `fixed_amount`, and `count` (N equal installments every M days or months).
  - `GET /party/v1/payment-terms/{id}/due-date` returns one (due_date, amount, discount_date, discount_amount) tuple per installment when `amount` is supplied.
  - SAP T052R rows (ZTERM, RATNR, RATPZ, RATZT) map one-to-one to schedule lines.
- **FR-7.16 One-time customers and vendors** — Must. The system shall provide one or more one-time Customer and Vendor roles per legal entity (role flag `one_time = true`, from a group with `one_time_default = true`) whose payee/sold-to name, address, tax id and bank details are captured on each document instead of on the role.
  - Consumers (purchasing 17, AP 19, sales 26, AR 30) store the captured data on the document header, the BSEC equivalent; `POST /party/v1/one-time-data:validate` runs FR-6.6 address and FR-7.4 tax-id validation and returns normalized values.
  - One-time roles are excluded from duplicate scoring; a document counterparty name/tax id used on ≥ 3 documents in 12 months raises a "convert to regular account" stewardship item (job PTY-J7).
- **FR-7.17 Party relationships: head office, alternate payer, permitted payee** — Must. The system shall maintain typed, effective-dated relationships between parties or roles: `invoice_account`, `head_office_of` / `branch_of`, `alternate_payer`, `permitted_payee`, `contact_for`, `parent_company` / `subsidiary_of`, plus tenant-defined types (AX DirRelationshipType).
  - `head_office_of` carries `decentralized_processing` (KNB1-XDEZV equivalent): when false, AR/AP open items of the branch post to the head-office account in waves 19 and 30.
  - Payment proposals (wave 19) pay only to the role's own bank accounts or to active permitted payees; adding a permitted payee is a protected-field change (FR-7.10).
  - `head_office_of` chains are acyclic and at most 5 levels deep (`PTY-REL-CYCLE`).
- **FR-7.18 Address books** — Should. The system shall maintain named address books (e.g. "US vendors", "EMEA customers") that group parties; a party may belong to many books; books carry team access lists (FR-6.14) enforced by OPA on party reads when the tenant enables `party.address_book_security`; each user has a default book applied to parties they create.
- **FR-7.19 Customer hierarchies** — Should. The system shall build effective-dated customer hierarchies with purposes `customer_pricing`, `customer_rebate` and `customer_reporting` whose nodes are Customer roles, reusing the wave-6 hierarchy engine (versions, closure table, as-of API); pricing (wave 26) and rebates (wave 29) resolve ancestors as of the document date in < 20 ms p95.
- **FR-7.20 Classification code lists and hold reasons** — Must. The system shall maintain tenant code lists for line of business, segment and subsegment, sales district, customer classification group, industry (NAICS 2022 / NACE Rev. 2.1 seeded), customer hold reasons and vendor hold reasons; role fields reference them, and every block or unblock records reason code, user, timestamp and free text.
  - Vendor `blocked` values are extended to the AX set: none, invoice, payment, requisition, all, never (never = AX "Never", exempt from inactivity blocking job PTY-J9).

1.7.4 Data model

Party

Field	Type	Required	Notes
id	uuid	yes	PK
tenant_id	uuid	yes	RLS
party_number	text(20)	yes	number sequence `PARTY`, unique per tenant
party_type	enum	yes	organization, person
name	text(200)	yes	display name; computed for persons
search_name	text(200)	yes	normalized; trigram index
org.legal_name / org.trade_name / org.registration_number / org.industry_code	text	legal_name yes	organization subtype
person.given_name / middle_name / family_name / prefix / suffix / dob	text, date	given+family yes	person subtype; PII-flagged
status	enum	yes	active, inactive, merged
merged_into_id	uuid	no	set when status = merged
owner_user_id / owner_team_id	uuid	no	stewardship
language_code / time_zone	text	no	
version, created_at, updated_at	int, timestamptz	yes	

CustomerRole (VendorRole is symmetric with `vendor_group_id`, `vendor_hold`)

Field	Type	Required	Notes
id	uuid	yes	PK
party_id	uuid	yes	FK party
legal_entity_id	uuid	yes	FK; unique (party_id, legal_entity_id)
account_number	text(20)	yes	sequence `CUST-{LE}`; unique per legal entity
customer_group_id	uuid	yes	FK
payment_term_id / delivery_term_id / delivery_mode_id	uuid	payment yes	FK
posting_profile_id	uuid	yes	FK; GL accounts attached in wave 11

Field	Type	Required	Notes
invoice_account_party_id	uuid	no	bill-to party (AX InvoiceAccount)
currency_code	char(3)	yes	default accounting currency
credit_limit / credit_currency / credit_rating / credit_hold	numeric(18,2), char(3), text, bool	no	protected fields
blocked	enum	yes	none, invoice, all
sales_tax_group_id	uuid	no	bound in wave 13
version	int	yes	

TaxRegistration

Field	Type	Required	Notes
id	uuid	yes	PK
party_id	uuid	yes	FK
registration_type	enum	yes	VAT, EIN, GSTIN, ABN, CNPJ, RFC, UTR, OTHER
country_code	char(2)	yes	
number	text(30)	yes	stored normalized (no spaces); unique (type, country, number) per tenant
valid_from / valid_to	date	no	
validation_status	enum	yes	unverified, valid, invalid, format_only
validated_at / validation_source	timestamptz, text	no	VIES, IRS_TIN, manual
is_primary	bool	yes	one per (party, country)

DuplicateCandidate / MergeCase — candidate: id, party_a_id, party_b_id (a < b), match_weight numeric(8,4), probability, level_detail jsonb, status (open, dismissed, merged), created_at; merge_case: id, survivor_id, merged_ids uuid[], survivorship jsonb, snapshot jsonb, workflow_id, status (draft, running, awaiting_ack, completed, reverted, failed), consumer_acks jsonb.

Invariants: a party with status `merged` has no active roles; `account_number` never reused after merge (merged role numbers are retained as aliases in `customer_alias`); at most one primary tax registration per (party, country); every role has a posting profile. Indexing: `party` GIN trigram on `search_name`; btree on `(tenant_id, party_type, status)`; blocking indexes on `left(search_name,4)`, `tax_registration.number`, `electronic_address.normalized`; `duplicate_candidate(status, match_weight desc)`.

VendorCertification / PaymentScheduleLine / PartyRelationship / AddressBook (FR-7.14 – FR-7.18) — vendor_certification: id, vendor_role_id FK, certification_type_id FK, number text(60), issuer text(100), valid_from date, valid_to date (required when type requires_expiry), document_id uuid null, status (valid, expiring, expired, revoked), revoked_reason text; vendor_diversity: vendor_role_id, classification_code, certification_id null, valid_from, valid_to. payment_schedule_line: payment_term_id FK, line_no int (1–24), allocation (percent, fixed_amount, count), value numeric(18,6), net_days int, day_of_month int null, offset_months int, discount_pct numeric(5,2) null, discount_days int null. party_relationship: id, type_code FK relationship_type, from_party_id, from_role_id null, to_party_id, to_role_id null, legal_entity_id null, valid_from, valid_to, attributes jsonb (e.g. decentralized_processing); unique (type_code, from_role_id, to_role_id, valid_from). address_book: id, code text(20), name, team_ids uuid[]; address_book_party (address_book_id, party_id) PK.

1.7.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
POST	/party/v1/parties	Create party (runs dedup)	`Idempotency-Key`	Maintain parties
GET	/party/v1/parties/{id}	Read (follows merged_into)	n/a	View parties
PATCH	/party/v1/parties/{id}	Update; protected fields → pending change	version check	Maintain parties
GET	/party/v1/parties:search?q=&role=customer&legalEntity=	Typeahead	n/a	View parties
POST	/party/v1/parties/{id}/roles/customer	Add customer role in `X-Passage-LegalEntity`	key header	Maintain customers
POST	/party/v1/parties/{id}/roles/vendor	Add vendor role	key header	Maintain vendors
POST	/party/v1/parties/{id}/tax-registrations	Add and validate	key header	Maintain parties
POST	/party/v1/tax-registrations/{id}:validate	Re-run adapter	idempotent (cached 30 d)	Maintain parties
GET	/party/v1/duplicates?status=open&minWeight=6	Stewardship list	n/a	Steward master data
POST	/party/v1/merge-cases	Start merge workflow	key header	Merge parties
POST	/party/v1/merge-cases/{id}:revert	Revert within 30 days	key header	Merge parties
POST	/party/v1/pending-changes/{id}:approve / :reject	Workflow decisions	key header	Approve master data changes
GET	/party/v1/payment-terms/{id}/due-date?invoiceDate=2026-03-31	Compute due date	n/a	any authenticated

Validation: tax registration format per country before adapter call; role creation requires the legal entity header and an existing group; merge requires all parties active and in the same tenant; search `q` minimum 2 characters.

Event	Trigger	Payload fields	Consumers
dev.passage.party.created.v1	commit	party_id, party_number, party_type, name, primary_address_id	search index, migration, audit
dev.passage.party.updated.v1	commit of non-protected change	party_id, changed_fields[], version	search, consumers caching names
dev.passage.party.customer.created.v1	role commit	party_id, legal_entity_id, account_number, customer_group_id, payment_term_id, posting_profile_id, currency_code	AR, sales, pricing, credit
dev.passage.party.vendor.created.v1	role commit	party_id, legal_entity_id, account_number, vendor_group_id, payment_term_id	AP, purchasing
dev.passage.party.duplicate.flagged.v1	score ≥ 6	candidate_id, party_a_id, party_b_id, match_weight	stewardship queue, notification
dev.passage.party.merged.v1	merge workflow enters awaiting_ack	survivor_id, merged_ids[], role_map{old_account→new_account}, merge_case_id	every service with party FKs; each replies on `dev.passage.party.merge.ack.v1`
dev.passage.party.change.approved.v1 / rejected.v1	workflow decision	party_id, field, old, new, approver_id, reason	audit, notification
dev.passage.party.taxregistration.validated.v1	adapter result	registration_id, status, source, validated_at	tax (wave 13), audit

1.7.6 User experience

Screen	Primary actions	Key fields/columns	Duty required
Global address book (parties list)	New party, search, filter by role/entity, open duplicates	party number, name, type, roles, primary address, status	View parties
Party detail	Edit, add role panels (customer/vendor/contact), addresses, electronic addresses, tax registrations, relationships, audit tab	all party fields; role panels collapsed by default	Maintain parties
Customers workspace (per legal entity)	New customer (party picker or inline create), block, edit terms, credit tab	account, name, group, terms, credit limit, hold, blocked	Maintain customers
Vendors workspace	New vendor, block, bank accounts (pending-change aware)	account, name, group, terms, bank verified flag	Maintain vendors
Duplicate review	Side-by-side compare, dismiss, start merge, pick survivor per field	match weight, field-level comparison levels	Steward master data
Merge case monitor	Progress, consumer acks, revert	consumers acked / pending, elapsed	Merge parties
Stewardship queue	Claim, resolve, bulk dismiss	item type, party, age, owner	Steward master data
Pending changes (approvals)	Approve/reject with reason	field, old/new, requester, SLA remaining	Approve master data changes

Interaction rules: the create-party dialog runs dedup after name and country are entered (debounced 400 ms) and shows candidates inline before save; `Ctrl+Enter` saves and opens the role panel; bulk block/unblock from the list is limited to 500 rows per action; protected fields render with a lock badge and show "pending" with the proposed value until approval; personalization of role panels (which are expanded) is per user.

1.7.7 Business rules and edge cases

- **BR-7.1** Party status machine: `active ↔ inactive`; `active → merged` only through a merge case; `merged` is terminal except via revert within 30 days, which restores the snapshot and sets `active`.
- **BR-7.2** Merge case machine: `draft → running → awaiting_ack → completed`; `running` or `awaiting_ack → failed` on activity error after 5 retries; `completed → reverted` within 30 days only when no consumer reports a post-merge transaction referencing the survivor that cannot be split (consumer rejects revert with reason).
- **BR-7.3** Survivorship default order per field: manual override > most recently validated (tax ids) > most recently updated > non-empty > survivor's value.
- **BR-7.4** Account numbers of merged roles become aliases; lookups by alias resolve to the survivor role and are logged for 12 months to catch stale integrations.
- **BR-7.5** Dedup weights are recomputed for an updated party only against candidates from its blocking keys; a full re-score job runs weekly (Temporal cron, Sunday 01:00 tenant local).
- **BR-7.6** Tax registration numbers are normalized before uniqueness checks (strip spaces, hyphens, dots; uppercase); two parties with the same VAT number in the same country are auto-flagged with weight +15.
- **BR-7.7** Payment term due date: `net_days` adds calendar days; `day_of_month` moves to that day in the month `offset_months` ahead, clamped to the last day; cash discount date computed the same way per tier; if discount date > due date the term is invalid at save.
- **BR-7.8** Protected-field changes by a user holding "Approve master data changes" still require a second approver (no self-approval).
- **BR-7.9** A person party's `dob` and government ids are PII-flagged: masked in lists, visible in detail only to duties with `pii.read`, excluded from search index and from CloudEvent payloads.
- **BR-7.10** Deleting a party is never allowed; `inactive` parties cannot receive new roles; roles on an `inactive` party cannot be unblocked.
- **BR-7.11** Concurrent merges touching the same party are serialized by a Temporal workflow id `merge-{tenant}-{min(party_ids)}`; the second request receives 409 with the running case id.
- **BR-7.12** Import rows with a `likely_duplicate` candidate are loaded with status `active` and a candidate record; they are not rejected, because migrations must be complete and reviewed afterward.
- **BR-7.13** Installment amounts: `amount_i = round(total × pct_i / 100)` using the currency's general rounding (FR-6.16); the last installment absorbs the remainder (`total − Σ previous`); percent lines must sum to exactly 100.00 (`PTY-SCHED-PCT-SUM`); each due date applies BR-7.7 to the baseline (invoice) date.
- **BR-7.14** Certification status is computed daily: `valid` while today < `valid_to − reminder_days`; `expiring` inside the window; `expired` after `valid_to`; `revoked` only manually with reason; each change emits `dev.passage.party.certification.status.changed.v1`.
- **BR-7.15** One-time roles cannot carry credit limits, bank accounts, tax registrations or posting-profile overrides on the role (`PTY-ONETIME-FIELD`); they cannot be merged as survivors.
- **BR-7.16** `head_office_of` requires both ends to hold the same role type (Customer–Customer or Vendor–Vendor) in the same legal entity; changing the head office while the branch has open items is refused through a wave-30/19 callback (returns "no open items" until those waves exist).
- **BR-7.17** A permitted payee must be an active party with at least one verified bank account; removal takes effect immediately, addition only after approval.

1.7.8 Acceptance criteria

- **AC-7.1** (FR-7.5) Given 10,000 seeded parties with 500 planted near-duplicates (name typos, swapped address lines, formatted tax ids), when the full re-score job runs, then flagged pairs with weight ≥ 6 achieve precision ≥ 0.95 and recall ≥ 0.90 against the labels.
- **AC-7.2** (FR-7.6) Given parties A and B each with a Customer role in USMF and B with a Vendor role in DEMF, when merged into A, then A holds all three roles, B's account numbers are aliases, every registered consumer acks, and the referential-integrity audit reports 0 rows referencing B.
- **AC-7.3** (FR-7.4) Given the recorded VIES fixture of 200 VAT numbers, when validated, then results equal the fixture; given the adapter stub returns a timeout, then the registration saves with `unverified` and an alert is raised after 3 consecutive timeouts.
- **AC-7.4** (FR-7.10) Given a customer with credit limit USD 50,000, when a user raises it to USD 120,000, then the stored limit stays 50,000, a pending change exists, the Temporal workflow has an open approval task, and after approval the limit is 120,000 with an `approved` event.
- **AC-7.5** (FR-7.2) Given a party with a Customer role in USMF, when a Vendor role is created in USMF, then both exist with distinct account numbers from the `CUST-USMF` and `VEND-USMF` sequences.
- **AC-7.6** (FR-7.9) Given payment term "Net 30 EOM+1" (day_of_month 31, offset 1) and invoice date 2026-01-31, when due date is computed, then it equals 2026-02-28; with cash discount 2% at 10 days, discount date is 2026-02-10.
- **AC-7.7** (FR-7.5) Given a `likely_duplicate` candidate at create, when the client retries with the override header but without the override duty, then 403.
- **AC-7.8** (FR-7.12) Given a 1,000-row CustTable extract with 20 duplicates of existing parties, when imported, then 1,000 roles exist, 20 duplicate candidates are open, and 0 rows are rejected for duplication.
- **AC-7.9** (FR-7.13) Given 1M parties, when typeahead `q=acm` is called 1,000 times, then p95 < 100 ms and results are ordered by similarity then name.
- **AC-7.10** (BR-7.9) Given a person with `dob`, when the list page is rendered by a user without `pii.read`, then the column shows `••••` and the CloudEvent payload has no `dob` key.
- **AC-7.11** (FR-7.15, BR-7.13) Given term "3 installments 40/30/30 at net 30/60/90" and an invoice of USD 1,000.01 dated 2026-03-01, when due dates are computed, then the amounts are 400.00 / 300.00 / 300.01 and the due dates 2026-03-31 / 2026-04-30 / 2026-05-30.

- **AC-7.12** (FR-7.14, BR-7.14) Given a vendor in group "Regulated" whose mandatory ISO 13485 certificate expires 2026-11-15 with 30 reminder days, when PTY-J6 runs on 2026-10-16, then status is `expiring` and the owner is notified; on 2026-11-16 status is `expired` and the vendor hold is `requisition`.
- **AC-7.13** (FR-7.16, BR-7.15) Given one-time vendor OTV-USMF, when a party with an identical name is created, then no duplicate candidate references OTV-USMF; when a credit limit is set on OTV-USMF, then 422 `PTY-ONETIME-FIELD`.
- **AC-7.14** (FR-7.17) Given branch B whose head office is H, when H is made a branch of B, then 422 `PTY-REL-CYCLE`; given permitted payee P added to vendor V, then P is not payable until the pending change is approved.

1.7.9 Test plan and fixtures

Fixtures: `party/parties-10k.jsonl` (generated with Faker seed 7, 500 labeled duplicate pairs in `party/dup-labels.csv`); `party/vies-recorded.json` (200 numbers, 150 valid, 50 invalid, recorded 2026-09); `party/tax-format-vectors.csv` (300 valid/invalid across 8 types); `party/custtable-extract.csv` and `party/kna1-extract.csv` (1,000 rows each, AX/SAP column names verbatim); `party/payment-terms.csv` (25 terms with 100 invoice-date → due-date oracle rows).

Test	Type	Target	Pass criterion
Dedup precision/recall	property	Splink model	P ≥ 0.95, R ≥ 0.90
Single-party scoring latency	performance	scorer	< 300 ms at 1M
Merge integrity	E2E (Temporal test server)	merge workflow	0 dangling FKs, all acks
Merge revert	E2E	revert	snapshot restored byte-equal
Tax format vectors	table-driven	validators	300/300
VIES adapter	contract (recorded)	adapter	matches fixture; timeout path
Change approval	Temporal workflow test	protected fields	blocked until approve; SLA timer fires after 2 business days
Due-date oracle	unit	payment terms	100/100
PII masking	contract	API + events	no PII fields in list or events
Typeahead	performance	search	p95 < 100 ms

Reconciliation: count(roles) per legal entity in import = source row count; Σ open candidates + dismissed + merged = total pairs ever flagged; every merged party has exactly one merge case.

1.7.10 Deployment and operations

Helm chart `passage-party` (service ×2, CloudNativePG `party-db`, Debezium connector, Splink scoring worker as a Python Deployment with 2 replicas, Temporal namespace `party`). Config: `PARTY_DEDUP_LIKELY_WEIGHT=12`, `PARTY_DEDUP_POSSIBLE_WEIGHT=6`, `PARTY_VIES_TIMEOUT_MS=5000`, `PARTY_MERGE_ACK_TIMEOUT_MIN=10`, `PARTY_APPROVAL_SLA_BUSINESS_DAYS=2`. Migrations additive via Atlas. Feature flags: `party.online_tax_validation`, `party.merge_revert`, `party.pii_masking` (default on). Scheduled jobs: weekly full re-score; daily VIES re-validation of registrations older than 30 days (max 5,000 per run); hourly stale-merge sweeper. SLOs: create p95 < 400 ms including dedup; search p95 < 100 ms; merge completion p95 < 5 min. Alerts: merge awaiting ack > 10 min; VIES failure rate > 20% over 15 min; duplicate queue > 1,000 open. Runbook entries: "Consumer not acking merge" (list registered consumers, `passagectl party merge-status`), "Re-train Splink model" (export labeled pairs, run `party-train`, publish model version). Rollback: previous digest; the Splink model version is pinned in config so a rollback restores scoring behavior.

1.7.11 Migration from AX / SAP

Source	Passage entity	Notes
AX DirPartyTable (PartyNumber, Name, NameAlias, InstanceRelationType, LanguageId)	Party	InstanceRelationType DirPerson/DirOrganization → party_type
AX DirPerson (FirstName, MiddleName, LastName, Gender, BirthDate via DirPersonName)	Party.person	names from DirPersonName valid-time current row
AX DirOrganization (OrgNumber), DirOrganizationName	Party.org	OrgNumber → registration_number
AX CustTable (AccountNum, Party, CustGroup, PaymentTermId, DlvTerm, DlvMode, Currency, CreditMax, CreditRating, Blocked, InvoiceAccount, VATNum, DataAreaId)	CustomerRole, TaxRegistration	DataAreaId → legal_entity; Blocked enum No/Invoice/All → blocked; VATNum → VAT registration with country from primary address
AX VendTable (AccountNum, Party, VendGroup, PaymentTermId, Blocked, VATNum, DataAreaId)	VendorRole	same pattern
AX ContactPerson (ContactPersonId, Party, ContactForParty)	ContactRole	ContactForParty → relationship row
AX DirPartyLocation + LogisticsLocationRole	PartyAddress with purposes	reuses wave-6 address load; IsPrimary → primary flag
AX LogisticsElectronicAddress (Type, Locator)	ElectronicAddress	Type Phone/Email/URL/Fax; phones normalized E.164 using party country
AX CustGroup/VendGroup, PaymentTerm, DlvTerm, DlvMode	groups, terms, modes	PaymentTerm.NumOfDays/PaymMethod (Net/CurrentMonth/…) mapped to net_days/day_of_month
SAP KNA1 (KUNNR, NAME1, LAND1, STCEG, STCD1, SPERR, LOEVM, ADRNR) + KNB1 (BUKRS, AKONT, ZTERM, ZUAWA)	Party, CustomerRole, TaxRegistration	one Party per KUNNR unless matched to an LFA1 by STCEG or ADRNR; BUKRS → legal_entity; ZTERM → payment term by code
SAP LFA1 (LIFNR, NAME1, STCEG, SPERR, SPERM) + LFB1 (BUKRS, AKONT, ZTERM)	Party, VendorRole	KNA1-LIFNR / LFA1-KUNNR cross references pre-merge the party
SAP BUT000 (PARTNER, TYPE, NAME_ORG1, NAME_FIRST, NAME_LAST) + BUT100 (RLTYP FLCU01/FLVN01/BUP001) + DFKKBPTAXNUM	Party, roles, TaxRegistration	roles map FLCU01→customer, FLVN01→vendor, BUP001→contact
SAP ADRC / ADR2 / ADR6 / KNVK	PartyAddress, ElectronicAddress, ContactRole	ADR2 TEL_NUMBER + TELNR_CALL merged
SAP T052 (ZTERM, ZTAGG, ZTAG1..3, ZPRZ1..2), TINC, KNKK (KLIMK, CTLPC)	PaymentTerm, DeliveryTerm, CreditProfile	T052 day-limit variants produce one Passage term per variant

Transformation notes: AX `Party` RecId joins are resolved through DirPartyTable.PartyNumber; SAP customer and vendor numbers are kept as `account_number` when they fit 20 characters, else a new sequence number is assigned and the SAP number stored as alias. Validation: every role must resolve to a legal entity and a group; tax ids failing format go to the stewardship queue, not rejection. Not migrated: AX `DirPartyRelationship` types other than contact-for; SAP sales-area (KNVV) and purchasing-org (LFM1) data (waves 26 and 17); SAP dunning data KNB5 (wave 30); AX `CustTrans`/`VendTrans` open items (transactional packs in wave 49).

1.7.12 Dependencies, risks, open questions

Depends on: wave 6 (legal entities, addresses, countries, number sequences per entity), wave 4 (Temporal approval template, outbox), wave 5 (import tool, audit, PII attributes from wave-3 metadata).

Risk	Likelihood	Impact	Mitigation
Consumers added in later waves forget to implement merge ack	Medium	High	Consumer registry with contract test required for any service subscribing to party events
VIES rate limits or outages block daily re-validation	High	Low	Backoff and cap per run; unverified is a non-blocking state
Splink model drifts for non-Latin names	Medium	Medium	Name normalization with Unicode NFKD; per-tenant threshold override

Open questions: (1) Do Prospect roles need a number sequence or stay numberless until conversion to Customer? Proposed: numberless; decide by wave 26. (2) Is the employee role created here or only in wave 42 with HcmWorker migration? Proposed: stub here (personnel number only); decide by wave 10. (3) Which survivorship rules are tenant-configurable in v1? Proposed: order list editable, levels fixed; decide by wave 10.

1.7.13 Parameters and setup

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
`party.dedup.mode`	tenant	enum	block_likely	off / warn / block_likely	Create behavior with candidates (FR-7.5)	Global address book parameters → Duplicate check (DirParameters)	BP duplicate check (Business Address Services / MDG matching)
`party.dedup.likely_weight`	tenant	decimal	12	8–20	Likely-duplicate threshold	—	MDG match threshold
`party.dedup.possible_weight`	tenant	decimal	6	3–12	Possible-duplicate threshold	—	—
`party.number_sequence`	tenant	sequence	`PARTY-{########}`	wave-5 sequences	Party numbers (FR-7.1)	Global address book parameters → Number sequences (Party ID)	BP number ranges (BUCF) and groupings (BUC2)
`party.customer.account_sequence`	legal entity	sequence	`CUST-{LE}-{######}`	sequences	Customer account numbers	AR parameters → Number sequences → Customer account	XDN1 number ranges per account group (OBD2)
`party.vendor.account_sequence`	legal entity	sequence	`VEND-{LE}-{######}`	sequences	Vendor account numbers	AP parameters → Number sequences → Vendor account	XKN1 number ranges per account group (OBD3)
`party.person.name_sequence`	tenant / country	enum	given_family	given_family / family_given / family_comma_given	Display name of persons	Name sequences (DirNameSequence)	BP name format rules per country (address layout key)
`party.tax.online_validation`	tenant	bool	true	true / false	Calls VIES/TIN adapters (FR-7.4)	EU VAT number validation (D365 sales tax parameters)	VIES check on BP tax numbers (DFKKBPTAXNUM)
`party.tax.cache_days`	tenant	int	30	1–365	Validation result reuse	—	—
`party.protected_fields`	legal entity	field set	bank account, tax registration, credit limit, vendor payment term, remit-to address, permitted payee	any role field	Fields routed to approval (FR-7.10)	Vendor approval workflow fields (D365 AP parameters → Vendor approval)	T055F sensitive fields (S_ALR_87003378), FK08/FD08
`party.approval.sla_days`	legal entity	int (business days)	2	1–10	Escalation timer	Workflow escalation	—
`party.group.mandatory_fields`	customer/vendor group	field set	primary address; tax id for organizations	role and party fields	Save-time required fields	Customer/vendor group mandatory fields (AR/AP parameters → mandatory fields)	Field status groups per account group (OBD2/OBD3, T077D/T077K)
`party.group.one_time_default`	group	bool	false	true / false	Roles in group are one-time (FR-7.16)	AR/AP parameters → One-time customer/supplier	Account group one-time indicator (XCPDK)
`party.customer.default_group`	legal entity	FK	none	customer groups	Default on create	AR parameters → General → Default customer group	Default account group
`party.credit.check_type`	legal entity	enum	balance	off / balance / balance_incl_open_orders	Credit check basis for wave 27	AR parameters → Credit rating → Credit limit type	OVA8 credit control (FSCM UKM in S/4)
`party.merge.revert_days`	tenant	int	30	0–90	Revert window (FR-7.6)	—	—
`party.cert.reminder_days`	certification type	int	30	0–180	Expiring window (BR-7.14)	Vendor certification types	—
`party.address_book_security`	tenant	bool	false	true / false	Enforce book team access (FR-7.18)	Global address book parameters → Use address book security	BP authorization groups (B_BUPA_GRP)
`party.inactivity_block_days`	legal entity	int	0 (off)	0–1,825	PTY-J9 blocks roles without transactions	Vendor inactivation (D365 AP periodic "Vendor inactivation")	—
`party.pii_masking`	tenant	bool	true	true / false	BR-7.9 masking	Personal data / privacy (D365 GDPR)	ILM blocking / end-of-purpose check

1.7.14 Inquiries and reports

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
Global address book	list inquiry	role, legal entity, type, address book, status	party number, name, type, roles, primary address, status	`party.party`	DirPartyTableListPage	BP search, S_ALR_87012180 address list
Customer list	list inquiry	legal entity, group, blocked, classification	account, name, group, terms, currency, credit limit, blocked	`party.customer_role`	CustTableListPage; SSRS Customer base data	S_ALR_87012179, XD03
Vendor list	list inquiry	legal entity, group, hold, diversity	account, name, group, terms, hold, certifications	`party.vendor_role`	VendTableListPage; SSRS Vendor base data	S_ALR_87012086, MKVZ
Duplicate candidates	operational report	weight range, status, age	pair, weight, probability, level detail, age	`party.duplicate_candidate`	Duplicate check results (DirDuplicateCheck)	MDG duplicate check results
Critical changes	operational report	field, legal entity, status, requester	field, old (masked), new (masked), requester, approver, SLA	`party.pending_change`	Vendor change proposals (D365)	S_ALR_87012090, S_ALR_87012183 (FK09/FD09)
Payment terms and schedules	list inquiry	term code	net rule, discount tiers, installments, due-date preview	`party.payment_term`	SSRS Terms of payment list; Cash discount list	OBB8 / OBB9 listing (T052, T052R)
Certification expiry	KPI	days to expiry, type, vendor group	expiring count, expired count, vendors on hold	`party.vendor_certification`	Vendor certifications (D365)	—
Diversity vendor base	KPI	classification, legal entity	vendor count per classification (spend added in wave 17)	`party.vendor_diversity`	Vendor diversity (D365)	—
Tax registration status	operational report	status, country, type	number, status, source, validated at	`party.tax_registration`	VAT number validation log	VIES check log
Hold history	drill-down	role, reason, date range	hold, reason, user, timestamp	wave-5 audit	Customer/Vendor hold history	XD04 / XK04 change documents
Relationships and head offices	list inquiry	type, party	from, to, type, validity, decentralized flag	`party.party_relationship`	Party relationships	KNA1-KNRZE / KNB1-KNRZB lists, VDH2N
Merge history	drill-down	date range, status	case, survivor, merged ids, ack count, revert	`party.merge_case`	—	—

1.7.15 Printed and electronic documents

Document	Trigger	Layout elements (header/line/footer fields)	Formats	Numbering sequence	Legal / retention requirement
Party master data sheet	on demand	header: party number, name, type, primary address; lines: roles per legal entity, terms, tax ids (masked); footer: printed by, timestamp	PDF	none	none
Bank-detail change confirmation	approval of a protected bank-account or permitted-payee change	header: party, role, change id; body: old/new IBAN masked to last 4, effective date, approvers; footer: callback-verification statement	PDF, email to the party's verified contact	`PCHG-{yyyy}-{#####}`	10 years as payment-fraud control evidence (SOX ITGC)
Data subject access export	privacy officer request for a person party	header: request id, subject, date; body: all personal fields, addresses, roles, processing purposes	JSON + PDF	`DSAR-{yyyy}-{####}`	respond within 1 month (GDPR Art. 12(3)), 45 days (CCPA); request log 3 years
Merge certificate	merge case completed	header: case id; lines: merged ids → survivor, consumer acks; footer: operator, timestamp	PDF	merge case number	10 years
Mailing labels	none	—	—	—	none: mailing labels are CRM scope (PRD non-goal)

1.7.16 Periodic and batch jobs

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
PTY-J1 Full duplicate re-score	weekly Sunday 01:00 tenant local	blocking key hash (16 partitions)	candidates upserted by (a, b); checkpoint per partition	< 2 h for 1M parties on 8 workers	partition retried 3×; partial results kept	queue > 1,000 open
PTY-J2 VIES re-validation	daily 04:00	country	max 5,000 per run; cursor by `validated_at`	< 30 min	backoff on rate limit; leaves `unverified`	failure rate > 20% / 15 min
PTY-J3 Stale merge sweeper	hourly	merge_case_id	idempotent	< 1 min	alerts on cases awaiting ack > 10 min	stale cases > 0
PTY-J4 Approval SLA escalation	every 15 min	legal_entity_id	Temporal timers; idempotent per task	< 1 min	escalation to approver's manager	SLA breaches per day
PTY-J5 Alias usage log purge	monthly	tenant	deletes rows > 12 months	< 5 min	retried next run	none
PTY-J6 Certification status update	daily 00:30	vendor_role_id range	status recomputed; events only on change	< 10 min for 100k certificates	retried; holds applied only after status commit	expired-mandatory count
PTY-J7 One-time conversion candidates	weekly	legal_entity_id	candidate upsert by normalized name/tax id	< 15 min	none	candidates created
PTY-J8 Personal data end-of-purpose check	monthly	party_id range	flags candidates; never deletes without approval	< 1 h per 1M persons	report only	candidates > 0
PTY-J9 Role inactivity blocking	monthly (off by default)	legal_entity_id	idempotent; skips `never`	< 15 min	dry-run report first	blocked count

1.7.17 Security duties and privileges

Duty	Privileges (entry points)	Segregation-of-duties conflicts	Default roles that include it
View parties	`GET /party/v1/**` (PII masked); Global address book	none	every business role
Maintain parties	`POST/PATCH /party/v1/parties`, tax registrations, relationships, address books	Approve master data changes	Master data steward, AR clerk, AP clerk
Maintain customers	customer role endpoints; Customers workspace	Post customer payments (wave 30)	AR clerk, Sales administrator
Maintain vendors	vendor role endpoints; certifications; Vendors workspace	Approve vendor invoices (wave 19), Release payments (wave 19)	AP clerk, Purchasing agent

Duty	Privileges (entry points)	Segregation-of-duties conflicts	Default roles that include it
Maintain payment and delivery terms	terms, schedules, delivery terms/modes	none	AR manager, AP manager
Steward master data	duplicates, stewardship queue, PTY-J1/J7 results	none	Master data steward
Merge parties	merge cases, `:revert`	Maintain vendors (same party), to prevent payee substitution	Master data steward lead
Approve master data changes	`pending-changes/{id}:approve/:reject`	Maintain vendors / Maintain customers (no self-approval, BR-7.8)	AP manager, Credit manager, Controller
Override duplicate check	`X-Passage-Override-Duplicate`	none	Master data steward lead
Read personal data	`pii.read`; DSAR export	Administer migration (bulk export risk)	Privacy officer, HR administrator

1.7.18 Message catalog

Code	Severity	User text	Cause	Remediation	Raised by
PTY-DUP-LIKELY	error	"{n} likely duplicates found."	Weight ≥ likely threshold on create	Review candidates or override with duty	FR-7.5
PTY-DUP-OVERRIDE-DUTY	error	"You are not allowed to override the duplicate check."	Override header without duty	Ask a steward	AC-7.7
PTY-TAX-FORMAT	error	"{type} {number} does not match the {country} format."	Regex failure	Correct the number	FR-7.4
PTY-TAX-CHECKDIGIT	error	"Check digit of {number} is wrong."	Algorithm failure (mod-97, mod-89, mod-36)	Correct the number	FR-7.4
PTY-TAX-UNVERIFIED	warning	"Online validation unavailable; saved as unverified."	VIES/TIN timeout	None; PTY-J2 retries	FR-7.4
PTY-ROLE-LE-HEADER	error	"Select a legal entity before adding a role."	Missing `X-Passage-LegalEntity`	Set the entity	FR-7.2
PTY-ROLE-GROUP-MISSING	error	"Group {code} does not exist in {entity}."	Unknown group	Create or pick a group	FR-7.3
PTY-MERGE-RUNNING	error	"Merge case {id} is already running for this party."	Concurrent merge	Wait for the running case	BR-7.11
PTY-MERGE-REVERT-BLOCKED	error	"{service} cannot split post-merge transactions."	Consumer refuses revert	Correct manually	BR-7.2
PTY-PENDING-SELF-APPROVAL	error	"You cannot approve your own change."	Requester = approver	Second approver	BR-7.8
PTY-TERM-DISCOUNT-AFTER-DUE	error	"Discount date is after the due date."	Invalid term	Fix days	BR-7.7
PTY-SCHED-PCT-SUM	error	"Installment percentages total {x}, not 100."	Percent lines ≠ 100	Adjust lines	BR-7.13
PTY-ONETIME-FIELD	error	"One-time accounts cannot hold {field}."	Forbidden field on one-time role	Capture on the document	BR-7.15
PTY-REL-CYCLE	error	"This relationship creates a cycle: {path}."	Head-office loop	Choose another head office	FR-7.17
PTY-CERT-EXPIRED	warning	"Mandatory certificate {type} expired on {date}; vendor on hold."	BR-7.14	Upload renewed certificate	FR-7.14
PTY-INACTIVE-ROLE	error	"Party is inactive; roles cannot be added or unblocked."	BR-7.10	Reactivate the party	BR-7.10
PTY-SEARCH-MIN-CHARS	info	"Type at least 2 characters."	Short query	Type more	FR-7.13

1.7.19 Performance budgets and capacity

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
Party create with dedup	5k/day; peak 200/min (imports via bulk path)	120 / 400 / 800 ms	50 req/s	~2 KB per party; 1M parties ≈ 2 GB incl. indexes	GIN trigram `search_name`; blocking indexes	scoring moves to async; create returns 202 with candidates later
Typeahead search	500k/day; peak 2,000/min	25 / 100 / 180 ms	300 req/s per replica	none	trigram + (tenant_id, status)	result cap drops 20 → 10
Single-party scoring	per create/update	60 / 300 / 500 ms at 1M	100/s on 2 workers	candidates ~5% of parties	blocking keys	queue grows; HPA to 6 workers
Weekly full re-score	1M parties	—	140 parties/s per worker	—	16 hash partitions	runtime extends; no user impact
Due-date / schedule computation	2M/day from AR/AP	1 / 3 / 6 ms	2,000 req/s	none	term cache	unchanged
Merge workflow	50/day	20 s / 5 min / 15 min (ack-bound)	10 concurrent	snapshot ~50 KB per case	workflow id per min(party)	queued; acks are the bottleneck
VIES validation	5k/day	300 ms / 2 s / 5 s (external)	20 concurrent	cache rows	—	`unverified` returned immediately

1.7.20 Localization and compliance hooks

Item	What varies	Country packs touching it (wave 48)	Extension point
Tax identifiers	US EIN/SSN (masked) and 1099 vendor flag (box type consumed by wave 19); UK VAT (HMRC VAT API after VIES exit) and UTR; DE USt-IdNr and Steuernummer; FR TVA intracommunautaire and SIREN/SIRET; IN GSTIN (state code + PAN) and PAN; MX RFC with CFDI 4.0 receptor data (régimen fiscal, código postal); CA BN with GST/HST and QST	all seven	`TaxIdValidator` registry; `TaxIdAdapter` (VIES, HMRC, IRS TIN Matching, GSTN, SAT LCO)
Name and address conventions	Person name order, Hindi/Devanagari names, Spanish double surnames (MX), Quebec bilingual	IN, MX, CA	`party.person.name_sequence`; transliteration attribute
Diversity classifications	US SBA programs (8(a), HUBZone, WOSB, SDVOSB); CA Indigenous business registry; UK none statutory	US, CA	classification code list seeded by pack
Payment term conventions	FR LME late-payment cap (60 days from invoice or 45 days end of month, Code de commerce L441-10); DE §286 BGB 30-day default; IN MSMED Act 45-day limit for MSE suppliers; UK Late Payment Act	FR, DE, IN, UK	term validation rule per country pack (warn on terms exceeding statutory maximum)
Privacy and retention	GDPR/UK GDPR erasure vs retention (HGB/AO 10 y for accounting-relevant data), CCPA/CPRA, DPDP Act 2023, LFPDPPP ARCO rights, PIPEDA	all	PII flags (BR-7.9), DSAR export, PTY-J8 end-of-purpose check

Item	What varies	Country packs touching it (wave 48)	Extension point
Sanctions screening	OFAC SDN (US), UK OFSI, EU consolidated list on vendor/customer create	all	screening adapter interface (wave 48 compliance) called at role creation; result stored on role

1.7.21 Coverage closure

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
AX §12.16.1 Procurement and sourcing, Common — Vendor certifications / Vendor diversity (D365), VendCertification; register §12.99.4 #158	PARTIAL-7	ADDED as FR-7.14	Expiry job PTY-J6, KPI "Certification expiry"
AX §12.16.4 Procurement and sourcing, Setup — Vendor certification types / Diversity classifications; register §12.99.4 #165	PARTIAL-7	ADDED as FR-7.14	Parameter `party.cert.reminder_days`; seeded diversity list
SAP §13.1 FI-GL Customizing — OBB8 / OBB9 Terms of payment / installment terms (T052, T052R); register §13.99.2 #17	PARTIAL-7	ADDED as FR-7.15	Installments via payment schedule lines; BR-7.13 rounding
SAP §13.2 FI-AP Master data — One-time vendor (account group CPD); register §13.99.2 #23	PARTIAL-7	ADDED as FR-7.16	Document-level capture stored by waves 17/19
SAP §13.2 FI-AP Customizing — OBB9 Installment terms (T052R); register §13.99.2 #35	PARTIAL-7	ADDED as FR-7.15	Same schedule model for vendor terms
SAP §13.2 FI-AP Customizing — OBD3 "one-time account" (T077K); register §13.99.2 #37	PARTIAL-7	ADDED as FR-7.16	Parameter `party.group.one_time_default`
SAP §13.3 FI-AR Customizing — OBB9 Installment terms (customers) (T052R); register §13.99.2 #47	PARTIAL-7	ADDED as FR-7.15	AR due dates per installment in wave 30
SAP §13.3 FI-AR Customizing — Define alternate payer / head office–branch (KNA1-KNRZE, KNB1); register §13.99.2 #50	PARTIAL-7	ADDED as FR-7.17	`head_office_of` with decentralized flag; `alternate_payer`; posting effect in waves 19/30

1.8 Wave 8: Product Master, Variants & Catalogs

1.8.1 Scope and business context

AX defines a shared `EcoResProduct` (subtyped `EcoResDistinctProduct` and `EcoResProductMaster`) with variants in `EcoResDistinctProductVariant`, dimension values in `EcoResSize/Color/Style/Configuration`, and releases it per company into `InventTable` with `InventDimGroup`-style product/storage/tracking dimension groups, `InventItemGroup` and `InventModelGroup`. SAP keeps `MARA` (client-level), `MARC` (plant), `MARD` (storage location), `MVKE` (sales), `MBEW` (valuation), material types (`T134`), variant configuration in LO-VC (`CUKB`, `CUOB`, `CABN/CAWN` characteristics) and the classification system (`KLAH/KSML`). Wave 8 defines the product once at tenant level, explodes variants from dimension groups, releases per legal entity with site/warehouse defaults, and adds attributes, categories, item groups, item model groups, GS1 identifiers and a constraint-based configurator foundation. At the end of the wave the product information management workspace holds the demo manufacturer's 500 items and 50 masters.

Out of scope: on-hand, costing values and inventory postings (waves 16, 20), sales/purchase prices (waves 17, 26), BOMs (wave 9), batch/serial *instances* (wave 16; this wave defines only whether an item is tracked), quality specs (wave 33).

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
Releasing an AX product to 10 companies means 10 passes through "Release products" plus editing InventTable defaults (item group, model group, site, warehouse) in each company; a missed default blocks the first PO with "Item model group not specified"	Release is a per-company copy with no template	Release profiles: one call releases to N entities with defaults derived from item group and site; missing-default check at release (FR-8.4)	Clicks per 10-entity release 60→3; first-transaction failures from missing defaults →0
SAP MM01 walks 15–20 views (basic, purchasing, MRP 1–4, accounting, costing); a material is "created" but unusable in a plant until every view is extended (MM01 extend)	View-based material master with per-plant/storage segments (MARC/MARD) each needing separate maintenance	One product record plus released-product per entity; plant-level data derives from site defaults (FR-8.4)	Time to a usable material in a new plant 25 min→<1 min
AX variant creation (EcoResProductVariant "Variant suggestions") is a modal that times out above ~500 combinations; D365 batch job needed	Synchronous form-driven explosion	Explosion is a Temporal job with checkpoints; 1,000 variants in <5 s (FR-8.2)	10k variants: 40 min batch→<60 s with progress
GTIN entry in AX (InventItemGTIN) and SAP (MARM-EAN11) accepts any 13 digits; bad check digits break EDI 856/ASN and retailer onboarding	No check-digit validation at entry	GS1 check-digit and prefix validation, generation from a GS1 company prefix (FR-8.9)	Invalid GTINs stored 0; retailer rejections for GTIN →0
Product attributes in AX (EcoResProductAttribute) require defining attribute types, attributes, categories and category attributes across four forms before a value can be entered; SAP class/characteristic (CL02/CT04) is similar	Classification metadata modeled as a separate hierarchy from products	Attribute sets attached to categories with inline attribute creation and typed validation (FR-8.6)	Setup of a 10-attribute class 30 min→3 min

1.8.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Shared product	EcoResProduct, EcoResDistinctProduct, EcoResProductMaster, Product details form, ProductNumber	MARA (MATNR, MTART, MEINS, MATKL), MM01/MM02/MM03	product-service `Product` (product_type item/service, subtype product/master)	full
Variants and dimensions	EcoResProductDimensionGroup, EcoResSize/Color/Style/Configuration, EcoResDistinctProductVariant, EcoResProductVariantDimensionValue	Generic material + variants (MARA-SATNR, KZKFG), characteristics CABN/CAWN	`DimensionGroup`, `DimensionValue`, `ProductVariant`	full
Storage / tracking dimension groups	EcoResStorageDimensionGroup, EcoResTrackingDimensionGroup (batch/serial active, physical/financial inventory flags)	MARA-XCHPF batch management, serial profile MARC-SERNP, valuation level	`StorageDimensionGroup`, `TrackingDimensionGroup`	full
Released product per company	InventTable (ItemId, ItemGroupId, ModelGroupId, DataAreaId), InventTableModule, InventItemSetupFilter, default order settings (InventItemInventSetup/PurchSetup/SalesSetup)	MARC (plant), MARD (storage location), MVKE (sales org), MBEW (valuation)	`ReleasedProduct` with `ReleasedProductSiteDefault`	full

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Item groups / model groups	InventItemGroup, InventModelGroup (InventModel FIFO/LIFO/WAvg/Std, PhysicalNegative, FinancialNegative, PostPhysical, PostFinancial)	Material type T134, material group T023, valuation class T025, price control MBEW-VPRSV	`ItemGroup`, `ItemModelGroup`	full
Units and conversions	UnitOfMeasureConversion product-specific, InventTable unit per module	MARA-MEINS, MARM alternative units	`ProductUomConversion`, unit per module (inventory/purchase/sales/BOM)	full
Attributes / classification	EcoResAttribute, EcoResAttributeType, EcoResCategory, EcoResCategoryHierarchy, EcoResProductCategory	Classification: KLAH, KSML, CABN, CAWN, AUSP (CL01/CL02/CT04)	`AttributeType`, `Attribute`, `AttributeSet`, `Category`, `CategoryHierarchy`, `ProductAttributeValue`	full
Configurator	Product configuration models (PCConfiguration, PCComponent, PCConstraint — D365 constraint-based configurator)	LO-VC: CU41 configuration profile, dependencies CUKB, object dependencies CUOB	`ConfigurationModel` solved by OR-Tools CP-SAT in a Python worker	partial (pricing and BOM/route generation from configuration in waves 26 and 9)
GS1 identifiers	InventItemGTIN, InventItemBarcode, BarcodeSetup	MARM-EAN11, EAN category T006M (NUMTP)	`ProductIdentifier` (GTIN-8/12/13/14, SSCC generation)	improved (validation and generation)
Images / documents	DocuRef attachments on EcoResProduct, product image	DMS (CV01N) links	`ProductDocument` (object storage key, type)	full
Product lifecycle	D365 product lifecycle state (EcoResProductLifecycleState)	MARA-MSTAE cross-plant status, MARC-MMSTA plant status	`lifecycle_state` on Product and ReleasedProduct	full
Related products	EcoResProductRelation, EcoResProductRelationType (Released product → Related products)	SD cross-selling via material determination (VB41/VB42/VB43), cross-selling profile	`ProductRelation`, `ProductRelationType` (FR-8.13)	full
Configurable lifecycle states	EcoResProductLifecycleState with enabled business processes (D365)	MARA-MSTAE / MARC-MMSTA with status control table T141 (OMS4)	`LifecycleState`, `LifecycleProcessPolicy` (FR-8.14)	full
Controlled group conversion	Change product dimension group / Change item model group (D365 periodic tasks), mass "Delete released products"	MM17 mass maintenance; MM06 flag for deletion; MMDE archive deletion	`group-change` and `obsolete` Temporal jobs (FR-8.15, FR-8.16)	improved (preconditions checked by callback)
Service master	EcoResProduct product type Service; procurement categories for services	AC01–AC06 service master (ASMD), service categories, standard service catalog	`Product` type service with `ServiceAttributes` (FR-8.17)	full
Variant tables and configuration templates	Table constraints (PCTableConstraint, user-defined/system-defined), configuration reuse	CU60–CU62 variant tables (CUVTAB/CUVTAB_VALC), CU7/CUCPT configuration templates	`DecisionTable`, `SavedConfiguration` (FR-8.18, FR-8.19)	full
Document info records	DocuRef, DocuType (Document management → Document types)	CV01N–CV04N document info record (DRAW, DRAT, DRAD), DC10 document types (TDWA)	`DocumentType`, `DocumentInfoRecord`, `DocumentOriginal`, `DocumentObjectLink` (FR-8.20, FR-8.21)	full

1.8.3 Functional requirements

- **FR-8.1 Product and product master** — Must. The system shall create tenant-level products (subtype `product`) and product masters (subtype `master`) with product number (sequence `PROD` or manual), name, description, search name, product type (item/service), base unit, and lifecycle state.
  - Product number regex `^[A-Z0-9][A-Z0-9._-]{0,39}$`; immutable after release.
  - Masters carry a `dimension_group_id` with 1–4 product dimensions chosen from size, color, style, configuration (named per tenant, e.g. "length").
- **FR-8.2 Variant explosion** — Must. The system shall generate variants for a master from the Cartesian product of selected dimension values, or from an explicit list, as a Temporal job with 500-row checkpoints.
  - Hard cap 10,000 variants per master; 1,000 variants in < 5 s.
  - Variant number is `{master}-{size}-{color}-{style}-{config}` with empty segments collapsed; override pattern per tenant.
  - Lookup by (master_id, dimension values) resolves with a unique composite index.
- **FR-8.3 Storage and tracking dimension groups** — Must. The system shall define storage dimension groups (site, warehouse, location, inventory status, license plate — each active, mandatory, primary stocking, physical/financial inventory flags) and tracking dimension groups (batch active/mandatory, serial active/mandatory, serial capture at sale/receipt), assigned to a product and immutable once a released product has inventory transactions (callback from wave 16).
- **FR-8.4 Released products with site/warehouse defaults** — Must. The system shall release a product to one or more legal entities, creating `ReleasedProduct` with item group, item model group, units per module, default site and warehouse, and per-site default warehouse and order settings (minimum/multiple/standard order quantities, lead time) for inventory, purchase and sales.
  - Release profiles: a named template of defaults per (legal entity, item group); release of 1,000 products to 3 entities completes in < 60 s.
  - Cascade: a per-site override wins over the entity default; absent both, the request is rejected with the missing field named.
- **FR-8.5 Item groups and item model groups** — Must. The system shall maintain item groups (posting hooks for GL arrive in wave 11) and item model groups with costing method (FIFO, LIFO, weighted_average, weighted_average_date, standard, moving_average), negative physical/financial inventory flags, post physical/financial inventory flags, stocked flag, and quarantine/registration/picking requirements.
- **FR-8.6 Attributes and categories** — Must. The system shall maintain attribute types (text, integer, decimal, boolean, date, enum, currency, with unit and min/max), attributes, attribute sets, and category hierarchies (procurement, sales, retail, reporting) where a category carries attribute sets; a product in a category inherits required attributes and is incomplete until they are filled.
  - Maximum 200 attributes per product; enum attributes have up to 500 values.
- **FR-8.7 Product-specific UoM conversions** — Must. The system shall store per-product conversions (e.g. 1 BOX = 12 EA for product X) that override class conversions; resolution order product → class → error.
- **FR-8.8 Configurator foundation** — Should. The system shall define configuration models per master: components, attribute domains, constraints (expression language with `==, !=, <, >, in, implies, allDifferent, sum`), default values, and a `solve` endpoint that returns a valid configuration or the minimal conflicting constraint set, using CP-SAT with a 2 s time limit.
  - A 50-constraint model solves in < 200 ms; the result is a variant or a configured-product instance with attribute values.
- **FR-8.9 GS1 identifiers** — Must. The system shall store GTIN-8/12/13/14 per (product/variant, unit) with check-digit validation (mod-10 weighting 3-1), allocate GTINs from a tenant GS1 company prefix with a next-number counter, generate SSCC-18 with extension digit, and render barcodes (EAN-13, GS1-128, DataMatrix) as SVG/PNG.
- **FR-8.10 Product lifecycle and blocking** — Must. The system shall enforce lifecycle states `draft → active → phase_out → obsolete` per product and per released product, with module-level blocks (purchase, sales, inventory, production) on released products.

- **FR-8.11 Images and documents** — Should. The system shall attach images (max 10 MB each, 20 per product) and documents to products in object storage with a primary image used in lists.
- **FR-8.12 Product search and catalogs** — Should. The system shall provide typeahead over product number, name, GTIN and attribute values, filtered by legal entity and category, p95 < 100 ms at 1M products, and allow catalogs as named category subtrees with a validity range.
- **FR-8.13 Product relations** — Should. The system shall maintain relation types (seeded: accessory, cross_sell, up_sell, substitute, spare_part, consumable, same_family; tenant-extensible) with a `symmetric` flag, and relations from a product or variant to another product or variant with sort order and `valid_from`/`valid_to`.
  - Maximum 200 relations per product; symmetric types create and delete the inverse in the same transaction.
  - Sales order entry (waves 26–27) reads `GET /product/v1/products/{id}/relations?type=` for suggestions; event `dev.passage.product.relation.changed.v1`.
- **FR-8.14 Configurable lifecycle states with process policies** — Must. The system shall let tenants define lifecycle states (code, name, category ∈ {draft, active, phase_out, obsolete} from FR-8.10, `default_for_new`, applies to product / released product / engineering version) and, per state, a policy of `allow`, `warn` or `block` for each business process: purchase_requisition, purchase_order, sales_quotation, sales_order, transfer_order, production_order, bom_line_use, master_planning, inventory_receipt, inventory_issue, counting, return_order.
  - `GET /product/v1/released-products/{id}/process-policy?process=` answers in < 10 ms p95; consumers cache the result and refresh on `releasedproduct.updated.v1`.
  - FR-8.10 boolean blocks stay as overrides (BR-8.12).
  - Seed mirrors D365 defaults: Prototype (draft: allows bom_line_use and planning only), Active, Phase out (blocks purchase_order and master_planning, warns on sales_order), Obsolete (blocks all except inventory_issue, counting and return_order).
  - Engineering versions (FR-9.14) carry their own state with the same policy model; the most restrictive of product, released-product and version policy applies.
- **FR-8.15 Mass obsolete and delete of released products** — Should. The system shall run a job that sets selected released products to an obsolete-category state (validated by BR-8.1) and deletes a released product only when every registered reference callback (inventory, purchasing, sales, production, engineering, pricing) reports zero references; otherwise the item is set obsolete and reported as "obsolete instead of deleted".
  - Max 10,000 items per run; a dry-run report precedes execution; deletion removes the released product only, never the shared product.
- **FR-8.16 Controlled change of dimension and model groups** — Should. The system shall change the item model group, storage dimension group or tracking dimension group of selected released products at an effective date through Temporal job `group-change-{id}`, after verifying through callbacks: on-hand = 0 (wave 16), no open purchase, sales, transfer or production orders (waves 16, 17, 21, 26), and inventory closed up to the effective date for costing-method changes (wave 20).
  - Before those waves exist the callbacks return "no references" and the change applies directly; each change writes an audit record and emits `releasedproduct.updated.v1` with `changed_fields`.
  - This job is the only path around BR-8.5 and FR-8.3 immutability.
- **FR-8.17 Service products** — Must. The system shall extend products of type `service` with: service category (code list with its own number sequence, e.g. `SVC-{cat}-{#####}`), service unit (hour, day, each, lump_sum, or any time-class unit), long purchasing text (≤ 4,000 characters, translatable), membership in standard service catalogs (category hierarchy role `service_catalog`), valuation class placeholder (bound in waves 11 and 20) and `requires_service_entry` flag read by purchasing (wave 17).
  - Service products never have storage or tracking dimension groups and never use a stocked item model group (BR-8.17).
- **FR-8.18 Configurator decision tables** — Should. The system shall maintain decision tables (columns = configuration attributes, rows = allowed value combinations; ≤ 50 columns, ≤ 100,000 rows) in a grid with CSV import/export, referenced from constraints as `table(name, attr1, …, attrN)` and pinned to the model version on activation.
  - LO-VC variant functions (ABAP function modules) are replaced by the sanctioned expression functions `round`, `min`, `max`, `abs`, `lookup`, `concat`, `substr`.
- **FR-8.19 Saved configurations and templates** — Should. The system shall save a solved configuration as a named `SavedConfiguration` (model id and version, selections, derived attribute values) at tenant scope or for a customer party, reuse it as the starting point of later solves, and re-validate saved configurations when a new model version activates; incompatible ones are flagged `stale` with the violated constraints.
- **FR-8.20 Document info records and document types** — Should. The system shall maintain document types (code, name, number sequence, allowed file types, max originals default 5 / max 20, version scheme numeric or alpha, part numbering on/off, `change_controlled` flag enforced by FR-9.25, status network id from FR-9.24, attribute set from FR-8.6, allowed object-link targets: product, released product, BOM version, route version, party, ECO) and document info records (DIR: document number, part `000`, version `00`, description, status, owner, originals with object-storage key, sha256 and size ≤ 200 MB, object links, attribute values).
  - Product images and documents from FR-8.11 become DIRs of system types `IMG` and `DOC`; the FR-8.11 endpoints are unchanged.
  - Endpoints: `POST /product/v1/documents`, `POST /product/v1/documents/{id}/versions`, `PUT /product/v1/documents/{id}/links`.
- **FR-8.21 Document search** — Should. The system shall search DIRs by number, description, type, status, attribute values, object link and full text of PDF, DOCX and TXT originals (text extracted at upload by a Python worker, ≤ 50 MB of text per original, Postgres `tsvector` with language-specific dictionaries), p95 < 300 ms at 2M DIRs.

1.8.4 Data model

Product

Field	Type	Required	Notes
id	uuid	yes	PK
tenant_id	uuid	yes	RLS
product_number	text(40)	yes	unique per tenant
subtype	enum	yes	product, master, variant
master_id	uuid	conditional	FK for variants
product_type	enum	yes	item, service
name / description / search_name	text(60)/text(1000)/text(60)	name yes	translations in product_translation
base_uom_id	uuid	yes	FK
dimension_group_id	uuid	masters only	product dimensions
storage_dimension_group_id / tracking_dimension_group_id	uuid	yes at release	immutable after first transaction
lifecycle_state	enum	yes	draft, active, phase_out, obsolete
dimension_values	jsonb	variants	{size, color, style, config}; unique with master_id
primary_image_key	text	no	object storage
version	int	yes	

ReleasedProduct

Field	Type	Required	Notes
id	uuid	yes	PK
product_id	uuid	yes	FK; unique (product_id, legal_entity_id)
legal_entity_id	uuid	yes	
item_number	text(40)	yes	defaults to product_number; unique per legal entity
item_group_id / item_model_group_id	uuid	yes	FK
inventory_uom_id / purchase_uom_id / sales_uom_id / bom_uom_id	uuid	inventory yes	convertible to base
default_site_id / default_warehouse_id	uuid	yes for stocked	warehouse must belong to site
lifecycle_state	enum	yes	same enum as product
blocked_purchase / blocked_sales / blocked_inventory / blocked_production	bool	yes	default false
net_weight / gross_weight / volume + units	numeric(18,6)	no	
site_defaults	1:N		ReleasedProductSiteDefault(site_id, warehouse_id, min_qty, multiple_qty, std_qty, lead_time_days per module)
version	int	yes	

ItemModelGroup

Field	Type	Required	Notes
id / tenant_id / code / name	uuid, uuid, text(10), text(60)	yes	code unique per tenant
costing_method	enum	yes	fifo, lifo, weighted_average, weighted_average_date, standard, moving_average
stocked	bool	yes	default true
physical_negative / financial_negative	bool	yes	default false
post_physical / post_financial	bool	yes	default true
registration_required / receiving_required / picking_required / deduction_required	bool	yes	
quarantine_required	bool	yes	default false
include_physical_value	bool	yes	used by costing (wave 20)

ConfigurationModel — id, master_id, version, status (draft/active/retired), components jsonb, attributes jsonb (name, domain), constraints jsonb (expression list, ≤ 2,000), defaults jsonb. **ProductIdentifier** — id, product_id, uom_id, type (GTIN8/12/13/14, SSCC, UPC, custom), value text(18), is_primary, check_digit_valid bool.

Invariants: a variant's dimension_values keys equal its master's dimension group; every released stocked product has item model group and default site/warehouse; GTIN values pass check digit; `obsolete` products have no released product in `active`. Indexing: unique `(master_id, dimension_values)` via a generated hash column; GIN trigram on `search_name`; `product_identifier(value)` unique per tenant; `released_product(legal_entity_id, item_number)` unique; attribute values in `product_attribute_value(product_id, attribute_id)` with a GIN index on a jsonb projection for filtered search.

Addendum entities (FR-8.13 – FR-8.21) — product_relation: id, type_code FK, from_product_id, to_product_id, sort_order int, valid_from, valid_to, unique (type_code, from_product_id, to_product_id). lifecycle_state: id, code text(20), name, category enum, default_for_new bool, applies_to text[]; lifecycle_process_policy: state_id, process enum, policy (allow, warn, block), PK (state_id, process). service_attributes: product_id PK/FK, service_category_code, service_uom_id, purchasing_text_id (translation), requires_service_entry bool, valuation_class text(10) null. decision_table: id, model_id, name, columns jsonb, row_count int, version int, checksum; rows in decision_table_row (table_id, row_no, values jsonb) with a GIN index. saved_configuration: id, model_id, model_version, scope (tenant, customer), party_id null, name, selections jsonb, status (valid, stale). document_type: code PK per tenant, settings jsonb; document_info_record: id, type_code, doc_number text(25), part char(3), doc_version text(2), description text(200), status_code, owner_user_id, unique (type_code, doc_number, part, doc_version); document_original: dir_id, seq, storage_key, sha256 bytea, size_bytes, mime, text_tsv tsvector; document_object_link: dir_id, target_type, target_id. group_change_job: id, change jsonb, effective_date, status, items jsonb.

1.8.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
POST	/product/v1/products	Create product or master	`Idempotency-Key`	Maintain products
GET	/product/v1/products/{id}	Read with variants summary	n/a	View products
POST	/product/v1/products/{id}/variants:explode	Start explosion job; returns job id	key header; job id keyed by request hash	Maintain products
GET	/product/v1/products/{id}/variants:lookup?size=M&color=RED	Resolve variant	n/a	View products
POST	/product/v1/products/{id}:release	Release to legal entities with profile	idempotent per (product, entity)	Release products
PATCH	/product/v1/released-products/{id}	Defaults, blocks, lifecycle	version check	Maintain released products
PUT	/product/v1/released-products/{id}/site-defaults/{siteId}	Per-site defaults	full replace	Maintain released products
POST	/product/v1/products/{id}/attributes	Set attribute values (validated against type)	full replace of set	Maintain products
POST	/product/v1/products/{id}/identifiers	Add GTIN; `allocate=true` draws from prefix	key header	Maintain products
POST	/product/v1/configuration-models/{id}:solve	Solve with given selections	pure function	Configure products
GET	/product/v1/products:search?q=&legalEntity=&category=	Typeahead	n/a	View products
GET	/product/v1/uom/convert?product=&from=&to=&qty=	Product-aware conversion	n/a	any authenticated

Validation: dimension values must exist in the dimension group; release rejects a `draft` product; identifier type must match length; `solve` rejects selections outside domains with the offending attribute.

Event	Trigger	Payload fields	Consumers
dev.passage.product.created.v1	commit	product_id, product_number, subtype, product_type, base_uom	engineering, search
dev.passage.product.variant.created.v1	per explosion checkpoint (batched, ≤ 500 ids)	master_id, variant_ids[], dimension_values[]	engineering, pricing, inventory
dev.passage.product.released.v1	release commit	product_id, legal_entity_id, item_number, item_group_id, item_model_group_id, default_site_id, default_warehouse_id, uoms	inventory, purchasing, sales, costing, planning
dev.passage.product.releasedproduct.updated.v1	PATCH	released_product_id, changed_fields[], blocks, lifecycle_state	all transactional services
dev.passage.product.identifier.added.v1	commit	product_id, type, value, uom_id	WMS (wave 31), EDI (wave 35)
dev.passage.product.configuration.solved.v1	solve returning a variant	model_id, master_id, selections, result_product_id	sales (wave 27), engineering

1.8.6 User experience

Screen	Primary actions	Key fields/columns	Duty required
Product information management workspace	Tiles: products, masters, released per entity, incomplete attributes, pending releases	counts, incomplete badges	View products
All products and masters	New, release, explode variants, lifecycle change	number, name, subtype, type, dimension groups, state	Maintain products
Product detail	Tabs: general, dimensions/variants grid, attributes, identifiers, images, releases, translations		Maintain products
Variant explosion dialog	Select values per dimension, preview count, start job, progress bar	dimension values, count, job status	Maintain products
Released products (per legal entity)	Edit defaults grid (inline), block, site defaults sub-grid, bulk edit by item group	item number, item group, model group, units, site, warehouse, blocks	Maintain released products
Item groups / item model groups	Edit, usage count	code, name, costing method, flags	Maintain product setup
Categories and attributes	Hierarchy tree, attribute set editor, assign products	category path, attributes, required	Maintain product categories
Configurator model editor	Add components/attributes/constraints, test solve, activate version	constraints, domains, solve result	Configure products
GS1 identifiers	Allocate, validate, print barcode	type, value, uom, valid	Maintain products

Interaction rules: the released-products grid supports bulk edit of selected rows (max 2,000) with one save; attribute inputs validate on blur against type and range; the explosion dialog warns above 2,000 variants and requires confirmation; barcode print uses the browser print dialog with an SVG preview; the legal-entity switcher filters the released-product views only.

1.8.7 Business rules and edge cases

- **BR-8.1** Lifecycle machine for Product and ReleasedProduct: `draft → active`, `active → phase_out`, `phase_out → active | obsolete`, `obsolete` terminal; a released product cannot be more "alive" than its product (product `obsolete` forces released `obsolete`).
- **BR-8.2** A master cannot change its dimension group once any variant exists; a dimension value cannot be deleted while any variant uses it.
- **BR-8.3** Explosion is idempotent: existing variants for a combination are skipped and reported; the job result lists created/skipped counts.
- **BR-8.4** Release copies defaults at release time; later changes to the release profile do not propagate (explicit "re-apply profile" action does, with a diff preview).
- **BR-8.5** Changing `costing_method` on an item model group is refused once any released product in it has a financial inventory transaction (wave-16 callback; returns false before wave 16).
- **BR-8.6** UoM conversion quantities round half-even to the target unit's `decimal_precision`; conversions that would produce zero from a non-zero input are rejected (`PRD-UOM-UNDERFLOW`).
- **BR-8.7** GTIN check digit: weights 3,1,3,… from the right of the payload; GTIN-12 stored as GTIN-14 with leading zeros for uniqueness; the same GTIN may not belong to two products in one tenant.
- **BR-8.8** Configurator time limit 2 s; on timeout the response is 409 `PRD-CFG-TIMEOUT` with the partial assignment; infeasible selections return the irreducible infeasible subset (IIS) of at most 10 constraints.
- **BR-8.9** Required attributes from a category are enforced at `active` transition, not at create, so drafts can be saved incomplete.
- **BR-8.10** Translations fall back language → base language of the tenant → product name; never empty.
- **BR-8.11** Variant numbers longer than 40 characters are truncated to 32 plus an 8-character hash, and the full dimension values remain the lookup key.
- **BR-8.12** Process policy precedence: an FR-8.10 block flag set to true wins; otherwise the most restrictive of the released-product state, product state and (when versions are tracked) engineering-version state applies; `warn` returns success with `PRD-LC-WARN`, `block` returns `PRD-LC-BLOCKED` naming state and process.
- **BR-8.13** Each tenant state maps to exactly one category; transitions between states follow the BR-8.1 category machine; a state in use by any product or released product cannot be deleted; exactly one state per `applies_to` target is `default_for_new`.
- **BR-8.14** Symmetric relations are stored as two rows created and deleted together; self-relations are rejected (`PRD-REL-SELF`); a relation to an obsolete-category product is rejected for new relations and kept for existing ones.
- **BR-8.15** Group-change preconditions are evaluated at scheduling and again at the effective date; a product failing at the effective date is skipped with its reason code; no product is ever partially changed.
- **BR-8.16** A new DIR version copies object links and attribute values but not originals; at most one version per (type, number, part) may be in a status with the release flag at a time.
- **BR-8.17** Setting a storage or tracking dimension group, or a stocked item model group, on a service product is rejected (`PRD-SVC-STOCKED`).

1.8.8 Acceptance criteria

- **AC-8.1** (FR-8.2) Given a master with 3 dimensions × 10 values, when explosion runs, then 1,000 variants exist in < 5 s, lookup by any combination returns the right variant in < 10 ms, and a second run creates 0 and skips 1,000.
- **AC-8.2** (FR-8.8) Given the 50-constraint fixture model and 100 selection sets (60 valid, 40 invalid), when solved, then valid sets return a configuration consistent with every constraint and invalid sets return an IIS, each in < 200 ms.
- **AC-8.3** (FR-8.4) Given release profile P for item group "FG" in USMF with default site S1/warehouse W1 and a site default for S2/W3, when 1,000 products are released and 10,000 random (product, site) default lookups run, then each returns the site override if present, else the entity default (property test).
- **AC-8.4** (FR-8.9) Given the 40 GS1 published test vectors plus 40 mutated ones, when validated, then 40 accepted and 40 rejected; given a prefix 0614141 with next number 123457, when allocated, then GTIN-13 `0614141123457x` has the correct check digit and the counter increments.
- **AC-8.5** (FR-8.3, BR-8.5) Given a released product with a financial transaction (simulated callback true), when its tracking dimension group is changed, then 409 `PRD-DIMGRP-LOCKED`.
- **AC-8.6** (FR-8.10) Given a released product with `blocked_sales = true`, then `releasedproduct.updated.v1` carries `blocks.sales = true` and a later wave's contract stub refuses a sales line.

- **AC-8.7** (FR-8.6) Given category "Fasteners" requiring attributes thread_pitch (decimal, 0.2–6.0 mm) and material (enum), when a product in it is activated without `material`, then 422 lists the missing attribute; with `thread_pitch = 7`, then 422 names the range.
- **AC-8.8** (FR-8.7) Given product X with 1 BOX = 12 EA and class conversion 1 CASE = 24 EA, when converting 2 BOX → CASE, then result is 1 CASE; when converting for product Y with no product conversion, then the class conversion applies.
- **AC-8.9** (FR-8.12) Given 1M products, when searched by a GTIN fragment, then p95 < 100 ms.
- **AC-8.10** (FR-8.14, BR-8.12) Given state "Phase out" with purchase_order = block and sales_order = warn, when the process policy is queried for purchase_order, then `PRD-LC-BLOCKED`; for sales_order, then allowed with `PRD-LC-WARN`; with `blocked_sales = true`, then sales_order is blocked.
- **AC-8.11** (FR-8.13, BR-8.14) Given symmetric type `substitute`, when A→B is created, then B→A exists; when B→A is deleted, then A→B is gone; when A→A is created, then 422 `PRD-REL-SELF`.
- **AC-8.12** (FR-8.16, BR-8.15) Given 100 released products scheduled to move to model group STD effective 2026-12-01 and an on-hand callback returning 5 units for 3 of them on that date, when the job runs, then 97 are changed, 3 are skipped with `PRD-GRPCHG-ONHAND`, and 97 update events are published.
- **AC-8.13** (FR-8.20, FR-8.21) Given the 2M-DIR fixture, when searching attribute `drawing_size = A3` with text "torque", then p95 < 300 ms; when version 01 of DRW-0000123-000 is created, then it has the 3 object links of version 00 and 0 originals.
- **AC-8.14** (FR-8.18) Given a decision table of 10,000 allowed (frame, fork, wheel) rows, when a selection outside the table is solved, then the IIS names the table constraint and the response time is < 200 ms.
- **AC-8.15** (FR-8.17, BR-8.17) Given service product "Calibration – hourly" in category CAL, when a tracking dimension group is assigned, then 422 `PRD-SVC-STOCKED`; its number is `SVC-CAL-00001`.

1.8.9 Test plan and fixtures

Fixtures: `product/demo-catalog.json` (500 items, 50 masters, 12 item groups, 4 model groups, 3 category hierarchies); `product/master-3x10x10.json`; `product/configurator-50.yaml` (bicycle model: frame, wheel, gear, color with 50 constraints; 100 selection sets labeled); `product/gs1-vectors.csv` (40 valid from GS1 check-digit calculator documentation, 40 mutated); `product/uom-product.csv` (30 product conversions); `product/mara-extract.csv` and `product/inventtable-extract.csv` (10,000 rows each).

Test	Type	Target	Pass criterion
Explosion performance and idempotency	performance + unit	explode job	< 5 s for 1,000; second run 0 creates
Variant lookup	property	lookup index	100% hits, p95 < 10 ms
Configurator fixture	table-driven	CP-SAT worker	100/100 expected outcomes, each < 200 ms
Release cascade	property	defaults resolver	10k lookups, 0 mismatches
GTIN vectors	unit	validator/allocator	80/80
Lifecycle transitions	state-machine property	product/released	every illegal transition rejected
Attribute validation	table-driven	attribute types	120 cases
Search latency	performance	typeahead	p95 < 100 ms at 1M
Event contracts	contract	6 events	registry accepts; consumer stubs decode

Reconciliation: count(variants) = |size| × |color| × |style| × |config| for fully exploded masters; count(released products) per entity = count in demo catalog; count(GTINs) = count(products with identifiers) in fixtures.

1.8.10 Deployment and operations

Helm chart `passage-product` (Go service ×2, CloudNativePG `product-db`, Debezium connector, `product-configurator` Python worker with OR-Tools, 2 replicas, 1 CPU / 1 GiB each). Config: `PRODUCT_MAX_VARIANTS=10000`, `PRODUCT_EXPLODE_CHECKPOINT=500`, `PRODUCT_CFG_TIME_LIMIT_MS=2000`, `PRODUCT_GS1_PREFIX` per tenant in the tenant settings entity, object storage bucket `passage-product-media`. Feature flags: `product.configurator`, `product.gs1_allocation`, `product.catalogs`. Scheduled jobs: nightly incomplete-attribute report; weekly orphan media sweep. SLOs: read p95 < 50 ms; release of 1,000 products < 60 s; solve p95 < 500 ms. Alerts: explosion job failed; configurator worker queue depth > 100; media bucket errors. Runbook: "Explosion job stuck" (Temporal `explode-{master_id}` inspect, resume from checkpoint), "Re-apply release profile". Rollback: previous digest; additive migrations only.

1.8.11 Migration from AX / SAP

Source	Passage entity	Notes
AX EcoResProduct (DisplayProductNumber, ProductType, InstanceRelationType), EcoResProductTranslation (Name, Description)	Product, translations	InstanceRelationType EcoResProductMaster → subtype master
AX EcoResProductMaster + EcoResProductDimensionGroup, EcoResProductMasterDimensionValue (Size/Color/Style/Configuration tables)	DimensionGroup, DimensionValue	dimension names kept as AX names unless renamed in mapping
AX EcoResDistinctProductVariant + EcoResProductVariantDimensionValue	ProductVariant	dimension_values from the four value tables
AX EcoResStorageDimensionGroup / EcoResTrackingDimensionGroup + *DimensionGroupFldSetup	storage/tracking groups	field flags per dimension
AX InventTable (ItemId, Product, ItemGroupId, ModelGroupId, DataAreaId, NetWeight, UnitVolume), InventTableModule (UnitId per module), InventItemSetupFilter / InventItemInventSetup (default site/warehouse), InventItemPurchSetup, InventItemSalesSetup	ReleasedProduct, ReleasedProductSiteDefault	one row per DataAreaId; InventDim resolved for site/warehouse defaults
AX InventItemGroup, InventModelGroup (InventModel, PhysicalNegative, FinancialNegative, PostPhysical, PostFinancial, Stocked)	ItemGroup, ItemModelGroup	InventModel enum → costing_method
AX UnitOfMeasureConversion with Product ≠ 0	ProductUomConversion	
AX EcoResAttribute*, EcoResCategory*, EcoResProductCategory, EcoResProductInstanceValue	attributes, categories, values	typed values from EcoResTextValue/IntValue/FloatValue/BooleanValue/DateTimeValue
AX InventItemGTIN (GTIN, ItemId, UnitId)	ProductIdentifier	check digit validated; failures to exception queue
SAP MARA (MATNR, MTART, MATKL, MEINS, MSTAE, XCHPF, SATNR, KZKFG, BRGEW/NTGEW/VOLUM)	Product, dimension/tracking hints	MTART → item group suggestion; XCHPF → batch active; SATNR → master link
SAP MAKT (MAKTX by SPRAS)	translations	
SAP MARC (WERKS, DISMM, PLIFZ, BSTMI, BSTRF, MMSTA, SERNP), MARD (LGORT), MVKE (VKORG, VTWEG), MBEW (BWKEY, VPRSV, BKLAS)	ReleasedProduct per company code of the plant; site defaults per plant	PLIFZ → lead_time_days; BSTMI/BSTRF → min/multiple qty; VPRSV S/V → standard/moving_average
SAP MARM (MEINH, UMREZ, UMREN), MEAN/MARM-EAN11	ProductUomConversion, ProductIdentifier	factor = UMREZ/UMREN

Source	Passage entity	Notes
SAP KLAH/KSML/CABN/CAWN/AUSP (class type 001)	AttributeSet, Attribute, values	characteristic data types CHAR/NUM/DATE mapped; multi-value → enum set
SAP CUKB/CUOB/CUKN (object dependencies)	ConfigurationModel	only `precondition/selection condition` dependency types with simple syntax are translated; others logged to exception queue

Validation: every released product resolves an item group and model group; units per module convertible to base; variants resolve to a master. Not migrated: AX `InventSum`/on-hand and `InventTrans` (wave 16 opening balances); SAP `MBEW` prices (wave 20); SAP `MLAN` tax classification (wave 13); AX retail-specific product tables (non-goal); LO-VC procedures and functions (no equivalent; re-authored as constraints).

1.8.12 Dependencies, risks, open questions

Depends on: wave 6 (sites, warehouses, UoM classes, legal entities), wave 5 (number sequences, import tool, media attachments), wave 4 (Temporal jobs, outbox). Does not depend on wave 7 (parties) except for vendor-item references, deferred to wave 17.

Risk	Likelihood	Impact	Mitigation
Configurator expression language grows into LO-VC complexity	Medium	Medium	Freeze grammar at 8 operators in v1; extensions via sanctioned functions only
Customers with 5+ product dimensions (apparel) exceed the 4-dimension model	Medium	Medium	Extra dimensions modeled as required attributes; evaluate a 5th dimension slot by wave 26
Release profiles diverge from AX default order settings semantics	Low	Medium	Fixture comparison against InventItemInventSetup exports

Open questions: (1) Should `item_number` be allowed to differ from `product_number` per entity (AX allows it)? Proposed: allowed but defaults equal; decide by wave 10. (2) Is moving-average a separate costing method or a parameter of weighted average? Proposed: separate, matching AX; decide by wave 20. (3) Catalogs: product-level or released-product-level membership? Proposed: product-level with entity filter at read; decide by wave 26.

1.8.13 Parameters and setup

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
`product.number_mode`	tenant	enum	sequence	sequence / manual / both	How product numbers are assigned (FR-8.1)	PIM parameters → Number sequences (Product number)	Material number ranges per material type (MMNR)
`product.number_pattern`	tenant	regex	`^[A-Z0-9][A-Z0-9._-]{0,39}$`	regex	Manual number validation	Product number format	OMSL material number format (TMCNM: length, leading zeros, lexicographic)
`product.variant_nomenclature`	tenant / master	template	`{master}-{size}-{color}-{style}-{config}`	tokens, separators, max 40 chars	Variant numbers (FR-8.2, BR-8.11)	Product nomenclature (EcoResProductNomenclature, D365)	Material variant number assignment
`product.max_variants`	tenant	int	10,000	100–10,000	Explosion cap	—	—
`product.explode_checkpoint`	tenant	int	500	100–2,000	Checkpoint size	—	—
`product.default_dimension_groups`	tenant / item group	FK × 3	none	groups	Pre-fill storage/tracking groups at create	PIM parameters → default dimension groups	Material type defaults (OMS2), batch management default
`product.release_profile`	legal entity × item group	FK	none	release profiles	Defaults at release (FR-8.4)	Default order settings templates / released product templates (D365)	Reference material on MM01 / material type views (T134)
`product.lifecycle.default_state`	tenant × target	FK	Prototype (product), Active (released)	lifecycle states	State on create (FR-8.14)	Product lifecycle states → Default for new products	MARA-MSTAE default
`product.lifecycle.process_policy`	state × process	enum	seeded per FR-8.14	allow / warn / block	Process enablement	Product lifecycle state → enabled business processes	OMS4 material status (T141: purchasing, BOM, routing, MRP, inventory messages)
`product.gs1.company_prefix`	tenant	digits	none	6–12 digits	GTIN allocation (FR-8.9)	GTIN setup / Bar code setup	EAN categories (T006M) and EAN number ranges (W4ES)
`product.barcode.symbologies`	tenant	set	EAN-13, GS1-128, DataMatrix	+ UPC-A, ITF-14, Code 128, Code 39, QR	Rendering choices	Bar code setup (BarcodeSetup)	—
`product.cfg.time_limit_ms`	tenant	int	2,000	200–10,000	Solver limit (BR-8.8)	Product configuration parameters (solver strategy)	Configuration profile settings (CUCO)
`product.media.limits`	tenant	size / count	10 MB, 20 per product	1–50 MB, 1–100	FR-8.11 limits	Product image settings	DC10 originals per document
`product.translation.fallback`	tenant	BCP 47	tenant base language	languages	BR-8.10	Product translations	MAKT fallback to logon language
`product.attr.required_enforcement`	tenant	enum	on_activate	on_create / on_activate / off	BR-8.9	Category attribute "Mandatory"	CT04 "entry required"
`product.doc.types`	tenant	records	IMG, DOC, DRW, SPC	FR-8.20 fields	Document behavior	Document types (DocuType)	DC10 (TDWA, TDWO, TDWP)
`product.service.category_sequence`	service category	sequence	`SVC-{cat}-{#####}`	sequences	Service numbers (FR-8.17)	—	Service master number ranges and service categories (IMG MM-SRV)
`product.relation.types`	tenant	list	7 seeded types	+ custom	FR-8.13	Product relation types (EcoResProductRelationType)	Cross-selling profiles (SD material determination)

1.8.14 Inquiries and reports

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
All products and masters	list inquiry	subtype, type, state, category, attribute	number, name, subtype, dimension groups, state	`product.product`	EcoResProductListPage	MM60 material list, MM03
Released products per legal entity	list inquiry	legal entity, item group, model group, state, blocks	item number, groups, units, site, warehouse, state	`product.released_product`	Released products; SSRS Item base data	MM60 by plant
Variants of a master	list inquiry	master, dimension values	variant number, dimension values, released entities	`product.product` (variant)	EcoResProductVariantListPage	MM60 filtered by SATNR
Incomplete products	KPI	category, legal entity	missing attributes, missing defaults, counts by category	completeness projection	Incomplete attribute report (nightly)	MM50 list of extendable materials
Lifecycle and process policy	KPI	state, process	products per state, blocked processes	`released_product` × policy	Product lifecycle state inquiry (D365)	MM60 by MSTAE/MMSTA
GTIN register	list inquiry	prefix, type, unit	GTIN, product, unit, primary, check digit	`product.product_identifier`	Bar codes / GTIN codes	MEAN / MARM-EAN11 list
Attribute search	drill-down	attribute, value range, category	product, attribute values	attribute value projection	Product attributes inquiry	CL30N, CT06
Configuration models and solves	drill-down	model, version, date range	solves, feasible %, p95 time, IIS frequency	solve log	Configuration inquiries; SSRS Product configuration model	CU50 simulation, CUTRACE
Item model and dimension group usage	list inquiry	group	products per group, costing method, flags	`product.item_model_group`	SSRS Item model group / Dimension group listings	OMS2, T134 overview
Document search	list inquiry	type, status, attribute, link, text	number, part, version, description, status, links	`product.document_info_record`	Document handling (DocuView)	CV04N
Product relations	list inquiry	type, product	from, to, type, validity	`product.product_relation`	Related products	VB43 material determination display
Group change and obsolete job history	drill-down	job, date	items changed, skipped (reason), deleted, obsolete	job projection	Periodic task history	MM17 log

1.8.15 Printed and electronic documents

Document	Trigger	Layout elements (header/line/footer fields)	Formats	Numbering sequence	Legal / retention requirement
Product data sheet	on demand	header: product number, name, primary image; lines: attributes, units, conversions, GTINs; footer: legal entity, date, translation language	PDF, email	none	none
Product barcode label	on demand or job PRD-J4	GTIN, human-readable interpretation, description, unit, optional batch/expiry AIs for GS1-128	PDF, ZPL (printer routing in wave 31)	none	GS1 General Specifications: symbol X-dimension, quiet zones, HRI
Product catalog export	on demand per catalog	header: catalog, validity, supplier; lines: product, description, unit, GTIN, attributes, price placeholder	BMEcat 2005 XML, CSV	`CAT-{yyyy}-{####}`	none
Configuration summary	solve saved as configuration	header: model, version, customer; lines: attribute selections; footer: constraint check result	PDF	saved configuration id	retained with the sales document (wave 27)
GDSN item publication	none in this wave	—	—	—	GDSN data-pool synchronization deferred to wave 35 integration hub

1.8.16 Periodic and batch jobs

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
PRD-J1 Variant explosion	on demand	master_id	500-row checkpoints; existing combinations skipped (BR-8.3)	1,000 variants < 5 s; 10,000 < 60 s	resume from checkpoint	job failed
PRD-J2 Incomplete-attribute report	nightly 03:00	category_id	read-only	< 10 min at 1M products	retried next night	none
PRD-J3 Orphan media sweep	weekly Saturday 02:00	storage prefix	marks then deletes after 7 days	< 30 min	stops on storage errors	bucket errors
PRD-J4 Barcode batch generation	on demand / nightly for new GTINs	product_id range	output keyed by (GTIN, symbology)	10,000 labels < 5 min	per-item error list	failures > 1%
PRD-J5 Group change conversion	at effective date (Temporal timer)	released_product_id	per-item idempotent; BR-8.15	1,000 items < 2 min	item skipped with reason	skipped > 0
PRD-J6 Mass obsolete / delete	on demand after dry run	legal_entity_id	per-item; delete only with zero references	10,000 items < 10 min	item set obsolete instead	none
PRD-J7 Document text extraction	on upload (queue)	original id	content hash	< 20 s per 10 MB PDF	retried 3×; DIR searchable by metadata	queue depth > 500
PRD-J8 Saved-configuration revalidation	on model activation	model_id	stale flag recomputed	10,000 configurations < 2 min	per-item error	stale count

1.8.17 Security duties and privileges

Duty	Privileges (entry points)	Segregation-of-duties conflicts	Default roles that include it
View products	`GET /product/v1/**`; PIM workspace	none	every business role
Maintain products	product create/edit, variants, attributes, relations, identifiers	none	Product manager, Master data steward
Release products	`:release`, release profiles	none	Product manager, Master data steward
Maintain released products	released-product edits, site defaults, blocks	none	Inventory manager, Purchasing manager
Maintain product setup	item groups, model groups, dimension groups, lifecycle states and policies	Post inventory adjustments (wave 16)	Product manager lead, Cost accountant
Run product group conversions	PRD-J5, PRD-J6	Maintain product setup (maker-checker on costing-method change)	Cost accountant

Duty	Privileges (entry points)	Segregation-of-duties conflicts	Default roles that include it
Configure products	configuration models, decision tables, `:solve` test	none	Product configurator modeler
Maintain product categories	category hierarchies, attribute sets	none	Category manager
Maintain documents	DIR create, versions, originals, links	Release engineering documents (FR-9.24) on the same DIR	Engineer, Document controller
Allocate GTINs	`identifiers?allocate=true`, prefix settings	none	Master data steward

1.8.18 Message catalog

Code	Severity	User text	Cause	Remediation	Raised by
PRD-NUM-FORMAT	error	"Product number {n} does not match the pattern."	Regex failure	Correct number	FR-8.1
PRD-NUM-IMMUTABLE	error	"Product number cannot change after release."	Edit after release	Create a new product	FR-8.1
PRD-VAR-CAP	error	"Explosion would create {n} variants; limit is {max}."	Cartesian product above cap	Reduce values	FR-8.2
PRD-VAR-DIMVAL-UNKNOWN	error	"{value} is not a value of dimension {dim}."	Unknown dimension value	Add the value first	FR-8.2
PRD-RELEASE-DRAFT	error	"Draft products cannot be released."	Release of draft	Activate first	FR-8.4
PRD-RELEASE-DEFAULT-MISSING	error	"Missing {field} for {entity}/{site}."	No profile or site default	Add the default	FR-8.4
PRD-DIMGRP-LOCKED	error	"Dimension group is locked by inventory transactions."	Change after transactions	Use the group-change job	FR-8.3, BR-8.5
PRD-UOM-UNDERFLOW	error	"Conversion rounds {qty} to zero."	Precision too low	Increase precision	BR-8.6
PRD-GTIN-CHECKDIGIT	error	"GTIN {v} has an invalid check digit."	mod-10 failure	Correct GTIN	BR-8.7
PRD-GTIN-DUPLICATE	error	"GTIN {v} already belongs to {product}."	Duplicate	Use another GTIN	BR-8.7
PRD-CFG-TIMEOUT	error	"Configuration not solved within {ms} ms."	Solver limit	Simplify or retry	BR-8.8
PRD-CFG-INFEASIBLE	error	"Selections conflict: {constraints}."	IIS found	Change selections	FR-8.8
PRD-ATTR-REQUIRED	error	"Required attributes missing: {list}."	Activation incomplete	Fill attributes	BR-8.9
PRD-ATTR-RANGE	error	"{attr} must be between {min} and {max}."	Out of range	Correct value	FR-8.6
PRD-LC-BLOCKED	error	"{process} is blocked for state {state}."	Policy block	Change state or use another product	BR-8.12
PRD-LC-WARN	warning	"{process} is discouraged for state {state}."	Policy warn	Confirm	BR-8.12
PRD-REL-SELF	error	"A product cannot be related to itself."	Self-relation	Choose another product	BR-8.14
PRD-GRPCHG-ONHAND	warning	"Skipped: on-hand {qty} on {date}."	Precondition failed	Empty stock, reschedule	BR-8.15
PRD-SVC-STOCKED	error	"Service products cannot be stocked."	Stocking setup on service	Remove group	BR-8.17
PRD-DOC-ORIGINAL-LIMIT	error	"Document type {t} allows {n} originals."	Too many files	Remove a file or new version	FR-8.20

1.8.19 Performance budgets and capacity

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
Product read	3M/day; peak 5,000/min	8 / 50 / 90 ms	500 req/s per replica	~3 KB per product + attributes	PK; (tenant_id, product_number) unique	read replicas (CNPG) absorb load
Variant lookup	10M/day from order lines	2 / 10 / 20 ms	2,000 req/s	none	unique (master_id, dimension hash)	unchanged
Release 1,000 products × 3 entities	20/day	25 / 60 / 90 s	2 concurrent per tenant	~2 KB per released product	(legal_entity_id, item_number) unique	queued; no timeout
Process-policy query	20M/day	1 / 10 / 20 ms	5,000 req/s (cached)	none	in-memory policy cache	stale cache ≤ 60 s
Typeahead search	1M/day	25 / 100 / 180 ms at 1M	300 req/s	trigram ~1 GB at 1M	GIN trigram on search_name, GTIN	results capped at 10
Configurator solve	20k/day; peak 100/min	60 / 200 / 500 ms (50 constraints)	20/s per worker	solve log ~1 KB	worker queue	HPA to 6 workers; queue > 100 alerts
Document search	50k/day	80 / 300 / 600 ms at 2M DIRs	50 req/s	originals 2–5 TB/yr in object storage; tsvector ~5%	GIN tsvector; attribute jsonb GIN	full-text limited to 1,000 hits

1.8.20 Localization and compliance hooks

Item	What varies	Country packs touching it (wave 48)	Extension point
Commodity and tax classification	HS/CN8 for Intrastat (DE, FR); HSN/SAC codes mandatory on IN GST invoices (6 digits above INR 5 crore turnover); SAT c_ClaveProdServ and c_ClaveUnidad on MX CFDI 4.0; UNSPSC optional	DE, FR, IN, MX	attribute sets supplied by pack; `ProductTaxClassificationHook` read by wave 13
Units and labeling	US FPLA dual metric/US customary net quantity; CA Consumer Packaging and Labelling Act bilingual; EU Directive 76/211/EEC ℮ mark	US, CA, DE, FR	unit display rules; translation requirements per country
GS1 prefixes	Prefix issued by GS1 US, UK, Germany, France, India, Mexico, Canada	all	prefix per legal entity allowed
Product names and descriptions	FR/CA-QC French-language requirement; MX Spanish CFDI description	FR, CA, MX	FR-8.12 translations; BR-8.10 fallback
Regulated attributes	Hazardous substance data (REACH, GHS), export control classification (ECCN/EAR, EU 2021/821), RoHS	all	attribute sets contributed by wave 48 compliance packs
Document retention	Technical documentation kept 10 years after last unit placed on market (EU MDR Art. 10(8), Machinery Regulation 2023/1230)	DE, FR	retention class per document type (FR-8.20)

1.8.21 Coverage closure

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
AX §12.15.1 PIM, Common — Released product → Related products, EcoResProductRelation; register §12.99.4 #141	PARTIAL-8	ADDED as FR-8.13	Symmetric types, sales suggestions read in waves 26–27
AX §12.15.1 PIM, Common — Released product → Product lifecycle state (D365), EcoResProductLifecycleState; register §12.99.4 #143	PARTIAL-8	ADDED as FR-8.14	Per-process allow/warn/block
AX §12.15.3 PIM, Periodic — Change product dimension groups / Change item model group; register §12.99.4 #146	PARTIAL-8	ADDED as FR-8.16	Callback-checked conversion job PRD-J5
AX §12.15.3 PIM, Periodic — Delete released products / Mark obsolete; register §12.99.4 #147	PARTIAL-8	ADDED as FR-8.15	Job PRD-J6 with reference callbacks
AX §12.15.4 PIM, Setup — Product lifecycle states (D365); register §12.99.4 #148	PARTIAL-8	ADDED as FR-8.14	Parameters `product.lifecycle.*`
AX §12.16.4 Procurement, Setup — Categories → category vendor assignment, category questionnaires; register §12.99.4 #162	PARTIAL-8	DEFERRED to wave 17	Category hierarchies exist here (FR-8.6); vendor-per-category assignment and questionnaires belong to sourcing in wave 17, as the register proposes
AX §12.34.1 ECM, Common — Product lifecycle states (per version, controlling process enablement); register §12.99.4 #283	PARTIAL-8	ADDED as FR-8.14	Engineering-version states applied by FR-9.14
AX §12.34.4 ECM, Setup — Product lifecycle states (enabled business processes per state, default states); register §12.99.4 #297	PARTIAL-8	ADDED as FR-8.14	`default_for_new` per target
SAP §13.15 MM-SRV Master data — AC01/AC02/AC03/AC04/AC06 service master; register §13.99.2 #163	PARTIAL-8	ADDED as FR-8.17	Service categories, purchasing text, service catalog
SAP §13.15 MM-SRV Customizing — Service master number ranges, service categories, organizational status, field selection (ASMD); register §13.99.2 #181	PARTIAL-8	ADDED as FR-8.17	Number range per category; field selection via wave-3 metadata field rules
SAP §13.32 LO-VC Master data — CU60/CU61/CU62/CU65/CU66/CU67 variant tables and functions; register §13.99.2 #356	PARTIAL-8	ADDED as FR-8.18	Table grid added; ABAP variant functions replaced by expression functions
SAP §13.32 LO-VC Master data — CU7 / CUCPT configuration templates; register §13.99.2 #359	PARTIAL-8	ADDED as FR-8.19	Tenant and customer scope, stale detection
SAP §13.35 DMS Master data — CV01N/CV02N/CV03N document info record; register §13.99.2 #374	PARTIAL-8	ADDED as FR-8.20	Status network, ECO versioning and signatures in FR-9.24/FR-9.25
SAP §13.35 DMS Master data — CV04N find document; register §13.99.2 #375	PARTIAL-8	ADDED as FR-8.21	Attribute, link and full-text search
SAP §13.35 DMS Master data — Fiori Manage Documents / Manage Document Info Records; register §13.99.2 #384	PARTIAL-8	ADDED as FR-8.20	Document screens in the PIM and engineering workspaces
SAP §13.35 DMS Reports — CV04N document search; register §13.99.2 #385	PARTIAL-8	ADDED as FR-8.21	"Document search" in §1.8.14
SAP §13.35 DMS Customizing — DC10 document types (TDWA, TDWS, TDWO, TDWP); register §13.99.2 #392	PARTIAL-8	ADDED as FR-8.20	Parameter `product.doc.types`

1.9 Wave 9: Engineering Data: BOMs, Routings, Resources & Change Management

1.9.1 Scope and business context

AX stores bills of material as `BOMTable` (BOM id) with `BOMVersion` (which product/site/date range uses which BOM) and `BOM` lines; routes as `RouteTable`/`RouteVersion`/`RouteOpr` with `RouteOprTable` operations, `WrkCtrTable`/`WrkCtrResourceGroup` resources, `WrkCtrCapability` and `WorkCalendarTable`; D365 adds engineering change management (ECR/ECO, product versions). SAP keeps `MAST` (material-to-BOM link), `STKO` (BOM header), `STPO` (BOM items), `STAS` (alternatives), routings in `PLKO`/`PLPO`/`PLAS` with `MAPL` assignment, work centers in `CRHD`/`CRCA`/`KAKO` (capacity), and change numbers in `AENR` (CC01). Wave 9 delivers BOM headers with versions and lines (effective dates, scrap, phantoms, by-/co-products, process formulas), routing versions with operations, relations and resource requirements by capability, resources with calendars, an ECR/ECO workflow with where-used impact analysis, and an explosion/implosion API. The cost roll-up only records the structure the wave-39 roll-up needs.

Out of scope: production orders (wave 21), capacity scheduling and Gantt (wave 23), potency/catch weight execution (wave 24), costing sheets and standard-cost roll (wave 39), PLM adapters beyond the event contract.

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
AX BOM designer (BOMDesigner form) loads a 7-level, 2,000-component BOM in 30–90 s and the "Calculate" explosion runs as a batch (BOMCalcJob) that users wait minutes for	Recursive X++ explosion row by row over BOMVersion/BOM	Closure-table-backed explosion service; 2,000 components in < 500 ms (FR-9.9)	Explosion 60 s–5 min→<0.5 s
SAP CS03 shows one BOM alternative at one date; "what is active on 2026-06-01" means CS03 with a key date, CS80 where-used, and CC03 change number, three transactions and still no diff	BOM validity scattered across STKO/STPO DATUV with AENNR change numbers	Versioned BOMs with as-of resolution, side-by-side version diff and effective-date preview (FR-9.1, FR-9.3)	Transactions to answer "what is active when" 3→1; clicks 15→2
Engineering change in AX 2012 is an unaudited edit of BOM lines; two engineers editing the same BOM overwrite each other; D365 ECM exists but is a separate product-version model many customers never turn on	No change object in the core BOM model	ECR→ECO workflow is the only path to change an active version; optimistic locking on drafts (FR-9.7, BR-9.3)	Unaudited changes to active BOMs 100%→0; lost-update incidents 0
Where-used (AX BOMWhereUsed, SAP CS15) is a flat list; an engineer cannot see which finished goods, orders, and sites a component change impacts before releasing	No impact analysis in the change flow	ECO impact analysis: multi-level where-used across sites with affected product count and open-order hooks (FR-9.8)	Impact assessment effort 2 h→<10 s
Work center capacity in SAP (CR02 capacities, KAKO) and AX (WrkCtrTable calendar + efficiency %) is keyed in several places; routing lead time calculated by hand in spreadsheets	Calendar, efficiency and operation times modeled separately	One calendar model with shifts and efficiency; routing lead-time calculation API (FR-9.6, FR-9.10)	Lead-time calculation manual→API, fixture-verified

1.9.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
BOM header / version	BOMTable (BOMId, Name, ItemGroupId, SiteId), BOMVersion (ItemId, BOMId, FromDate, ToDate, FromQty, ToQty, Active, Approved)	STKO (STLNR, STLAL, BMENG, DATUV), MAST (MATNR, WERKS, STLNR, STLAL), STAS, CS01/CS02/CS03	engineering-service `BomHeader`, `BomVersion`	full

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
BOM lines	BOM (LineNum, ItemId, BOMQty, BOMQtySerie, UnitId, FromDate, ToDate, ScrapConst, ScrapVar, BOMType Item/Phantom/Pegged/Vendor, Position, RoundUp, Formula)	STPO (POSNR, IDNRK, MENGE, MEINS, AUSCH, DUMPS phantom, ALPOS, POSTP item category, DATUV)	`BomLine`	full
Phantoms, by-/co-products	BOMType Phantom; co-products/by-products in PmfCoByProduct (process industries)	DUMPS, co-products MARC-KZKUP / STPO negative qty by-products	`BomLine.line_type` ∈ {item, phantom, pegged_supply, vendor, co_product, by_product}	full
Formulas (process)	PmfFormula, formula versions, scalable, yield percent	PP-PI master recipes (C201), STKO BMENG base qty	`BomHeader.kind = formula`, `yield_percent`, `scalable` flag	partial (batch execution in wave 24)
Routing header / version	RouteTable (RouteId), RouteVersion (ItemId, RouteId, FromDate, ToDate, Active, Approved)	PLKO (PLNNR, PLNAL, DATUV), MAPL (MATNR, WERKS, PLNNR), CA01/CA02/CA03	`RouteHeader`, `RouteVersion`	full
Operations and times	RouteOpr (OprNum, OprId, SetUpTime, ProcessTime, ProcessPerQty, TransitTime, QueueTimeBefore/After, OprPriority, NextOprNum, LinkType), RouteOprTable	PLPO (VORNR, ARBPL, VGW01..06 standard values, LAR01..06 activity types, PLIFZ), PLAS	`Operation` with times, `OperationRelation` (sequential/parallel via `next_operation_no` + priority)	full
Resources / work centers	WrkCtrTable (WrkCtrId, WrkCtrType Vendor/Machine/HumanResources/Tool/Location, Efficiency, CalendarId), WrkCtrResourceGroup, WrkCtrCapability, WrkCtrCapabilityResource	CRHD (ARBPL, VERWE category, KAPID), CRCA capacities, KAKO (capacity header, utilization), CRHD-STEUS control key	`Resource`, `ResourceGroup`, `Capability`, `ResourceCapability`	full
Calendars	WorkCalendarTable, WorkCalendarDate, WorkCalendarDateLine (shifts), WorkCalendarTemplate	Factory calendar TFACD/TFACS (SCAL), shift definitions	`WorkCalendar`, `CalendarDay`, `Shift`	full
Engineering change	D365 ECM: EngChgRequest, EngChgOrder, product versions, impact analysis, release to legal entities	ECM: AENR change master (CC01), ECR/ECO (CC31/CC32), effectivity	`EngineeringChangeRequest`, `EngineeringChangeOrder`, Temporal workflow	full
Where-used / explosion	BOMWhereUsed, BOM calculation (BOMCalcTable), BOM designer	CS11/CS12/CS13 (explosion), CS15 (where-used)	`/engineering/v1/bom:explode`, `:implode`, `:where-used`	improved (latency, as-of)
Cost roll-up	BOMCalcTable, costing versions	CK11N/CK40N	structure hooks only; roll-up in wave 39	partial by design
Engineering organization and release product structure	EngChgEngineeringOrganization, EngChgReleaseProductStructure, product release policies, Open product releases (acceptance)	ALE distribution of material and BOM (BD10, BD30, distribution model BD64, status BD87); MDG-M replication	`EngineeringOrganization` flag, `ReleasePolicy`, `ReleaseSession` / `ReleaseLine` (FR-9.14 – FR-9.16)	improved (one workflow with per-line status)
Product readiness	Product readiness policies and checks (D365 ECM)	No direct equivalent (MM50 extension lists, material status)	`ReadinessPolicy`, `ReadinessCheckResult` (FR-9.17)	improved
Engineering categories and version nomenclature	EngChgEngineeringProductCategory, version nomenclature	Revision levels (OS13 material revision levels, CC01 revision)	`EngineeringCategory`, `VersionNomenclature` (FR-9.18)	full
BOM usage and category	BOMTable (production BOM vs formula), no usage concept	STLAN usage (OS20), STLTY category M/D/E/T/K/P	`BomHeader.usage`, `BomHeader.category` (FR-9.19)	partial (order, project, equipment BOM instances in waves 27, 41, 44)
Alternative items and discontinuation	Plan material substitution (D365 planned-order substitution), BOM line substitution	STPO-ALPGR alternative item group with ALPST strategy / ALPRF priority / EWAHR probability; discontinuation STPO-KZAUS / NFMAT follow-up material	`BomLine.alt_*`, `BomLine.discontinuation_*` (FR-9.20)	full (MRP logic in wave 22)
Serial and parameter effectivity	Date effectivity only (BOMVersion/BOM FromDate/ToDate)	ECM effectivity types: date, serial number, parameter (IMG ECM → Effectivity)	`Effectivity` record on ECO, version and line (FR-9.21)	improved over AX, full vs SAP
Super BOM and super routing	Constraint-based configuration BOM line and route operation templates (PCBOMLineTemplate, PCRouteOperationTemplate)	CS40–CS42 super BOM with selection conditions (CU01), CA01 operation dependencies	`selection_condition` and `qty_expr` on BomLine / Operation (FR-9.22)	full
Engineering documents	DocuRef attached to engineering versions	DIR status network (DC20), document BOM item category D (CS01), document structures (CV11–CV15), ECM-controlled versions	DIR status network, signatures, ECO-controlled versions, document lines, structures (FR-9.23 – FR-9.26)	full
CAD / PLM engineering BOM synchronization	PLM integration via Dataverse (Teamcenter, Windchill partner connectors)	ECTR Engineering Control Center (CAD BOM transfer, CAD desktop CDESK)	eBOM import contract, comparison report, polling job (FR-9.27)	partial (vendor connectors in wave 35)

1.9.3 Functional requirements

- **FR-9.1 BOM headers and versions** — Must. The system shall create BOM headers (bom_id from sequence `BOM`, name, kind item/formula, site optional) and versions binding a header to a product (released product optional for site-specific), with `effective_from`/`effective_to`, `from_qty`/`to_qty` ranges, `approved` and `active` flags.
  - At most one active version per (product, site, overlapping date range, overlapping quantity range); activation checks the overlap.
  - Active versions are immutable; changes go through an ECO (FR-9.7) or by creating a new draft version.
- **FR-9.2 BOM lines** — Must. The system shall maintain lines with line number, component product/variant, quantity per `series` (per N parents), unit, line type (item, phantom, pegged_supply, vendor, co_product, by_product), position/reference designator, constant and variable scrap percent, `round_up` policy (none, quantity, measurement, consumption), effective dates per line, resource consumption flag and operation number.
  - Maximum 5,000 lines per version; quantity numeric(18,6); scrap 0–100% with 2 decimals.
  - Co-/by-product lines carry a cost allocation percent (sum ≤ 100 across co-products) used in wave 24.
- **FR-9.3 As-of resolution and diff** — Must. The system shall resolve the applicable BOM and route version for (product, site, date, quantity) and produce a line-level diff between any two versions.
- **FR-9.4 Routing headers, versions and operations** — Must. The system shall create routes (route_id from sequence `ROUTE`), versions bound to a product/site with effective dates, and operations with operation number, operation id (reusable definition), setup time, run time per `process_qty`, queue before/after, transit time, overlap quantity, `next_operation_no` and `priority` (primary, secondary1..3) for parallel branches, scrap percent, and link type (hard/soft).
  - Maximum 500 operations per version; times in hours with 4 decimals.

- **FR-9.5 Resource requirements by capability** — Must. The system shall express each operation's requirement as resource, resource group, capability (with minimum level), resource type, or skill, with quantity of resources (default 1); scheduling (wave 23) resolves requirements, this wave validates that at least one resource satisfies each requirement at activation.
- **FR-9.6 Resources, groups, capabilities, calendars** — Must. The system shall maintain resources (type machine, tool, labor, vendor, location), resource groups per site, capabilities with levels and effective dates, and work calendars with templates (7 day patterns), shifts (start, end, efficiency percent), closed days, and a generator for a date range.
  - Calendar generation for 3 years × 5 shifts completes in < 2 s; calendars are inherited group → resource unless overridden.
- **FR-9.7 ECR/ECO workflow** — Must. The system shall create engineering change requests (title, reason, priority, affected products, requester) that move through a Temporal workflow `draft → submitted → under_review → approved | rejected`, and change orders that bundle draft BOM/route versions, go through approval, and on release atomically expire old versions (`effective_to = release_date − 1`) and activate new ones with `effective_from = release_date`.
  - Release date may be future; the workflow holds a timer until then.
  - An ECO may affect up to 500 versions; release across them is one transaction per service and compensated on failure.
- **FR-9.8 Where-used and impact analysis** — Must. The system shall return single- and multi-level where-used for a component as of a date, across sites, with distinct top-level products; an ECO impact report lists affected products, sites, active versions, and counts from consumer hooks (open production and planned orders — stubs return 0 until waves 21–22).
- **FR-9.9 Explosion and implosion API** — Must. The system shall explode a product to N levels (default all, max 25) as of a date and quantity, resolving phantoms inline, applying series and scrap, returning a tree and a flattened summed-component list; and implode (where-used tree) in the reverse direction.
  - 7-level, 2,000-component explosion < 500 ms; results are cacheable by (version set hash, date, qty).
- **FR-9.10 Routing lead-time calculation** — Should. The system shall compute operation and total lead time for a quantity: setup + run × qty / process_qty, queue and transit times added, parallel branches taking the max, and efficiency applied from the calendar; results in hours and in calendar days against the site calendar.
- **FR-9.11 Cycle and integrity checks** — Must. The system shall reject a line whose component's own active BOM (recursively) contains the parent (`ENG-BOM-CYCLE`), using the product-level closure table, and reject activation when any component is `obsolete`.
- **FR-9.12 Copy and template** — Should. The system shall copy BOM and route versions to another product or site, with optional line filtering, and keep a `copied_from_version_id` lineage.
- **FR-9.13 PLM event contract** — Could. The system shall publish ECO lifecycle events in a shape that a PLM adapter can consume and accept inbound `eco.proposed` payloads through the import tool.
- **FR-9.14 Engineering organization and engineering products** — Must. The system shall let a legal entity be flagged `engineering_organization` (one or more per tenant); products whose engineering category (FR-9.18) has `track_versions = true` are engineering products owned by one engineering organization, and their engineering versions (version code from the nomenclature, effective range, lifecycle state from FR-8.14, attached BOM and route versions) are maintained only in that organization.
  - Operational legal entities receive products, BOMs and routes by release (FR-9.15) and cannot edit engineering-owned fields (`ENG-OWNED-FIELD`); local fields (site defaults, local BOM site) stay editable.
  - When the category sets `version_as_dimension = true`, the engineering version is an additional product dimension `version` so that inventory (wave 16) and orders track it (D365 "version" product dimension).
- **FR-9.15 Release policies and release product structure** — Must. The system shall release engineering products to operational legal entities through `ReleaseSession` workflows (Temporal `release-{id}`), created manually, by job ENG-J7, or automatically on ECO release, governed by a release policy that lists what is copied: product, released-product template (FR-8.4 profile), BOM versions (copy yes/no, activate yes/no), route versions (copy yes/no, activate yes/no), attributes, default order settings, document links (FR-8.20).
  - Each (product, entity) line moves through BR-9.13; resubmission creates a new line; a site-mapping table per receiving entity maps engineering sites to operational sites.
  - Releasing a 1,000-component structure to 3 entities completes in < 2 min.
- **FR-9.16 Product acceptance** — Should. The system shall let a receiving entity whose policy sets `require_acceptance = true` review release lines in "Open product releases", adjust site defaults and BOM/route site, and accept or reject with reason; accepted lines create or update the released product and activate copied versions; entities without acceptance accept automatically.
- **FR-9.17 Product readiness policies and checks** — Must. The system shall evaluate readiness policies (per engineering category, item group or release policy) made of automated checks — item model group set, storage/tracking groups set, default order settings per site, active BOM for manufactured items, active route, tax group (wave 13 hook), coverage group (wave 22 hook), purchase price agreement (wave 17 hook), sales price (wave 26 hook), warehouse setup (wave 31 hook) — and manual checks (text, assigned user or team from FR-6.14, due in N days, mandatory flag).
  - A released product stays in a state with category draft named `readiness_pending` (blocks transactional processes via FR-8.14) until every mandatory check is passed or not applicable, then moves to the policy's target state (default Active).
  - Hooks of waves not yet live return `not_applicable`; checks re-evaluate on relevant events and by job ENG-J9.
- **FR-9.18 Engineering product categories and version nomenclature** — Must. The system shall maintain engineering categories (code, name, product type, `track_versions`, `version_as_dimension`, nomenclature, default readiness policy, default release policy, attribute set, `change_controlled` = ECO mandatory) and version nomenclatures made of ordered segments: number (width, start), letter (A–Z, option to skip I and O), constant text, date (`yyyyMMdd` or `yyMM`), with separators; e.g. `V-{NN}` → V-01, V-02; `{A}` → A … Z, AA.
- **FR-9.19 BOM usage and category** — Must. The system shall carry `usage` ∈ {production, engineering, costing, maintenance, sales, universal} (SAP STLAN 1–6) and `category` ∈ {material, document, equipment, functional_location, sales_order, project} on BOM headers; this wave maintains material and document BOMs, while equipment/functional-location (wave 44), sales-order (wave 27) and project/WBS (wave 41) BOMs reuse the same structures with an owner reference and the same explosion API.
  - `bom:resolve` and `bom:explode` accept `usage` with a configurable fallback order (default production → universal).
- **FR-9.20 Alternative item groups and discontinuation** — Should. The system shall store on BOM lines an alternative group (`alt_group` 2 chars, `alt_priority` 1–99, `alt_strategy` priority or usage_probability, `usage_probability_pct`) and discontinuation data (`discontinuation_group`, `discontinue_type` single or simultaneous, `follow_up_group`, `follow_up_component_id`, `discontinue_on` date); explosion returns groups unresolved with this metadata and planning (wave 22) resolves them against availability.
- **FR-9.21 Serial and parameter effectivity** — Should. The system shall support effectivity type date (default), serial (end-item product plus serial range from–to) and parameter (tenant-defined parameters such as `model_year`, `customer_party_id`, `order_type`, with values or ranges) on ECOs and on the versions and lines they release; `bom:resolve` and `bom:explode` accept `effectivity_context` (e.g. `{"serial":"SN100045","parameters":{"model_year":2027}}`).
  - Without context, date effectivity applies and serial/parameter-conditioned lines are excluded unless `include_unconditional = true`.
  - Maximum 20 effectivity parameters per tenant; serial ranges compare lexicographically after zero-padding to the product's serial mask length.
- **FR-9.22 Configurable (super) BOM and routing** — Should. The system shall let BOM lines and route operations carry a `selection_condition` in the FR-8.8 expression grammar over the parent master's configuration attributes and an optional `qty_expr` (e.g. `length_m * 2`); exploding with a solved configuration includes only lines whose condition is true and evaluates quantity expressions; activation validates conditions against the active model version (`ENG-COND-UNKNOWN-ATTR`).
- **FR-9.23 Document and text BOM lines** — Should. The system shall add BOM line types `document` (references a DIR number/part/version, no consumption, printed on production papers in wave 21) and `text` (≤ 2,000 characters, translatable); planning and costing explosion modes skip both, `mode=full` includes

them.

- **FR-9.24 Document status network and release with electronic signature** — Should. The system shall let document types (FR-8.20) define a status network (statuses with release flag, allowed transitions, required duty, signature required, meaning text); default network `in_work → in_review → released → obsolete` plus `in_work → cancelled`; a signature transition requires Keycloak step-up re-authentication (password or WebAuthn) and records signer, printed name, timestamp, meaning and a hash of all originals, satisfying 21 CFR 11.50 (manifestation) and 11.70 (signature/record linking).
- **FR-9.25 Document versions under ECO** — Should. For document types with `change_controlled = true`, the system shall release a new DIR version only as an affected object of an ECO; ECO release sets the new version to the released status and the previous one to obsolete in the same compensated transaction as BOM/route versions (BR-9.9); ECO impact analysis lists documents linked to the affected products.
- **FR-9.26 Document structures and where-used** — Could. The system shall let a DIR carry a document structure (ordered child DIRs with optional item text, versioned with the parent) and answer where-used for a document across parent documents and BOM document lines (`GET /engineering/v1/documents/{id}:where-used`); cycles are rejected (`ENG-DOC-CYCLE`).
- **FR-9.27 CAD/PLM engineering BOM synchronization contract** — Should. The system shall accept engineering BOM payloads (`ebom.published`, JSON schema in the registry: header part number and revision; lines with find number, component part number, quantity, unit, reference designators, file URIs) through the import tool or `POST /engineering/v1/ebom-imports`, resolve part numbers via product number or `ProductIdentifier` type `cad_part`, create a draft BOM version plus an ECR, and produce an eBOM-versus-active-mBOM comparison (added, removed, changed lines).
  - Source configuration: application name (SolidWorks PDM, Inventor Vault, Teamcenter, Windchill, other), transport (SFTP or REST pull), mapping rules (unit codes, find number → line_no, phantom attribute), auto-ECR on/off; job ENG-J8 polls every 15 min.
  - Native CAD file management and 3D viewing are not provided; vendor-specific connectors ship in wave 35.

1.9.4 Data model

BomVersion

Field	Type	Required	Notes
id	uuid	yes	PK
tenant_id	uuid	yes	RLS
bom_header_id	uuid	yes	FK bom_header(bom_id, name, kind, site_id)
product_id	uuid	yes	FK product (variant allowed)
site_id	uuid	no	null = all sites
effective_from / effective_to	date	from yes	inclusive
from_qty / to_qty	numeric(18,6)	no	quantity-dependent versions
status	enum	yes	draft, active, expired, superseded
approved_by / approved_at	uuid, timestamptz	no	
base_qty / yield_percent	numeric(18,6), numeric(5,2)	yes / formulas	base_qty default 1
eco_id	uuid	no	ECO that activated it
copied_from_version_id	uuid	no	lineage
version	int	yes	optimistic lock

BomLine

Field	Type	Required	Notes
id / bom_version_id	uuid	yes	FK
line_no	int	yes	unique per version, step 10
component_product_id	uuid	yes	FK product
quantity / series / uom_id	numeric(18,6), numeric(18,6), uuid	yes	quantity per `series` parents
line_type	enum	yes	item, phantom, pegged_supply, vendor, co_product, by_product
scrap_const / scrap_var_pct	numeric(18,6), numeric(5,2)	yes	default 0
round_up	enum	yes	none, quantity, measurement, consumption
position / reference_designators	text(20), text[]	no	
operation_no	int	no	consumption at operation
effective_from / effective_to	date	no	line-level
cost_allocation_pct	numeric(5,2)	co/by only	
warehouse_id / resource_consumption	uuid, bool	no	

Operation

Field	Type	Required	Notes
id / route_version_id	uuid	yes	FK route_version (same shape as BomVersion minus qty range)
operation_no	int	yes	unique per version
operation_id	text(20)	yes	reusable operation definition
next_operation_no / priority / link_type	int, enum, enum	no	priority primary/secondary1..3; link hard/soft
setup_time_h / run_time_h / process_qty	numeric(10,4), numeric(10,4), numeric(18,6)	yes	run time per process_qty
queue_before_h / queue_after_h / transit_h	numeric(10,4)	no	
overlap_qty / scrap_pct	numeric(18,6), numeric(5,2)	no	
requirements	1:N	yes	OperationRequirement(kind resource/group/capability/type/skill, ref_id, level, quantity)
cost_category_setup_id / run_id	uuid	no	bound in wave 39

Resource / WorkCalendar — resource: id, code, name, type, site_id, group_id, calendar_id, efficiency_pct (default 100), capacity_per_day_h, exclusive bool, vendor_party_id (type vendor); calendar: id, code, template jsonb (7 days × shifts), generated_from/to; calendar_day: calendar_id, date, open bool, shifts jsonb [{start, end, efficiency_pct}], total_h.

EngineeringChangeOrder — id, eco_number (sequence `ECO`), title, reason, priority, status (draft, submitted, approved, scheduled, released, rejected, cancelled), release_date, affected_versions uuid[] (draft versions to activate, with the versions they supersede), impact jsonb snapshot, workflow_id.

Invariants: no two active BOM versions overlap for the same (product, site, date, qty); every active version's lines reference non-obsolete components; product closure table has no cycles; a released ECO's versions are all `active` and their predecessors `expired`; operation numbers referenced by `next_operation_no` exist in the same version. Indexing: `bom_version(product_id, site_id, effective_from, status)`; `bom_line(component_product_id)` for where-used; product closure (parent_product_id, child_product_id, depth) maintained on activation; `calendar_day(calendar_id, date)` PK.

Addendum entities (FR-9.14 – FR-9.27) — engineering_category: id, code text(20), name, product_type, track_versions bool, version_as_dimension bool, nomenclature_id FK, readiness_policy_id FK null, release_policy_id FK null, attribute_set_id FK null, change_controlled bool. version_nomenclature: id, code, segments jsonb [{type: number|letter|constant|date, width, start, skip_io, format, text}], separator text(3). engineering_version: id, product_id, version_code text(20), effective_from, effective_to, lifecycle_state_id, engineering_le_id, unique (product_id, version_code). release_policy: id, code, copy_bom bool, activate_bom bool, copy_route bool, activate_route bool, copy_attributes bool, copy_order_settings bool, copy_documents bool, require_acceptance jsonb {legal_entity_id: bool}; release_session: id, number `REL-{yyyy}-{#####}`, created_by, source (manual, eco, job), workflow_id; release_line: session_id, product_id, engineering_version_id, legal_entity_id, status (pending, sent, accepted, rejected, failed), reason, accepted_by. readiness_policy: id, code, checks jsonb [{key, kind auto|manual, mandatory, assignee, due_days}], target_state_id, continuous bool; readiness_check_result: released_product_id, check_key, status (pending, passed, failed, not_applicable), evaluated_at, signed_by. effectivity: id, type (date, serial, parameter), product_id null, serial_from, serial_to, parameters jsonb; referenced by eco, bom_version and bom_line via effectivity_id. bom_header gains usage, category, owner_ref; bom_line gains alt_group, alt_priority, alt_strategy, usage_probability_pct, discontinuation_group, discontinue_type, follow_up_group, follow_up_component_id, discontinue_on, selection_condition text, qty_expr text, document_ref (dir_id), text_id. document_status_network: id, statuses jsonb, transitions jsonb; document_signature: dir_id, version, transition, signer_id, meaning, signed_at, originals_hash. ebom_import: id, source_code, part_number, revision, payload jsonb, status, bom_version_id, ecr_id, unique (source_code, part_number, revision).

1.9.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
POST	/engineering/v1/bom-headers	Create header	`Idempotency-Key`	Maintain BOMs
POST	/engineering/v1/bom-versions	Create draft version (optionally copy from)	key header	Maintain BOMs
PUT	/engineering/v1/bom-versions/{id}/lines	Replace line set of a draft	full replace	Maintain BOMs
POST	/engineering/v1/bom-versions/{id}:activate	Activate outside ECO (requires duty "Activate BOM without ECO")	key header	Activate BOMs
GET	/engineering/v1/bom:resolve?product=&site=&date=&qty=	As-of version	n/a	View engineering data
POST	/engineering/v1/bom:explode	Body: product, site, date, qty, levels	pure	View engineering data
GET	/engineering/v1/bom:where-used?component=&date=&levels=	Implosion	n/a	View engineering data
GET	/engineering/v1/bom-versions/{a}:diff?against={b}	Line diff	n/a	View engineering data
POST	/engineering/v1/route-versions, PUT …/{id}/operations	Routes	as BOM	Maintain routes
POST	/engineering/v1/route-versions/{id}:lead-time?qty=	Lead-time calc	pure	View engineering data
POST	/engineering/v1/resources, /resource-groups, /capabilities, /calendars/{id}:generate	Resources and calendars	key header; generate idempotent per range	Maintain resources
POST	/engineering/v1/ecrs, /ecos, /ecos/{id}:submit, :approve, :release	Change management	key header	Maintain / Approve / Release engineering changes
GET	/engineering/v1/ecos/{id}/impact	Impact analysis	n/a	View engineering data

Validation: line set replacement runs cycle, unit-convertibility and component-state checks; activation validates overlap and resource satisfiability; `:release` requires `approved` status and all affected drafts to pass activation checks in a dry run before the transaction.

Event	Trigger	Payload fields	Consumers
dev.passage.engineering.bom.version.activated.v1	activation (direct or ECO)	bom_version_id, product_id, site_id, effective_from, effective_to, line_count, supersedes_version_id	planning, production, costing
dev.passage.engineering.bom.version.expired.v1	expiry by ECO	bom_version_id, effective_to, eco_id	planning, production
dev.passage.engineering.route.version.activated.v1	activation	route_version_id, product_id, site_id, operations[{no, resource requirements}]	planning, scheduling, production
dev.passage.engineering.resource.changed.v1	resource/calendar commit	resource_id, site_id, calendar_id, efficiency_pct, changed_fields[]	scheduling, shop floor
dev.passage.engineering.eco.submitted.v1 / approved.v1 / released.v1	workflow transitions	eco_id, eco_number, affected_versions[], release_date, approver_id	notification, audit, PLM adapter
dev.passage.engineering.calendar.generated.v1	generate	calendar_id, from, to, open_days	scheduling

1.9.6 User experience

Screen	Primary actions	Key fields/columns	Duty required
Engineering workspace	Tiles: BOMs, routes, resources, open ECRs/ECOs, versions expiring in 30 days	counts	View engineering data
BOM designer	Tree with inline line grid, add/remove, drag to reorder, as-of date picker, explode/implode toggle, version diff	line no, component, qty, series, unit, type, scrap, position, operation	Maintain BOMs
BOM versions	List per product, activate (with ECO or direct), copy	version, site, dates, qty range, status, ECO	Maintain BOMs
Route editor	Operation grid, network view (parallel branches), lead-time panel	op no, op id, next, priority, setup, run, process qty, requirements	Maintain routes
Resources and groups	New, capabilities tab, calendar assignment, utilization preview	code, type, site, group, calendar, efficiency	Maintain resources
Work calendars	Template editor, generate range, closed days	day, shifts, hours	Maintain resources
ECR / ECO	Create, add affected products/versions, impact report, submit/approve/release, schedule release date	number, title, status, affected, release date	Maintain / Approve / Release engineering changes
Where-used	Component picker, as-of date, levels, export CSV	parent, qty, level, site, version status	View engineering data

Interaction rules: BOM designer supports keyboard line entry (`Tab` through component/qty/unit, `Enter` adds next line at +10); component lookup searches wave-8 products filtered by lifecycle `active`; validation of cycles runs on line commit, overlap on activation; designer shows an "as of" ribbon with a date slider; network view in the route editor validates `next_operation_no` references live; personalization persists tree expansion depth.

1.9.7 Business rules and edge cases

- **BR-9.1** BOM/route version machine: `draft → active` (direct activation or ECO release), `active → expired` (effective_to passes or ECO), `active → superseded` (newer version activated for the same range by ECO), `draft → cancelled`; `active` is immutable.
- **BR-9.2** ECO machine: `draft → submitted → approved → scheduled → released`; `submitted | approved → rejected`; `draft | submitted | approved | scheduled → cancelled`; `released` terminal. `scheduled` waits on a Temporal timer for `release_date`.
- **BR-9.3** Draft versions use `version` optimistic locking; two engineers editing the same draft get 409 on the second save and a line-level merge view.
- **BR-9.4** Scrap: consumed quantity = `ceil_policy((qty_parent / series) × quantity × (1 + scrap_var_pct/100) + scrap_const)`; `round_up = quantity` rounds to the next whole unit, `measurement` to the unit's `decimal_precision`, `consumption` rounds the total across the order, not per line.
- **BR-9.5** Phantom lines are replaced by their own active BOM at explosion time, as of the same date; a phantom with no active BOM is reported as an explosion error, not silently skipped.
- **BR-9.6** Explosion depth cap is 25; exceeding it returns 422 `ENG-BOM-DEPTH`; cycle detection on insert makes this reachable only for legitimately deep structures.
- **BR-9.7** Parallel operations: an operation with `priority = secondary1` runs alongside the primary with the same `next_operation_no`; lead time takes the max of the branches; a secondary without a primary at the same join is rejected.
- **BR-9.8** Lead time with efficiency: run hours ÷ (resource efficiency × calendar shift efficiency); setup is not scaled by quantity; queue and transit are calendar-elapsed, not capacity-consuming.
- **BR-9.9** ECO release is all-or-nothing within engineering-service; failure after partial activation triggers Temporal compensation that reverts activated versions to `draft` and restores expired ones to `active`, then marks the ECO `approved` again with an error note.
- **BR-9.10** A release date earlier than today requires the duty "Backdate engineering changes" and is audited; a release date more than 365 days ahead is rejected.
- **BR-9.11** Deleting a resource is refused while any active route version requires it directly; capability-based requirements are unaffected.
- **BR-9.12** Co-product allocation percents on a version must sum to ≤ 100; by-products carry no allocation and may have negative cost in wave 24.
- **BR-9.13** Release line machine: `pending → sent → accepted | rejected`; `sent → failed` after 5 retries; `rejected` and `failed` are terminal for the line and resubmission creates a new line; an ECO release triggers release lines only for entities that previously accepted the product.
- **BR-9.14** A released product is ready when every mandatory check is `passed` or `not_applicable`; a passed automated check that later fails (e.g. the BOM expired) reverts the product to `readiness_pending` only when the policy sets `continuous = true` (default false); manual checks cannot be signed by the user who created the release session.
- **BR-9.15** Nomenclature increments: a number segment that overflows its width is rejected (`ENG-NOMEN-OVERFLOW`); letters roll Z → AA; date segments use the release date in the engineering organization's time zone; a version code is never reused for the same product.
- **BR-9.16** Alternative groups: with `usage_probability`, probabilities in a group sum to exactly 100; with `priority`, priorities are unique in the group; a line may not be both an alternative-group member and a follow-up component in the same group (`ENG-ALT-CONFLICT`).
- **BR-9.17** Effectivity precedence at resolution is serial > parameter > date; two serial-effective versions with overlapping ranges for the same (product, site) are rejected at ECO approval (`ENG-EFF-OVERLAP`).
- **BR-9.18** A signature binds DIR id, version, transition and the sha256 of all originals; changing originals after signature is refused (`ENG-DOC-SIGNED`); where the type requires independent review the signer cannot be the last editor.
- **BR-9.19** eBOM import is idempotent on (source, part number, revision): re-import updates the draft while it is still draft; once released, the same revision is rejected (`ENG-EBOM-REVISION-RELEASED`).

1.9.8 Acceptance criteria

- **AC-9.1** (FR-9.9) Given the 7-level, 2,000-component golden product, when exploded for qty 10 as of 2026-03-01, then the flattened component list equals `engineering/golden-explosion.csv` and p95 over 100 runs < 500 ms.
- **AC-9.2** (FR-9.3) Given BOM versions V1 (2025-01-01..2026-05-31) and V2 (2026-06-01..), when resolved as of 2026-01-01, then V1; as of 2026-06-01, then V2; as of 2026-05-31 with qty 1,000 where V3 covers qty ≥ 500, then V3.
- **AC-9.3** (FR-9.7, BR-9.2) Given an approved ECO replacing V1 with draft V2 at release date 2026-07-01, when the Temporal test clock passes 2026-07-01, then V1 is `expired` with effective_to 2026-06-30, V2 is `active`, both events are published, and the ECO is `released`.
- **AC-9.4** (FR-9.10) Given the 12 routing fixtures (sequential, two-branch parallel, overlap), when lead time is computed for qty 100, then results match fixture hours to 4 decimals.
- **AC-9.5** (FR-9.11) Given product A whose active BOM contains B, when a line adding A to B's draft is saved, then 422 `ENG-BOM-CYCLE` naming the path A→B→A.
- **AC-9.6** (FR-9.8) Given component C used in 30 products across 2 sites, when where-used is run as of today with levels = all, then 30 distinct top-level products and the ECO impact report shows the same set.
- **AC-9.7** (FR-9.5) Given an operation requiring capability "welding ≥ level 3" and no resource with it, when the route version is activated, then 422 `ENG-ROUTE-UNSATISFIED` names the operation.
- **AC-9.8** (BR-9.9) Given an ECO with 3 versions where the third fails activation, when released, then none are active, the ECO returns to `approved` with the error, and the audit shows the compensation.
- **AC-9.9** (FR-9.6) Given a 3-year calendar with 2 shifts and 10 closed days, when generated, then open-day count equals the fixture and generation < 2 s.
- **AC-9.10** (BR-9.4) Given a line qty 3 per series 2 with scrap_var 5% and scrap_const 1, round_up quantity, when the parent qty is 7, then consumption = ceil(7/2×3×1.05 + 1) = 13.
- **AC-9.11** (FR-9.15, FR-9.16, BR-9.13) Given engineering organization ENG1 and a policy that copies and activates BOM and route, requiring acceptance in USMF and not in DEMF, when product P version V-02 is released to both, then the DEMF line is `accepted` with active BOM and route on the mapped DEMF site and the USMF line waits in Open product releases; after acceptance, USMF has the released product and both events are published.
- **AC-9.12** (FR-9.17, BR-9.14) Given a readiness policy with 3 automated checks and 1 mandatory manual check, when P is released to USMF, then the released product is `readiness_pending` and a sales-order policy query returns `PRD-LC-BLOCKED`; after the manual check is signed and the BOM is active, the state becomes Active.
- **AC-9.13** (FR-9.18, BR-9.15) Given nomenclature `V-{NN}` with last version V-99, when the next version is requested, then `ENG-NOMEN-OVERFLOW`; given `{A}` with last Z, then AA.
- **AC-9.14** (FR-9.21, BR-9.17) Given an ECO with serial effectivity SN1000–SN1999 replacing line 30, when exploding with serial SN1500, then the new component is returned; with SN2000, the old component.
- **AC-9.15** (FR-9.22) Given a super BOM line with `frame == "carbon"` and a wheel line with `qty_expr = wheel_count`, when exploded with frame = carbon and wheel_count = 2, then only the carbon frame line appears and wheel quantity is 2.
- **AC-9.16** (FR-9.24, FR-9.25, BR-9.18) Given change-controlled type DRW with signature on release, when version 02 is released outside an ECO, then 409 `ENG-DOC-ECO-REQUIRED`; through an ECO, a signature record is stored, version 02 is released and version 01 obsolete.

- **AC-9.17** (FR-9.27, BR-9.19) Given an eBOM of 120 lines with 5 unknown part numbers, when imported, then a draft BOM version with 115 lines and an ECR exist, 5 lines are exceptions `ENG-EBOM-PART-UNKNOWN`, and the comparison counts equal the fixture.
- **AC-9.18** (FR-9.20, BR-9.16) Given alternative group A1 with probabilities 60/40, when exploded, then both lines return with group metadata; when probabilities are saved as 60/30, then 422 `ENG-ALT-CONFLICT`.

1.9.9 Test plan and fixtures

Fixtures: `engineering/golden-product.json` (7 levels, 2,000 components, 40 phantoms, 3 sites) with `golden-explosion.csv`; `engineering/version-dates.json` (12 overlapping-version scenarios); `engineering/routes-12.yaml` with lead-time oracle; `engineering/calendars.csv`; `engineering/eco-scenarios.yaml` (8 workflows including compensation); `engineering/bom-extract-ax.csv` (BOMVersion/BOM 10k rows) and `engineering/stko-stpo-extract.csv`.

Test	Type	Target	Pass criterion
Golden explosion	golden + performance	explode	byte-equal, p95 < 500 ms
As-of resolution	table-driven	resolve	12/12
Cycle detection	property (random DAGs + injected cycles)	line insert	0 cycles accepted, 0 false rejections
ECO workflow	Temporal test server	ECO	8/8 scenarios incl. compensation
Lead time	unit	calc	12/12 to 4 decimals
Scrap rounding	table-driven	consumption	40 cases
Calendar generation	unit + performance	generate	fixture equal, < 2 s
Where-used scale	performance	implode	100k lines, < 300 ms
Event contracts	contract	7 events	registry accepts

Reconciliation: Σ flattened explosion quantities = Σ over tree leaves; active version count per (product, site, date) ≤ 1 (nightly check); ECO affected versions = activated + expired events emitted.

1.9.10 Deployment and operations

Helm chart `passage-engineering` (Go service ×2, CloudNativePG `engineering-db`, Debezium connector, Temporal namespace `engineering`). Config: `ENG_BOM_MAX_LINES=5000`, `ENG_BOM_MAX_DEPTH=25`, `ENG_ROUTE_MAX_OPS=500`, `ENG_ECO_MAX_VERSIONS=500`, `ENG_EXPLODE_CACHE_TTL_S=300`. Feature flags: `engineering.direct_activation` (default off in production tenants), `engineering.formulas`, `engineering.plm_inbound`. Scheduled jobs: nightly overlap check; nightly expiry job setting `expired` on versions whose `effective_to` passed; 30-day expiry warning digest. SLOs: explode p95 < 500 ms; resolve p95 < 30 ms; ECO release p95 < 60 s. Alerts: overlap check finds > 0 rows; ECO stuck in `scheduled` past release_date + 10 min; explosion errors > 1% of calls. Runbook: "ECO compensation ran" (review error note, re-validate drafts, resubmit), "Rebuild product closure" (`passagectl eng rebuild-closure`). Rollback: previous digest; migrations additive.

1.9.11 Migration from AX / SAP

Source	Passage entity	Notes
AX BOMTable (BOMId, Name, SiteId, ItemGroupId)	BomHeader	
AX BOMVersion (ItemId, BOMId, FromDate, ToDate, FromQty, ToQty, Active, Approved, ApprovedBy, InventDimId→site)	BomVersion	Active=Yes → active; Approved without Active → draft with approved_by; date 1900-01-01 → null
AX BOM (BOMId, LineNum, ItemId, BOMQty, BOMQtySerie, UnitId, BOMType, ScrapConst, ScrapVar, Position, RoundUp, FromDate, ToDate, OprNum, InventDimId)	BomLine	BOMType enum Item/Phantom/Pegged/Vendor; co/by-products from PmfCoByProduct
AX RouteTable, RouteVersion, RouteOpr (OprNum, OprId, SetUpTime, ProcessTime, ProcessPerQty, TransitTime, QueueTimeBefore/After, OprPriority, NextOprNum, LinkType, Overlap), RouteOprTable (WrkCtrIdCost, requirements)	RouteHeader, RouteVersion, Operation, OperationRequirement	OprPriority Primary/Secondary1..3; requirements from RouteOprTable WrkCtrId / WrkCtrGroupId / WrkCtrCapability
AX WrkCtrTable (WrkCtrId, WrkCtrType, Efficiency, CalendarId, WrkCtrGroupId, VendAccount), WrkCtrResourceGroup, WrkCtrCapability, WrkCtrCapabilityResource (Level, FromDate, ToDate)	Resource, ResourceGroup, Capability, ResourceCapability	VendAccount → vendor_party_id via wave-7 alias
AX WorkCalendarTable, WorkCalendarDate, WorkCalendarDateLine (FromTime, ToTime, Efficiency), WorkCalendarTemplate	WorkCalendar, CalendarDay, Shift	times in seconds → hh:mm
D365 EngChgRequest / EngChgOrder (if present)	ECR / ECO	historical ECOs loaded as `released` with their versions
SAP MAST (MATNR, WERKS, STLNR, STLAL, STLAN usage) + STKO (STLAL, BMENG, BMEIN, DATUV, STLST status, AENNR) + STAS	BomHeader, BomVersion	one header per STLNR; one version per STLAL × DATUV; STLAN 1 (production) only; base_qty from BMENG
SAP STPO (POSNR, IDNRK, MENGE, MEINS, AUSCH scrap, DUMPS phantom, ALPOS, POSTP L/N/R, DATUV, DATUB, SANKA costing relevance)	BomLine	POSTP N (non-stock) → vendor; negative MENGE → by_product
SAP PLKO (PLNTY N, PLNNR, PLNAL, DATUV, VERWE, STATU) + MAPL + PLAS (sequence) + PLPO (VORNR, ARBPL, STEUS, VGW01..06, VGE0x units, PLIFZ, ZMERH, UEMUS overlap)	RouteHeader, RouteVersion, Operation	VGW01 setup, VGW02 machine, VGW03 labor → setup_time_h / run_time_h (labor kept as attribute); PLAS alternative sequences → parallel branches
SAP CRHD (OBJID, ARBPL, WERKS, VERWE, KAPID), CRCA, KAKO (KAPAZ, NGRAD utilization), CRTX	Resource, ResourceGroup, capacity_per_day_h	NGRAD → efficiency_pct
SAP TFACD/TFACS factory calendar, shift definitions	WorkCalendar	holiday calendars expanded for the migration range
SAP AENR (AENNR, DATUV, AETXT, AESTA)	ECO (historical, released)	effectivity dates recreated on versions

Validation: every line's component exists as a product in wave 8 and is not obsolete; every version's product is released at the version's site; no overlapping active versions after load (overlaps go to the exception queue with both versions listed); route requirements satisfiable. Not migrated: AX `BOMCalcTable` results (recomputed in wave 39), SAP `PLPO` activity-type costing fields `LAR0x` (wave 39), SAP document BOMs (STLTY D) and sales-order BOMs (wave 27 configured products), classification-based variant BOMs that depend on LO-VC procedures.

1.9.12 Dependencies, risks, open questions

Depends on: wave 8 (products, variants, UoM conversions, lifecycle), wave 6 (sites, calendars reference data), wave 7 (vendor parties for vendor-type resources), wave 4 (Temporal, outbox), wave 5 (number sequences `BOM`/`ROUTE`/`ECO`, audit).

Risk	Likelihood	Impact	Mitigation
Customers with un-versioned AX BOMs rely on in-place edits; forcing ECOs slows them	High	Medium	`engineering.direct_activation` flag per tenant with audit; ECO required only for products flagged `controlled`
SAP alternative sequences and parallel sequences map imperfectly to priority branches	Medium	Medium	Fixture comparison; unmapped PLAS structures reported, not silently flattened
Explosion cache serves stale results after ECO release	Low	High	Cache key includes the set of active version ids; release invalidates by product

Open questions: (1) Should BOM lines reference product variants directly or master plus dimension expressions (AX "dimension-based" lines)? Proposed: direct variant with an optional "inherit parent dimension" flag; decide by wave 21. (2) Formula yield at header or per line? Proposed: header yield plus line scrap; decide by wave 24. (3) Do ECOs cover released-product changes (item model group) too? Proposed: no in v1; decide by wave 10.

1.9.13 Parameters and setup

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
`eng.bom.approval_required`	tenant / site	bool	true	true / false	Activation requires approval (BR-9.1)	Inventory and warehouse management parameters → Bills of materials → BOM approval check	OS28 BOM modification parameters
`eng.direct_activation`	tenant	bool	false in production tenants	true / false	Activation outside ECO (feature flag)	— (in-place BOM edits)	OS28 "ECM mandatory" setting
`eng.bom.max_depth`	tenant	int	25	5–25	BR-9.6	BOM levels setting	CS12 explosion level limit
`eng.bom.max_lines`	tenant	int	5,000	100–10,000	FR-9.2	—	—
`eng.bom.usage_fallback`	tenant	list	production → universal	ordered usages	FR-9.19 resolution	—	OPJI/OPJM selection ID, OS20 usages
`eng.bom.scrap_default`	item group	percent	0	0–100	Default variable scrap on new lines	BOM line ScrapVar default	OS27 default values, MARC-AUSSS assembly scrap
`eng.route.time_unit`	tenant	enum	hours (4 dec)	hours / minutes	Operation time storage and display	Production control parameters → time unit	Standard value keys (OP19)
`eng.route.default_link_type`	tenant	enum	soft	hard / soft	Default operation relation	RouteOpr.LinkType	PLAS relationship type
`eng.cal.horizon_months`	resource group	int	36	1–60	Calendar generation window (FR-9.6)	Compose working times period	Factory calendar validity (SCAL)
`eng.cal.expiry_warning_days`	tenant	int	60	7–365	Job ENG-J4 warning	Update calendars	SCAL valid-to
`eng.eco.number_sequence`	tenant	sequence	`ECO-{######}`	sequences	ECO numbers	ECM parameters → Number sequences	Change number number-range object (CC01)
`eng.eco.max_horizon_days`	tenant	int	365	30–1,095	BR-9.10	—	—
`eng.effectivity.types`	tenant	set	{date}	date, serial, parameter	FR-9.21	—	IMG ECM → Effectivity types and parameters
`eng.org.engineering`	legal entity	bool	false	true / false	FR-9.14	ECM parameters → Engineering organization	—
`eng.release.default_policy`	engineering category	FK	none	release policies	FR-9.15	Product release policies	ALE distribution model (BD64)
`eng.release.require_acceptance`	release policy × legal entity	bool	false	true / false	FR-9.16	Release policy "require acceptance"	—
`eng.readiness.policy`	engineering category / item group	FK	none	readiness policies	FR-9.17	Product readiness policies	—
`eng.nomenclature`	engineering category	FK	`V-{NN}`	nomenclatures	FR-9.18	Version nomenclature	Revision levels (OS13)
`eng.doc.signature_meanings`	document status	text	"Approved for release"	≤ 100 chars	FR-9.24	Electronic signature requirements (D365)	Digital signature strategy on DC20 status
`eng.ebom.sources`	tenant	records	none	SFTP / REST source definitions	FR-9.27	PLM integration (Dataverse)	ECTR configuration
`eng.explode.cache_ttl_s`	tenant	int	300	0–3,600	Explosion cache	—	—

1.9.14 Inquiries and reports

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
BOM versions per product	list inquiry	product, site, status, usage, date	version, site, dates, qty range, status, ECO, approved by	`engineering.bom_version`	BOM versions; SSRS BOM versions	CS03, CS05
Multi-level explosion	drill-down	product, site, date, qty, usage, effectivity context, configuration	level, line, component, qty, scrap, alt group, effectivity	explode API	BOM designer; SSRS BOM lines	CS11 / CS12 / CS13
Where-used	drill-down	component, date, levels, site	parent, level, qty, version status, top-level count	product closure	BOMWhereUsed; SSRS BOM where-used	CS15
BOM version comparison	drill-down	version A, version B	added, removed, changed fields per line	`bom_line`	Engineering version comparison (D365)	CS14
Route operations and lead time	operational report	route version, qty	op, resource req., setup, run, queue, transit, lead time	route projection	SSRS Routes / Operations listings	CA03, CA97
Resource where-used	list inquiry	resource, group, capability	route versions, operations, site	operation requirements	Resource → Route versions	CA80, CR15
Work calendar	list inquiry	calendar, date range	day, open, shifts, hours, efficiency	`calendar_day`	SSRS Calendars / Working time	SCAL, CR03 capacity

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
ECR/ECO by status	KPI	status, priority, category, age	count, median cycle time, overdue	`engineering.eco`	Change request / change order inquiries	CC04 change master information system
ECO impact report	operational report	ECO	affected products, sites, versions, documents, open-order counts (hooks)	impact snapshot	Impact analysis report	CC04, CS15
Release status (product × legal entity)	list inquiry	product, entity, status, session	line status, version, accepted by, reason	`release_line`	Release status inquiry; SSRS Product release report	BD87 IDoc status for BD10/BD30
Readiness check status	operational report	entity, policy, check, status	pending checks, assignee, due date, age	`readiness_check_result`	Readiness check status inquiry	—
Engineering versions by category	list inquiry	category, product, state	version code, effective range, state, BOM/route	`engineering_version`	Engineering version inquiry	Revision level display (CC03)
eBOM vs mBOM comparison	drill-down	eBOM import, active BOM	added, removed, changed lines	`ebom_import`	—	ECTR CAD BOM comparison
Document structure and where-used	drill-down	DIR	children, parents, BOM document lines	document structure	—	CV13, CV15

1.9.15 Printed and electronic documents

Document	Trigger	Layout elements (header/line/footer fields)	Formats	Numbering sequence	Legal / retention requirement
Indented BOM report	on demand, attached to ECO	header: product, version, site, effective range, usage; lines: level, line no, component, qty/series, unit, scrap, position, operation; footer: approved by, ECO, page x/y	PDF, XLSX	none	kept with ECO record
Route sheet	on demand	header: product, route version, site; lines: op no, resource requirement, setup, run per qty, queue, transit; footer: lead time for reference qty	PDF	none	kept with ECO record
ECR / ECO document	submission and release	header: number, title, reason, priority, release date, effectivity; lines: affected versions with diff summary, affected documents, impact counts; footer: approvals with signature manifestation	PDF, email to approvers	`ECO-{######}`	10 years after product becomes obsolete (ISO 9001 §7.5.3; ISO 13485 §4.2.5 and 21 CFR 820 for medical-device tenants)
Product release report	release session completion	header: session number, policy; lines: product, version, entity, line status, reason	PDF	`REL-{yyyy}-{#####}`	7 years
Signed engineering document rendition	released status with signature	original plus signature page: printed name, date/time (UTC and local), meaning, hash	PDF/A-2b	DIR number/part/version	per document-type retention class; 21 CFR 11.10(c) record retention
Work calendar printout	on demand	calendar, month grid, shifts, closed days	PDF	none	none

1.9.16 Periodic and batch jobs

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
ENG-J1 Active-version overlap check	nightly 01:00	product_id hash (8 partitions)	read-only	< 10 min at 1M versions	report only	rows > 0
ENG-J2 Version expiry	nightly 00:05 site time	site_id	sets `expired` where `effective_to` < today; idempotent	< 5 min	retried hourly	failures > 0
ENG-J3 Expiry warning digest	weekly Monday 06:00	owner team	read-only	< 2 min	none	none
ENG-J4 Calendar horizon extension	monthly 1st 02:00	calendar_id	generate idempotent per range	< 2 s per calendar	per-calendar retry	calendars within warning window
ENG-J5 Scheduled ECO release	Temporal timer at release_date 00:00	eco_id	workflow id per ECO	< 60 s p95	compensation BR-9.9	ECO in `scheduled` > release_date + 10 min
ENG-J6 Product closure integrity	nightly 03:30	tenant	read-only	< 15 min	runbook "Rebuild product closure"	mismatches > 0
ENG-J7 Release product structures	every 15 min for pending sessions; on ECO release	session_id	line-level idempotent	1,000 components × 3 entities < 2 min	line `failed` after 5 retries	failed lines > 0
ENG-J8 eBOM source poll	every 15 min	source_code	idempotent per (source, part, revision)	< 1 min per 100 payloads	payload to exceptions with reason	source unreachable 3 polls
ENG-J9 Readiness evaluation	hourly and on events	legal_entity_id	recompute per (product, check)	< 5 min for 100k released products	check left `pending`	overdue manual checks

1.9.17 Security duties and privileges

Duty	Privileges (entry points)	Segregation-of-duties conflicts	Default roles that include it
View engineering data	`GET /engineering/v1/**`, explode, where-used, diff	none	every manufacturing role
Maintain BOMs	BOM headers, draft versions, lines; BOM designer	Approve engineering changes on the same ECO	Design engineer
Maintain routes and resources	route versions, operations, resources, calendars	none	Manufacturing engineer
Activate BOM without ECO	`bom-versions/{id}:activate`	Maintain BOMs (when `change_controlled`)	Engineering manager
Maintain engineering changes	ECR/ECO create, submit, eBOM import	Approve engineering changes	Design engineer, Manufacturing engineer
Approve engineering changes	`ecos/{id}:approve`	Maintain engineering changes on the same ECO (no self-approval)	Engineering manager, Quality manager
Release engineering changes	`ecos/{id}:release`, backdate with separate duty	none	Engineering manager
Release product structures	release sessions, ENG-J7, release policies	Accept product releases in the same receiving entity	Engineering administrator
Accept product releases	Open product releases accept/reject	Release product structures	Plant master data steward

Duty	Privileges (entry points)	Segregation-of-duties conflicts	Default roles that include it
Maintain readiness policies and sign checks	readiness policies; manual check sign-off	sign-off conflicts with creating the release session (BR-9.14)	Plant master data steward, Quality manager
Sign engineering documents	signature transitions (FR-9.24)	Maintain documents on the same DIR when independent review is required	Quality manager, Engineering manager
Administer eBOM sources	`eng.ebom.sources`, ENG-J8	none	Engineering administrator

1.9.18 Message catalog

Code	Severity	User text	Cause	Remediation	Raised by
ENG-BOM-CYCLE	error	"Adding {c} creates a cycle: {path}."	Recursive structure	Remove the line	FR-9.11
ENG-BOM-DEPTH	error	"Structure exceeds {max} levels."	Depth cap	Flatten or raise limit	BR-9.6
ENG-BOM-OVERLAP	error	"Version overlaps active version {v} for this site, date and quantity."	Overlap on activation	Adjust ranges	FR-9.1
ENG-BOM-COMP-OBSOLETE	error	"Component {c} is obsolete."	Obsolete component	Replace component	FR-9.11
ENG-BOM-PHANTOM-NOBOM	error	"Phantom {c} has no active BOM on {date}."	Phantom without BOM	Activate its BOM	BR-9.5
ENG-ROUTE-UNSATISFIED	error	"No resource satisfies operation {op} requirement {req}."	Requirement unmet	Add resource or capability	FR-9.5
ENG-ROUTE-NEXT-MISSING	error	"Next operation {n} does not exist."	Bad reference	Fix operation number	FR-9.4
ENG-ROUTE-SECONDARY-NOPRIMARY	error	"Secondary operation {op} has no primary at its join."	BR-9.7	Add primary	BR-9.7
ENG-ECO-NOT-APPROVED	error	"ECO {n} must be approved before release."	Wrong status	Approve first	FR-9.7
ENG-ECO-BACKDATE-DUTY	error	"Backdated release requires the Backdate duty."	Past release date	Use today or request duty	BR-9.10
ENG-ECO-HORIZON	error	"Release date is more than {d} days ahead."	Horizon exceeded	Choose an earlier date	BR-9.10
ENG-RES-IN-USE	error	"Resource {r} is required by active route {v}."	Delete in use	Change routes first	BR-9.11
ENG-OWNED-FIELD	error	"{field} is owned by engineering organization {eo}."	Local edit of engineering data	Raise an ECR	FR-9.14
ENG-READINESS-PENDING	warning	"{n} readiness checks are pending."	FR-9.17	Complete checks	FR-9.17
ENG-NOMEN-OVERFLOW	error	"Version numbering exhausted for {product}."	BR-9.15	Change nomenclature width	BR-9.15
ENG-ALT-CONFLICT	error	"Alternative group {g} is inconsistent: {reason}."	BR-9.16	Correct priorities/probabilities	BR-9.16
ENG-EFF-OVERLAP	error	"Serial ranges overlap with ECO {n}."	BR-9.17	Adjust ranges	BR-9.17
ENG-COND-UNKNOWN-ATTR	error	"Condition references unknown attribute {a}."	FR-9.22	Fix condition or model	FR-9.22
ENG-DOC-ECO-REQUIRED	error	"Document type {t} is change-controlled; release through an ECO."	FR-9.25	Add to an ECO	FR-9.25
ENG-DOC-SIGNED	error	"Originals are locked by signature on {date}."	BR-9.18	Create a new version	BR-9.18
ENG-EBOM-PART-UNKNOWN	warning	"Part {p} is not a known product."	FR-9.27	Create product or map identifier	FR-9.27
ENG-EBOM-REVISION-RELEASED	error	"Revision {r} of {p} is already released."	BR-9.19	Send a new revision	BR-9.19

1.9.19 Performance budgets and capacity

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
Explosion (7 levels, 2,000 components)	200k/day from planning and costing; peak 1,000/min	120 / 500 / 900 ms	50 req/s per replica	cache only	product closure; cache keyed by active version set	cache hit ratio rises; uncached p95 ≤ 1.2 s
As-of resolve	5M/day	5 / 30 / 60 ms	1,000 req/s	none	(product_id, site_id, effective_from, status)	unchanged
Where-used (100k lines)	20k/day	60 / 300 / 600 ms	50 req/s	none	btree bom_line(component_product_id)	levels capped at request value
BOM line save with cycle check	50k/day	20 / 80 / 150 ms	100 req/s	~200 B per line; 10M lines ≈ 3 GB	closure lookup	unchanged
ECO release (500 versions)	100/day	10 / 60 / 120 s	5 concurrent	ECO snapshots ~100 KB	Temporal workflow	queued; timers unaffected
Release session (1,000 components × 3 entities)	50/day	40 s / 2 min / 4 min	4 concurrent sessions	release lines ~1 KB	session_id partition of work	lines queued, no failure
eBOM import (500 lines)	500/day	2 / 8 / 15 s	10 concurrent	payloads ~200 KB	unique (source, part, revision)	ENG-J8 extends poll interval to 30 min

1.9.20 Localization and compliance hooks

Item	What varies	Country packs touching it (wave 48)	Extension point
Public holidays in work calendars	US federal; UK bank holidays per nation; DE holidays per Land; FR 11 jours fériés plus Alsace-Moselle; IN national and state holidays; MX mandatory rest days (Ley Federal del Trabajo Art. 74); CA federal and provincial	all seven	`HolidayCalendarProvider` feeding FR-9.6 closed days
Electronic records and signatures	US 21 CFR Part 11; EU GMP Annex 11; EU eIDAS for qualified signatures (optional)	US, DE, FR	signature policy per document type (FR-9.24)
Design and change control	ISO 9001 §8.3/§8.5.6; ISO 13485 §7.3.9; 21 CFR 820 (QMSR effective 2026-02-02); EU MDR Annex II technical documentation	US, DE, FR	`change_controlled` engineering categories; ECO record retention
Export control on technical data	US EAR/ITAR technical data, EU dual-use Regulation 2021/821	US, DE, FR	export classification attribute on engineering category; access restricted through OPA attributes (wave 48)
Units on drawings and BOMs	US customary vs metric	US	unit conversion (FR-6.9, FR-8.7) at display
Working time	Shift patterns must respect local limits (EU Working Time Directive 2003/88/EC, IN Factories Act 1948 §51 48 h/week); enforced for workers in wave 42, warned here when calendar shifts exceed 48 h/week	DE, FR, IN	calendar validation hook (warning only)

1.9.21 Coverage closure

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
AX §12.15.1 PIM, Common — Product readiness checks (D365), EcoResProductReadiness; register §12.99.4 #144	PARTIAL-9	ADDED as FR-9.17	Automated and manual checks; blocks via FR-8.14
AX §12.15.4 PIM, Setup — Product readiness policies (D365); register §12.99.4 #151	PARTIAL-9	ADDED as FR-9.17	Parameter `eng.readiness.policy`
AX §12.34.1 ECM, Common — Release product structure, EngChgReleaseProductStructure; register §12.99.4 #280	PARTIAL-9	ADDED as FR-9.15	Engineering vs operational split in FR-9.14
AX §12.34.1 ECM, Common — Product readiness checks (per LE checklist), EngChgProductReadiness; register §12.99.4 #281	PARTIAL-9	ADDED as FR-9.17	Per receiving legal entity
AX §12.34.1 ECM, Common — Product acceptance, EngChgProductAcceptance; register §12.99.4 #282	PARTIAL-9	ADDED as FR-9.16	Open product releases screen
AX §12.34.1 ECM, Common — Engineering product categories, EngChgEngineeringProductCategory; register §12.99.4 #284	PARTIAL-9	ADDED as FR-9.18	Category carries nomenclature, readiness and release policies
AX §12.34.2 ECM, Inquiries — Release status inquiry (product × legal entity); register §12.99.4 #286	PARTIAL-9	ADDED as FR-9.15	§1.9.14 "Release status"
AX §12.34.2 ECM, Inquiries — Readiness check status inquiry; register §12.99.4 #287	PARTIAL-9	ADDED as FR-9.17	§1.9.14 "Readiness check status"
AX §12.34.2 ECM, Reports — SSRS Product release report; register §12.99.4 #288	PARTIAL-9	ADDED as FR-9.15	§1.9.15 "Product release report", rendered by wave 46
AX §12.34.3 ECM, Periodic — Release product structures (batch); register §12.99.4 #289	PARTIAL-9	ADDED as FR-9.15	Job ENG-J7
AX §12.34.3 ECM, Periodic — Readiness check evaluation (batch); register §12.99.4 #290	PARTIAL-9	ADDED as FR-9.17	Job ENG-J9
AX §12.34.4 ECM, Setup — Engineering organizations; register §12.99.4 #292	PARTIAL-9	ADDED as FR-9.14	Parameter `eng.org.engineering`
AX §12.34.4 ECM, Setup — Engineering product categories (version nomenclature, attributes, readiness policy, release policy); register §12.99.4 #293	PARTIAL-9	ADDED as FR-9.18	—
AX §12.34.4 ECM, Setup — Version nomenclature (number/letter/date segments); register §12.99.4 #294	PARTIAL-9	ADDED as FR-9.18	BR-9.15 increment rules
AX §12.34.4 ECM, Setup — Product readiness policies / readiness checks; register §12.99.4 #295	PARTIAL-9	ADDED as FR-9.17	Hooks to waves 13, 17, 22, 26, 31 return not_applicable until live
AX §12.34.4 ECM, Setup — Product release policies; register §12.99.4 #296	PARTIAL-9	ADDED as FR-9.15	Parameter `eng.release.default_policy`
SAP §13.21 PP Master data — CS51/CS52/CS53/CS61/CS62/CS63/CS71 BOM categories; register §13.99.2 #238	PARTIAL-9	ADDED as FR-9.19	Usage and category on header; sales-order BOM instances in wave 27, WBS BOMs in wave 41, equipment/FL BOMs in wave 44 reuse the model
SAP §13.21 PP Master data — alternative items, discontinuation / follow-up material; register §13.99.2 #243	PARTIAL-9	ADDED as FR-9.20	Resolution logic in MRP wave 22
SAP §13.21 PP Customizing — OS40/OS41/OS44 ECM effectivity types (date, serial, parameter); register §13.99.2 #250	PARTIAL-9	ADDED as FR-9.21	Parameter `eng.effectivity.types`
SAP §13.32 LO-VC Master data — PSM / iPPE product variant structures; register §13.99.2 #360	PARTIAL-9	SUPERSEDED by FR-9.22 super BOM/routing with selection conditions	iPPE-specific objects (PVS nodes, access diagrams, CMP) have no equivalent; multi-level configurable structures are modeled as super BOMs over configuration attributes
SAP §13.32 LO-VC Master data — VC with batch/serial effectivity, parameter effectivity; register §13.99.2 #362	PARTIAL-9	ADDED as FR-9.21	Effectivity context combined with configuration in explode
SAP §13.35 DMS Master data — CV11/CV12/CV13/CV15 document structure; register §13.99.2 #376	GAP	ADDED as FR-9.26	Structures versioned with parent DIR
SAP §13.35 DMS Master data — CV01N status network with release workflow and digital signature; register §13.99.2 #378	PARTIAL-9	ADDED as FR-9.24	21 CFR 11 manifestation and linking
SAP §13.35 DMS Master data — CV01N version / part / change number (ECM); register §13.99.2 #379	PARTIAL-9	ADDED as FR-9.25	ECO-controlled DIR versions
SAP §13.35 DMS Master data — ECTR CAD integration, CAD BOM derivation; register §13.99.2 #381	GAP	ADDED as FR-9.27	Contract and import path here; native CAD file management out of scope; vendor connectors deferred to wave 35
SAP §13.35 DMS Master data — Document BOM items (CS01 item category D); register §13.99.2 #382	PARTIAL-9	ADDED as FR-9.23	Line types `document` and `text`
SAP §13.35 DMS Master data — PLM suite (Engineering Record, PSM, Visual Enterprise, Recipe Development, Specification management, Labeling); register §13.99.2 #383	PARTIAL-9	DEFERRED to wave 24	Recipe development and specifications go to wave 24 as the register proposes; global label management to wave 48; Visual Enterprise 3D viewing is out of scope; Engineering Record is covered by ECR/ECO (FR-9.7)
SAP §13.35 DMS Reports — CV13 / CV15 document structure display / where-used; register §13.99.2 #386	GAP	ADDED as FR-9.26	§1.9.14 "Document structure and where-used"
SAP §13.35 DMS Reports — ECTR reports (CAD BOM comparison); register §13.99.2 #388	GAP	ADDED as FR-9.27	§1.9.14 "eBOM vs mBOM comparison"
SAP §13.35 DMS Periodic — ECTR sync jobs; register §13.99.2 #391	GAP	ADDED as FR-9.27	Job ENG-J8
SAP §13.35 DMS Customizing — DC20 document status definitions; register §13.99.2 #393	PARTIAL-9	ADDED as FR-9.24	Status network per document type
SAP §13.35 DMS Customizing — ECTR configuration (CAD applications, templates, BOM sync rules); register §13.99.2 #396	GAP	ADDED as FR-9.27	Parameter `eng.ebom.sources`

1.10 Wave 10: Data Migration Framework & Legacy Connectors

1.10.1 Scope and business context

AX ships the Data Import Export Framework (DIXF/DMF: `DMFDefinitionGroup`, `DMFEntity`, staging tables such as `DMFCustomerEntity`, `DMFVendorEntity`, `DMFProductEntity`, `DMFBOMEntity`) and D365 the data management framework with data entities (`CustCustomerV3Entity`, `VendVendorV2Entity`, `EcoResReleasedProductV2Entity`, `BOMEntity`), data projects and packages; SAP ships LSMW (recording, batch input, BAPI, IDoc), the S/4HANA Migration Cockpit

(LTMC/LTMOM with migration objects such as `Customer`, `Supplier`, `Material`, `Bill of material`, `Routing`, `Work center`) and BAPIs (`BAPI_MATERIAL_SAVEDATA`, `BAPI_CUSTOMER_CREATEFROMDATA1`). Wave 10 builds the pipeline every later wave reuses: extract from AX SQL (ODBC) or SAP (RFC/OData or flat files), stage into a Postgres staging schema, map with a declarative DSL, validate, load through the public APIs of waves 6–9, and reconcile with row counts, hash totals and sampled field compares. Dry-run and idempotent re-run, a run ledger with lineage, and an exception queue with re-run close the loop. Phase 1 exits when the demo manufacturer's master data is fully migrated from a synthetic AX extract.

Out of scope: transactional data packs (open items, on-hand, open orders — wave 49), parallel-run diff harness (wave 49), live coexistence adapters (wave 49), X++/ABAP code conversion (non-goal).

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
DIXF staging-to-target fails at row 48,213 of 100,000 with "Function DMFEntityWriter... has been incorrectly called"; the partial load leaves half-created customers and the fix is manual SQL cleanup before re-run	Non-idempotent target writes; errors swallowed into DMFExecution log	Every load is idempotent by natural key and run id; failed rows go to the exception queue, successful rows stay; re-run touches only changed rows (FR-10.6, FR-10.7)	Re-run cost after failure: hours of cleanup→0; duplicate rows after re-run 0
LSMW requires recording a transaction (XD01) screen by screen; a screen layout change in a support pack breaks the recording silently	Batch-input emulation of GUI screens	Loads go through versioned public APIs with contract tests (FR-10.5)	Recording breakage per upgrade: recurring→0
Reconciliation in both tools is "count rows in source, count in target, eyeball"; field-level drift (truncated names, dropped leading zeros in account numbers) is discovered weeks later	No hash or sampled compare	Row counts + per-column hash totals + stratified sampled field compare with tolerance per type (FR-10.8)	Field-level drift found at load: 0%→100% of sampled columns; sign-off evidence auto-generated
Mapping lives in Excel and in the heads of consultants; the enum mapping for CustTable.Blocked or MARA-MTART is re-discovered on every project	Mappings not declarative or versioned	Mapping DSL in git with unit tests, enum tables and rejection reasons (FR-10.3)	Mapping reuse across projects: 0→100% of standard objects; mapping defects found by tests before load
A 100k-item load through DIXF takes 6–10 hours; SAP LTMC similar	Row-at-a-time batch processing	Partitioned parallel loaders (Go) against bulk endpoints with checkpoints (FR-10.6)	170k master records in < 30 min vs 6–10 h

1.10.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Migration project / definition	DMFDefinitionGroup, D365 data project, data package (manifest + package header)	LSMW project/subproject/object; LTMC migration project	migration-service `MigrationProject` with `MappingSpec` versions	full
Source extraction	DIXF ODBC/file source, AX SQL direct, D365 entity export	RFC (RFC_READ_TABLE, BAPIs), OData, SE16 extracts, IDoc outbound	`Connector` (ax-odbc, d365-odata, sap-rfc, sap-odata, csv/parquet)	full
Staging	DMF*Entity staging tables	LSMW read/convert data files; LTMC staging tables (DB staging)	Postgres schema `staging` with typed tables per source object + raw jsonb	full
Mapping / transformation	DMF mapping (source → staging → target), X++ transforms	LSMW field mapping and conversion rules (ABAP), LTMOM	Mapping DSL (YAML) with functions, lookups, enum tables	improved (tested, versioned)
Validation	Entity validation on target write	LTMC simulate; BAPI return messages	Validation stage with declarative expectations plus target-API dry run	improved
Load	DMFEntityWriter, data entity insert	Batch input / BAPI / IDoc posting	Parallel loaders against wave 6–9 bulk endpoints	full
Reconciliation	DMF execution log counts	LTMC monitoring counts	Row counts, hash totals, sampled compare, exception queue	improved
Run history / lineage	DMFExecution, job history	LSMW logs, LTMC run history	`MigrationRun` ledger with per-row lineage	improved
Standard objects	DMF customer, vendor, product, BOM, route entities	Migration Cockpit objects Customer, Supplier, Material, BOM, Routing, Work center	Connector packs for DirParty/CustTable/VendTable/InventTable/EcoResProduct/BOM/Route and KNA1/LFA1/BUT000/MARA/MAST-STKO-STPO/PLKO-PLPO/CRHD	full for Phase 1 scope
Scheduling / monitoring	Batch jobs, Data management workspace	SM37, LTMC monitor	Temporal workflows, migration workspace	full
Copy data between legal entities	DMFCopyEntity (Copy entity data between companies), D365 "Copy into legal entity"	EC01/EC02 organizational object copy; LSMW cross-company reload	`copy` project type (FR-10.14)	full
Configuration data packages	D365 configuration data projects, data templates, LCS asset library	Customizing transports (SE09/SE10, SCC1), BC Sets (SCPR20), cross-system viewer SCU0	signed configuration packages with diff (FR-10.15)	improved (diff before apply)
Recurring imports	D365 recurring data jobs (recurring integrations)	LSMW periodic runs, IDoc inbound processing (BD87)	scheduled incremental runs until cutover (FR-10.16)	full

1.10.3 Functional requirements

- **FR-10.1 Migration projects and runs** — Must. The system shall define projects (name, source system type ax2012/d365fo/sapecc/s4, target tenant, object list in dependency order, mapping spec versions) and execute runs with modes `dry_run`, `load`, and `reconcile_only`; each run records start/end, user, counts per stage, and the mapping and connector versions used.
  - Object dependency order for Phase 1 is fixed: reference data → org → parties → products → released products → resources/calendars → BOMs → routes → ECOs.
- **FR-10.2 Connectors** — Must. The system shall provide connectors: `ax-odbc` (read-only SQL over the AX 2012 database with DataAreaId and RecId-based paging), `d365-odata` (data entities with `$skiptoken` paging and change tracking), `sap-rfc` (RFC_READ_TABLE with 512-byte row limit handling, BAPI reads), `sap-odata` (API_BUSINESS_PARTNER, API_PRODUCT_SRV, API_BILL_OF_MATERIAL_SRV), and `file` (CSV, XLSX, Parquet with declared schema and codepage).
  - Each connector supports incremental extraction by `ModifiedDateTime/RecVersion` (AX) or `AEDAT/LAEDA` (SAP) when available; otherwise full extract.
  - Extraction throughput target 20,000 rows/s per connector worker on the dev cluster.
- **FR-10.3 Mapping DSL** — Must. The system shall express mappings as versioned YAML: source object, target entity, key definition (natural key columns), field rules (`copy`, `const`, `concat`, `lookup` against staged or target tables, `enum` with explicit table and default, `coerce` with type and format, `expr` in a restricted expression language, `default`), and `reject_when` conditions with reason codes.

    - Type coercions: AX `utcdatetime`/SAP `DATS`+`TIMS` to timestamptz with source zone; `NoYes` and `X`/blank to boolean; decimals with explicit scale; trim and codepage normalization.
    - Every mapping ships unit tests (input row → expected output or rejection) runnable in CI.
- **FR-10.4 Validation stage** — Must. The system shall validate staged, mapped rows with declarative expectations (not null, unique, FK-exists in target or staging, regex, range, set membership, row-count within ±N% of previous run) and a target-API dry run that calls the wave 6–9 endpoints with `X-Passage-Dry-Run: true` to collect business validation errors without writing.
    - Validation output: per-row status (ok, warn, reject) with reason codes; a run proceeds to load only when rejects ≤ the project's threshold (default 0.5%).
- **FR-10.5 Load through public APIs** — Must. The system shall load exclusively through versioned bulk endpoints (`POST /org/v1/import`, `/party/v1/parties:bulk`, `/product/v1/products:bulk`, `/engineering/v1/bom-versions:bulk`, …) with batches of 500 and `Idempotency-Key = sha256(run_id, object, natural_key)`, never by direct SQL into domain databases.
- **FR-10.6 Parallel, checkpointed, resumable loads** — Must. The system shall partition each object by hash of the natural key into N workers (default 8), checkpoint every batch in the run ledger, and resume from the last checkpoint after worker or pod failure without duplicates.
    - Target: 50k customers + 20k vendors + 100k items + 10k BOMs in < 30 min including reconciliation.
- **FR-10.7 Idempotent re-run** — Must. The system shall compute a content hash per mapped row; on re-run, rows with an unchanged hash and a successful prior load are skipped, changed rows are upserted by natural key, and rows absent from the source are reported (never deleted) unless the project enables `retire_missing` which sets the target to `inactive`.
- **FR-10.8 Reconciliation** — Must. The system shall produce, per object and run: source count, staged, mapped, rejected, loaded, skipped; per-column hash totals (sum of `hashtext` over normalized values for 1–20 chosen columns) on source-mapped vs target-read; and a stratified random sample (default 1%, min 100, max 5,000 rows) with field-by-field compare and per-type tolerance (decimals to scale, strings after trim/casefold, dates exact).
    - A run is `reconciled` only when counts tie, hash totals match, and sample mismatches = 0; otherwise `reconciled_with_exceptions` with every mismatch in the exception queue.
- **FR-10.9 Exception queue and re-run** — Must. The system shall list rejected and mismatched rows with reason, source key, mapped payload and target response; a user may edit the staged row, add a mapping override, or mark `accepted_difference` with a reason, then re-run only the exception set.
- **FR-10.10 Run ledger and lineage** — Must. The system shall keep an append-only ledger: for every loaded target record, the run id, source object, source key, content hash and mapped payload hash, queryable from the target record's audit tab ("migrated from AX CustTable US-00123 in run 42").
- **FR-10.11 Migration workspace** — Must. The system shall provide a workspace with project list, run history, per-stage progress, reconciliation report (downloadable as XLSX/PDF for sign-off), and exception queue.
- **FR-10.12 Packaging** — Should. The system shall package connectors and standard mapping packs as Helm sub-charts and OCI artifacts (`passage-migration-ax`, `passage-migration-sap`) versioned independently of the core service.
- **FR-10.13 PII handling in staging** — Must. The system shall encrypt PII-flagged staging columns at rest with a per-project key, purge staging data after a configurable retention (default 30 days after the run is signed off), and exclude PII from exception-queue exports unless the user holds `pii.read`.
- **FR-10.14 Copy entity data between legal entities** — Should. The system shall support a project type `copy` whose source is a tenant legal entity and whose target is another legal entity in the same tenant, reusing the mapping DSL with identity rules plus key-rewrite rules (source code → target code), dry run, idempotent load and reconciliation; supported objects: customer and vendor roles, released products with site defaults, BOM and route versions, resources and calendars.
- **FR-10.15 Configuration data packages** — Should. The system shall export setup data (the parameters of §1.6.13–§1.9.13, groups, terms, lifecycle states, document types, nomenclatures, readiness and release policies, mapping specs) as a versioned package (JSON bodies, manifest with schema version, dependency order, sha256 per file, signature by the tenant key) and import it into another tenant or environment after a dry-run diff showing create / update / unchanged per record; deletes are never applied.
- **FR-10.16 Recurring import jobs** — Should. The system shall let a project schedule incremental `load` runs (cron, minimum interval 15 min) from a connector or a file drop (SFTP or S3-compatible object storage path) during the coexistence and cutover window, using incremental extraction (FR-10.2); scheduling stops automatically at the project's `cutover_at`.
- **FR-10.17 Mapping packs for coverage-closure objects** — Must. The system shall extend the standard AX and SAP mapping packs, with tests, to the objects added by the phase-1 coverage closure: AX OMTeam/OMTeamMember → Team (FR-6.14); VendCertification/VendCertificationType → VendorCertification (FR-7.14); PaymSched/PaymSchedLine and SAP T052R → PaymentScheduleLine (FR-7.15); KNA1-KNRZE, KNB1-KNRZB/XDEZV, LFA1-LNRZA, LFZA and AX DirPartyRelationship → PartyRelationship (FR-7.17); DirAddressBook/DirAddressBookParty → AddressBook (FR-7.18); KNVH → customer hierarchy (FR-7.19); EcoResProductRelation → ProductRelation (FR-8.13); EcoResProductLifecycleState and MARA-MSTAE/MARC-MMSTA with T141 → LifecycleState (FR-8.14); ASMD/ASMDT → service products (FR-8.17); CUVTAB/CUVTAB_VALC → DecisionTable (FR-8.18); DRAW/DRAT/DRAD and DocuRef/DocuType → DocumentInfoRecord and links (FR-8.20); EngChgEngineeringProductCategory, version nomenclature, release and readiness policies (FR-9.15–FR-9.18); STPO ALPGR/ALPST/ALPRF/EWAHR/KZAUS/NFMAT (FR-9.20); AENR effectivity data (FR-9.21); STKO/STPO with STLTY = D document structures (FR-9.26).
    - The STLTY = D load supersedes the "not migrated: SAP document BOMs" note in §1.9.11.
- **FR-10.18 Data templates** — Could. The system shall let a project attach per-object default-value templates (D365 data templates / default templates per module) applied before mapping rules, so that fields absent in the source receive project-specific defaults recorded as `default_from_template` in lineage.

1.10.4 Data model

MigrationRun

Field	Type	Required	Notes
id	uuid	yes	PK
tenant_id / project_id	uuid	yes	FK project(name, source_type, objects[], thresholds)
run_no	int	yes	sequence per project
mode	enum	yes	dry_run, load, reconcile_only, exceptions_only
status	enum	yes	created, extracting, staging, mapping, validating, loading, reconciling, reconciled, reconciled_with_exceptions, failed, cancelled
mapping_versions / connector_versions	jsonb	yes	pinned at start
started_at / ended_at / started_by	timestamptz, uuid	yes	
counts	jsonb	yes	per object: source, staged, mapped, rejected, loaded, skipped, mismatched
parent_run_id	uuid	no	for exceptions_only re-runs
workflow_id	text	yes	Temporal
signed_off_by / signed_off_at	uuid, timestamptz	no	enables staging purge timer

StagingRow (one physical table per source object, common columns)

Field	Type	Required	Notes
run_id / object	uuid, text	yes	partition key
source_key	text(200)	yes	e.g. `USMF
raw	jsonb	yes	source columns verbatim (PII columns encrypted)
mapped	jsonb	no	output of mapping
content_hash	bytea(32)	no	sha256 of normalized mapped payload
status	enum	yes	staged, mapped, rejected, validated, loaded, skipped, failed, mismatched, accepted_difference
reason_code / reason_detail	text	no	e.g. `MAP-ENUM-UNMAPPED`, `VAL-FK-MISSING`, `API-422`
target_id	uuid	no	id returned by load
attempt	int	yes	increments per re-run

MappingSpec

Field	Type	Required	Notes
id / project_id	uuid	yes	
source_object / target_entity	text	yes	e.g. `CustTable` → `party.customer_role`
version	int	yes	immutable once a run pinned it
natural_key	text[]	yes	columns of the mapped payload
rules	jsonb	yes	ordered field rules
enum_tables	jsonb	no	{field: {source_value: target_value}, default}
reject_when	jsonb	no	[{expr, reason_code}]
tests	jsonb	yes	at least 1 case; CI fails on 0
checksum	text	yes	sha256 of the YAML

LineageEntry — run_id, object, source_key, target_entity, target_id, content_hash, loaded_at, idempotency_key (unique). **ReconciliationResult** — run_id, object, counts jsonb, hash_totals jsonb {column: {source, target, match}}, sample jsonb {size, mismatches[]}, status.

Invariants: a run's mapping versions never change after `extracting`; `loaded` rows have a lineage entry and a target_id; idempotency keys are unique across all runs; a `reconciled` status requires mismatches = 0 and rejects = 0 or all `accepted_difference`. Indexing: staging tables partitioned by `run_id` (list partitioning, dropped on purge); `(run_id, object, status)` btree; `lineage(target_entity, target_id)` for the audit tab; `lineage(idempotency_key)` unique.

Addendum entities (FR-10.14 – FR-10.18) — migration_project gains `project_type` (migrate, copy, config_package), `source_legal_entity_id`, `target_legal_entity_id`, `cutover_at`, `schedule_cron`; key_rewrite_rule: project_id, field, from_value, to_value; config_package: id, version text(20), schema_version int, manifest jsonb, signature bytea, created_by, created_at, applied jsonb [{tenant_id, applied_at, diff_counts}]; data_template: project_id, object, defaults jsonb.

1.10.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
POST	/migration/v1/projects	Create project	`Idempotency-Key`	Administer migration
POST	/migration/v1/projects/{id}/mapping-specs	Upload YAML; returns version and test results	checksum-idempotent	Maintain migration mappings
POST	/migration/v1/projects/{id}/runs	Start run (`mode`, `objects[]`, `from_checkpoint`)	key header; one active run per project	Run migrations
GET	/migration/v1/runs/{id}	Status and counts per stage	n/a	View migrations
POST	/migration/v1/runs/{id}:cancel	Cancel after current batch	key header	Run migrations
GET	/migration/v1/runs/{id}/reconciliation	Report (JSON; `Accept: application/vnd.openxmlformats…` for XLSX)	n/a	View migrations
GET	/migration/v1/runs/{id}/exceptions?object=&reason=	Exception queue	n/a	View migrations
PATCH	/migration/v1/exceptions/{rowId}	Edit staged row, set accepted_difference	version check	Resolve migration exceptions
POST	/migration/v1/runs/{id}:rerun-exceptions	Child run over exception set	key header	Run migrations
POST	/migration/v1/runs/{id}:sign-off	Sign-off; starts purge timer	key header	Approve migration sign-off
GET	/migration/v1/lineage?entity=party&id=	Lineage for a target record	n/a	View migrations
POST	/migration/v1/connectors/{type}:test	Connectivity and schema probe	pure	Administer migration

Validation: run start rejects if any object's mapping tests fail or a dependency object has no reconciled run in the project (override with `allow_unreconciled_deps=true` and the Administer duty); mapping upload rejects unknown functions, unmapped enum values without a default, and natural keys not produced by the rules.

Event	Trigger	Payload fields	Consumers
dev.passage.migration.run.started.v1	run start	run_id, project_id, mode, objects[], mapping_versions	notification, audit
dev.passage.migration.run.stage.completed.v1	each stage	run_id, object, stage, counts	workspace progress, audit
dev.passage.migration.run.completed.v1	terminal status	run_id, status, counts{staged, loaded, rejected, skipped, mismatched}, hash_match bool	notification, reconciliation UI, audit
dev.passage.migration.exception.raised.v1	reject or mismatch	run_id, object, source_key, reason_code	stewardship queue (wave 7 style)
dev.passage.migration.run.signedoff.v1	sign-off	run_id, signed_off_by, purge_at	audit, purge job

1.10.6 User experience

Screen	Primary actions	Key fields/columns	Duty required
Migration workspace	Tiles: projects, active runs, exceptions open, last reconciliation status	counts, status chips	View migrations
Project detail	Edit objects/order, upload mapping, view test results, start run (mode picker), connector test	object, mapping version, tests passed, last run	Administer migration

Screen	Primary actions	Key fields/columns	Duty required
Run monitor	Per-object stage pipeline with counts and throughput, cancel, logs link (Tempo trace)	stage, rows/s, ETA, errors	Run migrations
Reconciliation report	Counts table, hash totals per column, sample mismatches grid, download XLSX/PDF, sign-off	object, source/target counts, hash match, mismatch fields	View / Approve migration sign-off
Exception queue	Filter by reason, edit row inline, bulk accept difference with reason, re-run selection	source key, reason code, detail, mapped payload, target response	Resolve migration exceptions
Mapping editor (read-mostly)	View rules, enum tables, test cases; edit opens YAML with schema validation	rule, source, target, function	Maintain migration mappings
Lineage tab (on any migrated record)	Open run, open staged row	run no, source object, source key, loaded at	View migrations

Interaction rules: run monitor auto-refreshes every 2 s via SSE; exception grid supports keyboard navigation and inline JSON edit with schema hints; bulk accept limited to 1,000 rows per action and requires a reason of ≥ 10 characters; reconciliation report is read-only once signed off; PII columns render masked unless `pii.read`.

1.10.7 Business rules and edge cases

- **BR-10.1** Run state machine: `created → extracting → staging → mapping → validating → loading → reconciling → reconciled | reconciled_with_exceptions`; any stage `→ failed` after exhausting retries (5 per batch, exponential backoff 1–60 s); `→ cancelled` from any non-terminal state after the current batch commits; `dry_run` stops after `validating` with a simulated load report.
- **BR-10.2** Only one active run per project; a second start returns 409 with the active run id.
- **BR-10.3** Natural keys are normalized before hashing: trim, casefold for codes that the target treats case-insensitively, leading-zero preservation for SAP numbers (never cast to integer).
- **BR-10.4** Enum mapping with no match and no default rejects the row with `MAP-ENUM-UNMAPPED` and the value; mapping with default records a `warn` and the default used.
- **BR-10.5** Decimal coercion: AX `real` values are read as numeric(32,16) and rounded half-even to the target scale; a row whose rounding changes the value by more than 0.5 units of the last target decimal is flagged `warn` with code `MAP-PRECISION-LOSS`.
- **BR-10.6** Dates: AX `1900-01-01` and SAP `00000000` / `99991231` are nulls or open-ended markers by rule, never literal dates.
- **BR-10.7** Load batches are atomic per batch on the target side; a batch with one failing row is retried as singletons so one bad row rejects only itself.
- **BR-10.8** Re-run skip rule: skip when `content_hash` equals the last `loaded` lineage hash and the target record's version has not changed since (target `updated_at` ≤ lineage `loaded_at`); otherwise upsert; a target changed by a user after the load is reported as `TARGET-DRIFT` and not overwritten unless `overwrite_drift=true`.
- **BR-10.9** Hash totals use the same normalization on both sides; a hash mismatch with matching counts triggers an automatic widened sample (10%) before the run is marked with exceptions.
- **BR-10.10** Dependency between objects: a party role row whose party failed in the same run is rejected with `VAL-DEP-FAILED` referencing the parent source key, not retried blindly.
- **BR-10.11** Staging purge runs 30 days after sign-off (configurable 7–365); purge drops the run's partitions; lineage and reconciliation results are never purged.
- **BR-10.12** Concurrency with live users: loads run as a service account under OPA with the duties of the project owner; records created carry `created_by = migration:{run_id}` for audit.
- **BR-10.13** Copy projects rewrite every legal-entity-scoped natural key; a rewritten key that already exists in the target is rejected with `COPY-KEY-EXISTS` unless the project selects `upsert`.
- **BR-10.14** Configuration packages apply in manifest dependency order; a package whose schema version is newer than the target's is refused (`MIG-PKG-SCHEMA-NEWER`); a package whose signature does not verify is refused (`MIG-PKG-SIGNATURE`).
- **BR-10.15** Recurring runs never overlap (BR-10.2); a trigger that fires while a run is active is skipped and logged, never queued.

1.10.8 Acceptance criteria

- **AC-10.1** (FR-10.6, FR-10.8) Given the seeded AX-shaped dataset (50k CustTable, 20k VendTable, 100k InventTable/EcoResProduct, 10k BOMVersion/BOM), when a `load` run executes on the dev cluster, then it reaches `reconciled` in < 30 min with counts tied, all hash totals matching and 0 sample mismatches.
- **AC-10.2** (FR-10.7) Given the completed run, when the identical run executes again, then loaded = 0, skipped = 170,000, and no target `updated.v1` events are published.
- **AC-10.3** (FR-10.3) Given the mapping test suites for the 12 standard Phase 1 objects, when CI runs, then every test passes including type coercion (utcdatetime, NoYes, DATS), enum mapping (Blocked, MTART), default fill and rejection reasons.
- **AC-10.4** (FR-10.6) Given a load in progress, when a loader pod is killed at batch 137, then the resumed run continues from checkpoint 136, finishes, and the lineage table has no duplicate idempotency keys.
- **AC-10.5** (FR-10.4) Given a `dry_run` with 10 rows pointing at a non-existent customer group, when validated, then 10 rows are `reject` with `VAL-FK-MISSING` and nothing is written to party-db.
- **AC-10.6** (FR-10.9) Given 25 exceptions, when 20 are edited and 5 marked accepted_difference, then `rerun-exceptions` loads 20, skips 5, and the parent run moves to `reconciled`.
- **AC-10.7** (BR-10.8) Given a customer modified by a user after load, when the run is repeated with changed source data, then the row is `TARGET-DRIFT` and the user's change is preserved.
- **AC-10.8** (FR-10.2) Given the `sap-rfc` connector against the recorded RFC_READ_TABLE fixture with 600-byte rows, when extracting KNA1, then all columns are reassembled across two field groups with 0 truncation.
- **AC-10.9** (FR-10.13) Given a signed-off run, when 30 days pass on the Temporal test clock, then staging partitions are dropped and lineage rows remain.
- **AC-10.10** (FR-10.1) Phase 1 exit: given the synthetic AX extract of the demo manufacturer, when the full project runs, then every object is `reconciled`, the wave 6–9 workspaces show the migrated data, and the reconciliation XLSX is attached to the sign-off record.
- **AC-10.11** (FR-10.15, BR-10.14) Given a package of 240 setup records from tenant A, when it is dry-run against tenant B where 40 records are identical and 10 differ, then the diff shows 190 create, 10 update, 40 unchanged; after apply, a second apply reports 0 changes.
- **AC-10.12** (FR-10.14, BR-10.13) Given 500 released products in USMF, when a copy project loads them into CAMF, then the run is `reconciled`, every item number exists in CAMF, and a second run skips 500.
- **AC-10.13** (FR-10.17) Given the mapping test suites for the 15 added objects, when CI runs, then all pass; an AX PaymSched with 3 percent lines maps to 3 schedule lines summing 100.00.

1.10.9 Test plan and fixtures

Fixtures: `migration/ax-seed/` (generated AX-shaped CSVs with real column names: DirPartyTable, DirPerson, DirOrganization, LogisticsPostalAddress, CustTable 50k, VendTable 20k, EcoResProduct/InventTable 100k, EcoResProductMaster 2k, BOMVersion/BOM 10k, RouteVersion/RouteOpr 3k, WrkCtrTable 200; generator seed 10); `migration/sap-seed/` (KNA1/KNB1 10k, LFA1/LFB1 5k, BUT000/BUT100 15k, MARA/MARC/MARD/MARM 20k, MAST/STKO/STPO 5k, PLKO/PLPO/MAPL 2k, CRHD 100); `migration/mapping-tests/*.yaml` (≥ 10 cases per object); `migration/rfc-recorded.json`; `migration/demo-manufacturer-ax/` (the phase-exit extract).

Test	Type	Target	Pass criterion
Mapping DSL	unit	every rule function	100% branch coverage on functions; all object test cases pass
Full load performance	performance	end-to-end run	< 30 min, reconciled
Idempotent re-run	E2E	run twice	0 loaded second time
Pod-kill resume	chaos	loaders	no duplicate idempotency keys
Dry run isolation	contract	target APIs	0 writes on `X-Passage-Dry-Run`
Connector contracts	contract (recorded)	ax-odbc, d365-odata, sap-rfc, sap-odata, file	schema probes and paging match fixtures
Reconciliation math	property	hash totals and sampling	injected drift in 1 of 10k rows detected ≥ 99% with widened sample
Exception re-run	E2E	exceptions_only	parent reaches reconciled
PII at rest	security	staging	encrypted columns unreadable with DB role; purge verified
Event contracts	contract	5 events	registry accepts

Reconciliation checks: source count = staged; staged = mapped + rejected; mapped = loaded + skipped + failed; Σ per-object loaded = lineage rows for the run; target row count delta (before/after run) = loaded − upserts of existing keys.

1.10.10 Deployment and operations

Helm chart `passage-migration` (TS orchestration service ×2, Go loader workers as a scalable Deployment 2–16 replicas via HPA on queue depth, CloudNativePG `migration-db` with staging partitions on a separate tablespace, Temporal namespace `migration`); sub-charts `passage-migration-ax` (ODBC driver image with FreeTDS, mapping packs) and `passage-migration-sap` (RFC SDK not redistributable: image expects the customer-mounted NW RFC library; OData path works without it). Config: `MIG_WORKERS_DEFAULT=8`, `MIG_BATCH_SIZE=500`, `MIG_REJECT_THRESHOLD_PCT=0.5`, `MIG_SAMPLE_PCT=1`, `MIG_STAGING_RETENTION_DAYS=30`, `MIG_PII_KEY_RING` (Vault path), connector secrets in Vault. Feature flags: `migration.retire_missing`, `migration.overwrite_drift`, `migration.sap_rfc`. Scheduled jobs: hourly purge timer check; nightly lineage integrity check. SLOs: loader throughput ≥ 100 rows/s per worker sustained; run monitor update lag < 2 s; availability 99.5% (non-critical path). Alerts: run `failed`; batch retry rate > 5%; staging tablespace > 80%; connector auth failure. Runbook: "Resume a failed run" (`passagectl mig resume --run`), "Rotate PII key" (re-encrypt staging for active runs), "Widen sample manually". Rollback: previous digest; staging schema per run is unaffected; mapping packs are OCI artifacts pinned by digest in the project.

1.10.11 Migration from AX / SAP

This wave is the migration tool; its own "migration" is the catalog of standard objects it ships with, each a mapping pack with tests:

Source object (connector)	Target entity (wave)	Pack notes
AX CompanyInfo/OMLegalEntity, OMOperatingUnit, OMHierarchy*, InventSite, InventLocation, LogisticsPostalAddress, FiscalCalendar*, UnitOfMeasure* (ax-odbc)	wave 6 entities	natural keys DataAreaId, OMOperatingUnitNumber, SiteId, InventLocationId
AX DirPartyTable, DirPerson, DirOrganization, DirPartyLocation, LogisticsElectronicAddress, CustTable, VendTable, ContactPerson, CustGroup, VendGroup, PaymentTerm, DlvTerm, DlvMode (ax-odbc)	wave 7 entities	natural keys PartyNumber, `DataAreaId
AX EcoResProduct*, InventTable, InventTableModule, InventItemSetupFilter, InventItemGroup, InventModelGroup, UnitOfMeasureConversion, EcoResAttribute*/Category*, InventItemGTIN (ax-odbc)	wave 8 entities	natural keys DisplayProductNumber, `DataAreaId
AX BOMTable, BOMVersion, BOM, RouteTable, RouteVersion, RouteOpr, RouteOprTable, WrkCtrTable, WrkCtrResourceGroup, WrkCtrCapability*, WorkCalendar* (ax-odbc)	wave 9 entities	natural keys BOMId, `BOMId
D365 F&O entities CustCustomerV3Entity, VendVendorV2Entity, EcoResReleasedProductV2Entity, BOMEntity, RouteEntity, WorkCenterEntity (d365-odata)	waves 7–9	same natural keys via entity key fields
SAP T001, T001W, T001L, CSKS, ADRC, T009/T009B, T006 (sap-rfc / file)	wave 6	keys BUKRS, WERKS, `WERKS
SAP KNA1/KNB1, LFA1/LFB1, BUT000/BUT100/BUT020, ADR2/ADR6, KNVK, T052, KNKK (sap-rfc / sap-odata API_BUSINESS_PARTNER)	wave 7	keys KUNNR, LIFNR, PARTNER; CVI links honored
SAP MARA, MAKT, MARC, MARD, MARM, MEAN, KLAH/KSML/CABN/CAWN/AUSP (sap-rfc / API_PRODUCT_SRV)	wave 8	keys MATNR, `MATNR
SAP MAST/STKO/STPO/STAS, PLKO/PLPO/PLAS/MAPL, CRHD/CRCA/KAKO, AENR (sap-rfc / API_BILL_OF_MATERIAL_SRV)	wave 9	keys `STLNR

Transformation notes are owned by the waves above; this wave contributes the shared functions (`ax_datetime`, `ax_noyes`, `sap_dats`, `sap_lead_zero`, `codepage_normalize`, `lookup_party_alias`). Validation rules are the union of each target wave's rules plus cross-object dependency checks. Not migrated by this wave: any transactional table (CustTrans, VendTrans, InventTrans, InventSum, BKPF/BSEG, MSEG, VBAK/VBAP, EKKO/EKPO — wave 49 packs), AX security roles (re-modeled in wave 2's admin UI), DMF/LSMW definitions themselves (replaced by mapping packs), X++/ABAP customizations (non-goal).

1.10.12 Dependencies, risks, open questions

Depends on: waves 6, 7, 8 and 9 (bulk endpoints with `X-Passage-Dry-Run` support and natural-key upsert semantics), wave 4 (Temporal, outbox), wave 5 (audit tab integration for lineage, import/export tool), wave 2 (service-account duties, Vault secrets).

Risk	Likelihood	Impact	Mitigation
Bulk endpoints in waves 6–9 lack dry-run or upsert semantics when wave 10 starts	Medium	High	Contract requirement added to each wave's Definition of Done; wave 10 contract tests run against waves 6–9 in CI
SAP RFC SDK licensing blocks a self-contained connector image	High	Medium	OData and flat-file paths are first-class; RFC is a customer-mounted library
Synthetic AX fixture does not resemble real data quality	Medium	Medium	Fixture generator injects 2% noise (codepage, trailing spaces, invalid enums); first real customer extract (PRD open question 2) replaces it by wave 20
Reconciliation sampling misses rare drift	Low	Medium	Hash totals per column catch systematic drift; widened sample on mismatch

Open questions: (1) Is the mapping DSL YAML plus a restricted expression language enough, or do packs need a plug-in hook in TypeScript? Proposed: YAML only in v1, hooks behind a flag by wave 49; decide by wave 16. (2) Should lineage be stored in each domain database (next to the record) or only in migration-db? Proposed: migration-db with the audit tab querying it; decide by wave 11. (3) Who owns sign-off on reconciliation for the phase-exit demo — product or the implementation partner persona? Proposed: both sign; decide at the phase-1 exit review.

1.10.13 Parameters and setup

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
`mig.workers`	project	int	8	1–16	Loader partitions (FR-10.6)	Data management parameters → entity execution threads	Migration Cockpit number of background jobs
`mig.batch_size`	project	int	500	50–5,000	Rows per API call	Set-based processing / bundle size	LTMC transfer package size
`mig.reject_threshold_pct`	project	decimal	0.5	0–10	Load gate after validation (FR-10.4)	—	—
`mig.sample_pct`	project	decimal	1 (min 100, max 5,000 rows)	0.1–100	Reconciliation sample (FR-10.8)	Compare data	—
`mig.widened_sample_pct`	project	decimal	10	1–100	BR-10.9	—	—
`mig.staging_retention_days`	project	int	30	7–365	Purge after sign-off (BR-10.11)	Staging cleanup (job history cleanup)	Migration Cockpit staging table deletion
`mig.source.codepage`	connector	enum	UTF-8	UTF-8, Windows-1252, ISO-8859-1, UTF-16LE, SAP 1100, SAP 1160	Decode source bytes	Source data formats → code page	LSMW file code page, LTMC file encoding
`mig.source.timezone`	connector	IANA	source server zone	IANA	`utcdatetime` / DATS+TIMS conversion	Source data formats → time zone	User / system time zone of extract
`mig.retire_missing`	project	bool	false	true / false	FR-10.7	—	—
`mig.overwrite_drift`	project	bool	false	true / false	BR-10.8	—	—
`mig.allow_unreconciled_deps`	project	bool	false	true / false	Run-start dependency check	Entity sequencing	Migration object dependencies
`mig.recurring.min_interval_min`	tenant	int	15	15–1,440	FR-10.16	Recurring data jobs → recurrence	Job scheduling (SM36)
`mig.cutover_at`	project	timestamptz	none	future timestamp	Stops recurring runs	—	—
`mig.signoff.approvers`	project	int	2	1–3	Required signatures (§1.10.15)	—	—
`mig.connector.paging`	connector	record	ax-odbc 10,000 RecIds; d365 `$top` 10,000; RFC_READ_TABLE ROWCOUNT 50,000	per connector	Extraction page size	Entity paging / skip staging	RFC_READ_TABLE ROWCOUNT / ROWSKIPS
`mig.pii_key_ring`	project	Vault path	`passage/mig/{project}`	Vault paths	FR-10.13	—	—
`mig.package.signing_key`	tenant	Vault path	`passage/config-signing`	Vault paths	FR-10.15	—	—

1.10.14 Inquiries and reports

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
Run history	list inquiry	project, mode, status, date	run no, mode, status, start, duration, counts	`migration_run`	Execution history (DMFExecution); job history	Migration Cockpit monitor; SM37
Run stage progress	drill-down	run, object	stage, rows, rows/s, ETA, errors	stage events	Execution details	Migration Cockpit "Monitoring"
Reconciliation report	operational report (sign-off evidence)	run, object	counts per stage, hash totals per column, sample mismatches	`reconciliation_result`	Compare data results	Migration object statistics
Exception queue	operational report	run, object, reason code	source key, reason, mapped payload, target response	`staging_row` (rejected, mismatched)	Staging data with errors	Migration Cockpit messages; LSMW error log
Mapping catalog	list inquiry	project, object, version	rules, enum tables, tests passed, checksum	`mapping_spec`	Entity mapping inquiry	LTMOM migration object modeler
Record lineage	drill-down	target entity and id	run, source object, source key, loaded at, hashes	`lineage_entry`	—	—
Throughput KPI	KPI	project, object, worker	rows/s, retries, batch failures	run metrics	—	—
Configuration package diff	drill-down	package, target tenant	create / update / unchanged per record	`config_package`	Configuration data project comparison	SCU0 customizing cross-system viewer
Recurring schedule	list inquiry	project	next run, last result, skipped triggers	schedule projection	Recurring data jobs	SM37
Copy project summary	operational report	copy project	objects, rewritten keys, collisions	copy run	Copy entity data between companies log	EC01 log

1.10.15 Printed and electronic documents

Document	Trigger	Layout elements (header/line/footer fields)	Formats	Numbering sequence	Legal / retention requirement
Reconciliation sign-off report	`:sign-off`	header: project, run no, mode, mapping and connector versions, signers; lines: per object counts, hash totals, sample size and mismatches, accepted differences with reasons; footer: signatures, sha256 of the report	PDF, XLSX	`{project}-RUN-{run_no}`	data-conversion control evidence for SOX ITGC; retain 7 years minimum (10 years where HGB/AO applies)

Document	Trigger	Layout elements (header/line/footer fields)	Formats	Numbering sequence	Legal / retention requirement
Exception export	on demand	run, object, reason, source key, payload (PII masked)	XLSX, CSV	none	follows staging retention
Configuration package	export (FR-10.15)	manifest, dependency order, signatures	JSON (zip)	package version	7 years as change evidence
Migration evidence bundle	after sign-off	zip: sign-off report, mapping checksums, lineage summary, connector probe results	ZIP	`{project}-EVID-{run_no}`	7–10 years with go-live audit file

1.10.16 Periodic and batch jobs

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
MIG-J1 Staging purge timer	hourly	run_id	drops partitions once; re-run no-op	< 1 min per run	retried next hour	purge overdue > 24 h
MIG-J2 Lineage integrity	nightly 02:30	target_entity	read-only	< 20 min for 10M lineage rows	report only	orphans > 0
MIG-J3 Recurring incremental runs	per project cron (min 15 min)	project_id	BR-10.15; incremental watermark per object	< 5 min for 10k changed rows	run `failed`, next trigger proceeds	consecutive failures ≥ 3
MIG-J4 Staging tablespace monitor	every 5 min	tablespace	read-only	< 5 s	none	usage > 80%
MIG-J5 Connector credential expiry check	daily 06:00	connector	read-only	< 1 min	none	expiry within 14 days
MIG-J6 Orphaned staging partition sweep	weekly Sunday 04:00	partition	drops partitions with no run row	< 10 min	none	orphans found

1.10.17 Security duties and privileges

Duty	Privileges (entry points)	Segregation-of-duties conflicts	Default roles that include it
View migrations	`GET /migration/v1/**` (PII masked)	none	Implementation consultant, Data migration lead, Auditor
Administer migration	projects, connectors, `:test`, schedules, copy projects	Approve migration sign-off	Data migration lead
Maintain migration mappings	mapping-spec upload, data templates	Approve migration sign-off	Implementation consultant
Run migrations	start, cancel, rerun-exceptions	Approve migration sign-off	Data migration lead, Implementation consultant
Resolve migration exceptions	`PATCH /exceptions/{rowId}`, bulk accept difference	Approve migration sign-off	Master data steward
Approve migration sign-off	`:sign-off`	Run migrations, Resolve migration exceptions, Maintain migration mappings on the same project	Business process owner, Controller
Apply configuration packages	config package import and apply	Maintain migration mappings (package author cannot apply to production)	System administrator
Read staged personal data	`pii.read` on staging and exceptions	Administer migration	Privacy officer

1.10.18 Message catalog

Code	Severity	User text	Cause	Remediation	Raised by
MIG-RUN-ACTIVE	error	"Run {n} is already active for this project."	Second start	Wait or cancel	BR-10.2
MIG-MAP-TEST-FAIL	error	"{n} mapping tests failed for {object}."	CI or upload test failure	Fix mapping	FR-10.3
MIG-MAP-UNKNOWN-FN	error	"Unknown mapping function {fn}."	Upload validation	Use sanctioned function	FR-10.3
MAP-ENUM-UNMAPPED	error	"Value {v} of {field} has no mapping."	Enum without default	Add enum row or default	BR-10.4
MAP-PRECISION-LOSS	warning	"Rounding changed {field} by {delta}."	Scale reduction	Review target scale	BR-10.5
VAL-FK-MISSING	error	"{field} references {key}, which does not exist."	FK expectation	Load parent or fix value	FR-10.4
VAL-DEP-FAILED	error	"Parent {key} failed in this run."	Dependency failure	Fix parent row	BR-10.10
API-422	error	"Target rejected the row: {detail}."	Business validation	Edit row	FR-10.5
TARGET-DRIFT	warning	"Target changed after load; not overwritten."	User edit after load	Set overwrite_drift or accept	BR-10.8
MIG-THRESHOLD-EXCEEDED	error	"Rejects {x}% exceed threshold {t}%."	Validation gate	Resolve rejects	FR-10.4
MIG-DEP-UNRECONCILED	error	"Dependency {object} has no reconciled run."	Run-start check	Reconcile dependency	§1.10.5
MIG-HASH-MISMATCH	warning	"Hash total differs for {column}; sample widened."	BR-10.9	Review mismatches	BR-10.9
MIG-PKG-SCHEMA-NEWER	error	"Package schema {v} is newer than this environment."	Version skew	Upgrade target	BR-10.14
MIG-PKG-SIGNATURE	error	"Package signature is invalid."	Tampered or wrong key	Re-export	BR-10.14
COPY-KEY-EXISTS	error	"{key} already exists in {target}."	Copy collision	Choose upsert or rewrite rule	BR-10.13
MIG-CONN-AUTH	error	"Connector {c} authentication failed."	Bad credentials	Update Vault secret	FR-10.2
MIG-RFC-ROWWIDTH	info	"Rows of {table} exceed 512 bytes; read in {n} field groups."	RFC_READ_TABLE limit	none	FR-10.2

1.10.19 Performance budgets and capacity

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
Full phase-1 load (170k master records)	1–5 runs per project	end-to-end < 30 min	≥ 100 rows/s per worker; 8 workers	staging ~2 KB per row, dropped after purge	staging list-partitioned by run_id	HPA to 16 workers; runtime grows linearly

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
Extraction per connector worker	20k rows/s target	—	20,000 rows/s	none	source paging	backpressure on staging writes
Re-run with no changes	per run	< 5 min for 170k rows	hash compare 5,000 rows/s	none	(run_id, object, status)	unchanged
Run monitor update	SSE every 2 s	lag 0.5 / 2 / 4 s	200 concurrent viewers	none	event fan-out	refresh drops to 5 s
Reconciliation sample compare	1% sample, min 100, max 5,000 per object	< 60 s per object	500 target reads/s	results ~1 MB per run	—	sample compare serialized per object
Lineage lookup (audit tab)	50k/day	5 / 30 / 60 ms	200 req/s	~150 B per loaded row; 10M rows ≈ 2 GB	(target_entity, target_id)	unchanged
Configuration package apply (5,000 records)	10/day	20 / 60 / 120 s	1 concurrent per tenant	packages 1–10 MB	dependency order	queued

1.10.20 Localization and compliance hooks

Item	What varies	Country packs touching it (wave 48)	Extension point
Code pages and scripts	AX 2012 non-Unicode collations (Windows-1252 for US/UK/DE/FR/MX/CA data), SAP non-Unicode code pages 1100/1160, Devanagari and other Indic scripts in IN data	IN	`mig.source.codepage`; `codepage_normalize` function
Date and number formats in files	DD.MM.YYYY and decimal comma (DE, FR), DD/MM/YYYY (UK, IN, FR), MM/DD/YYYY (US), YYYY-MM-DD (CA ISO)	all	`coerce` rule with explicit format per source column
Country-specific source fields	SAP KNA1-STCD1..5 meaning per country (MX RFC, IN PAN/GSTIN in J_1I fields, FR SIRET in STCD2), AX country-specific tables (e.g. Mexico CFDI fields, India tax registration)	IN, MX, FR	mapping pack overlays keyed `country: XX` layered over the base pack
Data residency and transfer	GDPR Chapter V transfers, India DPDP Act 2023 cross-border rules, Mexico LFPDPPP transfer notice; staging stays in the tenant's region	all	per-tenant region pinning of migration-db; no cross-region connectors
Retention and erasure	staging purge (BR-10.11); sign-off evidence kept 7–10 years; personal data in exceptions masked	all	retention classes `mig-staging`, `mig-evidence`
Statutory master-data checks on load	MX RFC structure and SAT list checks, IN GSTIN state code vs address state, EU VAT format	MX, IN, DE, FR	target-API dry run (FR-10.4) runs the wave-7 validators

1.10.21 Coverage closure

No row in the AX gap register (§12.99) or the SAP gap register (§13.99) carries wave 10 as its current or proposed wave. Every AX and SAP inventory row tagged for wave 10 is `COVERED-10`. Three of those rows are covered in the inventory but were not named in this section until now: DMFCopyEntity, D365 configuration data projects and data templates, and recurring data jobs. They are now FR-10.14, FR-10.15, FR-10.18 and FR-10.16. The table below lists register-derived consequences for this wave: migration packs needed by the capabilities that waves 6–9 added to close their register rows.

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
(none assigned to wave 10)	—	—	0 register rows
Consequence of §1.6.21 (AX OMTeam rows #107, #114, #232, #251)	n/a (consequential)	ADDED as FR-10.17	OMTeam / membership pack
Consequence of §1.7.21 (AX #158, #165; SAP #17, #23, #35, #37, #47, #50)	n/a (consequential)	ADDED as FR-10.17	VendCertification, PaymSched/T052R, KNRZE/KNRZB/LFZA, CPD account groups flagged one-time
Consequence of §1.8.21 (AX #141, #143, #146, #147, #148, #283, #297; SAP #163, #181, #356, #359, #374, #375, #384, #385, #392)	n/a (consequential)	ADDED as FR-10.17	EcoResProductRelation, lifecycle states/T141, ASMD, CUVTAB, DRAW/DRAT/DRAD
Consequence of §1.9.21 (AX #144–#296 ECM rows; SAP #238, #243, #250, #362, #376, #378, #379, #381, #382, #386, #388, #391, #393, #396)	n/a (consequential)	ADDED as FR-10.17	Engineering categories, policies, STPO alternative/discontinuation fields, effectivity, STLTY = D structures

Part 2 — Phase 2: Financial Core (waves 11–15)

2.0 Phase overview

Business outcome at phase exit. At the end of wave 15 a controller closes a fiscal period for the demo manufacturer's three legal entities entirely inside Passage: every financial fact lives in one append-only universal journal (`ledger` service, Go + Postgres) that balances by construction; each line carries transaction, accounting and reporting currency amounts and is posted simultaneously to the leading, local-GAAP and tax ledgers; tax is determined and settled to the cent; periods are controlled per ledger × module; allocations, accruals and year-end carry-forward are automated; and the balance sheet, income statement and cash flow statement are generated from the journal with drill-down to the originating document. Every later module (inventory, AP, AR, assets, projects) posts only through the wave 11 posting API — there is no second path to the general ledger.

Phase-exit sign-off criteria

- Trial balance for each demo entity and each ledger sums to 0.00 in all three currencies after 1M synthetic lines; balance projection equals a full re-aggregation of the journal (zero rows differ).
- Posting API sustains 5,000 lines/s for 30 min on the dev cluster with p99 < 200 ms; duplicate `Idempotency-Key` yields a byte-identical 200 response.
- Parallel-ledger fixture (20 documents) posts per the matrix in §2.12.7 and each ledger's trial balance is zero.
- 500-scenario tax matrix (US/EU/IN/CA) matches expected results; settlement run ties to GL tax accounts to the cent.
- One simulated period closed across 3 entities with a 40-task checklist, dependencies honored; year-end carry-forward produces opening balances equal to closing balances per dimension combination.
- Statement pack (TB, BS, P&L, CF) ties to the trial balance to the cent; cash flow reconciles to the change in cash; finance stakeholders record sign-off in the wave 15 issue.

Cross-wave data model summary

Entity	Owning service	Key relationships
Ledger, LedgerGroup	ledger	LegalEntity (wave 6) 1:N Ledger; Ledger → FiscalCalendar, AccountingCurrency, ReportingCurrency
MainAccount, AccountStructure, DimensionAttribute, DimensionValue, DimensionCombination	ledger	ChartOfAccounts 1:N MainAccount; AccountStructure → ordered DimensionAttributes; DimensionCombination = hashed tuple of DimensionValues
JournalEntry, JournalLine, JournalBatch, JournalBatchLine	ledger	JournalEntry 1:N JournalLine; JournalEntry N:1 Ledger; JournalBatch (unposted) → JournalEntry (posted); SourceDocument reference (URI)
Balance (projection)	ledger	Keyed by ledger × account × DimensionCombination × fiscal period × currency type
ExchangeRateType, ExchangeRate, CurrencyPolicy	fx	ExchangeRate → (type, from, to, valid_from); Ledger → ExchangeRateType default
RevaluationRun, RevaluationLine	ledger	Produces JournalEntry pairs (posting + reversal)
TaxCode, TaxRate, TaxGroup, ItemTaxGroup, TaxJurisdiction, ExemptionCertificate, WithholdingTaxCode	tax	TaxGroup N:M TaxCode; ItemTaxGroup N:M TaxCode; TaxRate effective-dated per TaxCode × Jurisdiction
TaxTransaction, TaxSettlementRun	tax	TaxTransaction → JournalLine (posted tax line); SettlementRun → JournalEntry
PeriodStatus, CloseTemplate, CloseTask, CloseRun	close (TS/Temporal) + ledger (PeriodStatus)	PeriodStatus keyed ledger × period × module; CloseRun → CloseTasks → assignees (Party/Employee role)
AllocationRule, AllocationRun, AccrualScheme, RecurringJournal	ledger	Runs produce JournalEntry; rules reference AccountStructure filters
ReportDefinition, ReportRow, ReportColumn, ReportTree, StatementRun, StatementCell	reporting	ReportDefinition → MainAccount ranges + DimensionValue filters; StatementCell → Balance keys → JournalLines

Cross-wave event catalog

Event (CloudEvents type)	Producer	Consumers	Payload summary
dev.passage.ledger.journal.posted.v1	ledger	reporting, tax, audit, lakehouse, all subledgers (waves 16+)	entry id, ledger id, document id, posting date, period, line count, totals per currency type, source ref, trace id
dev.passage.ledger.journal.reversed.v1	ledger	reporting, tax, subledgers	original entry id, reversing entry id, reason code
dev.passage.ledger.balance.rebuilt.v1	ledger	reporting, ops alerting	ledger id, high-water sequence, rows, diffs
dev.passage.fx.rate.published.v1	fx	ledger, reporting, AP/AR (later)	rate type, pair, valid_from, rate, source, previous rate
dev.passage.fx.provider.degraded.v1	fx	ops alerting	provider, last success, fallback mode
dev.passage.ledger.revaluation.completed.v1	ledger	reporting, close	run id, ledger, period, unrealized gain/loss totals, entry ids
dev.passage.tax.calculated.v1	tax	document services (waves 17+, 26+)	document ref, lines, tax amounts, provider used, fallback flag
dev.passage.tax.settled.v1	tax	reporting, ledger	settlement period, payable/receivable totals, entry id
dev.passage.close.period.status-changed.v1	ledger	all posting services, close, reporting	ledger, period, module, old → new status, actor, approvals
dev.passage.close.task.completed.v1	close	close board, notifications	run id, task id, assignee, evidence link
dev.passage.ledger.allocation.completed.v1	ledger	reporting, close	run id, rule ids, iterations, entry ids
dev.passage.ledger.year-end.closed.v1	ledger	reporting, close	ledger, fiscal year, opening entry ids, retained earnings per dimension
dev.passage.reporting.statement.generated.v1	reporting	distribution, audit	run id, definition id, period, hash, output URIs

Phase-level risks

Risk	Likelihood	Impact	Mitigation	Owner
Balance projection drifts from journal under concurrent posting	Medium	High	Projection updated in the same Postgres transaction as the entry; nightly rebuild-and-compare job; drift alert at 1 row	ledger lead
Rounding differences across three currencies and N ledgers accumulate	Medium	High	ISO 4217 minor-unit rules in one shared Go package `money`; property tests over JPY/KWD/USD/EUR; rounding-difference account with tolerance	ledger lead
Tax engine correctness outside fixture coverage	High	High	Provider adapters (Avalara/Vertex) as production default for US; internal engine for VAT with accountant-reviewed fixtures	tax lead

Risk	Likelihood	Impact	Mitigation	Owner
Period reopened silently	Low	High	Reopen requires two distinct approvers (Temporal human tasks) and emits an audit event; no API bypass	close lead
Reporting projection lags and statements are stale at close	Medium	Medium	Statement run records the journal high-water sequence it covered; close task blocks until lag = 0	reporting lead
Accountant review capacity (two-person team)	High	Medium	Fixtures reviewed per wave by an external practicing accountant; sign-off recorded in the wave issue	product

2.11 Wave 11: Universal Journal & Chart of Accounts

2.11.1 Scope and business context

AX stores financial truth across `GeneralJournalEntry`/`GeneralJournalAccountEntry` with `DimensionAttributeValueCombination` as the account key, and SAP consolidated FI/CO into `ACDOCA`. Both rely on a posting layer that every module calls. Wave 11 builds that layer first: one append-only, double-entry journal per ledger, financial dimensions validated by account structures, a posting API with idempotency keys, a balance projection, and a journal workspace for manual, recurring and template journals with approval and attachments.

At the end of the wave a controller can define a chart of accounts and dimensions, post a manual journal (with approval), reverse it, and see the trial balance update in real time. Subledgers (waves 16+) will call `POST /api/v1/ledger/journal-entries` and nothing else.

Out of scope: multiple currencies beyond a single accounting currency (wave 12), tax lines (wave 13), period status enforcement beyond open/closed defaults (wave 14), statements (wave 15), intercompany (wave 40), budget control (wave 38).

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
AX `LedgerJournalTable` form: posting a 2,000-line journal runs `LedgerJournalCheckPost` synchronously; validation errors surface one at a time in the Infolog after minutes of processing, forcing repeated post attempts	Validation and posting interleaved in X++ with per-line dimension lookups against `DimensionAttributeValueCombination`	`POST /ledger/validate` returns every violation with `line_index` in one pass; posting is a single atomic transaction	Validation of 2,000 lines < 1 s (vs 2–5 min); all errors in one response (vs 1 per attempt)
SAP FB50/F-02: a document that fails mid-posting (dump, lock on `NRIV` number range) can consume a document number or leave a parked `VBKPF` that is re-keyed	Number assignment and insert into `BKPF`/`BSEG` are not one atomic unit with the application-level checks	Gap-free `posting_sequence` assigned inside the same Postgres transaction; idempotency key makes retries safe	0 lost numbers; 0 duplicate postings under crash test; retry needs 0 user action
Integrations double-post when a timeout hides a success (AIF/IDoc retries, Data management framework re-runs)	No idempotency contract on `LedgerJournalTrans` import or BAPI_ACC_DOCUMENT_POST	`Idempotency-Key` header with 400-day retention; same key + same payload → replay, different payload → 409	Duplicate-post incidents 1–3/month typical → 0
AX trial balance list page / SAP FAGLB03 are read from totals tables (`FAGLFLEXT`) that drift from line items after failed batches; reconciliation jobs (RFINDEX) run for hours	Totals maintained by separate update paths from line inserts	`Balance` upserted in the posting transaction; rebuild-and-compare job emits a diff count	Balance vs journal drift = 0 rows; rebuild of 10M lines < 15 min (vs multi-hour RFINDEX)
Reaching the source document from a GL line takes 6–10 clicks (AX voucher transactions → origin → subledger; SAP FB03 → environment → document flow)	Linkage stored in `SubledgerVoucherGeneralJournalEntry` / `BKPF-AWKEY` with per-module resolution logic	Every entry carries `source.uri`; UI resolves it as one link; `trace_id` on every entry	Clicks to source 8 → 1; any posting traceable through Tempo end-to-end
External systems (MES, BI, PLM) need custom X++/ABAP or middleware to learn that a posting happened	No event stream from the ledger; polling on `GeneralJournalEntry`/`ACDOCA` timestamps	`dev.passage.ledger.journal.posted.v1` on Kafka via outbox, AsyncAPI-described, plus REST/MCP	Integration lead time weeks → same day; event lag p95 < 2 s (vs 15-min+ polling)

2.11.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Chart of accounts and main accounts	`MainAccount`, `LedgerChartOfAccounts`, form MainAccountListPage	`SKA1` (chart), `SKB1` (company-code view), FS00, OB13	`ledger.MainAccount`, `ledger.ChartOfAccounts`; screen Chart of accounts	full
Financial dimensions	`DimensionAttribute`, `DimensionAttributeValue`, `DimensionFinancialTag`	CO objects (cost center `CSKS`, profit center `CEPC`), ACDOCA fields `RCNTR`, `PRCTR`, `RBUSA`	`ledger.DimensionAttribute`, `ledger.DimensionValue` (up to 20 per ledger)	full
Account structures / dimension validation	`DimensionHierarchy` (account structure), advanced rules	Field status groups (OBC4), validation/substitution (OB28/GGB0)	`ledger.AccountStructure` with ordered constraint rows	full
Ledger account combination	`DimensionAttributeValueCombination` (`RecId` as LedgerDimension)	ACDOCA field combination (no single key)	`ledger.DimensionCombination` (SHA-256 of ordered tuple)	improved: content-addressed, immutable
Journal entry / lines	`GeneralJournalEntry`, `GeneralJournalAccountEntry`, `SubledgerVoucherGeneralJournalEntry`	`BKPF`/`BSEG`, `ACDOCA`	`ledger.JournalEntry`, `ledger.JournalLine`	full
Manual journals (unposted)	`LedgerJournalTable`/`LedgerJournalTrans`, LedgerJournalTable form, journal names `LedgerJournalName`	FB50/F-02 park (`VBKPF`/`VBSEG`), FV50	`ledger.JournalBatch`, `ledger.JournalBatchLine`; screen Journals	full
Recurring / periodic journals	Periodic journals (`LedgerJournalTable.JournalType = Periodic`)	FBD1 recurring entries (`BKDF`)	`ledger.RecurringJournal` (template + schedule)	full
Journal approval	Ledger journal workflow `LedgerJournalApproval`	Parked document workflow (WS10000051)	Temporal approval workflow template (wave 4) bound to JournalBatch	full

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Reversal	`LedgerJournalTrans` reverse transaction, `TransactionReversalTrans`	FB08, FBRA (reset and reverse)	`POST /journal-entries/{id}/reverse` creating negating entry	full
Voucher numbering	`NumberSequenceTable` per journal name	Document number ranges per document type (FBN1, `NRIV`)	Number sequence service (wave 5), gap-free per ledger × document type	full
Trial balance / balances	`GeneralJournalAccountEntry` aggregation, Trial balance list page, `LedgerBalance...`	`FAGLFLEXT` (totals), `GLT0`, FAGLB03	`ledger.Balance` projection; Trial balance screen	full
Posting definitions / posting profiles	Posting definitions, `LedgerPostingSetup`	Account determination (OBYC, T030)	Deferred to the owning subledger waves; wave 11 exposes only account + dimension resolution hooks	partial (by design)
Financial reason codes	`ReasonTable`, `ReasonTableRef`, Reason codes form (Organization administration > Setup > Financial reasons); reversal reason prompt in `LedgerTransReverse`	`T041C` reasons for reversal (OB_REVERSE), negative-posting flag, alternative posting date	`ledger.ReasonCode` with `applies_to[]` modules; required on reversal when the journal name demands it (FR-11.15)	full
Advanced rule structures	`DimensionHierarchy` (type Advanced rule structure), `DimensionAdvancedRule`, `DimensionRuleCriteria`, form "Advanced rules"	Field status groups (OBC4) and validations only; no conditional segment model	`ledger.AdvancedRule` (filter → appended structure segments) (FR-11.16)	improved: versioned with the structure
Default descriptions (transaction text)	Default descriptions form (`TransactionTxt`), placeholders `%1`–`%3` per transaction type and language	Header text `BKPF-BKTXT` / line text `BSEG-SGTXT` set by substitution exits	`ledger.DescriptionTemplate` per source_type × language (FR-11.17)	full
Open-item managed G/L accounts and clearing	Not available for ledger accounts (only customer/vendor settlement and bank reconciliation)	`SKB1-XOPVW` open-item management, F-03/F-04 manual clearing, F.13/F13E automatic clearing, FBRA reset, FAGL_ACTIVATE_OP / FAGL_SWITCH_TO_OPEN_ITEM	`ledger.OpenItem`, `ledger.ClearingDocument`, clearing rules, tolerance groups (FR-11.19, FR-11.20); reused by waves 18/19/30	full
User-defined validation rules	Journal controls (`LedgerJournalControl`), main account validation (currency, user, posting type)	OB28 / GGB0 validations (`GB90*`, `T001Q`) with message classes at header/line/document	`ledger.ValidationRule` (prerequisite → check → message, CEL) (FR-11.21)	full
Dimension derivation / substitution	Default dimensions on master data; D365 default dimension templates; no rule engine	OBBH / GGB1 substitutions (`GB91*`, `T001R`), KEDR derivation strategy (`TKEDR*`, `K9R*`), 0KEM/0KEP PCA substitution (`T8A*`), FMDERIVE strategy	`ledger.DerivationStrategy` with ordered steps (table lookup, move, clear, expression, constant) applied before structure validation (FR-11.22)	full
Functional area / cost-of-sales accounting	Custom dimension attribute	OKBD functional areas (`TFKB`), FAGL_FUNC_AREA activation, OBBZ/OBBW derivation, `ACDOCA-RFAREA`	Standard dimension attribute `FUNC_AREA` with a shipped lookup-table derivation step (FR-11.22)	full
Document splitting	Not available (account structures require dimensions per line; no inheritance to AP/AR/tax lines)	FAGL_SPLIT*: item categories, splitting method 0000000012, zero-balance clearing account, constants (`T8G01`–`T8G40`)	`ledger.SplittingRule` per source_type: proportional inheritance of splitting dimensions to balance-sheet and tax lines plus zero-balance clearing lines (FR-11.23)	full
Dimension realignment	Not available (manual reclassification journals)	KEND / KEDR realignment run (CO-PA), re-derivation of characteristics on history	`ledger.RealignmentRun` posting reclassification entries, append-only (FR-11.24)	improved: no in-place update of history
Attachments with document types	`DocuRef`, `DocuType`, `DocuValue`, Document handling form	GOS attachments (`SRGBTBREL`), ArchiveLink (OAC0/OAC3) document types	Wave 5 document framework: `document_type`, retention class, store reference on every attachment (FR-11.18)	full

2.11.3 Functional requirements

- **FR-11.1 Ledger and chart of accounts** — Must. The system shall maintain one or more ledgers per legal entity, each bound to a chart of accounts, a fiscal calendar (wave 6), and an accounting currency.
  - A chart of accounts may be shared across legal entities (SAP `SKA1` semantics); company-specific attributes (`SKB1` semantics: suspended, posting allowed, default dimensions) live on `MainAccountLedgerSetting`.
  - Main account id is 1–20 characters, alphanumeric, unique per chart; type ∈ {asset, liability, equity, revenue, expense, profit_and_loss_total, balance_sheet_total, reporting}; totals and reporting types are non-postable.
  - Maximum 50,000 main accounts per chart; 500 charts per tenant.
- **FR-11.2 Financial dimensions** — Must. The system shall support up to 20 dimension attributes per ledger, each backed either by a Passage entity (department, cost center, site, project, customer, vendor, item) or by a custom value list.
  - Dimension values are effective-dated (`active_from`, `active_to`) and may be suspended; values from backing entities are synchronized by consuming that entity's CloudEvents.
  - Default dimensions on master data (party, product, site) are stored as a `DimensionCombination` id and merged at posting time by precedence: explicit line > source document header > master data default > account default.
- **FR-11.3 Account structures and validation** — Must. The system shall validate every line's (main account, dimensions) tuple against the ledger's active account structures before posting.
  - An account structure is an ordered list of segments (main account first) with per-segment constraint rows: value ranges, lists, wildcards (`*`), and "blank allowed". Advanced rules add extra segments when a filter matches (AX advanced rule semantics).
  - Validation is deterministic: the first structure whose main-account filter matches is applied; no match → `LEDGER_STRUCTURE_NOT_FOUND`.
  - Structures are versioned with `effective_from`; a posting uses the version effective on the posting date.
- **FR-11.4 Dimension combinations** — Must. The system shall intern each validated tuple as an immutable `DimensionCombination` whose id is the SHA-256 of the canonical tuple `(structure_version_id, account_id, dim1_value_id, …, dim20_value_id)`.
  - Combinations are never deleted; display name is derived (`1010-DEPT01-CC200`).
  - Lookup by id is a primary-key read; lookup by tuple is a hash computation plus one read.
- **FR-11.5 Posting API** — Must. The system shall expose `POST /api/v1/ledger/journal-entries` that posts a balanced entry atomically or rejects it entirely, with an idempotency key.
  - Request: `Idempotency-Key` header (1–128 chars, scoped to tenant × legal entity), body per §2.11.5. Maximum 10,000 lines per entry; larger documents must be split by the caller with a shared `document_id`.
  - Response 201 with the posted entry; 200 on replay of the identical payload; 409 `LEDGER_IDEMPOTENCY_CONFLICT` if the same key is reused with a different payload hash; 409 `LEDGER_IDEMPOTENCY_IN_PROGRESS` with `Retry-After: 1` while the first request is still in flight.
  - 422 with a `violations[]` array, each `{code, line_index, field, message}`; codes in BR-11.9. Posting never partially succeeds.
  - Idempotency records are retained 400 days; replays after expiry are treated as new requests (documented contract).

- **FR-11.6 Append-only journal** — Must. The system shall never update or delete a posted `JournalEntry` or `JournalLine`; corrections are new entries.
  - Enforced by Postgres: the application role has INSERT and SELECT only on `journal_entry/journal_line`; a trigger raises on UPDATE/DELETE for all roles.
  - Every entry receives a gap-free `posting_sequence` (bigint) per ledger from the number sequence service in gap-free mode, assigned inside the posting transaction.
- **FR-11.7 Balance projection** — Must. The system shall maintain `ledger.Balance` rows keyed by (ledger, account, dimension combination, fiscal period, currency type) and update them in the same database transaction as the posting.
  - Fields: `debit`, `credit`, `net`, `line_count`, `last_posting_sequence`; period-to-date only; year-to-date and opening balances are computed at query time by summing periods (opening balances live in period 0, see wave 14).
  - A rebuild job (§2.11.7 BR-11.7) reconstructs the table from the journal and reports differences.
- **FR-11.8 Reversal** — Must. The system shall create an exact negating entry for any posted entry via `POST /journal-entries/{id}/reverse`.
  - Reversal date defaults to the original posting date; may be any open date ≥ original. Each reversing line has `debit/credit` swapped and `reversal_of_line_id` set.
  - An entry can be reversed once; reversing a reversal is permitted (re-instating), each linked to its predecessor.
- **FR-11.9 Journal workspace (manual journals)** — Must. The system shall provide journal batches (AX `LedgerJournalTable` semantics) with lines, totals, validation on save, submit-for-approval, and post.
  - Journal names carry: voucher number sequence, default offset account, approval workflow id, `posting_restriction` (own journals only / by user group), and `lines_limit` (default 5,000).
  - Batch statuses: draft → validated → in_approval → approved → posting → posted | rejected | cancelled (state machine in §2.11.7).
- **FR-11.10 Recurring journals and templates** — Should. The system shall allow a posted or draft batch to be saved as a template (amounts or percentages) and a template to be scheduled (cron expression, fiscal-period-relative dates) to generate batches.
  - Generation runs on Temporal at the scheduled time; generated batches enter the approval workflow unless the template is flagged `auto_post` and the user who scheduled it holds duty `Post ledger journals without approval`.
- **FR-11.11 Attachments and notes** — Should. The system shall attach files (max 25 MB each, 50 per batch) and notes to batches and carry references to the posted entry.
- **FR-11.12 Source document linkage** — Must. The system shall record on each entry a `source` object `{system, type, id, uri}` and on each line an optional `source_line_ref`, enabling drill-down from statements (wave 15) to the originating document.
- **FR-11.13 Opening balances load** — Must. The system shall accept opening balances through the migration framework (wave 10) as a journal entry in period 0 of the first fiscal year, balanced against a conversion-suspense account that must be zero after load.
- **FR-11.14 Query API** — Must. The system shall expose line and balance queries with filters on ledger, account ranges, dimension values, posting date and period, paginated by keyset cursor (max 1,000 rows per page).
- **FR-11.15 Financial reason codes** — Must. The system shall maintain one shared `ReasonCode` list per tenant (code ≤ 10 characters, name, `applies_to[]` ⊆ {ledger, bank, customer, vendor, fixed_asset, inventory_counting, tax, project}, `requires_comment`, `negative_posting_allowed`, `alternative_posting_date_allowed`, `active`) that later modules reuse, and shall require a reason code on journal reversal when the journal name or the ledger parameter `reversal_reason_required` is set.
  - The reverse request carries `reason_code` and optional `reason_comment` (≤ 255 characters); both are stored on the reversing entry and emitted in `journal.reversed.reason_code`.
  - `negative_posting_allowed` (SAP `T041C` semantics, AX "Correction" parameter): the reversing lines are flagged `negative_posting = true` and the `Balance` projection reduces the original side (debit −100) instead of adding to the opposite side (credit +100); trial balance totals of debits and credits therefore return to their pre-posting values.
  - `alternative_posting_date_allowed = false` forces the reversal date to equal the original posting date when that period is open.
  - Maximum 500 codes per tenant; a referenced code cannot be deleted, only deactivated.
- **FR-11.16 Advanced rule structures** — Must. Beyond FR-11.3, the system shall maintain advanced rules: a filter over (main account ranges, dimension values, wildcards) that, when it matches a line, appends an advanced rule structure (additional segments with their own constraint rows) to the account structure applied to that line.
  - Several advanced rules may match; their structures are appended in `priority` order; the resulting segment list is capped at 20 attributes (`LEDGER_ADVANCED_RULE_SEGMENT_LIMIT`).
  - Advanced rules and advanced rule structures share the account structure's version and activation step (AX "Activate" on the structure); activation re-validates the 1,000 most recently used combinations under the new version and lists those that would become invalid before the user confirms.
- **FR-11.17 Default descriptions** — Should. The system shall maintain description templates keyed by (source_type, legal entity or tenant, language) with placeholders `%1` … `%9` bound to named fields (`{voucher}`, `{party_name}`, `{document_date}`, `{amount_txn}`, `{currency_txn}`, `{source_id}`, `{period}`), applied when a posting request omits `description` or a line omits `text`.
  - Substituted text is truncated to 255 characters with a trailing ellipsis; language resolves from the legal entity default language (wave 6), or from the user's UI language for manual journals when the journal name sets `description_language = user`.
  - Legal-entity templates override tenant templates (AX Default descriptions per company semantics).
- **FR-11.18 Attachment document types and retention** — Should. Attachments (FR-11.11) shall carry a `document_type` from the wave 5 document framework (shipped types `invoice_image`, `approval_evidence`, `supporting_calculation`, `correspondence`, `other`), a retention class (default `financial_record_10y`), and a store reference (object-storage key or external DMS URI), and shall remain readable from the posted entry after the batch is posted.
  - Attachments become immutable when the batch reaches `posted`; deleting an attachment before its retention class expires is rejected with `LEDGER_ATTACHMENT_RETAINED`.
  - Maximum 25 MB per file, 50 per batch, as in FR-11.11; virus scanning and content-type allow-list are inherited from wave 5.
- **FR-11.19 Open-item managed G/L accounts and clearing** — Must. The system shall allow `MainAccountLedgerSetting.open_item_managed = true` on balance-sheet accounts (clearing accounts, bank sub-accounts, GR/IR, suspense, payroll clearing); every posted line on such an account creates an `OpenItem`; open items are cleared by a `ClearingDocument` grouping items whose Σ(debit − credit) in the clearing currency is 0 within the applicable tolerance.
  - Manual clearing (SAP F-03 semantics): the user selects items (filters: assignment, `source_line_ref`, document id, date range, amount, dimension values); the system shows the residual; a residual within the user's and account's tolerance group posts a difference line to the tolerance group's difference account; a residual outside tolerance either creates a residual item (new open item for the remainder, `residual_of_item_id`) or is rejected with `LEDGER_CLEARING_UNBALANCED`.
  - Post with clearing (F-04 semantics): a manual journal line on an open-item account may list `clear_item_ids[]`; clearing happens in the same posting transaction and fails the whole post on mismatch.
  - Reset clearing (FBRA semantics): reopens the items, marks the clearing document `reset` with a reason code (FR-11.15) and actor; if the clearing posted difference or FX lines, a negating entry is posted. Posted entries are never modified.
  - Activation on an account with history (FAGL_ACTIVATE_OP / FAGL_SWITCH_TO_OPEN_ITEM semantics): permitted only through an activation run that creates one opening open item per non-zero (dimension combination, transaction currency) balance dated the activation date and records the run id on the account setting; deactivation requires zero open items.

    - Clearing currency per account: `accounting` (default) or `transaction` (foreign-currency sub-accounts); FX differences on clearing post to the realized gain/loss accounts of the wave 12 `CurrencyPolicy` and are excluded from wave 12 revaluation (`revalue_level = open_item`).
    - AP and AR settlement (waves 19/30) and GR/IR clearing (wave 18) reuse this engine through the open-item contract in §2.11.5 with their own item sources; this wave ships the GL account source only.
- **FR-11.20 Automatic clearing rules and tolerance groups** — Must. The system shall define automatic clearing rules per (ledger, account range) as an ordered list of up to 5 criteria fields (`assignment`, `source_line_ref`, `document_id`, `dim.<attr>`, `amount_txn`, `posting_date` bucket) that group open items (SAP OB74 semantics), and tolerance groups (SAP OBA0 / AX "Maximum penny difference" semantics) with absolute and percentage limits per currency, assigned to accounts and to users.
    - The scheduled job `gl-auto-clear` (§2.11.16) evaluates each rule, clears every group whose Σ = 0 (or within the account tolerance when the rule sets `allow_tolerance`) as one `ClearingDocument` per group, and never creates residual items; a simulation mode returns the proposed groups.
    - The effective tolerance is the minimum of the user's and the account's group; service-account runs use the account group only.
- **FR-11.21 User-defined validation rules** — Must. The system shall evaluate ordered validation rules per ledger at header, line and document level, each with `prerequisite` (CEL boolean over header fields, line fields, dimension values, main account attributes, source, user groups), `check` (CEL boolean) and `message` (message-catalog code, severity error | warning, parameter bindings).
    - A failed error rule produces a 422 violation `{code, rule_id, line_index}`; a failed warning rule produces a `warnings[]` entry and, for manual batches, a confirmation step before submit.
    - Rules are effective-dated and versioned; evaluation adds ≤ 2 ms per 100 lines; the rule editor runs a rule against saved sample entries and shows the result per line.
    - AX journal controls and main-account validations (currency, user, posting type) and SAP OB28/GGB0 validations are shipped as rule templates.
- **FR-11.22 Dimension derivation and substitution rules** — Must. The system shall apply a per-ledger `DerivationStrategy` before account-structure validation: ordered steps of type `table_lookup` (source fields → target dimension through a validity-dated lookup table, e.g., (account category, cost center) → functional area), `move` (copy a field or dimension to another), `clear`, `expression` (CEL) and `constant`, each with an optional condition and an `overwrite` flag.
    - Precedence extends FR-11.2: explicit line value > step with `overwrite` > source document header > master data default > account default > step without `overwrite`.
    - Every derived value is recorded per line as `derived_by_step_ids[]`, shown in the journal line derivation trace and returned by `POST /ledger/validate`.
    - Functional area for cost-of-sales accounting is a standard dimension attribute `FUNC_AREA` with a shipped lookup-table step; the P&L-by-function statement in wave 15 reads it. Segment derivation from profit center (SAP FAGL_SEGM) is a shipped `table_lookup` step.
    - Lookup tables are maintained in the UI and by CSV import (≤ 100,000 rows per table); SAP KEDR / 0KEM / FMDERIVE strategies and OBBH substitutions migrate to steps (§2.11.11).
- **FR-11.23 Document splitting: dimension inheritance and zero balance** — Must. The system shall, per source_type, inherit a configured set of splitting dimensions (for example profit center, segment, business unit) from the lines that carry them to the lines that do not (payable, receivable, tax, cash discount, bank, rounding) in proportion to the carrying lines' amounts, and post zero-balance clearing lines so that every entry balances per splitting dimension value.
    - Item categories per account range (expense_revenue, payable, receivable, tax, cash, balance_sheet_other) and the method (`active` = proportional inheritance; `passive` = inherit from the open items being cleared, FR-11.19) are configuration; each ledger names a `zero_balance_clearing_account` and a `default_splitting_value` constant used when no carrying line exists.
    - Splitting runs after derivation (FR-11.22) and before structure validation; produced lines carry `split_of_line_id` and `inherited = true`; proportional rounding uses the BR-12.4 residual rule; a line that cannot be split and has no default raises `LEDGER_SPLIT_NO_SOURCE`.
    - A balance sheet by profit center or segment (wave 15 `BS-STD` with a tree over the splitting dimension) therefore balances per unit.
- **FR-11.24 Dimension realignment** — Should. The system shall provide a controlled restatement that, for a filter (ledger, account ranges, period range, dimension values), re-derives selected dimensions with the current derivation strategy or an explicit old → new value mapping and posts reclassification entries per (account, period, old combination, new combination) flagged `is_realignment = true`, without modifying any posted line.
    - Simulation lists affected combinations, line counts and amounts; posting requires duty `Run dimension realignment`, a reason code and an open or on-hold GL period with the runner in the allowed group; a run is reversible as a unit.
    - Realignment entries are ordinary entries for balances and statements and appear in the wave 15 audit trail as `kind = realignment_run`.

2.11.4 Data model

MainAccount

Field	Type	Required	Notes
id	uuid	yes	PK
chart_of_accounts_id	uuid	yes	FK ChartOfAccounts
account_number	text(20)	yes	unique per chart; `^[A-Za-z0-9._-]{1,20}$`
name	text(120)	yes	translatable via wave 3 metadata
account_type	enum	yes	asset, liability, equity, revenue, expense, profit_and_loss_total, balance_sheet_total, reporting
debit_credit_default	enum	no	debit/credit; UI default only
is_postable	bool	yes	false for totals/reporting
suspended_from	date	no	posting rejected on/after this date
default_dimension_combination_id	bytea(32)	no	FK DimensionCombination
reconciliation_account_type	enum	no	none, customer, vendor, bank, inventory, fixed_asset — subledger-only posting (SAP recon account semantics)
created_at / created_by	timestamptz / uuid	yes	audit from CDC

AccountStructure (header) and **AccountStructureConstraint** (rows)

Field	Type	Required	Notes
id	uuid	yes	PK
ledger_id	uuid	yes	FK Ledger
version	int	yes	unique (ledger_id, name, version)
name	text(60)	yes	
segments	jsonb	yes	ordered array of dimension_attribute_id; first is MAIN_ACCOUNT
effective_from	date	yes	
status	enum	yes	draft, active, retired
constraint rows: segment_index	int	yes	0 = main account

Field	Type	Required	Notes
constraint rows: parent_path	jsonb	yes	the matched values of previous segments this row applies under
constraint rows: allowed	jsonb	yes	list of `{from,to}` ranges, exact values, `*`, `blank`

JournalEntry and **JournalLine**

Field	Type	Required	Notes
id	uuid	yes	PK
ledger_id	uuid	yes	FK Ledger
legal_entity_id	uuid	yes	denormalized for RLS
document_id	uuid	yes	groups entries across ledgers and split batches
voucher	text(30)	yes	from number sequence; unique (ledger_id, voucher)
posting_sequence	bigint	yes	gap-free per ledger; unique (ledger_id, posting_sequence)
posting_date	date	yes	
fiscal_period_id	uuid	yes	FK FiscalPeriod (wave 6) resolved from posting_date
document_date	date	no	
description	text(255)	no	
source_system / source_type / source_id / source_uri	text	yes	e.g. `ledger`, `manual_journal`, batch id, `passage://ledger/journal-batches/{id}`
idempotency_key	text(128)	yes	unique (tenant_id, legal_entity_id, idempotency_key)
payload_hash	bytea(32)	yes	SHA-256 of canonical request
reversal_of_entry_id	uuid	no	FK JournalEntry
posted_at / posted_by	timestamptz / uuid	yes	
trace_id	text(32)	yes	OpenTelemetry trace
line: id	uuid	yes	PK
line: entry_id	uuid	yes	FK
line: line_number	int	yes	unique per entry, 1..10000
line: dimension_combination_id	bytea(32)	yes	FK DimensionCombination (includes account)
line: main_account_id	uuid	yes	denormalized for indexing
line: debit_credit	enum	yes	D or C; amounts always positive
line: amount_txn / currency_txn	numeric(23,6) / char(3)	yes	wave 11: equals accounting currency
line: amount_acct / amount_rpt	numeric(23,6)	yes	rounded to minor units (BR-11.3)
line: quantity / unit	numeric(18,6) / text	no	statistical quantity
line: text	text(255)	no	
line: source_line_ref	text(200)	no	
line: reversal_of_line_id	uuid	no	

Balance (projection): `ledger_id`, `main_account_id`, `dimension_combination_id`, `fiscal_period_id`, `currency_type` (txn/acct/rpt), `currency` char(3), `debit`, `credit`, `net`, `line_count`, `last_posting_sequence`; PK over the first five.

ReasonCode (FR-11.15)

Field	Type	Required	Notes
id	uuid	yes	PK
code	text(10)	yes	unique per tenant; `^[A-Z0-9_]{1,10}$`
name	text(60)	yes	translatable
applies_to	enum[]	yes	ledger, bank, customer, vendor, fixed_asset, inventory_counting, tax, project
requires_comment	bool	yes	default false
negative_posting_allowed	bool	yes	default false; SAP `T041C-XNEGP`
alternative_posting_date_allowed	bool	yes	default true
active	bool	yes	

OpenItem and **ClearingDocument** (FR-11.19, FR-11.20)

Field	Type	Required	Notes
item: id	uuid	yes	PK
item: ledger_id / main_account_id / dimension_combination_id	uuid / uuid / bytea(32)	yes	account must be `open_item_managed`
item: journal_line_id	uuid	yes	unique; the line that created the item (or activation run)
item: source_type	enum	yes	gl_line, activation, residual; waves 18/19/30 add gr_ir, vendor, customer
item: amount_clearing / currency_clearing	numeric(23,6) / char(3)	yes	signed (debit positive) in the account's clearing currency
item: amount_acct	numeric(23,6)	yes	
item: assignment	text(50)	no	free matching key (SAP `ZUONR` semantics)
item: posting_date / due_date	date	yes / no	
item: status	enum	yes	open, cleared, reset_open
item: clearing_document_id	uuid	no	set when cleared
item: residual_of_item_id	uuid	no	FK OpenItem
doc: id	uuid	yes	PK
doc: ledger_id / main_account_id	uuid	yes	
doc: clearing_date	date	yes	posting date of difference/FX lines
doc: mode	enum	yes	manual, post_with_clearing, automatic, activation

Field	Type	Required	Notes
doc: rule_id	uuid	no	FK AutoClearingRule when automatic
doc: item_ids	uuid[]	yes	2..10,000
doc: difference_amount / difference_entry_id	numeric(23,6) / uuid	no	tolerance posting
doc: fx_difference_entry_id	uuid	no	wave 12 realized gain/loss
doc: status	enum	yes	cleared, reset
doc: reset_reason_code / reset_by / reset_at	text / uuid / timestamptz	conditional	

AutoClearingRule: `id`, `ledger_id`, `account_from`, `account_to`, `criteria` (jsonb ordered list ≤ 5 of field names), `allow_tolerance` bool, `active`. **ToleranceGroup**: `id`, `legal_entity_id`, `code`, `scope` (account | user), `limits` (jsonb per currency: `{abs_debit, abs_credit, pct}`), `difference_account_id`; assignment tables `tolerance_group_account` (account range) and `tolerance_group_user`.

ValidationRule and **DerivationStrategy** (FR-11.21, FR-11.22)

Field	Type	Required	Notes
rule: id / ledger_id / sequence	uuid / uuid / int	yes	evaluated in sequence
rule: level	enum	yes	header, line, document
rule: prerequisite	text (CEL)	no	empty = always
rule: check	text (CEL)	yes	must evaluate true, else message
rule: message_code / severity / params	text / enum / jsonb	yes	catalog code (§2.11.18), error or warning
rule: effective_from / effective_to / version / status	date / date / int / enum	yes	draft, active, retired
strategy: id / ledger_id / version / status		yes	one active version per ledger
step: id / strategy_id / sequence		yes	≤ 50 steps
step: kind	enum	yes	table_lookup, move, clear, expression, constant
step: condition	text (CEL)	no	
step: source_fields / target	jsonb / text	yes	target is a dimension attribute or line field
step: lookup_table_id	uuid	conditional	FK LookupTable (rows: source tuple, target value, valid_from, valid_to)
step: overwrite	bool	yes	default false

SplittingRule (FR-11.23): `id`, `ledger_id`, `source_type`, `splitting_dimensions` (attribute ids), `method` (active | passive), `item_categories` (jsonb account range → category), `zero_balance_clearing_account_id`, `default_splitting_value` (jsonb attribute → value), `active`. **RealignmentRun** (FR-11.24): `id`, `ledger_id`, `filter` (jsonb), `mapping` (jsonb old → new per attribute) or `strategy_version`, `mode` (simulate | post), `status` (proposed, posted, reversed, cancelled), `reason_code`, `entry_ids[]`, `reversal_entry_ids[]`, `combinations_affected`, `created_by`. **DescriptionTemplate** (FR-11.17): `id`, `scope` (tenant | legal_entity), `legal_entity_id`, `source_type`, `language`, `template` text(255), `field_bindings` (jsonb `%n` → field path).

Invariants

- For every JournalEntry: Σ debit lines = Σ credit lines in each of amount_txn (per currency), amount_acct and amount_rpt, exactly, after rounding.
- Every JournalLine's `dimension_combination_id` was valid under the account structure version effective on `posting_date`.
- `posting_sequence` is dense (no gaps) per ledger; `Balance.last_posting_sequence` ≤ max posted sequence.
- Σ Balance.net over all accounts for a (ledger, period, currency_type) = 0.

Indexing / partitioning: `journal_line` is range-partitioned by `fiscal_year` (one partition per year per tenant shard); indexes on (ledger_id, main_account_id, posting_date), (dimension_combination_id, posting_date), (entry_id); `journal_entry` indexed on (ledger_id, posting_sequence), (document_id), (source_system, source_type, source_id). `balance` is unpartitioned, PK is the clustered access path. All tables carry `tenant_id` with RLS.

2.11.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
POST	/api/v1/ledger/journal-entries	Post a balanced entry	`Idempotency-Key` required	Post journal entries (service accounts) / Post ledger journals
POST	/api/v1/ledger/journal-entries/{id}/reverse	Create negating entry	`Idempotency-Key` required	Reverse journal entries
GET	/api/v1/ledger/journal-entries/{id}	Entry with lines	n/a	View ledger transactions
GET	/api/v1/ledger/journal-lines?ledger=&account_from=&account_to=&dim.{attr}=&date_from=&date_to=&cursor=	Line query	n/a	View ledger transactions
GET	/api/v1/ledger/balances?ledger=&period_from=&period_to=&account_from=&account_to=&dim.{attr}=&group_by=	Balance query	n/a	View ledger balances
POST	/api/v1/ledger/validate	Dry-run validation of an entry (no post)	none (stateless)	Post ledger journals
GET/PUT	/api/v1/ledger/charts/{chart}/accounts[/{number}]	Main account CRUD	PUT is naturally idempotent	Maintain chart of accounts
GET/PUT	/api/v1/ledger/ledgers/{ledger}/account-structures[/{id}]	Structure CRUD and activation	PUT idempotent	Maintain account structures
POST	/api/v1/ledger/dimension-combinations/resolve	Tuple → combination id	stateless	View ledger transactions
POST/GET/PATCH	/api/v1/ledger/journal-batches[/{id}] and /{id}:submit, :approve, :post	Manual journal lifecycle	`Idempotency-Key` on :post	Maintain / Approve / Post ledger journals
POST	/api/v1/ledger/balances:rebuild	Trigger rebuild (admin)	run id returned	Administer ledger
GET/PUT	/api/v1/ledger/reason-codes[/{code}]	Reason code CRUD (shared)	PUT idempotent	Maintain reason codes
GET/PUT	/api/v1/ledger/ledgers/{ledger}/advanced-rules[/{id}]	Advanced rules and advanced rule structures	PUT idempotent	Maintain account structures
GET/PUT	/api/v1/ledger/description-templates[/{id}]	Default description templates	PUT idempotent	Maintain ledger setup

Method	Path	Purpose	Idempotency	Auth duty
GET	/api/v1/ledger/open-items?ledger=&account=&status=&assignment=&dim.{attr}=&cursor=	Open items on OI-managed accounts	n/a	View ledger transactions
POST	/api/v1/ledger/clearings	Manual clearing of selected items (with tolerance / residual options)	`Idempotency-Key` required	Clear open items
POST	/api/v1/ledger/clearings:simulate	Residual and tolerance preview	stateless	Clear open items
POST	/api/v1/ledger/clearings/{id}:reset	Reset clearing (reason code required)	`Idempotency-Key` required	Reset clearings
POST	/api/v1/ledger/accounts/{account}:activate-open-items	Activation run for an account with history	`Idempotency-Key` required	Administer ledger
GET/PUT	/api/v1/ledger/ledgers/{ledger}/auto-clearing-rules[/{id}] and /tolerance-groups[/{code}]	Automatic clearing rules, tolerance groups and assignments	PUT idempotent	Maintain clearing rules
POST	/api/v1/ledger/auto-clearing:run	Run automatic clearing now (simulate or clear)	run id	Run automatic clearing
GET/PUT	/api/v1/ledger/ledgers/{ledger}/validation-rules[/{id}] and POST /validation-rules/{id}:test	Validation rules CRUD and test against samples	PUT idempotent	Maintain validation and derivation rules
GET/PUT	/api/v1/ledger/ledgers/{ledger}/derivation-strategies[/{version}] and /lookup-tables[/{id}] (CSV import)	Derivation strategy, steps, lookup tables	PUT idempotent; import `Idempotency-Key`	Maintain validation and derivation rules
GET/PUT	/api/v1/ledger/ledgers/{ledger}/splitting-rules[/{source_type}]	Document splitting configuration	PUT idempotent	Maintain ledger setup
POST	/api/v1/ledger/realignments and /{id}:post, :reverse	Dimension realignment simulate / post / reverse	`Idempotency-Key` required	Run dimension realignment

Posting request (canonical JSON)

```
POST /api/v1/ledger/journal-entries
Idempotency-Key: ap-invoice-7F3A-post
{ "ledger_group": "ALL" | "ledger_id": "...",
  "document_id": "uuid", "posting_date": "2026-03-31", "document_date": "2026-03-28",
  "description": "Vendor invoice 7F3A",
  "source": {"system":"ap","type":"vendor_invoice","id":"7F3A","uri":"passage://ap/invoices/7F3A"},
  "lines": [
    {"line_number":1,"account":"6010","dimensions":{"DEPT":"D100","CC":"C200"},
     "debit_credit":"D","amount":{"currency":"USD","value":"1250.00"},"text":"Freight"},
    {"line_number":2,"account":"2100","dimensions":{},"debit_credit":"C",
     "amount":{"currency":"USD","value":"1250.00"}} ] }
```

Response 201: `{ "entries":[{"id","ledger_id","voucher","posting_sequence","fiscal_period_id","totals":{"txn":{...},"acct":"1250.00","rpt":"1150.75"},"lines":[...]}], "idempotency":{"key","replayed":false}, "trace_id" }`. Amounts are strings with exactly the currency's minor-unit scale.

Commands / validation: `PostJournalEntry` (validation order: schema → ledger/period resolution → account existence and postability → structure validation → combination interning → currency/rounding (wave 12) → period status (wave 14) → balance check → sequence assignment → insert → balance upsert → outbox). `ReverseJournalEntry` (original exists, not already reversed unless `allow_reinstate`, target date open). `SubmitJournalBatch` (every line valid, totals balanced, user owns batch or holds duty). `ApproveJournalBatch` (approver ≠ submitter unless journal name allows self-approval).

Event	Trigger	Payload fields	Consumers
dev.passage.ledger.journal.posted.v1	entry committed	entry_id, ledger_id, document_id, voucher, posting_sequence, posting_date, fiscal_period_id, line_count, totals{txn[],acct,rpt}, source, trace_id	reporting, tax, audit, lakehouse, subledgers
dev.passage.ledger.journal.reversed.v1	reversal committed	original_entry_id, reversing_entry_id, reason_code, posting_date	reporting, subledgers
dev.passage.ledger.batch.status-changed.v1	batch transition	batch_id, journal_name, from, to, actor, workflow_run_id	notifications, audit
dev.passage.ledger.balance.rebuilt.v1	rebuild finished	ledger_id, high_water_sequence, rows_written, rows_differing, duration_ms	ops alerting
dev.passage.ledger.account.changed.v1	account/structure change	chart_id, account_number, change_type, effective_from	reporting, dimension sync
dev.passage.ledger.open-item.cleared.v1	clearing document committed or reset	clearing_document_id, ledger_id, account, mode, item_ids, difference_amount, fx_difference_entry_id, status (cleared/reset), reason_code	bank reconciliation (wave 36), AP/AR (waves 19/30), reporting, audit
dev.passage.ledger.realignment.completed.v1	realignment posted or reversed	run_id, ledger_id, period_range, combinations_affected, entry_ids, reversal	reporting, audit
dev.passage.ledger.rules.changed.v1	validation rule, derivation strategy or splitting rule activated	ledger_id, kind, id, version, actor	posting cache, audit

Open-item contract for subledgers (used by waves 18/19/30): a service registers an item source `{source_type, resolver_uri}`; the clearing engine calls `resolver_uri` to fetch candidate items and posts the clearing through the same `ClearingDocument` path; the source service consumes `open-item.cleared` to update its own status. The posting request accepts per line `"clear_item_ids": [...]` (FR-11.19) and the derivation/splitting/validation stages run in the order shown in the command pipeline below.

Posting pipeline (revised with FR-11.21–FR-11.23): schema → ledger/period resolution → default descriptions (FR-11.17) → derivation strategy (FR-11.22) → document splitting (FR-11.23) → account existence and postability → structure and advanced rule validation (FR-11.3, FR-11.16) → validation rules (FR-11.21) → combination interning → currency/rounding (wave 12) → period status (wave 14) → balance check → open-item clearing (FR-11.19) → sequence assignment → insert → balance upsert → outbox. `POST /ledger/validate` runs the same stages up to the balance check and returns the derivation trace and splitting result.

2.11.6 User experience

Screen	Primary actions	Key fields/columns	Duty required
Chart of accounts	Create, edit, suspend, import CSV, view balances	number, name, type, postable, suspended_from, default dimensions	Maintain chart of accounts
Financial dimensions	Add attribute, bind to entity, maintain custom values	attribute, backing entity, active_from/to, suspended	Maintain financial dimensions
Account structures	Design segments, constraints grid, validate sample, activate version	segment, allowed ranges, effective_from, status	Maintain account structures

Screen	Primary actions	Key fields/columns	Duty required
Journals (list)	New batch, filter by status/name/owner, bulk submit	voucher, journal name, status, total debit/credit, owner, posting date	Maintain ledger journals
Journal batch (detail)	Add/edit lines inline, validate, submit, approve, post, attach, save as template	line grid: account, dimensions (segmented entry), D/C, amount, text; totals bar	Maintain / Approve / Post ledger journals
Trial balance	Filter ledger/period/dimension, drill to lines, export	account, opening, debit, credit, closing, net	View ledger balances
Ledger transactions	Filter, drill to source document, trace id link	voucher, date, account, dims, D/C, amount, source	View ledger transactions
Reason codes	Create, deactivate, set modules and flags	code, name, applies_to, requires_comment, negative_posting_allowed	Maintain reason codes
Open items and clearing	Filter items, select, see residual, clear, create residual item, reset clearing	account, assignment, date, amount (clearing / acct), status, clearing document	Clear open items / Reset clearings
Clearing rules and tolerances	Define auto-clearing criteria, tolerance groups, assign to accounts and users, simulate run	account range, criteria order, allow_tolerance, limits per currency, difference account	Maintain clearing rules
Validation and derivation rules	Rule editor with CEL assist, lookup table grid and CSV import, test against sample entries, activate version	sequence, level, prerequisite, check, message; step kind, source, target, overwrite	Maintain validation and derivation rules
Document splitting setup	Item categories by account range, splitting dimensions, method, zero-balance account, test with a sample document	source_type, dimensions, method, categories, clearing account	Maintain ledger setup
Dimension realignment	Define filter and mapping, simulate, review affected combinations, post, reverse	account range, periods, old value, new value, lines, amount	Run dimension realignment

Interaction rules: segmented account entry accepts `1010-D100-C200` typed as one string with per-segment lookup (Tab moves segment); validation on blur per line and on save for the batch; grid supports paste from Excel (up to 5,000 rows) and bulk fill-down of dimensions; keyboard: Ctrl+Enter = save line, Alt+P = post (confirm dialog), Esc = cancel edit; saved views and column personalization persist per user (wave 5 shell).

2.11.7 Business rules and edge cases

- **BR-11.1 Balance by construction.** An entry is accepted only if Σ debits = Σ credits in every amount column; the check is performed on rounded amounts and repeated inside the database transaction (CHECK via deferred constraint trigger).
- **BR-11.2 Zero-amount lines** are allowed only when `quantity` ≠ 0 (statistical) or the line carries `text`; otherwise rejected with `LEDGER_LINE_EMPTY`.
- **BR-11.3 Rounding.** Amounts are stored with scale equal to the currency's ISO 4217 minor units (USD/EUR 2, JPY 0, KWD/BHD 3); requests with excess precision are rejected with `LEDGER_AMOUNT_SCALE` (no silent rounding of transaction amounts). Derived amounts (wave 12) are rounded half-away-from-zero.
- **BR-11.4 Posting date.** Must fall in a fiscal period of the ledger's calendar; date before the ledger's `first_open_date` or in a closed period → `LEDGER_PERIOD_CLOSED`. Future dates are allowed up to 366 days.
- **BR-11.5 Concurrency.** Posting takes a row lock on `ledger` only for sequence assignment (sub-millisecond); balance upserts use `INSERT … ON CONFLICT DO UPDATE` ordered by PK to prevent deadlocks; the service retries serialization failures up to 3 times with jitter.
- **BR-11.6 Idempotency key semantics.** Key is compared after trimming; scope is (tenant, legal entity). A replay returns the original response including the original `trace_id` and `replayed: true`. Keys are persisted before the entry insert in the same transaction, so a crash leaves either both or neither.
- **BR-11.7 Balance rebuild algorithm.** (1) Record `hwm = max(posting_sequence)` per ledger. (2) In a shadow table, `INSERT … SELECT ledger_id, main_account_id, dimension_combination_id, fiscal_period_id, currency_type, SUM(debit), SUM(credit), COUNT(*), MAX(posting_sequence) FROM journal_line JOIN journal_entry WHERE posting_sequence ≤ hwm GROUP BY …`, chunked by fiscal period (each chunk ≤ 5M lines, committed separately). (3) Catch-up loop: apply lines with sequence in (hwm, new_hwm] as deltas; repeat until the delta is < 1,000 lines. (4) Take a 2-second advisory lock on posting for the ledger, apply the final delta, compare shadow to live row by row (FULL OUTER JOIN on PK, any non-zero difference recorded), swap tables atomically, release. (5) Emit `balance.rebuilt` with `rows_differing`; > 0 raises a P1 alert and the live table is kept as the rebuilt copy (the journal is truth).
- **BR-11.8 Reconciliation account protection.** Accounts with `reconciliation_account_type ≠ none` reject manual batch lines (`LEDGER_RECON_ACCOUNT_MANUAL`) unless the journal name is flagged `allow_recon_accounts` (migration and correction use only).
- **BR-11.9 Error codes (422 unless noted).** `LEDGER_UNBALANCED`, `LEDGER_LINE_LIMIT`, `LEDGER_LINE_EMPTY`, `LEDGER_AMOUNT_SCALE`, `LEDGER_ACCOUNT_NOT_FOUND`, `LEDGER_ACCOUNT_NOT_POSTABLE`, `LEDGER_ACCOUNT_SUSPENDED`, `LEDGER_RECON_ACCOUNT_MANUAL`, `LEDGER_STRUCTURE_NOT_FOUND`, `LEDGER_DIMENSION_REQUIRED`, `LEDGER_DIMENSION_INVALID`, `LEDGER_DIMENSION_INACTIVE`, `LEDGER_COMBINATION_INVALID`, `LEDGER_PERIOD_NOT_FOUND`, `LEDGER_PERIOD_CLOSED`, `LEDGER_PERIOD_ON_HOLD` (403), `LEDGER_DATE_INVALID`, `LEDGER_CURRENCY_MISMATCH`, `LEDGER_RATE_MISSING`, `LEDGER_ROUNDING_EXCEEDED`, `LEDGER_REVERSAL_ALREADY_REVERSED`, `LEDGER_IDEMPOTENCY_CONFLICT` (409), `LEDGER_IDEMPOTENCY_IN_PROGRESS` (409), `LEDGER_FORBIDDEN` (403).
- **BR-11.10 Journal batch state machine.** `draft → validated` (all lines valid) → `in_approval` (submit; skipped if journal name has no workflow) → `approved | rejected` → `posting` (lock) → `posted` (entry ids recorded) or back to `approved` with error on failure; `draft|validated|rejected → cancelled`; any line edit in `validated|approved` returns the batch to `draft`. Posted and cancelled are terminal.
- **BR-11.11 Document split.** Entries sharing a `document_id` are independent for balancing; callers that split a document must balance each part (use a clearing account) — the API does not defer balancing across requests.
- **BR-11.12 Clearing tolerance.** For a selected item set, `residual = Σ amount_clearing`. Let `T_user` and `T_account` be the applicable tolerance groups (absent = 0). The posting limit is `min(T_user, T_account)` per side (`abs_debit` for a debit residual, `abs_credit` for a credit residual) and additionally `pct × Σ|amount|` when `pct` is set. `|residual| = 0` → clear; `0 < |residual| ≤ limit` → clear and post the residual to the tolerance group's `difference_account_id` with the dimensions of the largest item; `|residual| > limit` → `residual_item = true` creates a residual item for `residual` on the same account and combination, else `LEDGER_CLEARING_UNBALANCED`.
- **BR-11.13 Open-item lifecycle.** `open → cleared` (exactly once per clearing document) → `reset_open` (reset) → `cleared` (again, by a new document); an item in `cleared` cannot be in a second active clearing document (`LEDGER_OPEN_ITEM_ALREADY_CLEARED`); a residual item's `residual_of_item_id` chain is at most 20 deep; clearing dates may not precede the latest posting date of the items cleared; a clearing document is reset as a whole, never partially.
- **BR-11.14 Derivation evaluation.** Steps run strictly in `sequence`; a step whose target was set by an earlier step in the same run is skipped unless `overwrite = true`; a step may not read a field it also writes; lookup tables are matched on the full source tuple with `*` wildcards and the most specific row wins (fewest wildcards, then latest `valid_from`); a strategy with > 50 steps or a step with a CEL parse error cannot be activated (`LEDGER_DERIVATION_INVALID`).
- **BR-11.15 Splitting proportions.** For an entry with carrying lines (amounts `a_i`, splitting values `v_i`) and a non-carrying line amount `b`: produce lines `b × a_i / Σa` per distinct `v`, rounded per BR-12.4 with the residual on the largest share; when Σa = 0 or no carrying line exists use `default_splitting_value` or raise `LEDGER_SPLIT_NO_SOURCE`; after inheritance, for each splitting value with Σ(debit – credit) ≠ 0, add a pair of zero-balance lines (clearing account) so each value balances; zero-balance lines are excluded from P&L statements and flagged `is_zero_balance = true`.
- **BR-11.16 Negative posting.** When a reversal uses a reason code with `negative_posting_allowed`, the reversing lines keep the original side with the opposite sign in the `Balance` projection (`debit −x`), while `JournalLine.debit_credit` stays D/C with positive amounts and `negative_posting = true`; reports that sum debits and credits (trial balance, document journal) apply the flag so turnover totals equal the pre-posting values.
- **BR-11.17 Validation rule evaluation.** All rules are evaluated (no short-circuit) so the response lists every violation; a rule referencing a dimension attribute not in the ledger is skipped and logged; warnings do not block API callers (service accounts) but are returned in `warnings[]`; the same rule set applies to reversals, allocations, accruals and year-end entries unless the rule's prerequisite excludes the `source_type`.

- **BR-11.18 Open-item account constraints.** `open_item_managed` is allowed only for balance-sheet accounts that are not reconciliation accounts of type customer/vendor (those are managed by waves 19/30) and not `is_postable = false`; the flag change is effective-dated and requires an activation run when the account has non-zero balances; open items are revalued (wave 12) at item level, so the account is excluded from balance-level revaluation.

2.11.8 Acceptance criteria

- **AC-11.1** (FR-11.5, FR-11.6) Given a balanced two-line USD entry in an open period, when posted with a new key, then 201 is returned within 200 ms p99, a `posting_sequence` is assigned, and `journal.posted` is observed on Kafka within 2 s.
- **AC-11.2** (FR-11.5) Given the same request repeated with the same key, when posted, then 200 is returned with `replayed: true` and no new entry exists.
- **AC-11.3** (FR-11.5) Given the same key with a changed amount, when posted, then 409 `LEDGER_IDEMPOTENCY_CONFLICT`.
- **AC-11.4** (FR-11.3) Given account 6010 requires DEPT under the active structure, when a line omits DEPT, then 422 `LEDGER_DIMENSION_REQUIRED` with `line_index`.
- **AC-11.5** (BR-11.1) Given lines summing to debit 100.00 / credit 99.99, when posted, then 422 `LEDGER_UNBALANCED` and no rows are written.
- **AC-11.6** (FR-11.7) Given 1M random balanced entries posted by 64 concurrent workers, when complete, then Σ Balance.net = 0 for every period and a rebuild reports `rows_differing = 0`.
- **AC-11.7** (FR-11.8) Given a posted entry, when reversed, then a new entry exists whose lines equal the original with D/C swapped and `reversal_of_line_id` set, and a second reversal returns `LEDGER_REVERSAL_ALREADY_REVERSED`.
- **AC-11.8** (FR-11.9, BR-11.10) Given a journal name with a 2-level approval, when a clerk submits a batch, then it is `in_approval`, the approver sees a Temporal task, and after approval the clerk can post.
- **AC-11.9** (FR-11.13) Given the demo opening balance file, when loaded through the migration framework, then the conversion-suspense account balance is 0.00 and the trial balance equals the AX extract totals.
- **AC-11.10** (FR-11.14) Given 10M lines, when querying lines for one account and month, then the first page returns in < 300 ms p95 using the keyset cursor.
- **AC-11.11** (FR-11.15) Given a journal name with `reversal_reason_required = true`, when a reversal is requested without `reason_code`, then 422 `LEDGER_REASON_REQUIRED`; when requested with a code flagged `negative_posting_allowed`, then the trial balance debit and credit turnover equal their values before the original posting.
- **AC-11.12** (FR-11.19, BR-11.12) Given open items of USD 100.00 (D) and USD 99.98 (C) on a clearing account and a user tolerance of USD 0.05, when cleared manually, then one clearing document exists, a USD 0.02 difference line is posted to the tolerance account, and both items are `cleared`; with tolerance USD 0.01 and `residual_item = true`, then a residual item of USD 0.02 is created instead.
- **AC-11.13** (FR-11.20) Given 1,000 open items on GR/IR-style accounts with matching `assignment` values summing to zero in 400 groups and 50 unmatched items, when `gl-auto-clear` runs, then 400 clearing documents exist, 50 items remain open, and no residual items were created.
- **AC-11.14** (FR-11.21) Given an active rule "lines on accounts 6000–6999 require DEPT when amount_acct > 1,000", when a 1,500.00 line without DEPT is validated, then 422 with the rule id and `line_index`; a 500.00 line without DEPT passes.
- **AC-11.15** (FR-11.22) Given a lookup step (account category = COGS, cost center = C200) → FUNC_AREA = PROD, when a line on a COGS account with C200 and no FUNC_AREA is posted, then the stored combination contains FUNC_AREA = PROD and `derived_by_step_ids` names the step.
- **AC-11.16** (FR-11.23, BR-11.15) Given a vendor invoice with expense lines 600.00 (PC1) and 400.00 (PC2), a tax line 190.00 and a payable line 1,190.00, when posted with an active splitting rule on PC, then the payable is split 714.00 / 476.00 and the tax 114.00 / 76.00, and Σ(debit – credit) per profit center is 0.00.
- **AC-11.17** (FR-11.24) Given 2,000 lines on cost center C100 across 3 periods, when a realignment C100 → C150 is posted and then reversed, then balances per combination equal the pre-run values and both runs appear in the audit trail.
- **AC-11.18** (FR-11.16) Given an advanced rule "account 5000–5999 and DEPT = D100 adds segment PROJECT (required)", when a line on 5100/D100 omits PROJECT, then 422 `LEDGER_DIMENSION_REQUIRED` for PROJECT; a line on 5100/D200 posts without PROJECT.
- **AC-11.19** (FR-11.17) Given a tenant template for `manual_journal` "Journal %1 of %2" bound to `{voucher}` and `{document_date}`, when a batch without description is posted, then the entry description is "Journal GJ-000123 of 2026-03-31".

2.11.9 Test plan and fixtures

- Fixtures: `coa-demo` (1,200 accounts, 3 charts, from the demo manufacturer's AX `MainAccount` extract); `dims-demo` (8 attributes, 2,400 values); `structures-demo` (4 structures, 2 advanced rules); `entries-random-1m` (generator: seeded, 1M entries, 2–50 lines each, balanced by construction); `entries-negative-120` (120 hand-written rejection cases, one per error code × variant); `opening-balances-demo` (3 entities, CSV from AX `GeneralJournalAccountEntry` aggregation).

Test	Type	Target	Pass criterion
Balanced-entry property test	property (Go rapid)	posting service	any generated balanced entry posts; any mutated unbalanced entry is rejected
Error-code table	unit	validator	120 cases map to expected code and line_index
Idempotency contract	contract (OpenAPI + Pact)	posting API	replay/conflict/in-progress semantics as specified
Concurrent posting	integration	Postgres + service	64 workers × 1M entries: zero sequence gaps/duplicates, TB = 0
Rebuild equivalence	integration	rebuild job	rows_differing = 0 after concurrent load
Throughput	performance (k6)	dev cluster 3 nodes	5,000 lines/s for 30 min, p99 < 200 ms, error rate 0
Journal workspace E2E	Playwright + axe	React shell	create → submit → approve → post; WCAG 2.1 AA pass
Append-only enforcement	unit (SQL)	triggers/grants	UPDATE/DELETE on journal tables raise for app role and superuser

Reconciliation checks: Σ Balance per (ledger, period) = 0; Σ Balance per account = Σ journal lines per account; count of `journal.posted` events = count of entries (outbox audit); opening-balance conversion suspense = 0.

2.11.10 Deployment and operations

Helm chart `passage-ledger` (deployment, HPA 3–12 pods on CPU 60%, PodDisruptionBudget 2, CloudNativePG cluster `ledger-db` 3 instances, Kafka topics `ledger.journal`, `ledger.batch`, Debezium outbox connector). Config: `LEDGER_MAX_LINES=10000`, `LEDGER_IDEMPOTENCY_TTL_DAYS=400`, `LEDGER_REBUILD_CHUNK_LINES=5000000`, `LEDGER_FUTURE_DATE_DAYS=366`. Migrations via Atlas generated from entity metadata; partitions for the next fiscal year created by a monthly job. Feature flags: `ledger.recurring_journals`, `ledger.advanced_rules`. Scheduled jobs (Temporal): nightly `balance-verify` (rebuild into shadow, compare, no swap unless diff), monthly `create-partitions`, recurring journal generator. SLOs: posting availability 99.9%; posting p99 < 200 ms; `journal.posted` publish lag p95 < 2 s. Alerts: balance verify diff > 0 (P1), sequence gap detected (P1), outbox lag > 60 s (P2), posting error rate > 1% over 5 min (P2). Runbook: rebuild procedure, sequence gap investigation, idempotency table growth. Rollback: Argo CD previous digest; schema migrations are additive-only in this wave; no data rollback required because the journal is append-only.

2.11.11 Migration from AX / SAP

Source	Passage entity	Notes
AX `MainAccount`, `LedgerChartOfAccounts`, `MainAccountLegalEntity`	MainAccount, ChartOfAccounts, MainAccountLedgerSetting	type mapping from `MainAccountType`; suspended → `suspended_from`
AX `DimensionAttribute`, `DimensionAttributeValue`, `DimensionFinancialTag`	DimensionAttribute, DimensionValue	entity-backed attributes re-bound to Passage parties/sites; custom lists copied
AX `DimensionHierarchy` (account structures), `DimensionConstraintTree/Node`	AccountStructure(+Constraint)	advanced rules flattened into constraint rows; activated version 1
AX `DimensionAttributeValueCombination`	DimensionCombination	recomputed from tuples; `RecId` kept in `legacy_ref` for cross-reference
AX `GeneralJournalEntry/GeneralJournalAccountEntry` (closing balances only)	JournalEntry (period 0)	opening balances per combination; detail history not migrated in Phase 2 (wave 49 transactional packs)
SAP `SKA1/SKAT/SKB1`	ChartOfAccounts, MainAccount, MainAccountLedgerSetting	`XSPEB` (blocked) → suspended; `MITKZ` → reconciliation_account_type
SAP `CSKS`, `CEPC`, `TGSB`	DimensionValue (CC, PC, BA attributes)	validity dates preserved
SAP `FAGLFLEXT/ACDOCA` closing balances by period	JournalEntry (period 0)	per ledger (`RLDNR`) → Passage ledger
AX `ReasonTable`, `ReasonTableRef`	ReasonCode	`applies_to` from the Ledger/Bank/Cust/Vend/Asset flags
AX `DimensionHierarchy` (advanced rule structures), `DimensionAdvancedRule`, `DimensionRuleCriteria`	AdvancedRule (+ structure)	criteria → filter; structure segments → appended segments
AX `TransactionTxt` (default descriptions)	DescriptionTemplate	`%1`–`%3` mapped to field bindings per transaction type
AX `DocuRef/DocuValue` on `LedgerJournalTable`	Attachment (wave 5 framework)	`DocuType` → document_type; files copied to object storage
SAP `T041C`	ReasonCode	`XNEGP` → negative_posting_allowed; `XABWD` → alternative_posting_date_allowed
SAP `SKB1–XOPVW`, open items on OI-managed G/L accounts (`BSIS` with `AUGBL` blank), `T043S`, `TF123`	MainAccountLedgerSetting.open_item_managed, OpenItem (activation run), ToleranceGroup, AutoClearingRule	one open item per uncleared `BSIS` row dated cutover; cleared history (`BSAS`) not migrated
SAP `GB90*/T001Q` validations, `GB91*/T001R` substitutions, `TKEDR*/K9R*` derivation, `T8A*` PCA substitution, `FMDERIVE*`, `TFKB` functional areas	ValidationRule, DerivationStrategy steps, LookupTable, dimension values for FUNC_AREA	Boolean rules converted to CEL where the exit is table-based; user exits (ZGGB*) listed in a conversion report for re-authoring
SAP `T8G01`–`T8G40` document splitting	SplittingRule	item categories → categories; splitting method → active; zero-balance account → clearing account

Validation: account count match; every migrated combination validates under the migrated structure (exceptions queued); opening TB per entity equals source to the cent. Not migrated: AX `LedgerJournalTable` unposted batches (users re-key), SAP parked documents, posting definitions (re-implemented per subledger wave).

2.11.12 Dependencies, risks, open questions

Depends on: wave 3 (metadata entity generation), wave 4 (outbox, Temporal approval template), wave 5 (gap-free number sequences, audit), wave 6 (legal entities, fiscal calendars, currencies), wave 7 (party dimension backing), wave 10 (opening balance load).

Risk	Likelihood	Impact	Mitigation
Gap-free sequence becomes a throughput bottleneck	Medium	Medium	Sequence lock held < 1 ms; batch allocation for multi-entry documents; measured in the 5k lines/s test
Dimension combination table growth (millions of tuples)	Medium	Low	32-byte hash key; combinations are reused; monitored
Structure change invalidates existing combinations	Medium	Medium	Combinations are tied to structure version; old versions stay queryable

Open questions: (1) Should `amount_txn` be stored as integer minor units instead of numeric(23,6)? Default: numeric with scale check; decide by wave 12 start. (2) Idempotency scope per legal entity vs per tenant? Default: per legal entity; decide by wave 11 mid-point. (3) Maximum dimensions 20 vs AX's practical 10? Default 20; decide by wave 11 exit.

2.11.13 Parameters and setup

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
`max_lines_per_entry`	tenant	int	10,000	100–50,000	Posting request line limit (FR-11.5)	— (journal `LinesLimit` on journal name)	999 line limit per `BSEG` document (hard)
`idempotency_ttl_days`	tenant	int	400	30–3,650	Retention of idempotency records (FR-11.5)	—	—
`future_posting_days`	legal entity	int	366	0–730	Maximum days ahead for `posting_date` (BR-11.4)	General ledger parameters > Ledger > "Allow posting to future periods" (implicit)	OB52 open-period range
`reversal_reason_required`	legal entity	bool	true	true / false	Reason code mandatory on reversal (FR-11.15)	General ledger parameters > Ledger > Reason code requirements (reversal)	T041C reason required on FB08
`negative_posting_enabled`	ledger	bool	false	true / false	Permits reason codes with `negative_posting_allowed` (BR-11.16)	General ledger parameters > Ledger > Correction (storno)	OBY6 "Negative postings permitted"

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
`check_voucher_used`	ledger	enum	reject_duplicates	reject_duplicates / warn / accept	Duplicate voucher detection across journal names	General ledger parameters > Ledger > Check for voucher used	FBN1 number range object `RF_BELEG` (unique by design)
`use_document_date_for_voucher`	ledger	bool	false	true / false	Voucher sequence drawn from document date year	General ledger parameters > Ledger > Use document date for vouchers	OBA7 document type "Doc. date = posting date"
`journal_name.posting_restriction`	journal name	enum	by_user_group	none / own_journals_only / by_user_group	Who may post batches of this name (FR-11.9)	Journal names > Posting restrictions	OBA7 authorization group
`journal_name.lines_limit`	journal name	int	5,000	1–50,000	Lines per batch (FR-11.9)	Journal names > Lines limit	—
`journal_name.allow_recon_accounts`	journal name	bool	false	true / false	Manual lines on reconciliation accounts (BR-11.8)	Journal names > Journal control (account types allowed)	OBA7 "Account types allowed" (D/K)
`journal_name.self_approval_allowed`	journal name	bool	false	true / false	Approver may equal submitter	Workflow configuration > automatic actions	WS10000051 agent rule
`journal_name.voucher_sequence_id`	journal name	ref	required	number sequence (wave 5), gap-free	Voucher numbering per journal name	Journal names > Voucher series	OBA7 number range per document type (FBN1)
`journal_name.description_language`	journal name	enum	legal_entity	legal_entity / user	Language for default descriptions (FR-11.17)	Default descriptions > Language	—
`max_dimension_attributes`	ledger	int	20	1–20	Attributes per ledger (FR-11.2)	Financial dimensions (practical limit ~10)	ACDOCA fixed fields + coding block extension (OXK3)
`account.open_item_managed`	main account × ledger	bool	false	true / false	Creates open items per line (FR-11.19)	—	FS00 company-code data "Open item management" (`SKB1-XOPVW`)
`account.clearing_currency`	main account × ledger	enum	accounting	accounting / transaction	Currency in which items must balance to clear	—	FS00 "Only balances in local currency"
`tolerance_group.limits`	legal entity (per group)	jsonb	`{USD:{abs_debit:0.05, abs_credit:0.05, pct:0}}`	per currency	Clearing difference posting limits (BR-11.12)	General ledger parameters > Ledger > Maximum penny difference	OBA0 tolerance groups for G/L accounts; OB57 user assignment
`auto_clearing.schedule`	ledger	cron	`0 2 * * *`	cron	Schedule of `gl-auto-clear` (FR-11.20)	—	F.13 batch variant (SM36)
`validation_rules.active_version`	ledger	int	latest active	activated version	Rule set in force (FR-11.21)	Journal controls	OB28 activation level 1/2 per company code
`derivation_strategy.active_version`	ledger	int	latest active	activated version	Strategy in force (FR-11.22)	—	KEDR strategy active; OBBH activation
`splitting.method` per source_type	ledger	enum	off	off / active / passive	Document splitting (FR-11.23)	—	FAGL_SPLIT activation per company code; splitting method
`splitting.zero_balance_clearing_account_id`	ledger	ref	none	balance-sheet account	Zero-balance lines (BR-11.15)	—	Zero-balance clearing account (T8G30)
`realignment.enabled`	ledger	bool	false	true / false	Enables FR-11.24 runs	—	KEND authorization
`balance_rebuild_chunk_lines`	tenant	int	5,000,000	1M–20M	Chunk size in BR-11.7	Financial dimension sets > Rebuild balances (no tuning)	RFINDEX variant
`attachment.default_retention_class`	legal entity	ref	`financial_record_10y`	wave 5 retention classes	Retention applied to voucher attachments (FR-11.18)	Document management parameters > Document types	OAC3 ArchiveLink document type / retention

2.11.14 Inquiries and reports

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
Trial balance	list inquiry	ledger, period range, dimension set, currency type, account range	account, opening, debit, credit, closing, net, line count	`Balance`	Trial balance list page (`LedgerTrialBalanceListPage`); SSRS Trial balance	FAGLB03, S_ALR_87012277, F.08
Ledger transactions (voucher transactions)	drill-down	ledger, voucher, date range, account, dimension values, source system	voucher, posting date, account, dimensions, D/C, txn/acct/rpt amounts, text, source link, trace id	`JournalLine` ⋈ `JournalEntry`	Voucher transactions / Ledger transactions inquiry; SSRS Ledger transaction list	FBL3N, FAGLL03, S_ALR_87012282, Fiori Display Line Items in General Ledger
Dimension statement	list inquiry	ledger, dimension attribute + value, period range	account, net per period, YTD	`Balance`	Dimension balance inquiry (`DimensionFocus` balances)	KE5Z (profit center), S_ALR_87013611 (cost center)
Chart of accounts listing	operational report	chart, account type, postable, suspended	number, name, type, category, default dimensions, OI flag, recon type	`MainAccount` ⋈ `MainAccountLedgerSetting`	SSRS Chart of accounts	S_ALR_87012326, S_ALR_87012328
Journal batches (unposted)	list inquiry	journal name, status, owner, date, amount	voucher, name, status, Σ debit, Σ credit, owner, approver, posting date	`JournalBatch`	General journal list page; SSRS Journal (LedgerJournal)	FBV0 / FBV3 parked documents list
Posted journals	operational report	journal name, posted date range, posted by	batch, vouchers, entry ids, totals, posted by/at	`JournalBatch` (posted) ⋈ `JournalEntry`	Posted journals list; SSRS Posted journals	S_ALR_87012287 document journal
Voucher (document) view	drill-down	voucher or entry id	header, all lines with dimensions and three currencies, reversal links, attachments	`JournalEntry`	SSRS Voucher (LedgerTransVoucher); Voucher transactions	FB03, S_ALR_87012289 compact document journal
Open items by account	list inquiry	ledger, account range, status, assignment, date, dimension	item, posting date, assignment, amount clearing/acct, days open, clearing document	`OpenItem`	— (customer/vendor open transactions only)	FBL3N open items, FAGLL03 (OI status)
Clearing documents	drill-down	account, clearing date range, mode, status	document, mode, items, difference, FX difference, reset reason/by	`ClearingDocument`	—	FB03 clearing document, FBRA history
Automatic clearing proposal / log	operational report	run id, ledger, rule	groups proposed, cleared, skipped (reason), items per group	`gl-auto-clear` run log	—	F.13 log (SE38 `SAPF124` output)
Validation rule test result	drill-down	rule id, sample entry	per line: prerequisite result, check result, message	`ValidationRule` test harness	—	GGB0 simulation
Derivation trace	drill-down	batch line or `validate` response	step sequence, kind, matched lookup row, value before/after	posting pipeline	—	KEDR "Analyze derivation" (KE4ST)
Document splitting simulation	drill-down	sample document	lines before/after split, inherited flags, zero-balance lines	posting pipeline	—	FB50 "Simulate general ledger" (split view)
Reason code usage	operational report	reason code, module, period	count of reversals, clearings resets, amounts by code	`JournalEntry` (reversal) ⋈ `ReasonCode`	Reason codes form (no report)	T041C usage via FB03 reversal reason
Balance projection drift KPI	KPI	ledger	rows_differing from last `balance-verify`, duration, HWM	`balance.rebuilt` events	Financial dimension sets rebuild log	RFINDEX / SAPF190 comparison report
Idempotency replays	operational report	legal entity, date range, source system	key, first seen, replays, payload hash, conflicts (409)	idempotency table	—	—

2.11.15 Printed and electronic documents

Document	Trigger	Layout elements	Formats	Numbering sequence	Legal / retention requirement
Journal batch printout (unposted)	user action on Journal batch; optional on submit for approval	header: journal name, batch id, owner, status, totals; lines: line no., account, dimensions, D/C, currency, amount, text; footer: validation messages, approval chain	PDF, XLSX	batch id (not a legal number)	none; internal working paper, retained with batch 90 days after posting
Posted voucher	user action on entry; attached automatically to approval evidence when the journal name sets `print_on_post`	header: ledger, voucher, posting date, document date, description, source, trace id; lines: account, dimensions, D/C, txn/acct/rpt amounts, text, derived/inherited flags; footer: reversal links, attachments list, posted by/at, result hash	PDF, XLSX, CSV	voucher (gap-free, FR-11.6)	financial record; retention per `attachment.default_retention_class` (default 10 years)
Clearing statement	on clearing document creation or reset	header: account, clearing date, mode, document id; lines: cleared items with assignment, dates, amounts, residual/difference lines; footer: tolerance applied, actor	PDF	clearing document id	financial record; 10 years
Chart of accounts export	user action	account attributes incl. default dimensions, OI flag, recon type, suspended_from	XLSX, CSV, JSON	—	none
Account structure / advanced rule definition export	user action or version activation	segments, constraint rows, advanced rules and structures, version, effective_from	JSON, XLSX	structure version	configuration record; kept with the version indefinitely
Approval evidence pack	batch posted after approval	batch printout + workflow history (submitter, approvers, timestamps, comments)	PDF	batch id	audit evidence; 10 years

No e-invoice or EDI documents originate in this wave.

2.11.16 Periodic and batch jobs

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
`balance-verify` (rebuild into shadow, compare, swap only on diff)	daily 01:00 tenant time zone	ledger	run id per (ledger, date); chunk checkpoints per fiscal period (BR-11.7)	10M lines < 15 min	retry 1× after 10 min; partial chunks rolled back per chunk	`balance.rebuilt.rows_differing > 0` → P1; duration > 60 min → P3
`create-partitions`	monthly, 1st 00:30	tenant shard	idempotent `CREATE TABLE IF NOT EXISTS` for next fiscal year	< 1 min	alert, retry daily	missing partition for next year within 60 days → P2
`recurring-journal-generate`	per template cron; default last business day of period 06:00	template	one batch per (template, scheduled date) key; replay returns existing batch	1,000 templates < 5 min	failed template marked; others continue	failed templates > 0 → P3; batch not generated by due date → P3
`gl-auto-clear`	daily 02:00	ledger × rule	run id per (ledger, rule, date); groups cleared individually with idempotency key `auto:{rule}:{group_hash}`	1M open items < 10 min	group-level failures logged, run continues	cleared count = 0 for 3 consecutive runs on a rule with open items → P3
`idempotency-purge`	daily 03:00	tenant	deletes records older than `idempotency_ttl_days`; checkpoint by created_at	< 5 min per 10M keys	retry next day	table growth > 2× expected → P3
`dimension-value-reconcile` (compare backing entities with `DimensionValue`)	daily 04:00	dimension attribute	idempotent upsert; diff report stored	< 2 min	alert	diff count > 0 → P3
`attachment-retention-sweep` (wave 5 framework, ledger hook)	weekly Sunday 05:00	legal entity	retention class evaluation; deletes only past expiry	< 10 min	skip and retry	failures → P3
`open-item-aging-snapshot`	daily 05:30	ledger	one row per (account, date)	< 2 min	retry	—

2.11.17 Security duties and privileges

Duty	Privileges (entry points)	Segregation-of-duties conflicts	Default roles that include it
Maintain chart of accounts	PUT /ledger/charts/*/accounts; screen Chart of accounts; import CSV	Post ledger journals; Maintain ledger journals	Financial controller, Accounting manager
Maintain financial dimensions	PUT dimension attributes/values; screen Financial dimensions	Post ledger journals	Accounting manager
Maintain account structures	PUT account-structures, advanced-rules; activation; screen Account structures	Post ledger journals	Accounting manager
Maintain ledger setup	PUT description-templates, splitting-rules, ledgers; screen Ledger setup, Document splitting setup	Post ledger journals; Maintain ledger journals	Accounting manager, System administrator (finance)
Maintain reason codes	PUT /ledger/reason-codes; screen Reason codes	—	Accounting manager
Maintain ledger journals	POST/PATCH journal-batches, :submit; screen Journals, Journal batch; attachments	Approve ledger journals (same batch); Maintain chart of accounts	Accountant, Accounting clerk
Approve ledger journals	:approve, :reject; Temporal task UI	Maintain ledger journals (same batch); Post ledger journals without approval	Accounting supervisor, Financial controller
Post ledger journals	:post on batches; POST /ledger/validate	Maintain chart of accounts; Maintain validation and derivation rules	Accountant (senior), Accounting supervisor
Post ledger journals without approval	`auto_post` templates, direct post when journal name has no workflow	Maintain ledger journals; Approve ledger journals	Financial controller (limited)
Post journal entries (service accounts)	POST /ledger/journal-entries with `source.system ≠ ledger`	not assignable to human users	Subledger service accounts (waves 16+)
Reverse journal entries	POST /journal-entries/{id}/reverse; screen Ledger transactions > Reverse	Approve ledger journals (same entry)	Accounting supervisor, Financial controller
View ledger transactions	GET journal-entries, journal-lines, open-items; drill-downs	—	All finance roles, Internal auditor
View ledger balances	GET balances; Trial balance; Dimension statement	—	All finance roles, Internal auditor, Department manager (own dimensions via OPA)
Clear open items	POST /ledger/clearings, :simulate; screen Open items and clearing	Reset clearings; Maintain clearing rules; Maintain bank reconciliation (wave 36)	Accountant (senior), Treasury accountant
Reset clearings	POST /clearings/{id}:reset	Clear open items	Accounting supervisor
Maintain clearing rules	PUT auto-clearing-rules, tolerance-groups and assignments	Clear open items; Run automatic clearing	Accounting manager
Run automatic clearing	POST /ledger/auto-clearing:run; job `gl-auto-clear`	Maintain clearing rules	Accounting supervisor, Finance batch operator
Maintain validation and derivation rules	PUT validation-rules, derivation-strategies, lookup-tables; :test	Post ledger journals; Run dimension realignment	Accounting manager, Finance systems analyst
Run dimension realignment	POST /ledger/realignments, :post, :reverse	Maintain validation and derivation rules; Approve ledger journals	Financial controller
Administer ledger	balances:rebuild, accounts:activate-open-items, config, partitions	Post ledger journals	Finance platform administrator

2.11.18 Message catalog

Code	Severity	User text	Cause	Remediation	Raised by
LEDGER-0001 `LEDGER_UNBALANCED`	error	Entry does not balance in {currency}: debits {debits}, credits {credits}.	Σ D ≠ Σ C in a currency column	Correct the line amounts or add the clearing line	BR-11.1, BR-12.5
LEDGER-0002 `LEDGER_LINE_LIMIT`	error	Entry has {count} lines; the limit is {max}.	More than `max_lines_per_entry`	Split the document by `document_id`	FR-11.5

Code	Severity	User text	Cause	Remediation	Raised by
LEDGER-0003 `LEDGER_LINE_EMPTY`	error	Line {line} has no amount, quantity or text.	Zero line without statistical content	Remove the line or add quantity/text	BR-11.2
LEDGER-0004 `LEDGER_AMOUNT_SCALE`	error	Amount {amount} has more decimals than {currency} allows ({scale}).	Excess precision	Round in the caller	BR-11.3
LEDGER-0005 `LEDGER_ACCOUNT_NOT_FOUND`	error	Account {account} does not exist in chart {chart}.	Unknown account	Create the account or correct the number	FR-11.1
LEDGER-0006 `LEDGER_ACCOUNT_NOT_POSTABLE`	error	Account {account} is a total or reporting account.	`is_postable = false`	Use a postable account	FR-11.1
LEDGER-0007 `LEDGER_ACCOUNT_SUSPENDED`	error	Account {account} is suspended from {date}.	`suspended_from ≤ posting_date`	Use another account or lift the suspension	FR-11.1
LEDGER-0008 `LEDGER_RECON_ACCOUNT_MANUAL`	error	Account {account} accepts subledger postings only.	Manual line on a reconciliation account	Use a journal name with `allow_recon_accounts` or post through the subledger	BR-11.8
LEDGER-0009 `LEDGER_STRUCTURE_NOT_FOUND`	error	No active account structure covers account {account} on {date}.	Structure filter gap	Extend a structure's main-account filter	FR-11.3
LEDGER-0010 `LEDGER_DIMENSION_REQUIRED`	error	Dimension {attribute} is required for account {account}.	Blank not allowed by the structure or advanced rule	Supply the dimension value	FR-11.3, FR-11.16
LEDGER-0011 `LEDGER_DIMENSION_INVALID`	error	Value {value} is not allowed for {attribute} under structure {structure}.	Constraint row mismatch	Choose an allowed value	FR-11.3
LEDGER-0012 `LEDGER_DIMENSION_INACTIVE`	error	Value {value} of {attribute} is not active on {date}.	Effective dates / suspended	Use an active value or adjust dates	FR-11.2
LEDGER-0013 `LEDGER_PERIOD_CLOSED`	error	Period {period} is closed for module {module}.	Period status	Post in an open period or request reopen (wave 14)	BR-11.4, BR-14.1
LEDGER-0014 `LEDGER_PERIOD_ON_HOLD`	error (403)	Period {period} is on hold; your user group may not post to it.	On-hold without membership	Ask the controller group to post or reopen	BR-14.1
LEDGER-0015 `LEDGER_IDEMPOTENCY_CONFLICT`	error (409)	Idempotency key {key} was already used with a different payload.	Key reuse	Use a new key for a new request	BR-11.6
LEDGER-0016 `LEDGER_IDEMPOTENCY_IN_PROGRESS`	error (409)	A request with key {key} is still being processed.	Concurrent duplicate	Retry after 1 s	FR-11.5
LEDGER-0017 `LEDGER_REVERSAL_ALREADY_REVERSED`	error	Entry {voucher} was already reversed by {reversing_voucher}.	Second reversal	Reverse the reversing entry to reinstate	FR-11.8
LEDGER-0018 `LEDGER_REASON_REQUIRED`	error	A reason code is required for this reversal.	`reversal_reason_required`	Select a reason code (and comment if required)	FR-11.15
LEDGER-0019 `LEDGER_REASON_INVALID_MODULE`	error	Reason code {code} does not apply to {module}.	`applies_to` mismatch	Choose a code valid for the module	FR-11.15
LEDGER-0020 `LEDGER_CLEARING_UNBALANCED`	error	Selected items leave a residual of {residual} {currency}, above the tolerance {limit}.	BR-11.12	Add items, create a residual item, or adjust the selection	FR-11.19
LEDGER-0021 `LEDGER_OPEN_ITEM_ALREADY_CLEARED`	error	Item {item} is already cleared by document {document}.	BR-11.13	Reset the earlier clearing first	FR-11.19
LEDGER-0022 `LEDGER_OPEN_ITEM_ACCOUNT_REQUIRED`	error	Account {account} is not open-item managed.	Clearing on a non-OI account	Activate open-item management	BR-11.18
LEDGER-0023 `LEDGER_OI_ACTIVATION_BALANCE`	error	Open-item activation needs an activation run because account {account} has a balance.	Flag changed on an account with history	Run accounts:activate-open-items	FR-11.19
LEDGER-0024 `LEDGER_VALIDATION_RULE_FAILED`	error / warning	{rule_message} (rule {rule_id}, line {line}).	User-defined rule	Follow the rule's remediation text	FR-11.21
LEDGER-0025 `LEDGER_DERIVATION_INVALID`	error	Derivation strategy version {version} cannot be activated: {detail}.	Parse error, > 50 steps, cyclic read/write	Fix the step	BR-11.14
LEDGER-0026 `LEDGER_SPLIT_NO_SOURCE`	error	Line {line} cannot inherit {attribute}: no carrying line and no default value.	FR-11.23	Add a value on the line or set `default_splitting_value`	BR-11.15
LEDGER-0027 `LEDGER_SPLIT_CLEARING_ACCOUNT_MISSING`	error	Document splitting is active but no zero-balance clearing account is set for ledger {ledger}.	Configuration	Set the account in Document splitting setup	FR-11.23
LEDGER-0028 `LEDGER_ADVANCED_RULE_SEGMENT_LIMIT`	error	Advanced rules add more than 20 segments for account {account}.	FR-11.16	Reduce the matching rules' segments	FR-11.16
LEDGER-0029 `LEDGER_ATTACHMENT_RETAINED`	error	Attachment {name} is retained until {date} and cannot be deleted.	Retention class	Wait for expiry or request a legal-hold exception (wave 5)	FR-11.18
LEDGER-0030 `LEDGER_REALIGNMENT_PERIOD_CLOSED`	error	Realignment touches period {period}, which is closed for GL.	Period control	Exclude the period or reopen it	FR-11.24
LEDGER-0031 `LEDGER_DESCRIPTION_TRUNCATED`	info	Description was truncated to 255 characters.	Template expansion	Shorten the template	FR-11.17
LEDGER-0032 `LEDGER_NEGATIVE_POSTING_DISABLED`	error	Reason code {code} allows negative posting but the ledger does not.	`negative_posting_enabled = false`	Use another reason code or enable the parameter	BR-11.16

2.11.19 Performance budgets and capacity

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
Post journal entry (2–50 lines, incl. derivation, splitting, validation rules)	200k lines/day per tenant; peak 5,000 lines/s at month-end	40 / 120 / 200 ms	5,000 lines/s sustained 30 min	400 B/line × 50M lines = 20 GB + 60% indexes ≈ 32 GB	`journal_line` range-partitioned by fiscal year; indexes §2.11.4	HPA to 12 pods; sequence lock serializes per ledger; p99 may rise to 600 ms; no rejection below 3×

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
Validate (dry run)	50k calls/day	20 / 60 / 100 ms	1,000 req/s	none	stateless	same as posting
Balance query (one account, 12 periods, group by dimension)	100k/day	30 / 150 / 300 ms	500 req/s	—	PK clustered on `balance`	read replica; cached dimension sets 60 s
Line query page (keyset, 1,000 rows)	50k/day	50 / 200 / 300 ms	300 req/s	—	(ledger, account, posting_date) partition pruning	replica; page size reduced to 500 under pressure
Balance rebuild	nightly, 10M lines	—	10M lines < 15 min	shadow table transient	chunk per fiscal period ≤ 5M lines	runs on replica snapshot; swap skipped if lock not acquired in 2 s
Manual clearing (≤ 10,000 items)	5k clearings/day	100 / 400 / 800 ms	50/s	150 B/open item; 2M items/year ≈ 300 MB	`open_item` index (ledger, account, status, assignment)	item selection capped at 10,000; larger via auto-clear
`gl-auto-clear`	1M open items nightly	—	1M items < 10 min	—	grouping in SQL per rule with hash on criteria	per-rule timeout 20 min; remaining rules next run
Derivation strategy evaluation	every posted line	≤ 0.2 ms per line (50 steps)	—	lookup tables ≤ 100k rows each, memory-resident per pod	lookup tables cached, invalidated by `rules.changed`	strategy cache miss adds one query per pod
Document splitting	30% of entries	≤ 1 ms per entry of 50 lines	—	+25% lines on split entries	—	—
Realignment run	10/month; ≤ 5M lines	—	1M lines < 5 min (simulate), < 10 min (post)	reclassification entries ≈ 2 lines per combination × period	chunked by period	run queued; one active run per ledger
Idempotency table	200k keys/day × 400 days ≈ 80M rows	lookup ≤ 1 ms	—	120 B/key ≈ 10 GB	PK (tenant, legal_entity, key); purged daily	—

2.11.20 Localization and compliance hooks

- Chart of accounts templates by country (German SKR03/SKR04, French Plan Comptable Général with mandatory classes 1–7, Indian Schedule III grouping, Spanish PGC, US/UK free-form): wave 48 country packs ship `ChartTemplate` JSON imported through PUT /ledger/charts; account number validation regex per template.
- Account name translations: `name` is translatable through wave 3 metadata; statutory languages per legal entity come from wave 6.
- Reversal practice: negative posting (storno) is the default expectation in DE/AT/CH/IT; country packs set `negative_posting_enabled = true` and ship reason codes flagged `negative_posting_allowed`; US/UK packs keep opposite-side reversal.
- Gap-free voucher numbering (FR-11.6) satisfies IT, FR, PT, ES and PL sequential-numbering rules; country packs may require a separate sequence per document class (e.g., IT sectional numbering) through the wave 5 number sequence scopes.
- Posting date vs document date: FR-11.5 accepts both; country packs add validation rules (FR-11.21) such as "document date ≤ posting date" (DE GoBD) or "posting within 30 days of document date".
- Retention: `attachment.default_retention_class` and journal retention map to statutory minimums (DE HGB §257 / AO §147: 10 years; US IRS: 7 years; UK: 6 years; FR: 10 years); the journal itself is never purged in Phase 2; archival export hooks are provided to wave 48 audit files (SAF-T via wave 13, GDPdU/GoBD export, FEC for France) through the line query API with stable ordering.
- Audit-file fields: `JournalLine` carries every field FEC (FR) and GoBD (DE) require (voucher, journal code via journal name, posting date, account, text, debit, credit, document date, validation date = posted_at); SAF-T `GeneralLedgerEntries` is produced by wave 13 from the same API.
- Privacy: `text`, `description` and attachment contents may hold personal data; they are tagged `pii_possible` for wave 7 data-subject request searches; no deletion from the journal — masking is applied on export only when legally required.
- Calendar and currency: fiscal calendars (wave 6) and ISO 4217 minor units (wave 12) are the only currency/calendar dependencies; rounding mode per ledger (BR-12.2) is set by country packs where commercial rounding differs.
- Extension point: `ledger.country_pack` hook set = chart template import, validation rule pack, description template language pack, reason code pack, and audit-file exporter registration; packs are declarative (JSON) and versioned with the wave 48 pack registry.

2.11.21 Coverage closure

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
AX §12.1.1 Common / Journals — Voucher attachments / document handling (`DocuView`) (AX register row 1)	PARTIAL-11	ADDED as FR-11.18	document types, retention class, store reference from wave 5 framework; attachment immutability after posting
AX §12.1.3 Periodic — Reason code assignment (reversal reasons) (AX register row 2)	PARTIAL-11	ADDED as FR-11.15	reason code required on reversal; negative posting semantics BR-11.16
AX §12.1.4 Setup — Chart of accounts → Advanced rule structures / Advanced rules (AX register row 3)	PARTIAL-11	ADDED as FR-11.16	advanced rules versioned with account structures; AC-11.18
AX §12.1.4 Setup — Journals → Default descriptions (Transaction text) (AX register row 5)	PARTIAL-11	ADDED as FR-11.17	templates per source_type × language; AC-11.19
AX §12.1.4 Setup — Posting → Reason codes (financial reasons) (AX register row 6)	PARTIAL-11	ADDED as FR-11.15	shared `ReasonCode` with `applies_to[]`
AX §12.3.4 Setup — Sales → Sales reasons / Reason codes (customer) (AX register row 32)	PARTIAL-11	ADDED as FR-11.15	`applies_to` includes customer; AR (wave 30) consumes
AX §12.6.4 Setup — Fixed asset → Reason codes (fixed assets) (AX register row 44)	PARTIAL-11	ADDED as FR-11.15	`applies_to` includes fixed_asset; wave 37 consumes
AX §12.14.4 Setup — Inventory → Counting → Counting reason code policies (AX register row 137)	PARTIAL-11	ADDED as FR-11.15 (codes); policies DEFERRED to wave 16	code list here; the counting policy (which codes are mandatory per warehouse) belongs to the inventory ledger wave
AX §12.29.1 Common / Journals — Reason codes (shared financial reasons across modules) (`ReasonTable`) (AX register row 239)	PARTIAL-11	ADDED as FR-11.15	
AX §12.29.4 Setup — Reason codes (Financial reasons: ledger, bank, customer, vendor, fixed asset) (AX register row 258)	PARTIAL-11	ADDED as FR-11.15	screen Reason codes; API /ledger/reason-codes
SAP §13.1 FI-GL Master data & documents — F-03 / F-04 Clear G/L account / post with clearing (SAP register row 1)	PARTIAL-11	ADDED as FR-11.19	manual clearing, post-with-clearing, reset (FBRA); AC-11.12

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
SAP §13.1 FI-GL Master data & documents — FAGL_ACTIVATE_OP (SAP register row 4)	PARTIAL-11	ADDED as FR-11.19	activation run creating opening open items
SAP §13.1 FI-GL Master data & documents — FAGL_SWITCH_TO_OPEN_ITEM (SAP register row 5)	PARTIAL-11	ADDED as FR-11.19	same activation run; deactivation requires zero open items
SAP §13.1 FI-GL Periodic processing — F.13 / F13E Automatic clearing (SAP register row 7)	PARTIAL-11	ADDED as FR-11.20	job `gl-auto-clear`; AC-11.13
SAP §13.1 FI-GL Customizing — OB28 / GGB0 Validations (SAP register row 12)	PARTIAL-11	ADDED as FR-11.21	CEL prerequisite/check/message; AC-11.14
SAP §13.1 FI-GL Customizing — OBBH / GGB1 Substitutions (SAP register row 13)	PARTIAL-11	ADDED as FR-11.22	derivation strategy steps
SAP §13.1 FI-GL Customizing — OBBZ / OBBW Substitution/validation for cost of sales accounting (SAP register row 14)	PARTIAL-11	ADDED as FR-11.22	FUNC_AREA attribute + shipped lookup step; AC-11.15
SAP §13.1 FI-GL Customizing — Document splitting (FAGL_SPLIT*) (SAP register row 15)	PARTIAL-11	ADDED as FR-11.23	active/passive inheritance, zero-balance lines; AC-11.16
SAP §13.1 FI-GL Customizing — OBA0 Tolerance groups for G/L accounts (SAP register row 18)	PARTIAL-11	ADDED as FR-11.20	`ToleranceGroup` per account and user; BR-11.12
SAP §13.1 FI-GL Customizing — OB74 Additional rules for automatic clearing (SAP register row 20)	PARTIAL-11	ADDED as FR-11.20	`AutoClearingRule.criteria`
SAP §13.1 FI-GL Customizing — Cost of sales accounting: functional areas (OKBD), FAGL_FUNC_AREA (SAP register row 22)	PARTIAL-11	ADDED as FR-11.22	functional area is a standard dimension attribute; P&L by function in wave 15
SAP §13.9 CO-PA Master data & documents — KEDR / KEDE derivation strategy (SAP register row 102)	PARTIAL-11	ADDED as FR-11.22	table_lookup steps with validity dates
SAP §13.9 CO-PA Periodic processing — KEND / KEDR realignment run (SAP register row 105)	PARTIAL-11	ADDED as FR-11.24	append-only reclassification; AC-11.17
SAP §13.9 CO-PA Customizing — KEDR derivation rules (table lookup, rule, move, clear, enhancement) (SAP register row 106)	PARTIAL-11	ADDED as FR-11.22	enhancement exits → `expression` (CEL) steps
SAP §13.9 CO-PA Customizing — 0KEM / 0KEP PCA substitution / derivation of PC (SAP register row 107)	PARTIAL-11	ADDED as FR-11.22	profit center derived from (sales org, material group) lookup tables once waves 8/27 supply the fields
SAP §13.11 FM / PSM Master data & documents — FMDERIVE (SAP register row 121)	PARTIAL-11	ADDED as FR-11.22	FM account assignment (fund, funds center, commitment item) modeled as dimension attributes; budget control in wave 38
SAP §13.11 FM / PSM Customizing — FMDERIVE strategy (SAP register row 122)	PARTIAL-11	ADDED as FR-11.22	strategy versions per ledger

2.12 Wave 12: Multi-Currency, Parallel Ledgers & Revaluation

2.12.1 Scope and business context

AX carries transaction, accounting and reporting currency on `GeneralJournalAccountEntry` and uses posting layers (current/operations/tax); SAP New GL carries currency types (00 document, 10 company code, 30 group) on `ACDOCA` and posts to leading and non-leading ledgers through ledger groups. Wave 12 adds to the journal: an exchange rate service (`fx`, Go) with rate types, provider adapters, triangulation and audit; three-currency amounts with ISO 4217 rounding; ledger groups so one document posts to N ledgers with per-ledger accounting differences; FX revaluation of GL balances (open-item revaluation for AP/AR uses the same engine when those waves arrive); and currency translation for reporting-currency restatement.

After this wave a user can post a EUR invoice into a USD-accounting entity with EUR reporting currency, see the amounts in all three currencies, run the month-end revaluation and see it auto-reverse. Out of scope: realized gain/loss on settlement (waves 19 and 30), group-currency consolidation translation (wave 40), hedge accounting.

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
SAP OB08 / `TCURR`: rates entered per 100 units with `TCURF` factors; a wrong factor silently converts amounts 100x; no deviation check	Factor table separate from rate table; no validation against the previous rate	Rates stored as plain `numeric(20,10)` "1 from = rate to"; > 10% deviation requires confirmation and emits a warning event	Factor-related misposting incidents → 0; deviation flagged in < 100 ms at entry
AX `ExchangeRate` import batch (`ExchangeRateProviderImport`) runs on a batch group; a failed run leaves no rate and postings fail hours later with "no exchange rate"	Batch framework with no fallback or alerting	Temporal schedule with retries; last-known rate stays valid; `fx.provider.degraded` alerts immediately	Posting failures from missing rates → 0; outage detected < 1 min (vs discovered at posting)
Rounding differences between `AccountingCurrencyAmount` and `ReportingCurrencyAmount` land in penny-difference accounts with no trace to the line (AX `LedgerParameters`); SAP rounding to OB00 account per document	Each line rounded independently; residual posted to a separate account without lineage	Residual allocated to the largest line and recorded as `rounding_adjustment` with the tolerance rule in BR-12.4	Unexplained rounding postings → 0; every residual traceable to its line
Parallel valuation needs SAP ledger groups + FB50L and separate runs per ledger, or AX posting layers that most reports ignore	Ledger-specific posting bolted onto a single-ledger document model	One request to `ledger_group: ALL` yields N balanced entries sharing `document_id`, atomically	Per-ledger reconciliation effort 2 days/close → automated check; ledger-specific adjustments 1 call
FAGL_FC_VAL / AX revaluation runs take hours on large `BSEG` sets and users rerun after rate corrections, producing duplicate adjustments	Open-item scan over unindexed valuation sets; no run idempotency	Revaluation selects from `Balance` keyed by currency; runs are idempotent per (ledger, period, rate type) and auto-reverse	Revaluation of 100k combinations < 5 min (vs 1–4 h); duplicate adjustment runs → 0

2.12.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Exchange rate types	`ExchangeRateType`, Currency exchange rate types form	`TCURV` (rate types M, EURX, P), OB07	`fx.ExchangeRateType`	full
Exchange rates	`ExchangeRate`, `ExchangeRateCurrencyPair`, OB08-style form	`TCURR`, OB08, `TCURF` (factors)	`fx.ExchangeRate` with `from`, `to`, `valid_from`, `rate` numeric(20,10); factor handled by rate precision	full

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Rate providers	Exchange rate providers (OANDA, Central Bank of Europe)	Market data interface (datafeed)	`fx` provider adapters: ECB, OpenExchangeRates, manual, CSV	full
Triangulation	Euro triangulation	`TCURR` via reference currency (`TCURV-BWAER`)	`fx` triangulation through ledger reference currency	full
Three currencies per line	`TransactionCurrencyAmount`, `AccountingCurrencyAmount`, `ReportingCurrencyAmount`	`WSL` (document), `HSL` (local), `KSL` (group) in ACDOCA	`amount_txn`, `amount_acct`, `amount_rpt` on JournalLine	full
Parallel ledgers / posting layers	Posting layers Current/Operations/Tax (`LedgerPostingLayer`)	Leading ledger 0L, non-leading ledgers, ledger groups, `RLDNR`	`ledger.Ledger` × `LedgerGroup`; entries per ledger share `document_id`	improved: unlimited ledgers, per-ledger calendar and currency
FX revaluation (GL)	Foreign currency revaluation (General ledger), `LedgerExchAdj`	FAGL_FC_VAL (balances), valuation methods OB59, valuation areas	`ledger.RevaluationRun` with method per ledger	full
Unrealized gain/loss accounts	Currency revaluation accounts per currency / ledger	OBA1 (KDB/KDF), OB09 per recon account	`CurrencyPolicy` per ledger × currency: unrealized_gain, unrealized_loss, adjustment accounts	full
Currency translation (reporting currency)	Reporting currency on ledger, revaluation of reporting currency	Currency translation (FAGL_FCV / consolidation)	`ledger.TranslationRun` (monthly, average/closing/historical by account type)	partial: group consolidation in wave 40
Rounding differences	Penny difference accounts (`LedgerParameters`)	Rounding difference account (OB00), tolerance	`CurrencyPolicy.rounding_difference_account`, tolerance per BR-12.4	full
Rate audit / history	Database log on `ExchangeRate`	`TCURR` change documents	`fx.ExchangeRate` is append-only with `superseded_by`	improved
Market data beyond FX (interest rates, indices, prices)	Not available (exchange rates only)	TBDM market data import, market data classes (`VTB_MARKET`, `JBD*`), rate types / yield curves / volatility customizing	`fx.MarketDataSeries` (kind ∈ {fx_rate, interest_rate, index, price}) with the same providers, audit and lookup (FR-12.13); curves and security valuation in wave 36	partial: series storage and import here, valuation in wave 36

2.12.3 Functional requirements

- **FR-12.1 Currency reference data and policy** — Must. The system shall use ISO 4217 currencies from wave 6 (code, numeric code, minor units) and maintain a `CurrencyPolicy` per ledger × currency with gain/loss/adjustment/rounding-difference accounts.
  - Minor units default from ISO 4217 (JPY 0, USD/EUR/GBP/INR 2, KWD/BHD/OMR 3, CLF 4); a tenant may not override them.
  - Non-ISO currencies (e.g., XTS test, loyalty points) can be defined with explicit minor units and flagged `is_statistical`.
- **FR-12.2 Exchange rate types and rates** — Must. The system shall maintain rate types (default, average, closing, budget, custom) and rates by (type, from, to, valid_from) with precision numeric(20,10).
  - Rate direction is `from → to` as "1 from = rate to"; the reciprocal is computed only if no explicit inverse rate exists and `allow_inverse` is set on the type.
  - Rates are append-only; a corrected rate for the same key supersedes the previous row and both are kept with `superseded_by`.
  - Maximum 10,000 pairs per type; history retained indefinitely.
- **FR-12.3 Rate lookup and triangulation** — Must. The system shall resolve a rate for (type, from, to, date) by: exact pair valid on date → inverse pair (if allowed) → triangulation through the ledger's reference currency (two hops, both must resolve) → `LEDGER_RATE_MISSING`.
  - Lookup is served from an in-memory cache per pod refreshed from `fx.rate.published` events; cold lookup p99 < 5 ms.
  - Triangulated amounts are computed in one step `amount × r1 × r2` at full precision, then rounded once.
- **FR-12.4 Provider adapters** — Must. The system shall import rates from ECB (daily reference rates), OpenExchangeRates and CSV through a Temporal schedule per rate type.
  - Provider timeout 10 s, 3 retries with exponential back-off; on failure the last-known rate remains valid and `fx.provider.degraded` is emitted; rates older than `max_rate_age_days` (default 5 business days) cause posting warnings, not rejections, unless the ledger sets `reject_stale_rates`.
  - Imported rates are stored with `source`, `provider_timestamp` and raw payload hash for audit.
- **FR-12.5 Three-currency amounts on every line** — Must. The posting API shall accept `amount` in any currency, convert to accounting and reporting currency using the ledger's default rate type (or an explicit `rate_override` with rate type and value), and store all three amounts rounded per currency.
  - If a line's currency equals the accounting currency, `amount_acct = amount_txn` exactly (no rate applied); likewise for reporting.
  - Explicit `rate_override` requires duty `Override exchange rates` and is recorded on the line.
  - An entry may contain lines in multiple transaction currencies; balancing is checked per transaction currency as well as in accounting and reporting currency.
- **FR-12.6 Rounding and residual allocation** — Must. The system shall apply ISO 4217 minor-unit rounding (half away from zero) per derived amount, then allocate any residual so that each derived column balances.
  - Algorithm in BR-12.4; the residual goes to the line with the largest absolute amount on the side that needs it; if the residual exceeds tolerance the post is rejected with `LEDGER_ROUNDING_EXCEEDED`.
- **FR-12.7 Ledger groups and parallel posting** — Must. The system shall define ledger groups (e.g., `ALL`, `LEADING`, `LOCAL`, `TAX`) per legal entity; a posting request addressed to a group produces one `JournalEntry` per member ledger, all committed in one transaction and sharing `document_id`.
  - Each ledger has its own accounting principle code (IFRS, US-GAAP, HGB, TAX), fiscal calendar, accounting currency, reporting currency and default rate type; conversions are performed per ledger.
  - Per-ledger differences are expressed by the caller (subledgers send ledger-specific lines, e.g., different depreciation) or by `LedgerAccountMapping` rows that remap an account per ledger (e.g., IFRS 16 lease accounts to operating lease expense in local GAAP).
  - A request addressed to a single non-leading ledger (ledger-specific adjustment, SAP FB50L semantics) is allowed when the user holds duty `Post ledger-specific adjustments`.
- **FR-12.8 FX revaluation of GL balances** — Must. The system shall run a revaluation per ledger × period × rate type over balance-sheet accounts flagged `revalue = true`, computing unrealized gain/loss per account × dimension combination × transaction currency, posting it on the period-end date and auto-reversing it on the first day of the next period.
  - Method per ledger: `closing_rate` (default, FAGL_FC_VAL semantics with reversal) or `cumulative_no_reversal` (delta against prior revaluation, AX semantics); both are supported, the ledger chooses.
  - Simulation mode produces the proposal without posting; the proposal is retained 90 days.
- **FR-12.9 Currency translation for reporting currency** — Should. The system shall restate reporting-currency balances monthly: monetary balance-sheet accounts at closing rate, non-monetary at historical (the posted `amount_rpt`), P&L at average rate, with the difference posted to a cumulative translation adjustment (CTA) equity account.

- **FR-12.10 Exchange rates workspace** — Must. The system shall provide screens for rate types, rate entry/import, provider schedules, lookup tester and rate history.
- **FR-12.11 Rate audit** — Must. The system shall record who/what created each rate, the provider payload hash, and expose a history view by pair; a rate change that moves more than 10% from the previous value requires confirmation in the UI and emits a warning event.
- **FR-12.12 Posting-time currency validation** — Must. The system shall reject a transaction currency that is suspended or not enabled for the legal entity with `LEDGER_CURRENCY_MISMATCH`, and a missing rate with `LEDGER_RATE_MISSING` including the (type, pair, date) in the violation.
- **FR-12.13 Market data series** — Should. The `fx` service shall store, besides exchange rates, generic market data series of kind `interest_rate` (reference rates such as SOFR, €STR, EURIBOR 3M, SONIA by tenor), `index` (CPI, commodity indices) and `price` (security or commodity prices by identifier), each a series of (series_code, valid_from, value numeric(20,10), source, provider_timestamp, payload_hash), append-only with `superseded_by`, imported by the same provider schedule framework as FR-12.4 (ECB SDW, CSV, manual) and queryable by `GET /fx/series/{code}?date=`.
  - Series carry `unit` (percent per annum, index points, currency per unit), `day_count` for rates (ACT/360, ACT/365, 30/360) and `tenor` (ON, 1W, 1M, 3M, 6M, 12M) as metadata; no interpolation or curve bootstrapping in this wave.
  - Deviation warning (FR-12.11) applies with a series-specific threshold (default 25% for rates, 10% for prices).
  - Consumers: wave 36 (interest calculation, yield curves, security valuation), wave 38 (budget rate assumptions), wave 29 (index-linked subscription pricing).

2.12.4 Data model

ExchangeRate (fx)

Field	Type	Required	Notes
id	uuid	yes	PK
rate_type_id	uuid	yes	FK ExchangeRateType
from_currency / to_currency	char(3)	yes	ISO 4217; unique (type, from, to, valid_from, version)
valid_from	date	yes	effective until next valid_from for the same key
rate	numeric(20,10)	yes	> 0
source	enum	yes	manual, ecb, openexchangerates, csv, migration
provider_timestamp	timestamptz	no	
payload_hash	bytea(32)	no	SHA-256 of provider record
superseded_by	uuid	no	FK ExchangeRate; non-null means not current
created_at / created_by	timestamptz / uuid	yes	

Ledger (extended) and **LedgerGroup**

Field	Type	Required	Notes
id	uuid	yes	PK
legal_entity_id	uuid	yes	FK
code	text(10)	yes	e.g. `0L`, `IFRS`, `HGB`, `TAX`; unique per legal entity
accounting_principle	enum	yes	IFRS, US_GAAP, LOCAL_GAAP, TAX, MANAGEMENT
is_leading	bool	yes	exactly one leading ledger per legal entity
accounting_currency / reporting_currency	char(3)	yes	
reference_currency	char(3)	no	triangulation pivot (default accounting currency)
default_rate_type_id / closing_rate_type_id / average_rate_type_id	uuid	yes	FK ExchangeRateType
fiscal_calendar_id	uuid	yes	FK (wave 6)
rounding_mode	enum	yes	half_away_from_zero (default), half_even
revaluation_method	enum	yes	closing_rate, cumulative_no_reversal
group: id / legal_entity_id / code / member_ledger_ids	uuid / uuid / text / uuid[]	yes	`ALL` auto-maintained

RevaluationRun and **RevaluationLine**

Field	Type	Required	Notes
id	uuid	yes	PK
ledger_id	uuid	yes	
fiscal_period_id	uuid	yes	
rate_type_id	uuid	yes	typically closing
valuation_date	date	yes	period end
mode	enum	yes	simulate, post
status	enum	yes	proposed, posted, reversed, cancelled
posting_entry_id / reversal_entry_id	uuid	no	FK JournalEntry
totals_gain / totals_loss	numeric(23,6)	yes	accounting currency
line: account_id, dimension_combination_id, currency_txn		yes	key
line: balance_txn, balance_acct_posted, rate_used, balance_acct_revalued, adjustment	numeric	yes	adjustment = revalued – posted

MarketDataSeries (fx, FR-12.13): `id`, `code` text(30) unique per tenant (e.g., `EURIBOR_3M`, `SOFR_ON`, `CPI_US`), `kind` enum (interest_rate, index, price), `unit` text, `currency` char(3) optional, `tenor` enum optional, `day_count` enum optional, `provider_id` optional, `active` bool; **MarketDataPoint**: `series_id`, `valid_from` date, `value` numeric(20,10), `source` enum, `provider_timestamp`, `payload_hash` bytea(32), `superseded_by` uuid, `created_at/by`; unique (series_id, valid_from, version); index (series_id, valid_from DESC) WHERE superseded_by IS NULL.

Invariants: `amount_acct = round(amount_txn × rate, minor_units(acct))` per line before residual allocation; after allocation Σ D = Σ C in every column; exactly one leading ledger per legal entity; every member of a ledger group belongs to the same legal entity; a revaluation run that is `posted` with method `closing_rate` has a reversal entry dated period_end + 1 day.

Indexing: `exchange_rate` index on (rate_type_id, from_currency, to_currency, valid_from DESC) WHERE superseded_by IS NULL; `journal_line` adds index on (ledger_id, currency_txn, posting_date) for revaluation selection; `revaluation_line` PK (run_id, account_id, dimension_combination_id, currency_txn).

2.12.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
GET/PUT	/api/v1/fx/rate-types[/{code}]	Rate type CRUD	PUT idempotent	Maintain exchange rates
POST	/api/v1/fx/rates	Create rate(s), bulk up to 5,000	`Idempotency-Key`	Maintain exchange rates
GET	/api/v1/fx/rates?type=&from=&to=&date=	Resolve a rate (with triangulation path)	n/a	View exchange rates
GET	/api/v1/fx/rates/history?type=&from=&to=	Rate history incl. superseded	n/a	View exchange rates
POST	/api/v1/fx/providers/{provider}:import	Trigger import now	run id	Administer exchange rates
POST	/api/v1/fx/convert	Convert amount(s) with rounding (stateless)	none	View exchange rates
GET/PUT	/api/v1/ledger/ledgers/{id}/currency-policies/{currency}	Gain/loss/rounding accounts	PUT idempotent	Maintain ledger setup
GET/PUT	/api/v1/ledger/legal-entities/{le}/ledger-groups[/{code}]	Ledger group membership	PUT idempotent	Maintain ledger setup
POST	/api/v1/ledger/revaluations	Create run (simulate or post)	`Idempotency-Key`	Run foreign currency revaluation
GET	/api/v1/ledger/revaluations/{id}[/lines]	Inspect proposal/results	n/a	View ledger balances
POST	/api/v1/ledger/revaluations/{id}:post	Post a simulated proposal	`Idempotency-Key`	Run foreign currency revaluation
POST	/api/v1/ledger/translations	Reporting-currency translation run	`Idempotency-Key`	Run currency translation
GET/PUT	/api/v1/fx/series[/{code}]	Market data series definitions (FR-12.13)	PUT idempotent	Maintain exchange rates
POST	/api/v1/fx/series/{code}/points	Append points, bulk up to 5,000	`Idempotency-Key`	Maintain exchange rates
GET	/api/v1/fx/series/{code}?date= and /history	Resolve a value on a date; full history	n/a	View exchange rates

Posting request extensions (wave 11 contract, additive): `"ledger_group": "ALL"`, per line `"amount": {"currency":"EUR","value":"1000.00"}`, optional `"rate_override": {"rate_type":"M","rate":"1.0850000000"}`, optional `"ledger_lines": {"HGB": [ … ]}` for ledger-specific substitutions. Response contains `entries[]` one per ledger with `amounts: {txn, acct, rpt}` and `rates_applied[]`.

Commands: `PublishRate` (rate > 0, currencies enabled, 10% deviation warning), `RunRevaluation` (period open for module GL, accounts flagged, closing rate exists for every currency with balance else `LEDGER_RATE_MISSING`), `RunTranslation`.

Event	Trigger	Payload fields	Consumers
dev.passage.fx.rate.published.v1	rate committed	rate_type, from, to, valid_from, rate, previous_rate, source, deviation_pct	ledger cache, reporting, AP/AR
dev.passage.fx.provider.degraded.v1	import failure after retries	provider, last_success_at, rate_type, error	ops alerting
dev.passage.ledger.revaluation.completed.v1	run posted	run_id, ledger_id, period, rate_type, gain_total, loss_total, posting_entry_id, reversal_entry_id	reporting, close
dev.passage.ledger.translation.completed.v1	translation posted	run_id, ledger_id, period, cta_amount, entry_id	reporting, close
dev.passage.fx.series.published.v1	market data point committed	series_code, kind, valid_from, value, previous_value, source, deviation_pct	treasury (wave 36), budgeting (wave 38), subscription pricing (wave 29)

2.12.6 User experience

Screen	Primary actions	Key fields/columns	Duty required
Exchange rate types	Create, set defaults per ledger	code, name, allow_inverse, provider	Maintain exchange rates
Exchange rates	Enter, import CSV, view history, compare to provider	type, from, to, valid_from, rate, source, deviation vs previous	Maintain exchange rates
Provider schedules	Configure provider, cron, test connection, run now	provider, rate type, pairs, last run, status	Administer exchange rates
Rate lookup tester	Enter type/pair/date, see resolution path	path (direct/inverse/triangulated), rate, valid_from	View exchange rates
Ledger setup	Ledgers, groups, currency policies, account mapping	code, principle, currencies, rate types, revaluation method, accounts	Maintain ledger setup
Foreign currency revaluation	Simulate, review proposal grid, post, view reversal	account, dims, currency, balance txn, posted acct, rate, revalued, adjustment	Run foreign currency revaluation
Journal line (extended)	Enter amount in any currency; see acct/rpt amounts live	currency, amount, rate (editable with duty), acct amount, rpt amount	Maintain ledger journals

Interaction rules: the line grid shows derived amounts as read-only cells that recompute on currency/amount/date change within 100 ms; a rate override cell is editable only with the duty and is highlighted; the revaluation proposal grid supports excluding rows (recorded as exclusions on the run) and exporting to XLSX; a rate deviation > 10% opens a confirmation dialog with the previous rate.

2.12.7 Business rules and edge cases

- **BR-12.1 Minor units.** `scale(currency)` is the ISO 4217 minor unit; a stored amount must satisfy `amount = round(amount, scale)`; CHECK constraint `scale(amount) ≤ scale(currency)` is validated in the service and by a trigger.
- **BR-12.2 Rounding mode.** Default half-away-from-zero (matches AX `round()` and SAP commercial rounding); `half_even` is selectable per ledger for statistical ledgers only. Rounding occurs once per derived amount, after full-precision multiplication (numeric(38,16) intermediate).
- **BR-12.3 Rate date.** The rate for conversion is the one valid on `posting_date` unless the request supplies `rate_date` (allowed for AP/AR documents using document date); rate_date must be ≤ posting_date + 0 days (no future rates).
- **BR-12.4 Residual allocation.** For each derived column (acct, rpt): compute `rounded_i` per line; `residual = Σ rounded_debits − Σ rounded_credits`. If `|residual| ≤ tolerance = 0.5 × unit × line_count` (unit = 10^−scale), add `−residual` to the rounded amount of the line with the largest `|amount|` on the side that reduces the residual (ties: lowest line_number); the adjusted line records `rounding_adjustment`. If `|residual| > tolerance` reject with `LEDGER_ROUNDING_EXCEEDED`. When the entry has only one line per side and the residual is non-zero, post the residual to `rounding_difference_account` instead of adjusting the line, provided `|residual| ≤ 1 unit`.
- **BR-12.5 Multi-currency balancing.** Balancing is checked per transaction currency; an entry with EUR debit and USD credit must include explicit cross-currency lines (clearing) or is rejected with `LEDGER_UNBALANCED` listing the unbalanced currency.
- **BR-12.6 Parallel-ledger posting matrix.** For a request to ledger group `ALL` with leading `0L` (IFRS), `HGB` (local GAAP) and `TAX`:

Source document type	0L (IFRS)	HGB (local)	TAX	Rule
Manual journal, ledger_group ALL	post	post	post	identical lines, converted per ledger
Ledger-specific adjustment (single ledger)	post only if addressed	post only if addressed	post only if addressed	duty-gated
FX revaluation	post	post	skip if ledger.revalue = false	run per ledger
Account-mapped lines (`LedgerAccountMapping`)	original account	mapped account	mapped account	mapping keyed (ledger, account, effective_from)
Subledger with principle-specific lines (`ledger_lines`)	common lines + 0L lines	common lines + HGB lines	common lines + TAX lines	each ledger must balance independently
Year-end close (wave 14)	per ledger calendar	per ledger calendar	per ledger calendar	independent runs

- **BR-12.7 Stale rates.** A rate older than `max_rate_age_days` yields a `warnings[]` entry `FX_RATE_STALE` in the response; with `reject_stale_rates` it is a 422 `LEDGER_RATE_MISSING`.
- **BR-12.8 Revaluation state machine.** `proposed → posted → reversed` (automatic at period+1 for closing_rate method) | `proposed → cancelled`; a second run for the same (ledger, period, rate type) while one is `posted` is rejected unless the first is reversed; cumulative method runs post the delta versus the last posted run.
- **BR-12.9 Revaluation selection.** Only balance-sheet accounts with `revalue = true` and non-zero `balance_txn` in a currency ≠ accounting currency; reconciliation accounts for AP/AR are revalued at open-item level in waves 19/30 and are excluded here (`revalue_level = open_item`).
- **BR-12.10 Provider precedence.** If two providers deliver the same (type, pair, date), the one with higher `priority` wins and the other is stored as `superseded`.
- **BR-12.11 Rate precision in display.** Rates display 6 decimals by default with full 10 on hover/export; amounts never display more than the currency scale.
- **BR-12.12 Market data series resolution.** A value for (series, date) is the point with the greatest `valid_from ≤ date` that is not superseded; no point → `FX_SERIES_VALUE_MISSING` (422); points older than `max_series_age_days` (default 10 business days for rates, 45 for indices) return `FX_SERIES_STALE` in `warnings[]`; the `fx` service never interpolates between points.

2.12.8 Acceptance criteria

- **AC-12.1** (FR-12.5, FR-12.6) Given a 3-line EUR entry posted to a USD ledger with rate 1.0850000000, when posted, then each `amount_acct` equals the rounded product, Σ D = Σ C in USD, and at most one line carries a `rounding_adjustment` of ≤ 0.01.
- **AC-12.2** (BR-12.1) Given 10,000 random amounts in JPY, KWD, USD and EUR converted in all directions, when summed per entry, then every entry balances to the minor unit and no stored amount has scale beyond the currency's.
- **AC-12.3** (FR-12.3) Given no GBP→CHF rate but GBP→EUR and EUR→CHF, when converting, then the response path is `triangulated` and the amount equals one-step rounding of `a × r1 × r2`.
- **AC-12.4** (FR-12.7, BR-12.6) Given the 20-document parallel-ledger fixture, when posted to `ALL`, then 0L, HGB and TAX each receive the expected lines (mapped accounts and ledger-specific lines) and each ledger's TB is 0.
- **AC-12.5** (FR-12.8) Given the revaluation fixture (12 accounts × 4 currencies), when run with closing rates, then unrealized gain/loss per line equals the workbook to the cent and a reversal entry exists dated period end + 1.
- **AC-12.6** (FR-12.4) Given the ECB adapter times out 3 times, when the schedule runs, then no rates change, `fx.provider.degraded` is emitted and a P2 alert fires.
- **AC-12.7** (FR-12.11) Given a manual rate 12% above the previous, when saved, then the UI requires confirmation and the event carries `deviation_pct = 12.0`.
- **AC-12.8** (FR-12.12) Given a line in a currency not enabled for the entity, when posted, then 422 `LEDGER_CURRENCY_MISMATCH`.
- **AC-12.9** (FR-12.9) Given the translation fixture, when run, then CTA equals total assets – liabilities – equity restated at the specified rates, to the cent.
- **AC-12.10** (FR-12.13, BR-12.12) Given series `EURIBOR_3M` with points on 2026-03-02 (2.4100) and 2026-03-03 (2.4300), when `GET /fx/series/EURIBOR_3M?date=2026-03-02` is called, then value 2.4100000000 with `valid_from = 2026-03-02`; when a point of 3.1000 is appended for 2026-03-04, then `fx.series.published` carries `deviation_pct = 27.57` and the UI requires confirmation.

2.12.9 Test plan and fixtures

- Fixtures: `iso4217-2026` (all active currencies with minor units); `rates-ecb-2025` (recorded ECB daily reference rates, 12 months); `amounts-random-10k` (seeded amounts across JPY/KWD/USD/EUR incl. extremes 0.001 and 9,999,999,999.999); `parallel-ledger-20` (20 documents with expected per-ledger lines, accountant-reviewed); `reval-workbook` (12 accounts × 4 currencies with XLSX expected values, FAGL_FC_VAL semantics); `translation-workbook`.

Test	Type	Target	Pass criterion
Rounding property test	property	`money` package	balance after allocation for all generated entries; residual ≤ tolerance
Rate resolution unit tests	unit	fx resolver	direct/inverse/triangulated/missing per table
Provider adapter contract	contract (recorded HTTP)	ECB, OXR adapters	parse recorded payloads; failure modes
Parallel-ledger fixture	integration	posting API	per-ledger lines and TB = 0
Revaluation workbook	integration	revaluation job	adjustment per line equals workbook
Reversal timing	integration (Temporal time-skip)	revaluation workflow	reversal posted on period+1
Rate cache consistency	integration	ledger pods	a published rate is used by all pods within 2 s
Conversion latency	performance	fx + posting	posting p99 stays < 200 ms with 3-currency conversion

Reconciliation: per ledger per currency type TB = 0; Σ revaluation adjustments = posted gain – loss; `fx.rate.published` count = rate rows.

2.12.10 Deployment and operations

Helm chart `passage-fx` (deployment 2–6 pods, CloudNativePG `fx-db`, topics `fx.rates`, `fx.providers`); `passage-ledger` upgraded with currency policy tables. Config: `FX_MAX_RATE_AGE_DAYS=5`, `FX_PROVIDER_TIMEOUT_S=10`, `FX_DEVIATION_WARN_PCT=10`, `LEDGER_ROUNDING_MODE=half_away_from_zero`. Migrations: add `amount_rpt/currency_txn` backfill for wave 11 entries (= accounting amounts), add `ledger_group`, `currency_policy`, `revaluation_*`. Feature flags: `fx.triangulation`, `ledger.parallel_ledgers`, `ledger.translation`. Scheduled jobs: ECB import 16:30 CET business days; OXR hourly (if licensed); month-end revaluation on the close checklist (wave 14). SLOs: rate lookup p99 < 5 ms; import success ≥ 99% of business days. Alerts: provider degraded (P2), stale rate used in posting > 100/h (P3), revaluation run failure (P2). Runbook: manual rate entry during provider outage; re-run revaluation after rate correction (reverse then re-run). Rollback: digest rollback; feature flags off disable parallel posting (entries then go only to the leading ledger — documented as a degraded mode, not for production).

2.12.11 Migration from AX / SAP

Source	Passage entity	Notes
AX `ExchangeRateType`, `ExchangeRateCurrencyPair`, `ExchangeRate`	ExchangeRateType, ExchangeRate	AX stores rate per 100 units by default → divided; `ValidFrom` preserved
AX `Ledger` (accounting/reporting currency, posting layers)	Ledger, LedgerGroup	Current → leading; Operations/Tax layers → additional ledgers only if the customer used them
AX `LedgerExchAdj` history	not migrated	prior revaluations are embedded in migrated closing balances
SAP `TCURV`, `TCURR`, `TCURF`, `TCURX`	ExchangeRateType, ExchangeRate	rate = `UKURS × TFACT/FFACT`; `TCURX` decimals cross-checked against ISO 4217, exceptions reported
SAP `T882` (ledger assignment), `T881` (ledgers), ledger groups	Ledger, LedgerGroup	leading `0L` → is_leading; currency types 10/30 → accounting/reporting
SAP OBA1/OB09 gain/loss accounts	CurrencyPolicy	per ledger × currency
SAP TBDM market data (`VTB_MARKET`, reference interest rates `T056R`/`T056P`, index tables)	MarketDataSeries, MarketDataPoint	reference rate ids → series codes; yield curve definitions not migrated (wave 36 re-defines curves over migrated series)

Validation: rate counts per type; sampled 1,000 conversions compared with source values to the cent; opening balances in all three currencies tie per ledger. Not migrated: provider credentials (re-entered in Vault), valuation run history.

2.12.12 Dependencies, risks, open questions

Depends on: wave 11 (journal, posting API), wave 6 (currencies), wave 4 (Temporal schedules), wave 5 (audit).

Risk	Likelihood	Impact	Mitigation
SAP `TCURX` non-ISO decimals conflict with ISO 4217	Medium	Medium	Migration report flags conflicts; ISO wins; amounts rescaled with sign-off
Residual allocation changes a user-visible line amount	Medium	Low	Adjustment recorded on the line and shown in UI; alternative rounding-difference account configurable
Provider licensing (OXR)	Low	Low	ECB and manual are license-free defaults

Open questions: (1) Should reporting currency be per ledger or per legal entity? Default per ledger; decide by wave 12 mid-point. (2) Historical rate for non-monetary items in translation: store rate on line at posting (default) or look up by date? Default store; decide by wave 12 exit. (3) Support SAP-style "second local currency" (currency type 40) as a fourth amount? Default no (use a parallel ledger); revisit at wave 40.

2.12.13 Parameters and setup

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent
`ledger.accounting_currency`	ledger	char(3)	required	enabled ISO 4217	Currency of `amount_acct`	Ledger form > Accounting currency
`ledger.reporting_currency`	ledger	char(3)	= accounting	enabled ISO 4217	Currency of `amount_rpt`	Ledger form > Reporting currency
`ledger.reference_currency`	ledger	char(3)	accounting currency	ISO 4217	Triangulation pivot (FR-12.3)	Currency exchange rate types > Euro triangulation
`ledger.default_rate_type_id` / `closing_rate_type_id` / `average_rate_type_id`	ledger	ref	`DEFAULT` / `CLOSING` / `AVERAGE`	rate types	Conversion at posting, revaluation, translation	Ledger form > Exchange rate type, budget exchange rate type
`rate_type.allow_inverse`	rate type	bool	true	true / false	Reciprocal lookup when no explicit inverse (FR-12.2)	— (AX stores both directions)
`rate_type.provider_id` and schedule	rate type	ref + cron	ECB, `30 16 * * 1–5` CET	providers: ecb, openexchangerates, csv, manual	Import schedule (FR-12.4)	Currency exchange rate providers; Import currency exchange rates batch
`fx.max_rate_age_days`	tenant	int	5	1–60 business days	Stale rate warning threshold (BR-12.7)	—
`ledger.reject_stale_rates`	ledger	bool	false	true / false	Stale rate becomes a 422	—
`fx.deviation_warn_pct`	tenant	numeric	10	1–100	Confirmation threshold on rate entry (FR-12.11)	—
`fx.provider_timeout_s` / `fx.provider_retries`	tenant	int	10 / 3	1–60 / 0–5	Provider call behavior (FR-12.4)	Batch retry on `ExchangeRateProviderImport`
`ledger.rounding_mode`	ledger	enum	half_away_from_zero	half_away_from_zero / half_even	BR-12.2	— (fixed)
`currency_policy.unrealized_gain_account_id` / `unrealized_loss_account_id` / `realized_gain_account_id` / `realized_loss_account_id`	ledger × currency	ref	required when currency enabled	P&L accounts	Revaluation and clearing FX postings	Currency revaluation accounts (General ledger > Setup > Currency)
`currency_policy.rounding_difference_account_id` and `rounding_tolerance_units`	ledger × currency	ref + int	required; 1	balance-sheet or P&L account; 0–5 units	BR-12.4 single-line residual	General ledger parameters > Ledger > Penny difference accounts (`LedgerParameters`)
`ledger.revaluation_method`	ledger	enum	closing_rate	closing_rate / cumulative_no_reversal	FR-12.8	Foreign currency revaluation > "Financial dimensions / Reversal" behavior
`account.revalue` and `account.revalue_level`	main account × ledger	bool + enum	false; balance	balance / open_item	Revaluation selection (BR-12.9)	Main account > Foreign currency revaluation checkbox
`ledger_group.member_ledger_ids`	legal entity	uuid[]	`ALL` auto	ledgers of the entity	Parallel posting target (FR-12.7)	Posting layers (Current/Operations/Tax)
`ledger.accounting_principle`	ledger	enum	IFRS	IFRS / US_GAAP / LOCAL_GAAP / TAX / MANAGEMENT	Drives `LedgerAccountMapping` and subledger ledger-specific lines	—

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent
`translation.rate_by_account_type`	ledger	jsonb	monetary: closing; non_monetary: historical; pnl: average; equity: historical	rate kinds	FR-12.9	Reporting currency adjustment settings (D365)
`translation.cta_account_id`	ledger	ref	required for translation	equity account	CTA posting (FR-12.9)	—
`fx.provider_priority`	tenant	jsonb	ecb 10, openexchangerates 20, csv 30, manual 40	ordered	BR-12.10 precedence	—
`series.max_series_age_days`	series kind	int	rates 10, indices 45, prices 5	1–120	BR-12.12 staleness warning	—
`series.deviation_warn_pct`	series kind	numeric	rates 25, prices 10, indices 10	1–100	FR-12.13 confirmation	—

2.12.14 Inquiries and reports

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
Exchange rates by pair	list inquiry	rate type, from, to, date range, source	valid_from, rate, inverse, source, provider timestamp, superseded, deviation vs previous	`ExchangeRate`	Currency exchange rates form; SSRS Exchange rate (Currency exchange rates)	OB08 display, S_ALR_87012XXX via `TCURR` table view, Fiori Manage Exchange Rates
Rate lookup tester	drill-down	type, pair, date	resolution path (direct / inverse / triangulated), hops, rates used, result	fx resolver	—	—
Rate history / audit	drill-down	pair, type	version chain with `superseded_by`, created by, payload hash, provider	`ExchangeRate`	Database log on `ExchangeRate`	`TCURR` change documents (SCU3)
Provider import log	operational report	provider, rate type, date range	run, status, pairs imported, pairs unchanged, errors, duration	import run log	Batch job history for `ExchangeRateProviderImport`	TBDM import log
Ledger trial balance per ledger and currency type	list inquiry	ledger, period range, currency type (txn/acct/rpt), currency filter	account, opening, debit, credit, closing in selected currency type	`Balance`	Trial balance with posting layer filter	FAGLB03 per ledger (`RLDNR`), S_PL0_86000030
Ledger comparison	operational report	two ledgers, period, account range	balance ledger A, ledger B, difference, mapped account	`Balance` × `LedgerAccountMapping`	—	GCAC ledger comparison
Multi-currency line inquiry	drill-down	ledger, currency_txn, date range, account	line, txn amount/currency, rate applied, rate type, override flag, acct, rpt, rounding adjustment	`JournalLine`	Voucher transactions (three currency columns)	FAGLL03 with document/local/group currency columns
Foreign currency revaluation proposal / results	drill-down	run id	account, dimensions, currency, balance txn, posted acct, rate used, revalued, adjustment, exclusion flag	`RevaluationLine`	Foreign currency revaluation form (simulation/results); SSRS Exchange adjustment	FAGL_FC_VAL log / posting list, S_ALR_87012XXX valuation list
Revaluation history	list inquiry	ledger, period range, rate type	run, mode, status, gain, loss, posting entry, reversal entry	`RevaluationRun`	Foreign currency revaluation history (`LedgerExchAdj`)	FAGL_FC_VAL run history (`FAGL_BSBW_HISTRY`)
Translation (CTA) report	operational report	ledger, period	account group, historical/closing/average rate, restated amount, CTA contribution	translation run	Reporting currency adjustment report (D365)	FAGL_FC_TRANS log
Stale rate usage	KPI	ledger, period	postings with `FX_RATE_STALE` warnings per day, pairs affected	posting warnings log	—	—
Market data series inquiry	list inquiry	series code, kind, date range	valid_from, value, unit, tenor, source, deviation	`MarketDataPoint`	—	TBDM market data display, `T056P` reference rates
Rate overrides audit	operational report	ledger, period, user	entry, line, rate type, override rate, market rate, deviation, user	`JournalLine.rate_override`	—	Document header exchange rate ≠ `TCURR` (FB03 rate field)

2.12.15 Printed and electronic documents

Document	Trigger	Layout elements	Formats	Numbering sequence	Legal / retention requirement
Exchange rate table printout	user action; scheduled monthly	header: rate type, date range, ledger reference currency; lines: pair, valid_from, rate, source; footer: generated at, provider payload hashes	PDF, XLSX, CSV	—	supporting record for audit of conversions; 10 years when attached to a close run
Foreign currency revaluation posting list	run posted	header: ledger, period, rate type, valuation date, method; lines: account, dimensions, currency, balances, rate, adjustment; footer: totals gain/loss, posting and reversal vouchers, result hash	PDF, XLSX	revaluation run id; vouchers from the ledger sequence	financial record; 10 years
Currency translation statement	translation run posted	header: ledger, period, rates applied per class; lines: account group, historical/closing/average amounts; footer: CTA movement, voucher	PDF, XLSX	run id	financial record; 10 years
Rate deviation confirmation record	rate saved above `fx.deviation_warn_pct`	pair, previous rate, new rate, deviation, user, timestamp, confirmation text	PDF (audit evidence), JSON	—	audit evidence; 10 years

No external e-documents; rate files received from providers are stored as raw payloads (hash in `ExchangeRate.payload_hash`) for 13 months.

2.12.16 Periodic and batch jobs

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
`fx-import-ecb`	business days 16:30 CET	rate type	run id per (provider, rate type, date); points upserted by key, unchanged values skipped	< 30 s	3 retries, exponential back-off; `fx.provider.degraded` after final failure; last-known rates stay valid	provider degraded → P2; no import in 2 business days → P2
`fx-import-openexchangerates` (optional)	hourly	rate type	same	< 30 s	same	same
`fx-import-csv-inbox`	every 15 min	file	file hash as idempotency key	< 1 min	file quarantined with error report	parse errors → P3
`fx-series-import` (interest/index/price series)	business days 18:00	series	run id per (series, date)	< 1 min	same as rates	stale series beyond `max_series_age_days` → P3
`ledger-fx-revaluation` (automation hook on close checklist, wave 14)	period end + 1 business day 06:00, per ledger	ledger × rate type	idempotent per (ledger, period, rate type); second run rejected while one is posted (BR-12.8)	100k combinations < 5 min	run marked failed; close task blocked	failure → P2
`ledger-fx-revaluation-reverse`	first day of next period 00:10	run	reversal idempotent (`reversal_entry_id` set once)	< 1 min	retry hourly up to 24 h	reversal missing by day 1 12:00 → P2
`ledger-translation` (close hook)	period end + 2 business days	ledger	idempotent per (ledger, period)	200k balances < 3 min	failed → close task blocked	failure → P2
`fx-rate-cache-refresh-audit`	every 5 min	pod	compares pod cache version with latest published rate	< 1 s	pod restarts cache	pod lag > 2 s → P3
`fx-stale-rate-report`	daily 07:00	ledger	daily snapshot	< 1 min	—	stale postings > 100/h → P3

2.12.17 Security duties and privileges

Duty	Privileges (entry points)	Segregation-of-duties conflicts	Default roles that include it
View exchange rates	GET /fx/rates, /rates/history, /convert, /series; screens Exchange rates (read), Rate lookup tester	—	All finance roles
Maintain exchange rates	PUT /fx/rate-types, POST /fx/rates, POST /fx/series/*/points; screens Exchange rate types, Exchange rates, Market data series	Override exchange rates; Run foreign currency revaluation	Treasury accountant, Accounting manager
Administer exchange rates	POST /fx/providers/{p}:import; provider schedules and credentials (Vault); screen Provider schedules	Maintain exchange rates	Finance platform administrator
Override exchange rates	`rate_override` on posting lines; journal line rate cell	Maintain exchange rates; Approve ledger journals	Accounting supervisor (limited), Treasury accountant
Maintain ledger setup	PUT currency-policies, ledger-groups, ledgers, account mapping; screen Ledger setup	Post ledger journals; Run foreign currency revaluation	Accounting manager
Post ledger-specific adjustments	POST /ledger/journal-entries addressed to a single non-leading ledger	Approve ledger journals (same entry)	Financial controller, IFRS/local GAAP specialist
Run foreign currency revaluation	POST /ledger/revaluations, :post; screen Foreign currency revaluation	Maintain exchange rates; Maintain ledger setup	Accounting supervisor, Financial controller
Run currency translation	POST /ledger/translations	Maintain ledger setup	Financial controller, Group accountant
View ledger balances (per ledger)	GET balances with `ledger` filter; Ledger comparison	—	All finance roles

2.12.18 Message catalog

Code	Severity	User text	Cause	Remediation	Raised by
FX-0001 `LEDGER_RATE_MISSING`	error	No {rate_type} rate from {from} to {to} valid on {date} (direct, inverse or triangulated).	FR-12.3 lookup exhausted	Enter the rate or import; check `allow_inverse` and reference currency	FR-12.3, FR-12.12
FX-0002 `LEDGER_CURRENCY_MISMATCH`	error	Currency {currency} is not enabled or is suspended for {legal_entity}.	Currency not enabled	Enable the currency (wave 6)	FR-12.12
FX-0003 `LEDGER_ROUNDING_EXCEEDED`	error	Rounding residual {residual} {currency} exceeds the tolerance {tolerance}.	BR-12.4	Review amounts; a line split may be needed	FR-12.6
FX-0004 `FX_RATE_STALE`	warning	Rate {rate_type} {from}/{to} is {age} days old (limit {max}).	BR-12.7	Import or enter a current rate	FR-12.4
FX-0005 `FX_RATE_DEVIATION`	warning	New rate {rate} deviates {pct}% from the previous {previous}.	FR-12.11	Confirm or correct the rate	FR-12.11
FX-0006 `FX_RATE_INVALID`	error	Rate must be greater than 0 with at most 10 decimals.	Validation	Correct the value	FR-12.2
FX-0007 `FX_PROVIDER_DEGRADED`	warning (ops)	Provider {provider} failed after {retries} retries; last success {last_success}.	FR-12.4	Check provider status; enter rates manually	FR-12.4
FX-0008 `FX_RATE_OVERRIDE_FORBIDDEN`	error (403)	You do not hold the duty to override exchange rates.	FR-12.5	Remove the override or request the duty	FR-12.5
FX-0009 `LEDGER_GROUP_UNKNOWN`	error	Ledger group {code} does not exist for {legal_entity}.	FR-12.7	Create the group or use a ledger id	FR-12.7
FX-0010 `LEDGER_SPECIFIC_FORBIDDEN`	error (403)	Posting to a single non-leading ledger requires the duty "Post ledger-specific adjustments".	FR-12.7	Address the ledger group or request the duty	FR-12.7
FX-0011 `LEDGER_LEDGER_LINES_UNBALANCED`	error	Ledger-specific lines for {ledger} do not balance ({debits} / {credits}).	BR-12.6	Balance each ledger's lines	FR-12.7
FX-0012 `REVAL_RUN_EXISTS`	error	A posted revaluation already exists for {ledger} {period} {rate_type}.	BR-12.8	Reverse it before re-running	FR-12.8
FX-0013 `REVAL_RATE_MISSING`	error	No closing rate for {currency} on {valuation_date}; {count} balances cannot be revalued.	FR-12.8	Enter the closing rate	FR-12.8
FX-0014 `REVAL_PERIOD_CLOSED`	error	GL is closed for {period}; revaluation cannot post.	BR-14.1	Reopen or choose another period	FR-12.8
FX-0015 `TRANSLATION_CTA_ACCOUNT_MISSING`	error	No CTA account configured for ledger {ledger}.	FR-12.9	Set `translation.cta_account_id`	FR-12.9

Code	Severity	User text	Cause	Remediation	Raised by
FX-0016 `FX_SERIES_VALUE_MISSING`	error	Series {code} has no value on or before {date}.	BR-12.12	Import or enter a point	FR-12.13
FX-0017 `FX_SERIES_STALE`	warning	Series {code} value is {age} days old.	BR-12.12	Import a current point	FR-12.13
FX-0018 `FX_RATE_DATE_FUTURE`	error	Rate date {rate_date} is after the posting date.	BR-12.3	Use a rate date ≤ posting date	FR-12.5

2.12.19 Performance budgets and capacity

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
Rate lookup (cached)	every posted line in foreign currency: 60k/day; peak 5,000/s	0.05 / 1 / 5 ms	20,000/s per pod	—	in-memory map (type, from, to) → sorted valid_from	cache miss → one indexed query; posting p99 budget unchanged
Rate publish (manual or import)	2,000 points/day	20 / 80 / 150 ms	500/s bulk	200 B × 500k rows ≈ 100 MB	index §2.12.4	import queued
`POST /fx/convert` (stateless)	100k/day	5 / 20 / 40 ms	2,000/s	—	—	—
Parallel posting to 3 ledgers	30% of entries	+15 / +40 / +60 ms over single ledger	5,000 lines/s aggregate	3× journal rows for parallel entries	shared `document_id` index	HPA; entries stay atomic
Revaluation run	monthly per ledger; 100k combinations × 4 currencies	—	100k combinations < 5 min	revaluation lines 120 B × 1.2M/year ≈ 150 MB	`journal_line` (ledger, currency_txn, posting_date); `revaluation_line` PK	run time scales linearly; proposal retained 90 days
Translation run	monthly; 200k balances	—	< 3 min	—	balance PK	—
Rate history query	5k/day	20 / 100 / 200 ms	—	—	(type, from, to, valid_from DESC)	—
Market data series storage	50 series × 260 points/year	lookup 1 ms	—	< 5 MB	(series_id, valid_from DESC)	—

2.12.20 Localization and compliance hooks

- Statutory rate sources: country packs (wave 48) register the mandatory provider per legal entity — ECB reference rates (EU), Bundesbank/ÖNB monthly VAT rates (DE/AT, `Umsatzsteuer-Umrechnungskurse`), HMRC monthly rates (UK), Banco de México FIX (MX), RBI reference rates (IN), Bank of Canada (CA) — as additional `fx` provider adapters with their own rate types (e.g., `TAX_MONTHLY`); the tax engine (wave 13) selects the statutory rate type per country for VAT reporting.
- Rate direction and quotation conventions (direct vs indirect quotation, per-100 units as in AX and `TCURF` factors) are normalized at import; display conventions per locale (decimal separator, 6 decimals) come from wave 5 formatting.
- Rounding: ISO 4217 minor units are not overridable; Swiss 0.05 cash rounding and similar are invoice-level concerns handled by waves 29/30 pricing, not by the ledger.
- Parallel ledgers for local GAAP: country packs ship ledger templates (`HGB`, `PCG`, `Ind AS`, `JGAAP`) with accounting principle, calendar (e.g., Japan April–March), and `LedgerAccountMapping` starter sets.
- Hyperinflation (IAS 29) restatement and functional-currency changes are out of scope for Phase 2; the `MarketDataSeries` of kind `index` (CPI) is the hook wave 40 uses.
- Privacy: none (no personal data in rates); provider credentials are secrets in Vault.
- Extension point: `fx.provider` adapter interface (`Fetch(rateType, date) → []RatePoint`), registered by country packs; `ledger.account_mapping_pack` for principle-specific account remaps.

2.12.21 Coverage closure

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
SAP §13.6 FSCM Master data & documents — TBDM market data import (rates, prices) (SAP register row 74)	PARTIAL-12	ADDED as FR-12.13 (series storage and import); valuation DEFERRED to wave 36	exchange-rate import was already FR-12.4; interest, index and price series now stored with the same provider and audit model
SAP §13.6 FSCM Periodic processing — TBDM import run (SAP register row 82)	PARTIAL-12	ADDED as FR-12.13	job `fx-series-import` (§2.12.16)
SAP §13.6 FSCM Customizing — Market data: rate types, yield curves, volatility (`VTB*`, `TCURR`) (SAP register row 85)	PARTIAL-12	ADDED as FR-12.13 for rate types and series metadata; yield curves and volatility DEFERRED to wave 36	curve bootstrapping, interpolation and volatility surfaces belong to treasury (wave 36), which consumes `fx.series.published`

2.13 Wave 13: Tax Engine (Sales/Use, VAT/GST, Withholding)

2.13.1 Scope and business context

AX determines tax by intersecting a sales tax group (party side, `TaxGroupHeading`/`TaxGroupData`) with an item sales tax group (`TaxItemGroupHeading`/`TaxItemGroupData`) to find tax codes (`TaxTable`) with rates (`TaxData`), posting results to `TaxTrans`. SAP uses tax procedures with condition types, tax codes per country (`T007A`, FTXP), jurisdiction codes for US, and withholding tax types/codes. Wave 13 builds the `tax` service (Go) that any document line calls for determination, calculation and posting lines, with an internal rules engine as default and an Avalara/Vertex-compatible provider adapter interface, plus settlement to the GL and statutory extracts (VAT return, EU sales list, Intrastat, SAF-T).

After this wave a manual journal or any later document gets correct tax lines for US sales/use tax, EU VAT (standard, reduced, reverse charge, intra-community), Indian GST (CGST/SGST/IGST) and Canadian GST/HST/PST, and the tax settlement run posts the net payable and reconciles to the tax accounts. Out of scope: document-level invoicing (waves 18, 29), 1099/26AS statutory filing formats (hooks only; forms in wave 48 country packs), customs duty.

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
SAP FTXP: a tax code is a single rate per procedure step with no validity dates; a rate change (e.g., DE 19% → 16% in 2020) forces new codes and mass master-data updates in `KNVI`/`MLAN`	`T007A` has no effective dating	`TaxRate` rows are effective-dated under a stable `TaxCode`; groups and parties keep their assignments	Rate change rollout 2–5 days of config → 1 rate row; zero master-data touches
AX `TaxTrans` and SAP `BSET` show the result but not why: users cannot see which group intersection, exemption or jurisdiction produced the amount; support tickets replay the document in a test client	Determination logic in X++ `Tax` class / condition technique with no trace output	`POST /tax/calculate:explain` returns `determination_trace[]` step by step; tester screen renders it	"Why this tax?" investigation 30–60 min → < 1 min
US multi-jurisdiction via SAP external tax interface or AX ISV connectors: provider outage blocks invoicing (RFC timeout, document cannot save)	Synchronous dependency with no fallback	Provider adapter with 2 s timeout, internal-engine fallback, `tax_fallback` flag and recommit queue	Invoicing downtime during provider outage → 0; fallback decision < 2.5 s
Sales tax settlement (AX "Settle and post sales tax", SAP F.12 / S_ALR_87012357) posts a total that does not match the GL tax accounts; controllers reconcile by hand in Excel	Tax transactions and GL postings written by different code paths with separate rounding	`TaxTransaction` linked to `JournalLine` by id; settlement blocks on mismatch (`TAX_SETTLEMENT_MISMATCH`)	Settlement-to-GL reconciliation 4 h/period → automated, 0.00 variance enforced
Price-inclusive rounding differs across SAP condition steps and AX "per line / per document" settings, producing 1-cent mismatches with customer invoices and credit notes	Multiple rounding points without a distribution rule	One algorithm (BR-13.3) with largest-remainder distribution; credit notes use the original bracket	1-cent invoice disputes → 0 in the 500-scenario matrix

2.13.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Tax codes and rates	`TaxTable`, `TaxData` (effective-dated values, limits)	`T007A` (tax codes), FTXP, condition records `KONP`/`A003`	`tax.TaxCode`, `tax.TaxRate` (effective-dated, bracketed)	full
Party-side tax group	`TaxGroupHeading`, `TaxGroupData`, Sales tax groups form	Customer/vendor tax classification (`KNVI`/`LFA1`–`STKZU`), tax category on BP	`tax.TaxGroup` (N:M TaxCode)	full
Item-side tax group	`TaxItemGroupHeading`, `TaxItemGroupData`	Material tax classification (`MLAN`)	`tax.ItemTaxGroup` (N:M TaxCode)	full
Determination	Intersection of group and item group	Tax procedure (TAXUSJ/TAXEUR), access sequences, condition technique	Intersection + jurisdiction resolution + rule overrides (§2.13.7 BR-13.1)	improved: explainable trace
Jurisdictions	`TaxJurisdiction` (US), sales tax authorities `TaxAuthorityAddress`	Jurisdiction codes (`TTXJ`), external tax interface (Vertex/Sabrix)	`tax.TaxJurisdiction` hierarchy (country > state > county > city > district)	full
Exemptions	Tax exempt numbers, `TaxExempt` codes	Exemption licenses (withholding), tax code 0%	`tax.ExemptionCertificate` (party × jurisdiction × validity × reason)	full
Calculation modes	Price includes tax, calculation method (whole amount/interval), tax on tax	Condition calculation types, `KSCHL` steps, from/to step references	Inclusive/exclusive, compound sequence, bracketed rates	full
Reverse charge / use tax	Reverse charge item groups, Use tax checkbox on tax code	Acquisition tax codes (EU), use tax (US) via tax procedure	`TaxCode.mechanism` ∈ {standard, reverse_charge, use_tax, withholding}	full
Partial recoverability	Non-deductible percentage on tax code	Non-deductible tax (NAV/NVV condition types)	`TaxCode.recoverable_pct` with expense distribution	full
Withholding tax	Withholding tax codes/groups (`TaxWithholdTable`), 1099 fields	Extended withholding tax types/codes (`T059P`, `T059Z`), `WITH_ITEM`	`tax.WithholdingTaxCode`, `tax.WithholdingTransaction`; trigger at invoice or payment	full
Posted tax	`TaxTrans`	`BSET`, ACDOCA tax fields	`tax.TaxTransaction` linked to JournalLine	full
Settlement and reporting	Settlement periods, "Settle and post sales tax", EU sales list, Intrastat	Tax payable posting (F.12/S_ALR_87012357), ACR (Advanced Compliance Reporting), Intrastat (VE01)	`tax.TaxSettlementRun`, VAT return, ESL, Intrastat, SAF-T extracts	full (formats in wave 48)
External provider	Avalara/Vertex ISV connectors	External tax interface (RFC_CALCULATE_TAXES_DOC)	Provider adapter interface (`TaxProvider`) with failover	full
Intrastat master data	Foreign trade parameters, Commodity codes (`IntrastatCommodity`), Transaction codes (`IntrastatTransactionCode`), Transport methods, Ports, Statistics procedures, Country/region properties (EU), Intrastat compression / check setup	Foreign trade customizing (VEB/VE0: `T604`, `T605`, `T606`, `T616` modes of transport, `T618` customs offices), commodity codes (`T604`), Intrastat settings per country	`tax.CommodityCode`, `tax.IntrastatTransactionCode`, `tax.TransportMode`, `tax.Port`, `tax.StatisticsProcedure`, `tax.CountryTradeProperty` (FR-13.15)	full
Intrastat journal and declaration	Intrastat journal (`IntrastatArchiveGeneral`, `Intrastat` form): transfer from invoices, validate, compress, export file	VE01 / MEIS / VI99 declaration runs (`VEIAV`), Intrastat checks, file export per country	`tax.IntrastatLine` with transfer, validation, compression, correction and export (FR-13.16); country formats via wave 48	full
Commodity code on products	Released product > Foreign trade > Commodity code	Material master Foreign trade export view (`MARC-STAWN`)	`product.commodity_code_id` (wave 8 field, FK to `tax.CommodityCode`), default per category	full
VAT recovery on expenses	Expense management > Setup > Tax configuration (recoverable VAT per country), Recover VAT (ER-based claim), SSRS VAT recovery report	Non-deductible tax (NAV/NVV), ESC claim via DRC / country-specific reports; no native EU refund directive flow	`tax.VatRecoveryPolicy` per (country, expense category), foreign VAT reclaim extract (FR-13.17)	full
Withholding remittance and certificates	Withholding tax payment (settle), 1099 summary; India TDS challan via GL/Indian localization	J1INCHLN (TDS challan), J1INBANK (bank challan update), J1INCERT (Form 16A), generic WHT reporting RFIDYYWT	`tax.WithholdingRemittanceRun`, certificate numbering and hooks (FR-13.18); country forms in wave 48	partial: forms in wave 48

2.13.3 Functional requirements

- **FR-13.1 Tax codes and effective-dated rates** — Must. The system shall define tax codes per legal entity with mechanism (standard, reverse_charge, use_tax, withholding), rate rows effective-dated with optional amount brackets (`from_amount`, `to_amount`), recoverable percentage, jurisdiction, and posting accounts (payable, receivable, non-recoverable expense, use-tax expense).
  - Rate precision numeric(9,6) in percent (e.g., 19.000000); brackets evaluated on the line base or document base per code setting (AX "calculation method": whole amount vs interval).
  - Maximum 2,000 codes per legal entity; rate history retained indefinitely.
- **FR-13.2 Tax groups and item tax groups** — Must. The system shall maintain party-side tax groups and item-side item tax groups, each a set of tax codes; defaults come from party roles (customer/vendor), delivery address jurisdiction, and product/category.
- **FR-13.3 Jurisdiction hierarchy** — Must. The system shall model jurisdictions as a tree (country > state/province > county > city > special district) with address-to-jurisdiction resolution by postal code tables or provider lookup, and compute stacked rates (e.g., CA state 7.25% + county + district).

- **FR-13.4 Determination and calculation API** — Must. The system shall expose `POST /api/v1/tax/calculate` taking a document (header: legal entity, document type, dates, party, addresses, currency; lines: amount, quantity, product, tax group, item tax group, overrides) and returning per-line and per-document tax lines with an explain trace.
  - Stateless, p99 < 50 ms for 100-line documents with the internal engine; provider calls add their latency (timeout 2 s).
  - Order of operations in BR-13.1. Results carry `engine: internal | avalara | vertex`, `fallback: bool`, and `determination_trace[]`.
- **FR-13.5 Inclusive and exclusive prices** — Must. The system shall support price-inclusive lines by backing out tax: `base = gross / (1 + Σ non-compound rates)`, iteratively resolving compound codes; rounding per BR-13.3.
- **FR-13.6 Compound tax, reverse charge, use tax, partial recoverability** — Must. The system shall calculate tax-on-tax by code sequence, generate equal input and output lines for reverse charge, accrue use tax as a liability with the expense to the line's account, and split recoverable vs non-recoverable amounts.
- **FR-13.7 Exemption certificates** — Must. The system shall apply certificates by (party, jurisdiction, validity, reason code, optional product category), zeroing the applicable codes and recording the certificate id on the tax transaction; expired certificates produce `TAX_EXEMPTION_EXPIRED` warnings and full tax.
- **FR-13.8 Withholding tax** — Must. The system shall calculate withholding (vendor and customer) with code, base (gross, net, tax-inclusive), rate, threshold and annual accumulation, triggered at invoice or payment per code; results are stored as `WithholdingTransaction` and exposed to AP/AR (waves 19/30) and to 1099/26AS reporting hooks.
- **FR-13.9 Tax posting** — Must. The system shall convert a calculated document into journal lines (posting API, wave 11) with the tax account per code, dimension inheritance from the taxed line, and create `TaxTransaction` rows linked to the posted `JournalLine` ids, within the caller's document transaction via a prepared-lines contract (`POST /tax/calculate` → caller includes returned lines in its posting request → tax consumes `journal.posted` to link).
- **FR-13.10 Provider adapters and failover** — Must. The system shall implement a `TaxProvider` interface (`Calculate`, `Commit`, `Void`, `ValidateAddress`) with Avalara AvaTax REST v2 and Vertex O-Series adapters, selectable per legal entity × document type; on timeout or 5xx the internal engine is used and the document is flagged `tax_fallback = true` for later recommit.
  - Provider credentials in Vault; requests and responses hashed and stored 7 years for audit (payload itself retained 13 months).
- **FR-13.11 Settlement periods and settlement run** — Must. The system shall define settlement periods per tax authority (monthly, quarterly, annual) and run a settlement that sums tax transactions by code and period, posts the net payable/receivable to the authority's vendor/customer (party role) or a settlement account, and marks transactions settled.
  - Re-runs for the same period post only the delta (late-posted transactions) as a new settlement with `version` incremented.
  - Settlement totals must equal the GL tax account movements for the period; a difference > 0.00 blocks posting with `TAX_SETTLEMENT_MISMATCH`.
- **FR-13.12 Statutory extracts** — Should. The system shall produce VAT return boxes (configurable box mapping per country), EU sales list (ESL, by customer VAT id and transaction type), Intrastat lines (commodity code, weight, value, partner country) and SAF-T (OECD v2.0 XSD-valid XML) for a period.
- **FR-13.13 Tax configuration workspace** — Must. Screens for codes, rates, groups, jurisdictions, certificates, withholding, settlement periods, provider settings and a calculation tester.
- **FR-13.14 Tax matrix test harness** — Must. The system shall ship a fixture runner that executes the 500-scenario matrix against the engine in CI and reports diffs per scenario.
- **FR-13.15 Intrastat master data** — Must. The system shall maintain, per tenant with legal-entity overrides: commodity codes (Combined Nomenclature CN8, with validity year, supplementary unit, description, hierarchy by HS6), nature-of-transaction codes (two-digit EU list plus national second digit), transport modes (1–9 per EU regulation 2019/2152), ports and airports (UN/LOCODE), statistics procedures, delivery terms (Incoterms 2020) mapping, country/region trade properties (EU member, Intrastat threshold arrival/dispatch, reporting currency, arrival/dispatch statistical value rules), and the legal entity's Intrastat registration (VAT id, third-party declarant, agent).
  - CN8 code lists are imported yearly from the EU RAMON/Eurostat CSV through a CSV importer (≤ 20,000 rows); expired codes stay for historic lines.
  - Commodity code defaults on products via category (wave 8 exposes `commodity_code_id` and `country_of_origin`); a line without a commodity code at Intrastat transfer time is reported as an exception, not dropped.
- **FR-13.16 Intrastat journal, validation, compression and export** — Must. The system shall build `IntrastatLine` rows from posted documents (wave 13: manual journals flagged with trade data; waves 18/27/28/29 register vendor invoices, sales invoices, shipments and receipts as sources through the `IntrastatSource` contract) with direction (arrival/dispatch), commodity code, partner country and partner VAT id (dispatches, EU 2022 requirement), country of origin, nature of transaction, transport mode, delivery terms, net mass, supplementary units, invoice value, statistical value, and period.
  - Validation rules per country (mandatory fields by direction, mass > 0 unless supplementary unit, partner VAT id format via wave 7) produce `TAX_INTRASTAT_INVALID` exceptions on a worklist; lines can be corrected in the journal with an audit trail (field, old, new, user).
  - Compression merges lines with identical (direction, commodity, partner country, origin, transaction nature, transport mode, delivery terms, partner VAT id) per period into one declaration line (summed mass, units, values) per the country's compression setup.
  - Export produces the declaration dataset for the period (JSON canonical) and country formats registered by wave 48 (DE XML (Destatis), FR DEB/EMEBI, NL CBS IDEP, IT Elenchi; wave 13 ships the canonical format and a generic CSV); thresholds per country decide whether a declaration is required and are reported on the period summary.
  - Corrections after export create delta lines flagged `correction_of_line_id` and a correction declaration for the original period.
- **FR-13.17 VAT recovery on expenses** — Should. The system shall maintain `VatRecoveryPolicy` rows per (expense category, country of expense, legal entity country) with `recoverable_pct` (domestic input VAT per category, e.g., DE entertainment 70%, FR passenger cars 0%, BE 50%), `foreign_reclaim_eligible` (EU Directive 2008/9/EC or 13th Directive) and the minimum claim thresholds; the calculation API applies the policy when a document line carries an `expense_category` (expense reports in wave 43, vendor invoices in wave 19) by setting the code's recoverable percentage per line.
  - A foreign VAT reclaim extract per (legal entity, refund country, calendar quarter or year) lists eligible transactions with invoice reference, vendor VAT id, amounts, and expense codes per Annex of the directive (codes 1–10), and a VAT recovery report shows recoverable, non-recoverable and reclaimable amounts per period and country.
  - Non-recoverable amounts post to the line's expense account (FR-13.6) and reclaimable foreign VAT posts to a `foreign_vat_receivable_account_id` per policy when `book_foreign_vat_as_receivable = true`, otherwise to expense.
- **FR-13.18 Withholding remittance and certificate hooks** — Should. The system shall group posted `WithholdingTransaction` rows by (legal entity, authority, withholding code section, period) into a `WithholdingRemittanceRun` that posts the liability transfer to the authority party and records the remittance reference (bank challan number, payment date, bank branch code) and, per payee and period, assigns certificate numbers from a number sequence and exposes the data set (payee, tax id, section, base, rate, tax, remittance references) that country packs render as Form 16A / 26Q (IN), 1099-NEC/MISC and 1042-S (US), CIS statements (UK) and `Lohnsteuerbescheinigung`-style certificates (wave 48).
  - A remittance run may be `proposed → posted → cancelled` and its transactions are flagged `remitted`; quarterly returns reference remittance runs; a certificate is immutable once issued and can be reissued with a new number and `supersedes_certificate_id`.

2.13.4 Data model

TaxCode and **TaxRate**

Field	Type	Required	Notes
id	uuid	yes	PK
legal_entity_id	uuid	yes	

Field	Type	Required	Notes
code	text(20)	yes	unique per legal entity
name	text(120)	yes	
mechanism	enum	yes	standard, reverse_charge, use_tax, withholding
jurisdiction_id	uuid	no	FK TaxJurisdiction
authority_party_id	uuid	yes	FK Party (role tax authority)
settlement_period_id	uuid	yes	FK TaxSettlementPeriod
calc_basis	enum	yes	line, document (bracket evaluation)
compound_sequence	int	no	null = not compound; higher sequences apply on base + earlier tax
recoverable_pct	numeric(9,6)	yes	default 100
payable_account_id / receivable_account_id / nonrecoverable_account_id / use_tax_expense_account_id	uuid	conditional	FK MainAccount
rounding	enum	yes	per_line, per_document (default per_document for VAT, per_line for US)
rate: tax_code_id, valid_from, valid_to		yes	non-overlapping intervals
rate: from_amount / to_amount	numeric(23,6)	no	bracket
rate: rate_pct	numeric(9,6)	yes	
rate: min_tax / max_tax	numeric(23,6)	no	caps

TaxTransaction

Field	Type	Required	Notes
id	uuid	yes	PK
legal_entity_id / ledger_id	uuid	yes	leading ledger
tax_code_id	uuid	yes	
jurisdiction_id	uuid	no	
source (system, type, id, line_ref)	text	yes	document line
journal_line_id	uuid	no	set when `journal.posted` consumed
tax_direction	enum	yes	output (sales), input (purchase), use, withholding
base_amount_txn / tax_amount_txn / currency_txn	numeric / char(3)	yes	
base_amount_acct / tax_amount_acct	numeric(23,6)	yes	
recoverable_amount_acct / nonrecoverable_amount_acct	numeric(23,6)	yes	sum = tax_amount_acct
rate_pct_applied	numeric(9,6)	yes	
exemption_certificate_id	uuid	no	
counterparty_party_id / counterparty_tax_id	uuid / text	no	for ESL
engine / fallback / provider_ref	enum / bool / text	yes	
settlement_run_id	uuid	no	null = unsettled
posting_date / fiscal_period_id	date / uuid	yes	

TaxSettlementRun: `id`, `legal_entity_id`, `authority_party_id`, `settlement_period_id`, `period_from`, `period_to`, `version`, `status` (proposed, posted, cancelled), `output_tax_total`, `input_tax_total`, `net_amount`, `entry_id`, `transaction_count`, `created_by`, `posted_at`.

ExemptionCertificate: `id`, `party_id`, `jurisdiction_id`, `certificate_number`, `reason_code`, `valid_from`, `valid_to`, `product_category_id` (optional), `document_uri`, `status` (active, expired, revoked).

IntrastatLine (FR-13.16) and Intrastat master data (FR-13.15)

Field	Type	Required	Notes
id	uuid	yes	PK
legal_entity_id / reporting_period	uuid / text(7)	yes	`YYYY-MM`
direction	enum	yes	arrival, dispatch
source (system, type, id, line_ref)	text	yes	originating document line
commodity_code_id	uuid	conditional	FK CommodityCode (CN8, `validity_year`); missing → exception
partner_country / origin_country	char(2)	yes / conditional	ISO 3166-1; origin mandatory for dispatches since 2022
partner_vat_id	text(20)	conditional	dispatches; format-checked (wave 7)
transaction_nature_code	text(2)	yes	FK IntrastatTransactionCode
transport_mode	text(1)	yes	FK TransportMode (1–9)
delivery_terms	text(3)	conditional	Incoterms 2020
port_id	uuid	no	FK Port (UN/LOCODE)
statistics_procedure_id	uuid	no	FK StatisticsProcedure
net_mass_kg / supplementary_units	numeric(18,3) / numeric(18,3)	conditional	mass required unless CN8 has supplementary unit only
invoice_value / statistical_value / currency	numeric(23,6) / numeric(23,6) / char(3)	yes	statistical value per country rule (FR-13.15)
status	enum	yes	transferred, validated, exception, compressed, exported, corrected
compressed_into_id / correction_of_line_id / export_run_id	uuid	no	
corrections	jsonb	no	[{field, old, new, user, at}]

`CommodityCode`: `id`, `code` text(8), `validity_year`, `description`, `supplementary_unit`, `parent_hs6`; `IntrastatTransactionCode`: `code` text(2), `description`, `country` (null = EU list); `TransportMode`: `code` text(1), `description`; `Port`: `locode` text(5), `name`, `country`; `StatisticsProcedure`: `code`, `description`, `country`; `CountryTradeProperty`: `country`, `is_eu_member`, `threshold_arrival`, `threshold_dispatch`, `reporting_currency`, `statistical_value_rule` (invoice_value |

invoice_plus_freight_to_border I custom), `compression_fields` jsonb, `export_format_id` (wave 48). `IntrastatExportRun`: `id`, `legal_entity_id`, `period`, `direction`, `line_count`, `total_value`, `format`, `output_uri`, `hash`, `status`, `declared_at`.

VatRecoveryPolicy (FR-13.17): `id`, `legal_entity_id`, `expense_category_id` (wave 43/19 category list; `*` allowed), `expense_country` char(2), `recoverable_pct` numeric(9,6), `foreign_reclaim_eligible` bool, `directive` enum (2008_9, 13th, none), `expense_code_annex` text(2), `book_foreign_vat_as_receivable` bool, `foreign_vat_receivable_account_id`, `min_claim_amount` numeric(23,6), `valid_from`, `valid_to`. `VatReclaimExtract`: `id`, `legal_entity_id`, `refund_country`, `period_from`, `period_to`, `transaction_ids[]`, `total_reclaimable`, `output_uri`, `status`.

WithholdingRemittanceRun (FR-13.18): `id`, `legal_entity_id`, `authority_party_id`, `section_code`, `period_from`, `period_to`, `status` (proposed, posted, cancelled), `transaction_ids[]`, `total_withheld`, `entry_id`, `remittance_reference` jsonb (`challan_no`, `bank_code`, `paid_on`, `bsr_code`), `posted_at`. `WithholdingCertificate`: `id`, `payee_party_id`, `period`, `certificate_number` (sequence per legal entity × section), `transaction_ids[]`, `issued_at`, `supersedes_certificate_id`, `output_uri`.

Invariants: Σ TaxTransaction.tax_amount_acct per (code, period) = movement on the code's payable/receivable account for that period (checked by settlement); recoverable + nonrecoverable = tax; rate intervals per code do not overlap; a settled transaction cannot change `settlement_run_id` except to null via a cancelled run. Indexing: `tax_transaction` on (legal_entity_id, tax_code_id, fiscal_period_id, settlement_run_id), (source_system, source_type, source_id), (journal_line_id); partitioned by fiscal year.

2.13.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
POST	/api/v1/tax/calculate	Determine and calculate for a document	stateless (optional `Idempotency-Key` for provider commit)	Calculate tax (service accounts)
POST	/api/v1/tax/calculate:explain	Same with full determination trace	stateless	View tax configuration
POST	/api/v1/tax/commit	Commit provider transaction after document posting	`Idempotency-Key` required	Calculate tax
GET/PUT	/api/v1/tax/legal-entities/{le}/codes[/{code}] and /codes/{code}/rates	Codes and rates	PUT idempotent	Maintain tax codes
GET/PUT	/api/v1/tax/legal-entities/{le}/groups[/{id}] and /item-groups[/{id}]	Groups	PUT idempotent	Maintain tax groups
GET/PUT	/api/v1/tax/jurisdictions[/{id}] and POST /jurisdictions:resolve	Jurisdiction tree and address resolution	PUT idempotent	Maintain tax jurisdictions
GET/POST/PATCH	/api/v1/tax/exemption-certificates[/{id}]	Certificates	`Idempotency-Key` on POST	Maintain tax exemptions
GET/PUT	/api/v1/tax/legal-entities/{le}/withholding-codes[/{code}]	Withholding	PUT idempotent	Maintain withholding tax
GET	/api/v1/tax/transactions?le=&code=&period=&settled=	Posted tax transactions	n/a	View tax transactions
POST	/api/v1/tax/settlements	Propose or post a settlement run	`Idempotency-Key`	Settle tax
POST	/api/v1/tax/settlements/{id}:post	Post a proposal	`Idempotency-Key`	Settle tax
POST	/api/v1/tax/extracts/{vat-return	esl	intrastat	saf-t}
GET/PUT	/api/v1/tax/intrastat/commodity-codes[/{code}], /transaction-codes, /transport-modes, /ports, /statistics-procedures, /country-properties[/{country}] and POST /commodity-codes:import	Intrastat master data (FR-13.15)	PUT idempotent; import `Idempotency-Key`	Maintain foreign trade setup
POST	/api/v1/tax/intrastat/lines:transfer	Transfer lines from registered sources for a period	`Idempotency-Key` (period)	Maintain Intrastat journal
GET/PATCH	/api/v1/tax/intrastat/lines[/{id}]?le=&period=&direction=&status=	Intrastat journal and corrections	PATCH audited	Maintain Intrastat journal
POST	/api/v1/tax/intrastat/lines:validate, :compress and /exports	Validate, compress, export declaration	run id	Produce tax reports
GET/PUT	/api/v1/tax/legal-entities/{le}/vat-recovery-policies[/{id}]	VAT recovery policies (FR-13.17)	PUT idempotent	Maintain tax codes
POST	/api/v1/tax/vat-reclaims	Foreign VAT reclaim extract for (refund country, period)	run id	Produce tax reports
POST	/api/v1/tax/withholding/remittances and /{id}:post, :cancel	Withholding remittance runs (FR-13.18)	`Idempotency-Key`	Settle tax
POST	/api/v1/tax/withholding/certificates:issue	Issue certificates per payee and period	`Idempotency-Key`	Produce tax reports

Calculation request/response (abridged): request `{legal_entity, document_type, document_date, tax_date, currency, party:{id, role, tax_id}, ship_from, ship_to, lines:[{line_ref, amount, quantity, product_id, tax_group, item_tax_group, price_includes_tax, account, dimensions, override:{tax_code?, exempt_reason?}}]}`; response `{engine, fallback, lines:[{line_ref, base, taxes:[{code, jurisdiction, rate_pct, tax_amount, recoverable, nonrecoverable, direction}]}], document_taxes_by_code:[…], posting_lines:[… wave 11 line objects …], trace_id, determination_trace[]}`.

Validation: every line has resolvable groups or an override; dates within code validity; currency enabled; party tax id format valid for reverse charge; totals of `posting_lines` balance against the caller's lines.

Event	Trigger	Payload fields	Consumers
dev.passage.tax.calculated.v1	calculate with commit intent	document ref, engine, fallback, totals per code, trace_id	document services, audit
dev.passage.tax.transaction.recorded.v1	TaxTransaction linked to journal line	transaction id, code, period, base, tax, direction, journal_line_id	reporting, lakehouse
dev.passage.tax.settled.v1	settlement posted	run id, authority, period, output, input, net, entry_id, version	reporting, ledger
dev.passage.tax.provider.fallback.v1	provider failure	provider, document ref, error, retry_after	ops, AP/AR recommit job
dev.passage.tax.rate.changed.v1	rate row created	code, valid_from, rate_pct, previous	document services cache
dev.passage.tax.intrastat.exported.v1	declaration export completed	export_run_id, legal_entity, period, direction, line_count, total_value, format, hash	audit, wave 48 submission connectors

Event	Trigger	Payload fields	Consumers
dev.passage.tax.withholding.remitted.v1	remittance run posted	run_id, authority, section, period, total_withheld, entry_id, remittance_reference	AP (wave 19), reporting, wave 48 returns

`IntrastatSource` contract (used by waves 18/27/28/29): a document service registers `{source_type, resolver_uri}`; at transfer the tax service calls the resolver for posted documents in the period and receives lines with trade fields; documents reversed after transfer produce negative lines on the next transfer.

2.13.6 User experience

Screen	Primary actions	Key fields/columns	Duty required
Tax codes	Create, add rate rows, set accounts, mechanism	code, mechanism, jurisdiction, current rate, authority, settlement period	Maintain tax codes
Tax groups / item tax groups	Assign codes, set defaults for party/product	group, codes, exempt flags	Maintain tax groups
Jurisdictions	Tree view, import postal tables, resolve address tester	level, code, parent, rates stacked	Maintain tax jurisdictions
Exemption certificates	Register, upload document, expire	party, jurisdiction, number, validity, reason	Maintain tax exemptions
Withholding codes	Rates, thresholds, trigger point, reporting category	code, rate, base, threshold, 1099 box	Maintain withholding tax
Calculation tester	Enter a sample document, see tax lines and trace	line, code, rate, base, tax, explanation	View tax configuration
Tax transactions	Filter by code/period/document, drill to journal line and source	document, code, base, tax, direction, settled	View tax transactions
Settlement	Propose, review by code, post, view history	authority, period, output, input, net, status, version	Settle tax
Provider settings	Select provider per entity/document type, test connection	provider, environment, company code, last success	Administer tax
Foreign trade setup	Maintain commodity codes (import yearly CN8), transaction codes, transport modes, ports, statistics procedures, country properties and thresholds	code, description, validity year, supplementary unit; country, threshold arrival/dispatch, compression fields	Maintain foreign trade setup
Intrastat journal	Transfer period, work exceptions, correct fields, validate, compress, export, view declaration summary vs threshold	direction, commodity, partner country, VAT id, nature, transport, mass, units, invoice/statistical value, status	Maintain Intrastat journal / Produce tax reports
VAT recovery policies	Define recoverable % per category and country, reclaim eligibility, accounts; run reclaim extract; view recovery report	category, country, recoverable %, directive, annex code, receivable account	Maintain tax codes / Produce tax reports
Withholding remittance	Propose run per authority/section/period, enter remittance reference, post, issue certificates	payee, section, base, rate, withheld, challan no., certificate no.	Settle tax / Produce tax reports

Interaction rules: the tester renders the determination trace as a step list (groups → intersection → jurisdiction → exemptions → brackets → compounding → rounding); rate grids validate non-overlapping intervals on save; settlement proposals show a reconciliation panel (transactions vs GL) and block the post button on mismatch.

2.13.7 Business rules and edge cases

- **BR-13.1 Order of operations.** (1) Resolve `tax_date` (document date unless the document type specifies delivery date). (2) Resolve party tax group (override > party address jurisdiction default > party role default) and item tax group (override > product > category > legal entity default). (3) Candidate codes = TaxGroup.codes ∩ ItemTaxGroup.codes; if the ship-to jurisdiction requires stacked rates, expand jurisdiction codes. (4) Apply exemption certificates: remove exempted codes, record certificate. (5) Apply explicit line override (duty-gated). (6) Compute base per line: exclusive → amount; inclusive → back out (FR-13.5). (7) Evaluate brackets on line or document basis per code. (8) Calculate non-compound codes, then compound codes in `compound_sequence` order on `base + Σ earlier taxes`. (9) Apply min/max caps. (10) Reverse charge → emit input and output lines of equal amount; use tax → liability line with offset to the line's expense account. (11) Split recoverable/non-recoverable. (12) Round per BR-13.3. (13) Withholding is computed separately on the configured base and never alters the document tax. Every step writes to `determination_trace`.
- **BR-13.2 Provider precedence.** If a provider is configured for (legal entity, document type), steps 3–11 are delegated; the provider's results are normalized into the same structures; the internal engine still validates rounding and balancing of the returned lines.
- **BR-13.3 Rounding.** `per_document` (VAT default): sum unrounded tax per code across lines, round once to currency minor units, then distribute to lines proportionally with largest-remainder allocation so line taxes sum to the document tax. `per_line` (US default): round each line's tax per code. Rounding mode is the ledger's (wave 12).
- **BR-13.4 Inclusive back-out with compound taxes.** Solve `gross = base × Π(1 + r_i)` for compound stacks and `gross = base × (1 + Σ r_i)` for parallel codes; base rounded last; the sum of base + taxes must equal gross to the minor unit (residual to the largest tax line).
- **BR-13.5 Brackets.** Evaluated on the absolute base; credit notes (negative amounts) use the same bracket as the positive amount; `calc_basis = document` sums all lines of the same code before bracket lookup.
- **BR-13.6 Effective dates.** A code with no rate valid on `tax_date` → `TAX_RATE_NOT_FOUND` (422); a rate change mid-period is applied by date, never pro-rated.
- **BR-13.7 Reverse charge eligibility.** Requires a counterparty tax id passing the country format check (wave 7) and both parties in different EU member states (or domestic reverse-charge categories configured); otherwise falls back to standard rate with warning `TAX_REVERSE_CHARGE_INELIGIBLE`.
- **BR-13.8 Withholding thresholds.** Annual accumulation per (vendor, code, fiscal year); withholding applies to the amount exceeding the threshold in the document that crosses it; accumulation is updated only on posting, not calculation.
- **BR-13.9 Settlement state machine.** `proposed → posted | cancelled`; `posted` is terminal; a cancelled run releases its transactions; settlement for a period may not post while the period is `closed` for module TAX (wave 14); a posted run cannot include transactions dated after `period_to`.
- **BR-13.10 Provider commit idempotency.** `commit` with the same key is replayed; a provider `Void` is issued when a document is reversed (`journal.reversed` consumer) and failures queue for retry with alerting after 24 h.
- **BR-13.11 Negative and zero rates.** Rate 0 is valid (zero-rated vs exempt distinguished by `reason_code` on the code); negative rates are rejected (`TAX_RATE_INVALID`).
- **BR-13.12 Multi-currency.** Tax is calculated in transaction currency and converted with the document's rates (wave 12); settlement is in accounting currency; the ESL reports in EUR using the ECB rate on tax_date when the accounting currency is not EUR.
- **BR-13.13 Intrastat line lifecycle.** `transferred → validated | exception`; `exception → validated` after correction; `validated → compressed` (lines merged into one compressed line referencing members) → `exported`; an exported line is immutable; a later correction creates a new line with `correction_of_line_id` dated in the original period and marks the original `corrected`; a period can be exported more than once (each export run is a version; the latest is the declaration of record). Statistical value = invoice value × (1 + `freight_pct`) when the country rule is `invoice_plus_freight_to_border` and no explicit freight is available, with `freight_pct` on the country property (default 0).
- **BR-13.14 Intrastat thresholds.** The period summary compares cumulative calendar-year value per direction with the country threshold; below threshold the export is produced but flagged `declaration_not_required`; crossing the threshold mid-year sets `declaration_required_from` on the legal entity's country property and raises `TAX_INTRASTAT_THRESHOLD_CROSSED` (info).

- **BR-13.15 VAT recovery precedence.** Policy resolution: (expense category, expense country, legal entity) > (category, country, `*`) > (`*`, country, legal entity) > (`*`, country, `*`); the resolved `recoverable_pct` overrides the tax code's default for that line only; foreign reclaim applies only when expense country ≠ legal entity country, the vendor VAT id is valid for the expense country, and the invoice meets the country's minimum (EU: simplified invoice ≤ EUR 1,000 accepted; fuel ≤ EUR 250); amounts below `min_claim_amount` per quarter (EUR 400) or year (EUR 50) are carried to the annual claim.
- **BR-13.16 Withholding remittance.** A remittance run may include only `WithholdingTransaction` rows with `posting_date ≤ period_to`, not yet remitted, for one (authority, section); posting transfers the withholding payable to the authority party's open item (wave 19) or settlement account and sets `remitted = true`; cancelling a posted run is allowed only before the certificate issue and posts a negating entry; certificates are numbered per (legal entity, section, fiscal year) gap-free.

2.13.8 Acceptance criteria

- **AC-13.1** (FR-13.4, FR-13.14) Given the 500-scenario matrix, when run in CI, then 100% of scenarios match expected tax per line and per document to the minor unit.
- **AC-13.2** (FR-13.5, BR-13.4) Given a EUR 119.00 inclusive line at 19% VAT, when calculated, then base 100.00 and tax 19.00; given 3 inclusive lines of 33.33 each at 19%, then the document tax equals round(Σ unrounded) and line taxes sum to it.
- **AC-13.3** (FR-13.6) Given a Canadian QC line of CAD 100.00 with GST 5% and QST 9.975% (non-compound since 2013), when calculated, then taxes are 5.00 and 9.98; given a configured compound stack, then the second tax applies on base + first tax.
- **AC-13.4** (FR-13.6) Given an intra-EU purchase from a DE vendor into FR with a valid VAT id, when calculated, then an input and an output line of equal amount are produced and the net tax is 0.00.
- **AC-13.5** (FR-13.7) Given an expired exemption certificate, when calculated, then full tax applies and `TAX_EXEMPTION_EXPIRED` is in warnings.
- **AC-13.6** (FR-13.10) Given AvaTax times out, when calculating, then the internal engine responds within 2.5 s total, `fallback = true`, and `tax.provider.fallback` is emitted.
- **AC-13.7** (FR-13.11) Given the settlement fixture for March 2026, when the run is posted, then net payable equals output – input, the posting balances, and Σ settled transactions equals the GL tax account movement to the cent.
- **AC-13.8** (FR-13.12) Given the demo EU entity, when SAF-T is generated, then the XML validates against the OECD v2.0 XSD.
- **AC-13.9** (FR-13.8, BR-13.8) Given a vendor with USD 550 cumulative and a USD 600 threshold, when a USD 100 invoice is posted, then withholding applies to USD 50.
- **AC-13.10** (BR-13.9) Given the TAX module is closed for the period, when a settlement post is attempted, then 422 `LEDGER_PERIOD_CLOSED`.
- **AC-13.11** (FR-13.15) Given the Eurostat CN8 file for 2026 (≈ 9,500 codes), when imported, then every code has `validity_year = 2026`, the 2025 codes remain for historic lines, and a product category default resolves `commodity_code_id` on a sample product.
- **AC-13.12** (FR-13.16, BR-13.13) Given 1,200 dispatch lines for DE in March 2026 of which 30 lack net mass, when validated and compressed, then 30 exceptions are listed, the remaining lines compress to the expected 180 declaration lines (fixture), Σ invoice value equals the source documents, and the canonical export carries the partner VAT ids.
- **AC-13.13** (FR-13.16) Given an exported line whose commodity code is later corrected, when the journal is corrected, then a correction line with `correction_of_line_id` exists, the original is `corrected`, and a correction export run for the same period is produced.
- **AC-13.14** (FR-13.17, BR-13.15) Given a DE entity with an entertainment policy of 70% and an expense line of EUR 119.00 incl. 19% VAT, when calculated, then recoverable 13.30, non-recoverable 5.70 posted to the expense account; given a FR hotel invoice for the same DE entity, then the line is marked reclaimable under Directive 2008/9 with annex code 6 and appears in the Q1 reclaim extract for FR.
- **AC-13.15** (FR-13.18, BR-13.16) Given 40 Indian TDS transactions under section 194J for April 2026, when a remittance run is posted with challan reference, then the liability transfer balances, all 40 are `remitted`, and certificates issued for 12 payees are numbered gap-free and carry the challan reference.

2.13.9 Test plan and fixtures

- Fixtures: `tax-matrix-500` (US 200: multi-jurisdiction, exemptions, use tax; EU 180: standard/reduced/reverse charge/triangulation; IN 70: CGST/SGST/IGST, TDS; CA 50: GST/HST/PST/QST; each with expected results reviewed by an accountant); `jurisdictions-us-sample` (5 states' postal tables); `settlement-2026-03` (1,200 transactions with GL expectations); `saf-t-demo`; recorded AvaTax/Vertex HTTP fixtures.

Test	Type	Target	Pass criterion
Matrix runner	fixture (CI)	internal engine	500/500 match
Rounding distribution property test	property	per_document rounding	line taxes sum to document tax; each line within 1 unit of proportional
Inclusive back-out property	property	FR-13.5	base + taxes = gross exactly
Provider contract	contract (recorded)	AvaTax, Vertex adapters	request mapping and response normalization
Failover	integration (fault injection)	provider client	fallback within 2.5 s, event emitted
Settlement reconciliation	integration	settlement job	transactions = GL movement
SAF-T schema	unit	extract generator	XSD valid
Calculation latency	performance	tax API	100-line document p99 < 50 ms internal

Reconciliation: Σ TaxTransaction per code and period = GL tax account movement; settlement net = VAT return net box; ESL totals = Σ reverse-charge/intra-community output transactions.

2.13.10 Deployment and operations

Helm chart `passage-tax` (deployment 3–10 pods, CloudNativePG `tax-db`, topics `tax.calculations`, `tax.transactions`, `tax.settlements`; Kafka consumer of `ledger.journal`). Config: `TAX_PROVIDER_TIMEOUT_MS=2000`, `TAX_PROVIDER_RETRIES=1`, `TAX_PAYLOAD_RETENTION_DAYS=395`, `TAX_DEFAULT_ROUNDING=per_document`. Secrets: provider credentials in Vault paths `tax/providers/{le}`. Migrations: tax schema; partitions per fiscal year. Feature flags: `tax.provider.avalara`, `tax.provider.vertex`, `tax.extracts.saft`. Scheduled jobs: provider recommit retry (hourly), certificate expiry notifications (daily), settlement reminders per period. SLOs: calculate p99 < 50 ms (internal), availability 99.9%, provider fallback rate < 0.5%/day. Alerts: fallback rate > 2% over 1 h (P2), commit retry queue > 100 (P2), settlement mismatch (P2). Runbook: provider outage, re-commit queue drain, rate correction after posting (reverse documents, never edit transactions). Rollback: digest rollback; flags disable providers (internal engine only).

2.13.11 Migration from AX / SAP

Source	Passage entity	Notes
AX `TaxTable`, `TaxData`, `TaxAuthorityAddress`, `TaxPeriodHead`	TaxCode, TaxRate, authority Party, TaxSettlementPeriod	`TaxData` intervals → brackets; ledger posting group `TaxLedgerAccountGroup` → accounts

Source	Passage entity	Notes
AX `TaxGroupHeading/TaxGroupData`, `TaxItemGroupHeading/TaxItemGroupData`	TaxGroup, ItemTaxGroup	exempt flags preserved
AX `TaxExemptCodeTable`, customer `TaxExemptNumber`	ExemptionCertificate	validity defaulted to migration date → open; steward review queue
AX `TaxWithholdTable`, `TaxWithholdGroupHeading`, 1099 setup	WithholdingTaxCode	
AX `TaxTrans` (unsettled only)	TaxTransaction	linked to migrated opening balance lines by code
SAP `T007A/T007S`, `KONP/A003`, `T030K`	TaxCode, TaxRate, accounts	tax procedure steps → compound sequences
SAP `TTXJ/TTXD` jurisdictions	TaxJurisdiction	
SAP `T059P/T059Z`, `LFBW`	WithholdingTaxCode, party assignments	
SAP `BSET` (unsettled)	TaxTransaction	
AX `IntrastatCommodity`, `IntrastatTransactionCode`, `IntrastatTransportMode`, `IntrastatPort`, `IntrastatStatProc`, `IntrastatParameters`, `IntrastatCountryRegionParameters`	CommodityCode, IntrastatTransactionCode, TransportMode, Port, StatisticsProcedure, CountryTradeProperty	commodity codes re-keyed to CN8 validity year; `InventTable.IntrastatCommodity` → product `commodity_code_id` (wave 8)
AX `Intrastat` (journal, current open period only), `IntrastatArchiveGeneral`	IntrastatLine	open period lines migrated as `transferred`; archived declarations kept in the legacy archive
AX `TrvTaxConfiguration` / expense tax setup (recoverable VAT per country)	VatRecoveryPolicy	category mapping to wave 43 expense categories
SAP `T604`, `T605`, `T616`, `T618`, `MARC-STAWN`, `VEIAV` (open period)	CommodityCode, IntrastatTransactionCode, TransportMode, Port, product commodity code, IntrastatLine	`VEIAV` rows for the current period only
SAP `T059P/T059Z` sections, J1INCHLN challan history (open quarter)	WithholdingRemittanceRun (posted, historical reference only)	prior certificates not re-issued

Validation: code counts; a 200-document sample recalculated in Passage matches the source tax to the cent; unsettled totals per code match. Not migrated: settled history (kept in the legacy archive), provider transaction logs.

2.13.12 Dependencies, risks, open questions

Depends on: wave 11 (posting), wave 12 (currency conversion for tax amounts), wave 7 (party tax ids, VIES check), wave 8 (product categories), wave 6 (addresses).

Risk	Likelihood	Impact	Mitigation
Jurisdiction tables for US are vast and change monthly	High	Medium	Providers are the production default for US; internal engine ships sample states only
Country-specific VAT box mappings	High	Medium	Mapping is configuration (wave 48 packs); wave 13 ships DE/FR/UK/IN reference mappings
Rounding disputes with legacy figures	Medium	Low	Rounding mode configurable per code; migration validation sample

Open questions: (1) Settlement counterpart as tax authority Party (vendor role) vs settlement account? Default Party; decide by wave 13 mid-point. (2) Store provider raw payloads for 13 months or 7 years? Default 13 months payload + 7 years hash; decide by wave 13 exit. (3) Should `tax/calculate` be callable from the posting API automatically for manual journals with a tax group? Default yes behind flag `ledger.auto_tax`; decide by wave 14.

2.13.13 Parameters and setup

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
`tax.provider` per document type	legal entity × document type	enum	internal	internal / avalara / vertex	Engine selection (FR-13.10)	Sales tax parameters > External tax (ISV) / D365 Tax calculation parameters	External tax interface activation (`TTXD`, RFC destination) per tax procedure
`tax.provider_timeout_ms` / `tax.provider_retries`	tenant	int	2,000 / 1	500–10,000 / 0–3	Failover timing (FR-13.10)	—	RFC timeout
`tax.default_rounding`	legal entity	enum	per_document (VAT), per_line (US)	per_line / per_document	BR-13.3	General ledger parameters > Sales tax > Rounding (per line / per document) "Calculation"	OBY6 "Tax rounding" / `T001-TXKRS`; condition rounding rule
`tax.price_includes_tax_default`	legal entity × document type	bool	false (US), true (B2C retail)	true / false	Default for `price_includes_tax` (FR-13.5)	Accounts receivable parameters > Prices include sales tax	Pricing procedure gross/net condition (`KZWI`)
`tax.tax_date_basis`	legal entity × document type	enum	document_date	document_date / delivery_date / posting_date	BR-13.1 step 1	General ledger parameters > Sales tax > "Date of sales tax calculation"	OBCK/`T001-XTXDT` tax reporting date
`tax.conditional_settlement` (cash basis)	legal entity	bool	false	true / false	Tax becomes due on payment (AX conditional sales tax)	General ledger parameters > Sales tax > Conditional sales tax	`T007A` "deferred tax" (target tax code, RFUMSV50)
`tax.tax_on_prepayment`	legal entity	bool	false	true / false	Tax lines on prepayment invoices (waves 19/30)	General ledger parameters > Sales tax > Sales tax on prepayment	Down payment tax (F-29 with tax code)

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
`tax.cash_discount_base`	legal entity	enum	net_of_tax	net_of_tax / incl_tax	Cash discount tax adjustment base (waves 19/30)	General ledger parameters > Sales tax > Cash discount on invoice incl. sales tax	OBY6 "Discount base is net value"
`tax_code.settlement_period_id` and `authority_party_id`	tax code	ref	required	settlement periods, authority parties	Settlement grouping (FR-13.11)	Sales tax codes > Settlement period; Sales tax authorities	Tax payable posting F.12 by tax code; tax office vendor in `T001`
`tax_code.rounding`	tax code	enum	inherits entity	per_line / per_document	BR-13.3 per code	Sales tax authorities > Rounding	—
`tax.reporting_box_mapping`	legal entity (country)	jsonb	DE/FR/UK/IN reference mappings	box id → (code, direction, base/tax)	VAT return boxes (FR-13.12)	Sales tax reporting codes	ACR report definitions / `T007K` tax report box
`tax.saft_version`	legal entity	enum	OECD_2_0	OECD_2_0 / country variants (wave 48)	SAF-T schema	Electronic reporting SAF-T format configuration	ACR SAF-T report
`withholding.trigger`	withholding code	enum	payment	invoice / payment	FR-13.8	Withholding tax codes > "Withholding tax on invoice/payment"	`T059P` "accumulation / posting at payment"
`withholding.threshold` / `withholding.annual_accumulation`	withholding code	numeric / bool	0 / false	≥ 0	BR-13.8	Withholding tax codes > Limits	`T059Z` minimum amount, accumulation type
`intrastat.registration` (VAT id, declarant, agent)	legal entity	jsonb	required for EU entities	—	Export header (FR-13.15)	Foreign trade parameters > Intrastat	Foreign trade customizing: company code Intrastat data (VE0)
`intrastat.country_property.threshold_arrival` / `threshold_dispatch`	country	numeric	per country (DE EUR 3,000,000 arrival / 1,000,000 dispatch)	≥ 0	BR-13.14	Country/region properties (EU)	Country-specific threshold in VEB settings
`intrastat.compression_fields`	country	jsonb	EU default set (FR-13.16)	field list	Compression keys	Intrastat compression setup	VE01 aggregation settings
`intrastat.statistical_value_rule` / `freight_pct`	country	enum / numeric	invoice_value / 0	invoice_value / invoice_plus_freight_to_border / custom	BR-13.13	Foreign trade parameters > Statistical value	VEB statistical value calculation
`vat_recovery.min_claim_quarter` / `min_claim_year`	legal entity	numeric	EUR 400 / EUR 50	≥ 0	BR-13.15 carry-forward	—	—
`tax.payload_retention_days`	tenant	int	395	30–2,555	Provider payload retention (FR-13.10)	—	—
`tax.recommit_retry_interval`	tenant	duration	1 h	5 min–24 h	Provider recommit queue	—	—

2.13.14 Inquiries and reports

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
Posted tax transactions	list inquiry	legal entity, code, period, direction, settled, document	document, code, jurisdiction, base, tax, recoverable, non-recoverable, direction, settled run	`TaxTransaction`	Posted sales tax inquiry; SSRS Sales tax transactions — details	S_ALR_87012357 (line items), FBL3N on tax accounts, `BSET` view
Tax specification by voucher	drill-down	voucher / document	lines with codes, base, tax, determination trace link	`TaxTransaction` ⋈ `JournalLine`	SSRS Sales tax specification by ledger transaction	FB03 → Tax data
Sales tax settlement report	statutory report	authority, period, version	output, input, use, net, by code; GL reconciliation panel	`TaxSettlementRun`	SSRS Sales tax payments; Settled sales tax inquiry	S_ALR_87012357 advance return, F.12 (RFUMSV10)
VAT return (box report)	statutory report	legal entity, period	box id, base, tax per box mapping	`TaxTransaction` grouped by `reporting_box_mapping`	Sales tax report (by reporting codes)	RFUMSV00 / S_ALR_87099918, ACR VAT return
EU sales list	statutory report	legal entity, period	customer VAT id, country, value goods, services, triangulation	`TaxTransaction` (reverse charge / intra-community output)	SSRS EU sales list	RFASLM00 / S_ALR_87012400
Intrastat declaration summary	statutory report	legal entity, period, direction	lines, Σ invoice value, Σ statistical value, Σ mass, exceptions, threshold status	`IntrastatLine`	Intrastat report / Intrastat list	VE02 / VE03, MEIS output
Intrastat exceptions worklist	list inquiry	period, direction, rule	line, missing/invalid field, source document	`IntrastatLine` (status exception)	Intrastat validation result	VE01 error log
Withholding tax report	statutory report	legal entity, code / section, period, payee	payee, tax id, base, rate, withheld, remitted, certificate	`WithholdingTransaction`, `WithholdingRemittanceRun`	SSRS Withholding tax; Tax 1099 summary / detail	S_ALR_87012111, RFIDYYWT, S_P00_07000134

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
VAT recovery report	operational report	legal entity, period, country, category	recoverable, non-recoverable, reclaimable, carried forward	`TaxTransaction` ⋈ `VatRecoveryPolicy`	SSRS VAT recovery report (expense)	— (custom report over `BSET` NAV/NVV)
Foreign VAT reclaim extract	statutory report	legal entity, refund country, period	invoice ref, vendor VAT id, date, taxable amount, VAT, annex code	`VatReclaimExtract`	Recover VAT (ER-based claim)	—
SAF-T audit file	statutory report	legal entity, period	GL entries, master files, source documents (OECD 2.0)	ledger + tax + party APIs	Electronic reporting SAF-T	ACR SAF-T (FIUAMSAFT)
Calculation tester / explain	drill-down	sample document	determination trace steps	tax engine	Sales tax calculation (tax information dialog)	Tax procedure analysis (FB60 > tax simulation)
Provider fallback KPI	KPI	legal entity, day	fallback rate, recommit queue size, mean provider latency	`tax.provider.fallback` events	—	—
Exemption certificate expiry	operational report	party, jurisdiction, days to expiry	certificate, valid_to, status, document link	`ExemptionCertificate`	Tax exempt numbers listing	Exemption licenses list (J_1BLFZ-type / `LFBW` exemption dates)
Tax configuration listing	operational report	legal entity	codes, rates, groups, item groups, accounts	tax setup	SSRS Sales tax list / Sales tax codes	`T007A` / FTXP listing

2.13.15 Printed and electronic documents

Document	Trigger	Layout elements	Formats	Numbering sequence	Legal / retention requirement
VAT return	settlement period close / user	header: entity, VAT id, period, version; lines: boxes with base and tax; footer: net payable/refundable, preparer, settlement voucher	PDF, canonical JSON; country e-formats (ELSTER XML, UK MTD JSON, FR EDI-TVA) via wave 48	settlement run id + version	statutory; 10 years (DE/FR), 6 (UK), 7 (US)
EU sales list	monthly / quarterly	header: entity VAT id, period; lines: customer VAT id, country, goods, services, triangulation	PDF, CSV, canonical XML; country e-formats in wave 48	extract run id	statutory; 10 years
Intrastat declaration	monthly per direction	header: PSI VAT id, declarant, period, direction; lines: CN8, partner country, partner VAT id, origin, nature, transport, delivery terms, mass, units, values	canonical JSON, CSV; DE XML (Destatis IDEV), FR EMEBI, NL CBS via wave 48	export run id (versioned)	statutory; 10 years
SAF-T file	on request / monthly (PT, NO, PL mandates)	OECD 2.0 header, master files, GL entries, source documents	XML (XSD-validated)	extract run id	statutory; equals ledger retention
Tax settlement voucher	settlement posted	entity, authority, period, codes, output/input/net, voucher	PDF	ledger voucher	financial record; 10 years
Withholding certificate	certificate issue	payer, payee, tax ids, section, period, base, rate, withheld, remittance references, certificate no.	PDF; country forms (Form 16A, 1099-NEC/MISC, 1042-S) rendered by wave 48	per (legal entity, section, fiscal year), gap-free	statutory; 7–10 years per country
Withholding remittance statement	remittance run posted	authority, section, period, transactions, challan/bank reference	PDF, CSV	remittance run id	statutory; 10 years
Foreign VAT reclaim file	reclaim extract	applicant, refund country, period, invoices with annex codes	XML per refund-country portal (wave 48), CSV	extract run id	statutory; 10 years
Exemption certificate image	certificate registered	uploaded document	PDF / image	certificate number (external)	statutory; certificate validity + 4 years (US streamlined)

2.13.16 Periodic and batch jobs

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
`tax-provider-recommit`	hourly	legal entity × provider	commit with stored `Idempotency-Key`; queue item deleted on success	1,000 items < 2 min	exponential back-off; alert after 24 h	queue > 100 → P2
`tax-journal-link` (consume `journal.posted`, link TaxTransaction)	continuous	legal entity	upsert by (source, line_ref)	lag p95 < 5 s	dead-letter after 5 attempts	DLQ > 0 → P2
`tax-settlement-propose`	per settlement period end + 1 day	authority	run per (authority, period, version)	1M transactions < 3 min	proposal marked failed; close task blocked	mismatch → P2
`tax-certificate-expiry`	daily 06:00	legal entity	daily snapshot	< 1 min	—	certificates expiring ≤ 30 days → notification
`intrastat-transfer`	monthly, 3rd business day 05:00	legal entity × direction	transfer keyed by (source line, period); re-run adds only new and reversed lines	100k lines < 5 min	source resolver errors listed; run continues	exceptions > 0 → close task "Intrastat exceptions"
`intrastat-cn8-import`	yearly, 1 December	tenant	file hash	< 1 min	quarantine file	import missing by 31 December → P3
`withholding-accumulation-rebuild`	daily 02:30	vendor	recomputes annual accumulation from posted transactions; compare	100k vendors < 5 min	—	diff > 0 → P2
`vat-reclaim-quarterly`	quarter end + 10 days	legal entity × refund country	run per (country, quarter)	< 2 min	—	—
`saft-monthly` (where mandated)	5th day of month	legal entity	run per period	1M lines < 10 min	retry once	XSD failure → P2

2.13.17 Security duties and privileges

Duty	Privileges (entry points)	Segregation-of-duties conflicts	Default roles that include it
Calculate tax (service accounts)	POST /tax/calculate, /tax/commit	not assignable to humans	Document service accounts
View tax configuration	/tax/calculate:explain; read screens	—	Tax accountant, Accountant, Internal auditor
Maintain tax codes	PUT codes, rates, VAT recovery policies; screen Tax codes, VAT recovery policies	Settle tax; Produce tax reports (same period sign-off)	Tax manager

Duty	Privileges (entry points)	Segregation-of-duties conflicts	Default roles that include it
Maintain tax groups	PUT groups / item-groups	Maintain tax codes (optional)	Tax manager, Tax accountant
Maintain tax jurisdictions	PUT jurisdictions, postal table import	—	Tax manager
Maintain tax exemptions	certificates CRUD	Maintain customer master (wave 7)	Tax accountant, AR credit specialist
Maintain withholding tax	withholding codes	Settle tax	Tax manager
View tax transactions	GET transactions, Intrastat lines (read)	—	Tax accountant, Accountant, Internal auditor
Settle tax	settlements, :post; withholding remittances	Maintain tax codes; Maintain withholding tax	Tax accountant (senior), Financial controller
Produce tax reports	extracts, Intrastat exports, VAT reclaims, certificates	Maintain tax codes	Tax accountant
Maintain foreign trade setup	Intrastat master data CRUD and CN8 import	Maintain Intrastat journal	Tax manager, Trade compliance officer
Maintain Intrastat journal	transfer, PATCH lines (corrections), validate, compress	Maintain foreign trade setup	Trade compliance clerk, Tax accountant
Administer tax	provider settings, credentials (Vault), recommit queue	Settle tax	Finance platform administrator

2.13.18 Message catalog

Code	Severity	User text	Cause	Remediation	Raised by
TAX-0001 `TAX_RATE_NOT_FOUND`	error	Tax code {code} has no rate valid on {tax_date}.	BR-13.6	Add a rate row	FR-13.1
TAX-0002 `TAX_RATE_INVALID`	error	Rate {rate} is not valid; rates must be ≥ 0 with intervals that do not overlap.	BR-13.11	Correct the rate rows	FR-13.1
TAX-0003 `TAX_GROUP_UNRESOLVED`	error	No tax group or item tax group could be resolved for line {line}.	BR-13.1 step 2	Set party/product defaults or override	FR-13.2
TAX-0004 `TAX_NO_INTERSECTION`	warning	Groups {group} and {item_group} share no tax code; line {line} is untaxed.	BR-13.1 step 3	Review group setup	FR-13.4
TAX-0005 `TAX_EXEMPTION_EXPIRED`	warning	Exemption certificate {number} expired on {valid_to}; full tax applied.	FR-13.7	Renew the certificate	FR-13.7
TAX-0006 `TAX_REVERSE_CHARGE_INELIGIBLE`	warning	Reverse charge not applicable: {reason}; standard rate applied.	BR-13.7	Check VAT id and countries	FR-13.6
TAX-0007 `TAX_PROVIDER_FALLBACK`	warning	Provider {provider} unavailable; internal engine used. Document flagged for recommit.	FR-13.10	None; recommit runs automatically	FR-13.10
TAX-0008 `TAX_SETTLEMENT_MISMATCH`	error	Settlement {total} differs from GL tax account movement {gl} by {diff}.	FR-13.11	Investigate unlinked tax lines or manual postings on tax accounts	FR-13.11
TAX-0009 `TAX_SETTLEMENT_PERIOD_CLOSED`	error	Module TAX is closed for {period}.	BR-13.9	Reopen TAX or settle next period	BR-13.9
TAX-0010 `TAX_OVERRIDE_FORBIDDEN`	error (403)	You may not override the tax code on this line.	BR-13.1 step 5	Remove the override or request the duty	FR-13.4
TAX-0011 `TAX_INCLUSIVE_RESIDUAL`	info	Inclusive back-out residual {residual} applied to the largest tax line.	BR-13.4	None	FR-13.5
TAX-0012 `TAX_INTRASTAT_INVALID`	error	Intrastat line {line}: {field} {reason}.	FR-13.16 validation	Correct the line or the source master data	FR-13.16
TAX-0013 `TAX_INTRASTAT_COMMODITY_MISSING`	error	No commodity code for product {product} on line {line}.	Product without CN8	Set the product or category commodity code	FR-13.15
TAX-0014 `TAX_INTRASTAT_LINE_EXPORTED`	error	Line {line} was exported in run {run} and cannot be edited; create a correction.	BR-13.13	Use the correction action	FR-13.16
TAX-0015 `TAX_INTRASTAT_THRESHOLD_CROSSED`	info	Cumulative {direction} value {value} exceeds the {country} threshold {threshold}; declarations required from {period}.	BR-13.14	Submit declarations from that period	FR-13.16
TAX-0016 `TAX_COMMODITY_CODE_EXPIRED`	warning	Commodity code {code} is not valid for {year}.	CN8 yearly change	Map to the successor code	FR-13.15
TAX-0017 `TAX_VAT_RECOVERY_POLICY_MISSING`	warning	No VAT recovery policy for category {category} in {country}; tax code default {pct}% used.	BR-13.15	Add a policy	FR-13.17
TAX-0018 `TAX_RECLAIM_BELOW_MINIMUM`	info	Reclaimable VAT {amount} for {country} is below the minimum; carried to the annual claim.	BR-13.15	None	FR-13.17
TAX-0019 `TAX_WHT_ALREADY_REMITTED`	error	Transaction {id} is already included in remittance {run}.	BR-13.16	Exclude it	FR-13.18
TAX-0020 `TAX_WHT_CERTIFICATE_ISSUED`	error	Remittance {run} has issued certificates and cannot be cancelled.	BR-13.16	Reissue certificates with corrections	FR-13.18
TAX-0021 `TAX_SAFT_SCHEMA_INVALID`	error	SAF-T file failed XSD validation: {detail}.	FR-13.12	Correct source master data (e.g., missing tax registration)	FR-13.12

2.13.19 Performance budgets and capacity

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
`POST /tax/calculate` (internal, 100 lines)	300k documents/day; peak 200/s	8 / 25 / 50 ms	1,000 documents/s per 10 pods	none (stateless)	rate/group caches per pod	HPA to 10 pods; p99 ≤ 120 ms
`POST /tax/calculate` (provider)	30% of US documents	provider + 10 ms	per provider quota	payload 13 months ≈ 50 GB	—	timeout 2 s → internal fallback
TaxTransaction linking	1M tax lines/month	lag p95 < 5 s	2,000/s	350 B/row × 12M = 4 GB	partition by fiscal year; indexes §2.13.4	lag grows; settlement waits for lag = 0
Settlement proposal	monthly; 1M transactions	—	< 3 min	settlement rows small	(le, code, period, settlement_run_id)	runs on replica
Intrastat transfer + validate + compress	100k lines/month per entity	—	< 5 min	250 B × 1.2M/year = 300 MB	(le, period, direction, status)	chunked per source type
VAT return / ESL extract	monthly	—	< 1 min	outputs ≈ 1 MB	—	—
SAF-T export	monthly / on request; 1M lines	—	< 10 min	1 GB XML per month (object storage, compressed 10:1)	streamed generation	queued, one per entity

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3x load
Calculation explain	5k/day	15 / 60 / 120 ms	100/s	—	—	—

2.13.20 Localization and compliance hooks

- Tax regimes vary by country in rates, mechanisms (VAT vs GST vs sales/use), reverse-charge categories (domestic reverse charge for construction, scrap, mobile phones in DE/UK), cash-basis VAT (FR services, PT), split payment (IT, PL), and tax point rules; the internal engine models them as configuration; wave 48 packs ship tax code sets, box mappings and settlement periods per country.
- Statutory filings: VAT return e-formats (ELSTER DE, MTD UK, EDI-TVA FR, SII ES real-time ledger, Fattura/LIPE IT), ESL formats, Intrastat national formats, SAF-T variants (PT, NO, PL JPK, RO D406), US 1099 IRIS/FIRE files, India GSTR-1/3B and TDS 26Q, Canada GST34 are produced by pack exporters registered on the `tax.extract_format` extension point over the canonical datasets of FR-13.12, FR-13.16, FR-13.18.
- E-invoicing clearance (SDI, CFDI, Peppol) is wave 35/48; the tax engine supplies tax breakdowns in the canonical form these require.
- Currency: VAT returns in national currency; ESL in EUR (BR-13.12); statutory rate type per country (wave 12 §2.12.20).
- Rounding: per-document vs per-line default per country (DE/FR per document, US per line, IN per line per GST rules).
- Retention: VAT records 10 years (DE, FR), 6 (UK), 7 (US), 8 (IN); tax transactions are part of the append-only ledger domain and never purged in Phase 2.
- Privacy: party tax ids and addresses are personal data for sole traders; Intrastat partner VAT id and withholding payee data are tagged `pii` for wave 7 data-subject requests; exports are access-logged.
- Foreign trade beyond Intrastat (export documents, customs declarations, export control screening) is a wave 48 foreign trade pack; wave 13 provides commodity codes, country of origin and trade fields reused by that pack.
- Extension points: `tax.provider` adapter, `tax.extract_format`, `tax.box_mapping_pack`, `tax.intrastat_validation_pack`, `tax.withholding_form` renderer.

2.13.21 Coverage closure

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
AX §12.1.4 Setup — Foreign trade → Intrastat parameters, commodity codes, transaction codes, transport methods, ports, statistics procedure (AX register row 7)	PARTIAL-13	ADDED as FR-13.15	master data entities and screen Foreign trade setup
AX §12.10.2 Inquiries & Reports — SSRS VAT recovery report (expense tax) (AX register row 78)	PARTIAL-13	ADDED as FR-13.17	VAT recovery report in §2.13.14
AX §12.10.3 Periodic — Expense → Recover VAT (ER-based claim) (AX register row 81)	PARTIAL-13	ADDED as FR-13.17	foreign VAT reclaim extract; portal file formats DEFERRED to wave 48
AX §12.10.4 Setup — Expense → Tax configuration (recoverable VAT per country, tax groups on expenses) (AX register row 86)	PARTIAL-13	ADDED as FR-13.17	`VatRecoveryPolicy`; expense categories come from wave 43
AX §12.14.1 Common — Inventory → Commodity codes (Intrastat on item) (AX register row 124)	PARTIAL-13	ADDED as FR-13.15	product `commodity_code_id` (wave 8 field) referencing `tax.CommodityCode`
AX §12.29.1 Common — Foreign trade → Intrastat (journal) / EU sales list (link) (AX register row 236)	PARTIAL-13	ADDED as FR-13.16	Intrastat journal with corrections and audit
AX §12.29.3 Periodic — Foreign trade → Intrastat transfer / validation / export (file) (AX register row 247)	PARTIAL-13	ADDED as FR-13.16	transfer, validate, compress, export; national file formats via wave 48
AX §12.29.4 Setup — Foreign trade parameters, Commodity codes, Transaction codes, Transport methods, Ports, Statistics procedures, Country/region properties, Intrastat compression, check setup, EU sales list reporting (AX register row 255)	PARTIAL-13	ADDED as FR-13.15 (setup), FR-13.16 (compression, checks)	ESL reporting was already FR-13.12
SAP §13.2 FI-AP — J1INCHLN / J1INBANK / J1INCERT (IN WHT) (SAP register row 25)	PARTIAL-13	ADDED as FR-13.18 (remittance, challan reference, certificate numbering); Form 16A / 26Q rendering DEFERRED to wave 48	IN country pack renders forms over the canonical dataset
SAP §13.17 LE-SHP — Foreign trade / export documents in delivery (customs, commercial invoice, EUR.1, Intrastat from delivery; GTS) (SAP register row 205)	PARTIAL-13	ADDED as FR-13.16 for Intrastat from deliveries (via `IntrastatSource`); export documents and customs DEFERRED to wave 48	register proposes a wave 48 foreign trade/customs pack; wave 28 shipments register as an Intrastat source
SAP §13.17 LE-SHP Customizing — Foreign trade: export control, preference, Intrastat settings (VEB, VE0; `T604`, `T605`) (SAP register row 208)	PARTIAL-13	ADDED as FR-13.15 for Intrastat settings; export control and preference DEFERRED to wave 48	denied-party screening and preference calculation are trade compliance, not tax
SAP §13.18 TM — Customs declarations via GTS from TM (SAP register row 212)	PARTIAL-13	DEFERRED to wave 48	customs declarations belong to the foreign trade/customs pack; wave 13 supplies commodity codes and origin data

2.14 Wave 14: Period Close, Year-End & Allocations

2.14.1 Scope and business context

AX controls posting through `LedgerPeriod` statuses (open, on hold, closed) per module (`LedgerPeriodModuleAccessControl`) and offers the financial period close workspace, allocation rules (`LedgerAllocation`), accrual schemes and year-end close; SAP uses OB52 posting period intervals per account type with authorization groups, the Financial Closing Cockpit, assessment/distribution cycles (KSV5/KSU5), the accrual engine and balance carry-forward (FAGLGVTR). Wave 14 adds to Passage: a period-control matrix enforced inside the posting API; a close checklist run on Temporal with templates, dependencies and a cross-entity board; an allocation engine (fixed, basis, iterative) with reversal; accrual schemes and recurring journal scheduling (completing FR-11.10); and year-end close with carry-forward per dimension.

After this wave a controller can close March 2026 for three entities from one board, with every subledger path rejected after close, allocations and accruals posted and reversed on schedule, and year-end producing opening balances. Out of scope: subledger-specific close tasks (inventory close wave 20, AP/AR aging waves 19/30), consolidation (wave 40), budget vs actual (wave 38).

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
SAP OB52 (`T001B`): closing a period is an edit of interval rows per account type and company code, done by Basis/FI power users across many company codes; a typo opens the wrong range and postings land in a closed month	Period control is a maintenance view, not a controlled transition with validation	Period-control grid with state machine (BR-14.3), GL-closes-last rule, bulk close across ledgers with confirmation	Close of 3 entities × 10 modules: 30 OB52 edits → 1 bulk action; wrong-period postings → 0
Reopening a closed period in AX (Ledger calendar form) or SAP is a single-user action with no approval; auditors find silent reopenings in the database log weeks later	No workflow on period status	Reopen requires two approvers, a reason, an expiry timer and emits `close.period.status-changed`	Unapproved reopenings → 0; audit evidence available in < 1 s rather than at audit time
Close tracking lives in Excel or the AX financial period close workspace that does not block dependent tasks; SAP Closing Cockpit setup requires consultants	Task status is informational; automation hooks are limited to batch jobs	Temporal-driven CloseRun with DAG dependencies, automation hooks that complete on completion events, cross-entity board	Close coordination emails/period 50+ → 0; task status latency hours → seconds
AX allocation rules (`LedgerAllocation`) and SAP KSV5/KSU5 cycles post rounding residues to odd destinations and have no reciprocal (iterative) option without CO-OM workarounds; reruns double-post	Residual handling undefined; cycles not idempotent	Largest-share residual rule, iterative solver with convergence check, runs reversible as a unit and idempotent by key	Allocation rerun duplicates → 0; reciprocal allocations supported natively (vs manual spreadsheets)
FAGLGVTR / AX year-end close must be rerun after late postings; operators delete and regenerate opening entries, breaking the audit trail	Carry-forward implemented as mutable opening balances	Year-end run reverses its predecessor and regenerates (append-only), verifies opening = closing per combination before commit	Opening/closing mismatch after reruns → 0; audit trail unbroken

2.14.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Period status	`LedgerPeriod` (Open/On hold/Closed), Ledger calendar form	`T001B` intervals via OB52 (periods 1–12, 13–16 special)	`ledger.PeriodStatus` per ledger × period × module	full
Module access control	`LedgerPeriodModuleAccessControl`, user groups per module	OB52 authorization group (`BRGRU`), account type (+, A, D, K, M, S)	PeriodStatus.module × `allowed_group_id`	full
Special periods	Closing period type on fiscal calendar	Periods 13–16	Fiscal period `kind = adjustment` (wave 6) with own PeriodStatus	full
Close workspace	Financial period close workspace (templates, tasks, dependencies, calendar)	Financial Closing Cockpit / Advanced Financial Closing	`close` service: CloseTemplate, CloseRun, CloseTask (Temporal)	full
Allocations	`LedgerAllocation`, allocation rules (basis/fixed/equally/spread), process allocation request	KSV5 (distribution), KSU5 (assessment), cycles/segments, FAGLGA35	`ledger.AllocationRule`, `AllocationRun` with fixed, basis, equal, iterative methods	full
Accruals	Accrual schemes (`LedgerAccrualScheme`), ledger accruals	Accrual engine (ACE), FBS1 with reversal	`ledger.AccrualScheme`; reversal via wave 11 reversal	full
Recurring entries	Periodic journals	FBD1/F.14	`ledger.RecurringJournal` (wave 11) with calendar-relative schedules	full
Year-end close	General ledger > Year-end close (`LedgerFiscalYearClose...`), opening transactions, retained earnings per dimension	FAGLGVTR balance carry-forward, retained earnings account (OB53)	`ledger.YearEndCloseRun` producing period-0 opening entries	full
Reopen period	Change status back to Open	OB52 edit	Dual-approval reopen workflow	improved: four-eyes, audited
Close calendar / status board	Workspace tiles per entity, task list by due date	Cockpit task list, status overview	Close board across legal entities	full
Balance-sheet regrouping / reclassification	Not standard (manual reclassification journals; vendor debit balances via "Customer/vendor balance list" and manual journal)	FAGLF101 / F101 sort and reclassify by remaining term, FAGL_CL_REGROUP (S/4 closing regrouping), FAGL_CL_RGRP sort method and adjustment accounts (`T030`, `T043`), regroup vendors with debit balances and customers with credit balances	`ledger.RegroupingRule`, `ledger.RegroupingRun` with auto-reversal (FR-14.13); AP/AR item sources from waves 19/30	full

2.14.3 Functional requirements

- **FR-14.1 Period-control matrix** — Must. The system shall maintain a status per (ledger, fiscal period, module) where module ∈ {GL, AP, AR, INV, FA, PROJ, TAX, BANK, PAYROLL, ALL} and status ∈ {never_opened, open, on_hold, closed}.
  - `ALL` is the default when no module row exists; a module row overrides `ALL`. `on_hold` carries `allowed_group_id` (user group that may still post).
  - The posting API resolves module from `source.system` (mapping table, default GL for manual journals) and rejects per BR-14.1. The check is inside the posting transaction (status row read with `FOR SHARE`), so a close committing concurrently wins or loses atomically.
- **FR-14.2 Period status transitions** — Must. The system shall allow `never_opened → open`, `open ↔ on_hold`, `open|on_hold → closed`, and `closed → open` only through the reopen workflow (FR-14.3).
  - Closing a period for `ALL` requires every module row to be closed or absent; closing GL requires all other modules closed (GL closes last).
  - Period 13–16 adjustment periods may be open while 12 is closed.
- **FR-14.3 Reopen with dual approval** — Must. The system shall reopen a closed period only via a Temporal workflow requiring two distinct approvers holding duty `Approve period reopen`, a reason, and an expiry (reopened period auto-closes after N days, default 3).
  - Each reopen increments `reopen_count` and emits `close.period.status-changed` with both approvers.
- **FR-14.4 Close templates and runs** — Must. The system shall define close templates (tasks with module, description, assignee role, due offset in business days from period end, dependencies, evidence requirement, automation hook) and instantiate a `CloseRun` per (template, period, set of legal entities).
  - Maximum 500 tasks per template; dependencies form a DAG (cycle rejected on save).
  - Automation hooks call Passage jobs (revaluation, allocation, accrual, settlement, year-end, statement pack) and mark the task complete when the job emits its completion event.
- **FR-14.5 Close board** — Must. The system shall show tasks across entities by status (not started, in progress, blocked, completed, skipped) with due dates, owners, overdue counts, and allow bulk reassignment and evidence attachment.
- **FR-14.6 Allocation rules** — Must. The system shall define allocation rules with source (account/dimension filter, period, ledger), destination (account/dimension targets), method ∈ {fixed_percentage, fixed_weight, equally, basis}, basis source (balances of statistical or financial accounts by dimension, e.g., headcount), offset account, and `allocate_from_zero` behavior.
  - Percentages must sum to 100.000000 (tolerance 0); weights normalized; basis computed from the Balance projection for the period.
  - Rounding per BR-14.4; destination lines inherit dimensions from the basis.
- **FR-14.7 Iterative (reciprocal) allocations** — Should. The system shall solve mutually dependent rules (service departments allocating to each other) iteratively until the residual per source < 1 minor unit or 100 iterations, then post one entry per rule.

- **FR-14.8 Allocation runs and reversal** — Must. Runs support simulate and post modes, record the basis snapshot, and are reversible as a unit (reversing every produced entry); a rule may be flagged `auto_reverse_next_period`.
- **FR-14.9 Accrual schemes** — Must. The system shall define schemes (debit/credit accounts, frequency, number of occurrences, spread method ∈ {equal, by_days, custom}) that split a source line into future-dated entries, each auto-reversed per scheme (e.g., monthly accrual reversed on day 1).
  - Generated entries are scheduled on Temporal and posted on their dates if the period is open; otherwise the task appears as blocked on the close board.
- **FR-14.10 Year-end close** — Must. The system shall close a fiscal year per ledger: (a) for each P&L account × dimension combination, post the net to retained earnings (per dimension when `retain_dimensions = true`, else to the ledger's retained earnings combination) in the closing period, and (b) create opening entries in period 0 of the next year for each balance-sheet account × combination equal to its closing balance.
  - Re-runnable: a subsequent run reverses the prior run's entries and regenerates (append-only).
  - Requires all periods of the year closed for all modules except `GL` in `on_hold` for the closing user group; year-end entries are flagged `is_closing_entry` / `is_opening_entry` and excluded from P&L statements.
- **FR-14.11 Recurring journal scheduling** — Must. Completes FR-11.10: schedules by fiscal period offset (e.g., "last business day of period"), with pause/resume, next-run preview and a generated-batch history.
- **FR-14.12 Close reporting** — Should. The system shall report close duration per period and entity (period end to GL closed), tasks completed late, and reopen history.
- **FR-14.13 Balance-sheet regrouping (reclassification)** — Must. The system shall run, per ledger and key date, regrouping rules that reclassify balance-sheet positions for presentation and post adjustment entries to adjustment accounts, auto-reversed on the first day of the next period:
  - Sort method `remaining_term` (FAGLF101 semantics): open items of a source (GL open items from FR-11.19 in this wave; vendor and customer open items and receivable/payable reconciliation accounts when waves 19/30 register their `open_item_source`) are bucketed by remaining term from the key date to `due_date` (default buckets ≤ 1 year, 1–5 years, > 5 years) and each bucket's amount is reclassified from the source account to the bucket's adjustment account with the configured target (e.g., long-term portion of a loan or receivable).
  - Sort method `debit_credit_balance` per party: vendors whose net balance is a debit are reclassified from payables to "receivables – vendors with debit balance"; customers with a credit net balance from receivables to "payables – customers with credit balance"; the balance is computed per party × reconciliation account × splitting dimensions (FR-11.23) and currency.
  - Sort method `account_balance_sign` for GL accounts (bank accounts with overdraft reclassified to short-term borrowings; VAT receivable/payable offset positions): the whole account × combination balance is reclassified when its sign is opposite the account's `normal_balance`.
  - Each run supports simulate and post, records the snapshot it used, is idempotent per (ledger, key date, rule set), and is reversible as a unit; posted entries carry `is_regrouping = true` and keep the source line's dimensions; the close checklist (FR-14.4) offers a "Regrouping" automation hook.

2.14.4 Data model

PeriodStatus

Field	Type	Required	Notes
ledger_id	uuid	yes	PK part
fiscal_period_id	uuid	yes	PK part
module	enum	yes	PK part; ALL, GL, AP, AR, INV, FA, PROJ, TAX, BANK, PAYROLL
status	enum	yes	never_opened, open, on_hold, closed
allowed_group_id	uuid	no	required when on_hold
reopen_count	int	yes	default 0
reopen_expires_at	timestamptz	no	
changed_at / changed_by / approvals	timestamptz / uuid / jsonb	yes	approvals = [{user_id, at}] for reopen

CloseTask (within CloseRun)

Field	Type	Required	Notes
id	uuid	yes	PK
run_id	uuid	yes	FK CloseRun (template_id, fiscal_period_id, legal_entity_ids[], status)
legal_entity_id	uuid	yes	
template_task_id	uuid	yes	
module	enum	yes	
name / description	text	yes	
assignee_user_id / assignee_role	uuid / text	conditional	
due_at	timestamptz	yes	period_end + offset business days
depends_on	uuid[]	no	task ids
status	enum	yes	not_started, in_progress, blocked, completed, skipped
evidence_uri / evidence_required	text / bool	conditional	
automation	jsonb	no	{job, params, completion_event}
completed_at / completed_by	timestamptz / uuid	no	
temporal_workflow_id	text	yes	

AllocationRule and **AllocationRun**

Field	Type	Required	Notes
id	uuid	yes	PK
ledger_id	uuid	yes	
name	text(60)	yes	unique per ledger
source_filter	jsonb	yes	account ranges + dimension filters + `include_opening`
method	enum	yes	fixed_percentage, fixed_weight, equally, basis
destinations	jsonb	yes	[{account, dimensions, pct
offset_account_id / offset_dimension_mode	uuid / enum	yes	mode: source_dimensions, fixed

Field	Type	Required	Notes
iterative_group	text	no	rules in the same group are solved together
auto_reverse_next_period	bool	yes	
run: id, rule_ids[], fiscal_period_id, mode (simulate/post), status (proposed, posted, reversed, cancelled), iterations, basis_snapshot (jsonb), entry_ids[], reversal_entry_ids[]			

AccrualScheme: `id`, `ledger_id`, `code`, `debit_account_id`, `credit_account_id`, `frequency` (monthly, quarterly, custom), `occurrences`, `spread` (equal, by_days, custom[]), `start_rule` (document_date, next_period_start), `auto_reverse` bool, `reverse_day` int. **YearEndCloseRun**: `id`, `ledger_id`, `fiscal_year_id`, `retained_earnings_combination_id`, `retain_dimensions`, `status`, `closing_entry_ids[]`, `opening_entry_ids[]`, `previous_run_id`.

RegroupingRule and **RegroupingRun** (FR-14.13)

Field	Type	Required	Notes
rule: id / ledger_id / code	uuid / uuid / text(20)	yes	unique (ledger_id, code)
rule: sort_method	enum	yes	remaining_term, debit_credit_balance, account_balance_sign
rule: source	jsonb	yes	{source_type: gl_open_item / vendor / customer / account_balance, account ranges, dimension filter}
rule: buckets	jsonb	conditional	remaining_term: [{from_days, to_days, adjustment_account_id, target_account_id}]
rule: adjustment_account_id / target_account_id	uuid	conditional	debit/credit balance and sign methods
rule: group_by	text[]	yes	party, reconciliation account, splitting dimensions, currency
rule: active / sequence	bool / int	yes	
run: id / ledger_id / key_date / rule_ids	uuid / uuid / date / uuid[]	yes	
run: mode / status	enum / enum	yes	simulate, post; proposed, posted, reversed, cancelled
run: snapshot	jsonb	yes	per rule: groups with balances, buckets, items count (compressed)
run: entry_ids / reversal_entry_ids	uuid[]	no	reversal dated key_date + 1 day
run: totals	jsonb	yes	per adjustment account

Invariants: at most one PeriodStatus per (ledger, period, module); `closed` GL implies every other module closed; an AllocationRun that is `posted` has Σ destination amounts = source amount per rule (after rounding); YearEndCloseRun opening balances per combination = closing balances (verified by the run before commit). Indexing: `period_status` PK; `close_task` on (run_id, status), (assignee_user_id, due_at); `allocation_run` on (ledger_id, fiscal_period_id).

2.14.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
GET	/api/v1/ledger/ledgers/{id}/periods?year=	Period-control matrix	n/a	View period status
PATCH	/api/v1/ledger/ledgers/{id}/periods/{period}/modules/{module}	Transition status (open/on_hold/closed)	naturally idempotent on target status	Maintain period status
POST	/api/v1/ledger/ledgers/{id}/periods/{period}:request-reopen	Start reopen workflow	`Idempotency-Key`	Request period reopen
POST	/api/v1/close/templates and GET/PUT /{id}	Templates	PUT idempotent	Maintain close templates
POST	/api/v1/close/runs	Instantiate run for period × entities	`Idempotency-Key`	Run period close
GET	/api/v1/close/runs/{id}/tasks?entity=&status=	Board data	n/a	View close board
POST	/api/v1/close/tasks/{id}:start, :complete, :skip, :reassign	Task actions	`Idempotency-Key`	Work close tasks
GET/PUT	/api/v1/ledger/ledgers/{id}/allocation-rules[/{rule}]	Rules	PUT idempotent	Maintain allocation rules
POST	/api/v1/ledger/allocations	Run (simulate/post)	`Idempotency-Key`	Run allocations
POST	/api/v1/ledger/allocations/{id}:post, :reverse	Post proposal / reverse run	`Idempotency-Key`	Run allocations
GET/PUT	/api/v1/ledger/ledgers/{id}/accrual-schemes[/{code}]	Schemes	PUT idempotent	Maintain accrual schemes
POST	/api/v1/ledger/year-end-closes	Run year-end close (simulate/post)	`Idempotency-Key`	Run year-end close
GET/PUT	/api/v1/ledger/recurring-journals[/{id}] and :pause, :resume	Schedules	PUT idempotent	Maintain ledger journals
GET/PUT	/api/v1/ledger/ledgers/{id}/regrouping-rules[/{code}]	Regrouping rules (FR-14.13)	PUT idempotent	Maintain regrouping rules
POST	/api/v1/ledger/regroupings and /{id}:post, :reverse	Regrouping run simulate / post / reverse	`Idempotency-Key`	Run regrouping

Commands: `TransitionPeriodStatus` (validates FR-14.2 ordering; closing with unposted approved batches dated in the period → `CLOSE_PENDING_BATCHES` unless `force` with duty); `RequestReopen` (reason ≥ 10 chars, two approvers distinct from requester); `RunAllocation` (period open for GL, basis non-zero or `allocate_from_zero`); `RunYearEndClose` (all periods closed per FR-14.10, retained earnings account exists and is equity).

Event	Trigger	Payload fields	Consumers
dev.passage.close.period.status-changed.v1	PeriodStatus transition	ledger_id, fiscal_period_id, module, from, to, actor, approvals[], reason	all posting services (cache), close, reporting, audit
dev.passage.close.run.created.v1	run instantiated	run_id, template_id, period, legal_entity_ids, task_count	notifications
dev.passage.close.task.completed.v1	task completed/skipped	run_id, task_id, status, actor, evidence_uri, late (bool)	board, notifications, reporting
dev.passage.ledger.allocation.completed.v1	run posted/reversed	run_id, rule_ids, period, iterations, entry_ids, reversal	reporting, close
dev.passage.ledger.accrual.scheduled.v1	scheme applied	source_entry_id, scheme, occurrences[] (dates, amounts)	close board
dev.passage.ledger.year-end.closed.v1	year-end posted	ledger_id, fiscal_year_id, closing_entry_ids, opening_entry_ids, retained_earnings_total	reporting, close
dev.passage.ledger.regrouping.completed.v1	regrouping posted or reversed	run_id, ledger_id, key_date, rule_ids, totals per adjustment account, entry_ids, reversal	reporting, close

2.14.6 User experience

Screen	Primary actions	Key fields/columns	Duty required
Ledger calendar / period control	Grid ledger × period × module; set status; bulk close; request reopen	period, module, status, allowed group, changed by, reopen count	Maintain period status
Close templates	Build task list, dependencies (DAG view), due offsets, automation	task, module, role, due offset, depends on, evidence, hook	Maintain close templates

Screen	Primary actions	Key fields/columns	Duty required
Close board	Instantiate run, kanban/list across entities, filter overdue, reassign, attach evidence, complete	entity, task, owner, due, status, blocked by, evidence	View / Work close tasks
Allocation rules	Define source, method, destinations, basis; simulate	name, method, source filter, destinations, offset, iterative group	Maintain allocation rules
Allocation runs	Simulate, review proposal (source → destinations), post, reverse	rule, source amount, destination, basis value, pct, amount	Run allocations
Accrual schemes	Define, preview schedule on a sample amount	code, accounts, frequency, occurrences, spread, reverse day	Maintain accrual schemes
Year-end close	Select year/ledger, simulate, review retained earnings by dimension, post	account, combination, closing balance, opening balance, retained earnings	Run year-end close
Regrouping	Define rules (method, source, buckets, accounts), simulate for a key date, review groups (party / bucket / amount), post, reverse	rule, source account, party, bucket, balance, adjustment account, target account, amount	Maintain regrouping rules / Run regrouping

Interaction rules: period grid supports keyboard range selection and bulk status change with a confirmation summarizing affected modules; close board tasks open in a side panel without losing filters; blocked tasks show the blocking task inline; allocation proposals support "what-if" edits to percentages that recompute live but require saving the rule to post.

2.14.7 Business rules and edge cases

- **BR-14.1 Period-control decision.** For a line with posting_date → period P, module M (from source mapping), user U: status = row(P, M) if present else row(P, ALL) if present else `never_opened`. `open` → allow; `on_hold` → allow iff U ∈ allowed_group else 403 `LEDGER_PERIOD_ON_HOLD`; `closed` or `never_opened` → 422 `LEDGER_PERIOD_CLOSED`. Service accounts for subledgers are members of no on-hold group by default.
- **BR-14.2 Period-control matrix (reference configuration for March close).**

Module	Day 1–3 after period end	Day 4–5	After GL close
INV, PROJ, PAYROLL	on_hold (ops group)	closed	closed
AP, AR, BANK	open	on_hold (AP/AR supervisors)	closed
TAX	open	open	closed after settlement
FA	open	closed	closed
GL	open	on_hold (controllers)	closed
ALL (default for unmapped)	open	on_hold (controllers)	closed

- **BR-14.3 Period status state machine.** `never_opened → open`; `open → on_hold`; `on_hold → open`; `open|on_hold → closed`; `closed → open` only via reopen workflow (two approvals) which sets `reopen_expires_at`; on expiry a Temporal timer sets `closed` again and emits the event. Transitions are rejected with `CLOSE_INVALID_TRANSITION`.
- **BR-14.4 Allocation rounding.** Destination amounts = round(source × share, scale); residual = source − Σ destinations; residual applied to the destination with the largest share (ties: first by definition order). Basis values of zero across all destinations → skip rule with `ALLOC_ZERO_BASIS` unless `allocate_from_zero` = equally.
- **BR-14.5 Iterative convergence.** Reciprocal groups solved by Gauss–Seidel iteration on the unrounded amounts; stop when max |Δ| < 10^−scale / 2 or at 100 iterations (then fail `ALLOC_NO_CONVERGENCE`); rounding applied once after convergence per rule.
- **BR-14.6 Allocation period lock.** A run posts only if GL is open or on_hold with the runner in the allowed group; the basis period may differ from the posting period (e.g., prior-period headcount) and is snapshotted on the run.
- **BR-14.7 Accrual spread by days.** Amount_i = round(total × days_i / total_days); residual to the last occurrence; occurrences dated the first day of each period (or scheme `post_day`) and reversed the first day of the following period.
- **BR-14.8 Year-end retained earnings per dimension.** When `retain_dimensions`, the retained earnings line keeps the P&L line's dimension combination (replacing only the main account); dimension values inactive on the opening date are remapped to the ledger's `default_closing_combination` and listed in the run report.
- **BR-14.9 Year-end re-run.** A new run for the same (ledger, year) first reverses all entries of `previous_run_id` (dated the same dates), then regenerates; opening period 0 is not subject to period control of the new year's period 1.
- **BR-14.10 Close task dependencies.** A task becomes `in_progress`-eligible only when all `depends_on` tasks are `completed` or `skipped`; skipping requires a reason and duty `Skip close tasks`; automation tasks cannot be completed manually unless marked `manual_override_allowed`.
- **BR-14.11 Concurrency on close.** Closing GL takes `FOR UPDATE` on the PeriodStatus row and waits for in-flight postings (which hold `FOR SHARE`) up to 5 s before failing with `CLOSE_BUSY`; retried by the UI.
- **BR-14.12 Calendar mismatch across ledgers.** Period-control is per ledger; a ledger group posting where any member ledger's period is closed is rejected as a whole with the offending ledger named.
- **BR-14.13 Regrouping computation.** Remaining term = `due_date − key_date` in days; items without `due_date` fall into the shortest bucket and are listed as `no_due_date`; overdue items (negative term) fall into the shortest bucket. For `debit_credit_balance`, the group balance is Σ open items per (party, reconciliation account, splitting dimension values, currency) at the key date; only groups whose sign is opposite the account's normal balance are reclassified, for their full balance. Entries: debit/credit the adjustment account and the target account in accounting and reporting currency using the posted amounts (revalued amounts when a wave 12 revaluation for the key date is posted, so reclassification follows valuation); one entry per rule per run; auto-reversal on key_date + 1 day. A second posted run for the same (ledger, key date, rule) is rejected (`CLOSE_REGROUPING_EXISTS`) until the first is reversed. Rules run in `sequence`; an item is used by at most one rule per run.

2.14.8 Acceptance criteria

- **AC-14.1** (FR-14.1, BR-14.1) Given AP is closed for March and GL open, when a vendor-invoice posting (source.system = ap) dated 2026-03-31 is attempted, then 422 `LEDGER_PERIOD_CLOSED`; a manual GL journal on the same date posts.
- **AC-14.2** (FR-14.1) Given every subledger posting path in the contract suite (manual, ap, ar, inv, fa, proj, tax, bank stubs), when the period is closed for ALL, then every path is rejected (table-driven test, 0 exceptions).
- **AC-14.3** (FR-14.2) Given AP is still open, when GL close is requested, then `CLOSE_INVALID_TRANSITION` naming AP.
- **AC-14.4** (FR-14.3) Given a closed period, when a reopen is requested and approved by two distinct users, then status is `open`, `reopen_count = 1`, and after the expiry timer the period is `closed` again (Temporal time-skip).
- **AC-14.5** (FR-14.6, BR-14.4) Given the allocation fixture (rent USD 10,000.01 by headcount 3/5/2), when run, then destinations are 3,000.00, 5,000.01, 2,000.00 and Σ = source.
- **AC-14.6** (FR-14.7) Given two service departments allocating 10% to each other, when run iteratively, then the result converges within 100 iterations and matches the reciprocal workbook to the cent.

- **AC-14.7** (FR-14.9) Given a USD 1,200.00 annual insurance invoice with a 12-occurrence equal scheme, when applied, then 12 entries of 100.00 are scheduled on period starts with reversals on the next period start.
- **AC-14.8** (FR-14.10) Given a 12-period dataset, when the year-end close is posted, then every balance-sheet combination's opening balance equals its closing balance, P&L accounts open at 0.00, and retained earnings change equals net income.
- **AC-14.9** (FR-14.4, FR-14.5) Given a 40-task template across 3 entities with dependencies, when the run completes, then no task was completed before its dependencies and the board shows 120 tasks completed.
- **AC-14.10** (BR-14.11) Given 50 concurrent postings in flight, when GL close is requested, then it either waits ≤ 5 s and succeeds with no posting committed after the close timestamp, or returns `CLOSE_BUSY`.
- **AC-14.11** (FR-14.13, BR-14.13) Given a loan clearing account with open items due 2026-09-30 (USD 40,000.00), 2028-03-31 (USD 120,000.00) and 2032-03-31 (USD 200,000.00) and key date 2026-03-31, when the `remaining_term` rule runs, then USD 40,000.00 stays short-term, USD 320,000.00 is reclassified to long-term in one entry, and the reversal is dated 2026-04-01.
- **AC-14.12** (FR-14.13) Given stub vendor open items where vendor V7 nets to a debit of USD 1,250.00 and customer C3 nets to a credit of USD 800.00, when the `debit_credit_balance` rules run, then USD 1,250.00 moves from payables to "receivables – vendors with debit balance" and USD 800.00 from receivables to "payables – customers with credit balance"; a second post for the same key date returns `CLOSE_REGROUPING_EXISTS`.

2.14.9 Test plan and fixtures

- Fixtures: `period-matrix-demo` (3 ledgers × 16 periods × 10 modules); `close-template-40` (40 tasks, 3 entities, 12 dependencies, 6 automation hooks); `alloc-fixtures-25` (fixed, weight, equal, basis, 3 reciprocal groups; XLSX expected); `accrual-fixtures-10`; `fy2025-12-periods` (12 posted periods, 400 combinations, expected opening balances).

Test	Type	Target	Pass criterion
Period decision table	unit	BR-14.1	60 cases (status × module × group)
Subledger path contract	contract	all posting clients' stubs	closed period rejected on every path
Close race	integration	ledger + close	no post commits after close timestamp
Reopen workflow	Temporal test	close service	two approvals, expiry auto-close
Allocation workbook	integration	allocation engine	totals equal, residual rule honored
Reciprocal convergence property	property	iterative solver	converges for random 2–6 department matrices with shares < 50%
Year-end equivalence	integration	year-end job	opening = closing per combination
Close board E2E	Playwright + axe	React	40-task run completes; WCAG AA

Reconciliation: Σ allocation destinations = Σ sources per run; Σ accrual occurrences = source amount; opening balances per combination = closing; retained earnings Δ = net income per ledger.

2.14.10 Deployment and operations

Helm charts: `passage-close` (TypeScript service, 2–4 pods, CloudNativePG `close-db`, Temporal namespace `close`), `passage-ledger` upgraded (period status, allocation, accrual, year-end). Config: `CLOSE_REOPEN_DEFAULT_DAYS=3`, `CLOSE_LOCK_WAIT_MS=5000`, `ALLOC_MAX_ITERATIONS=100`, `ALLOC_CONVERGENCE_FRACTION=0.5`. Migrations: `period_status` seeded from fiscal calendars (`never_opened`), existing demo periods set `open`. Feature flags: `close.reopen_workflow` (always on in prod), `ledger.iterative_allocations`. Scheduled jobs: accrual and recurring journal generators (Temporal schedules), reopen expiry timers, close reminder notifications (daily 08:00 entity time zone). SLOs: period decision adds < 2 ms to posting p99; close board p95 < 500 ms for 1,000 tasks. Alerts: reopen without expiry (P2), posting rejected rate for closed periods > 50/h (P3, indicates a subledger misconfiguration), allocation non-convergence (P3). Runbook: emergency reopen, stuck close lock, re-running year-end. Rollback: digest rollback; period status rows are retained; disabling the flag never bypasses period control.

2.14.11 Migration from AX / SAP

Source	Passage entity	Notes
AX `LedgerPeriod`, `LedgerPeriodModuleAccessControl`, `LedgerFiscalCalendarPeriod`	PeriodStatus	statuses copied; modules mapped (Ledger→GL, VendInvoice→AP, CustInvoice→AR, Inventory→INV, Asset→FA, Project→PROJ, Sales tax→TAX, Bank→BANK)
AX `LedgerAllocation`, `LedgerAllocationRule*` (basis/destination/source)	AllocationRule	basis "statistical" → basis spec on statistical accounts
AX `LedgerAccrualScheme`	AccrualScheme	
AX financial period close templates/tasks (`FinancialPeriodCloseTemplate*`)	CloseTemplate, template tasks	dependencies and due offsets preserved
SAP `T001B` (OB52)	PeriodStatus	account type + → ALL, D → AR, K → AP, A → FA, M → INV, S → GL; authorization group → allowed_group
SAP KSV5/KSU5 cycles (`T811C`, `T811S`, `T811K`)	AllocationRule	segments → rules; tracing factor → basis spec
SAP `T030` retained earnings (OB53)	Ledger.retained_earnings_combination_id	per ledger
SAP closing cockpit templates	CloseTemplate	
SAP FAGLF101 sort methods and adjustment accounts (`T030` transactions PYO, PYU, PYT; `T043`), FAGL_CL_RGRP settings	RegroupingRule	sort method buckets → buckets; adjustment/target accounts per reconciliation account; prior regrouping runs not migrated (they auto-reverse)

Validation: period statuses per module equal the source at cutover; allocation rules re-executed on the last closed period in simulate mode and compared to source postings (tolerance 0.01 per destination). Not migrated: completed close task history, prior allocation run history, SAP accrual engine objects (re-keyed as schemes).

2.14.12 Dependencies, risks, open questions

Depends on: wave 11 (posting API hook, reversal), wave 12 (revaluation hook on checklist), wave 13 (settlement hook), wave 4 (Temporal human tasks and timers), wave 6 (fiscal calendars with adjustment periods), wave 2 (user groups).

Risk	Likelihood	Impact	Mitigation
Subledger services (future waves) bypass module mapping	Medium	High	Source mapping is mandatory; unmapped `source.system` → GL and rejected when GL on hold; contract test suite grows per wave
Iterative allocation performance with many dimensions	Low	Medium	Solver limited to 50 rules per group; measured in fixtures

Risk	Likelihood	Impact	Mitigation
Year-end with millions of combinations	Medium	Medium	Chunked generation (50k lines per entry, multiple entries per run); run measured on 1M-combination synthetic set

Open questions: (1) Should on_hold allow service accounts of the owning module by default? Default no; decide by wave 14 mid-point. (2) Retained earnings per dimension as default? Default yes for the demo; decide with accountant review by wave 14 exit. (3) Do adjustment periods 13–16 get their own close checklist? Default: same run, tasks flagged `adjustment_only`.

2.14.13 Parameters and setup

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivale
`period_control.module_mapping`	tenant	jsonb	ledger→GL, ap→AP, ar→AR, inventory→INV, fa→FA, project→PROJ, tax→TAX, bank→BANK, payroll→PAYROLL	source.system → module	BR-14.1 module resolution	Ledger calendar > Module access (`LedgerPeriodModuleAccessControl`)	OB52 ac types (+, K, M, S,
`period_control.on_hold_group_id`	ledger × period × module	ref	none	user groups (wave 2)	Who may post while on hold	Ledger calendar > Access level / user group	OB52 authoriz group (`BRGRU`) second interval

CLOSE-0011 `ALLOC_ZERO_BASIS`	warning	Rule {rule} skipped: basis is zero for all destinations.	BR-14.4	Check basis data or set allocate_from_zero	BR-14.4
CLOSE-0012 `ALLOC_NO_CONVERGENCE`	error	Iterative group {group} did not converge in {n} iterations.	BR-14.5	Review reciprocal shares (≥ 50% loops)	FR-14.7
CLOSE-0013 `YEAR_END_PERIODS_OPEN`	error	Year-end close needs all periods of {year} closed; open: {list}.	FR-14.10	Close the listed periods	FR-14.10
CLOSE-0014 `YEAR_END_RE_ACCOUNT_INVALID`	error	Retained earnings account {account} must be an equity account.	FR-14.10	Fix the ledger setting	FR-14.10
CLOSE-0015 `YEAR_END_DIMENSION_REMAPPED`	warning	{count} combinations had inactive values and were remapped to {default}.	BR-14.8	Review the run report	BR-14.8
CLOSE-0016 `CLOSE_REGROUPING_EXISTS`	error	A posted regrouping exists for {ledger} {key_date} rule {rule}.	BR-14.13	Reverse it first	FR-14.13
CLOSE-0017 `CLOSE_REGROUPING_SOURCE_UNAVAILABLE`	error	Open-item source {source} is not registered for {ledger}.	AP/AR wave not live	Use GL sources only or wait for the source	FR-14.13
CLOSE-0018 `CLOSE_REGROUPING_NO_DUE_DATE`	warning	{count} items without due date were placed in the shortest bucket.	BR-14.13	Maintain due dates on the source documents	BR-14.13

2.14.19 Performance budgets and capacity

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
Period decision in posting	every posting line batch	+0.3 / +1 / +2 ms	at 5,000 lines/s	—	`period_status` PK cached per pod, invalidated by event	cache miss → PK read
Period transition (close GL)	3 entities × 10 modules × 16 periods per year	50 / 500 / 5,000 ms (lock wait)	—	480 rows/year/ledger	PK	`CLOSE_BUSY` returned after 5 s
Close board load	1,000 tasks	80 / 300 / 500 ms	50 req/s	1,000 tasks × 12 runs × 1 KB = 12 MB	(run_id, status), (assignee, due_at)	page size reduced
Allocation run	1,000 rules, 50k destinations	—	< 5 min	basis snapshots 10 MB/run	balance PK queries per rule	runs queued per ledger
Iterative allocation group	≤ 50 rules	—	< 60 s	—	in-memory solver	fail at 100 iterations
Accrual generation	10k occurrences/day	—	< 2 min	—	(scheme, date)	—
Year-end close	1M combinations	—	< 20 min	2M lines/year/ledger	chunked entries of 50k lines	chunk size reduced, run longer
Regrouping	1M open items	—	< 10 min	2 entries per rule per period	`open_item` (account, status, due_date)	per-rule timeout 20 min

2.14.20 Localization and compliance hooks

- Fiscal calendars vary (JP/IN April–March, AU July–June, 4-4-5 retail calendars, 13-period calendars) — handled by wave 6 calendars; period control is per ledger so local-GAAP ledgers can follow a different year end.
- Year-end: some jurisdictions require closing to the profit-and-loss summary account then to retained earnings (FR, ES PGC class 129 "Resultado del ejercicio"; IT "Utile d'esercizio") and separate opening/closing balance sheets (DE "Eröffnungsbilanzkonto"/"Schlussbilanzkonto" 9000/9008); country packs configure an intermediate result account and closing/opening balance sheet accounts as year-end template steps.
- Regrouping: remaining-term disclosure buckets vary — HGB §268(4)/(5) "Restlaufzeit bis 1 Jahr / mehr als 5 Jahre", IFRS current/non-current (IAS 1.66–1.76: 12 months), US GAAP current maturities; country packs ship bucket sets and adjustment account sets; debit-balance vendor reclassification is mandatory under HGB and common under IFRS.

- Statutory locking: DE GoBD requires "Festschreibung" (posted entries immutable within the period of the VAT return) — satisfied by append-only journal plus period close; FR FEC closes the year with a "clôture" that is irreversible — country pack sets `reopen_approvers = 3` and disallows reopen after the statutory deadline.
- Retention of close evidence: 10 years (DE/FR), 7 (US SOX workpapers per PCAOB AS 1215).
- SOX: reopen dual approval, close pack evidence and SoD duties above are the SOX 404 control hooks consumed by wave 48 controls monitoring.
- Extension points: `close.template_pack` (country/industry close templates), `ledger.year_end_step` (intermediate result account, closing/opening BS accounts), `ledger.regrouping_bucket_pack`.

2.14.21 Coverage closure

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
SAP §13.1 FI-GL Periodic processing — FAGLF101 / F101 Regroup receivables/payables (sorted list, reclassification by remaining term) (SAP register row 8)	GAP (propose 14)	ADDED as FR-14.13	`remaining_term` and `debit_credit_balance` methods; AC-14.11
SAP §13.1 FI-GL Periodic processing — FAGL_CL_REGROUP / FAGL_CL_MIGRATION Closing: regrouping (S/4) (SAP register row 10)	GAP (propose 14)	ADDED as FR-14.13	same engine; migration of FAGL_CL settings in §2.14.11
SAP §13.1 FI-GL Customizing — FAGL_CL_RGRP / Define sort method & adjustment accounts for regrouping (`T043`, `T030`) (SAP register row 21)	GAP (propose 14)	ADDED as FR-14.13	`RegroupingRule` buckets and adjustment/target accounts; parameters in §2.14.13
SAP §13.2 FI-AP Periodic processing — FAGLF101 (AP) Regroup vendors with debit balances (SAP register row 30)	GAP (propose 14)	ADDED as FR-14.13	rule ships in this wave; vendor item source activates when wave 19 registers `open_item_source = vendor` (AC-14.12 uses stub items)
SAP §13.3 FI-AR Periodic processing — FAGLF101 (AR) Regroup customers with credit balances (SAP register row 42)	GAP (propose 14)	ADDED as FR-14.13	customer item source activates with wave 30

2.15 Wave 15: Financial Reporting, Statements & Audit Trail

2.15.1 Scope and business context

AX ships Management Reporter (row, column, reporting tree definitions over dimensions) plus trial balance and ledger transaction inquiries; SAP uses financial statement versions (OB58, `T011`/`T011T`, `FAGL_011*`), Fiori financial statement apps and document-flow drill-down. Wave 15 builds the `reporting` service (Go, with its own Postgres read model fed by ledger events) with a row/column/tree report designer, standard statements (trial balance, balance sheet, P&L, cash flow indirect, comparatives, by-entity consolidated view), drill-down to the journal line and source document, scheduled distribution with row-level security on dimensions, and the audit trail report. This is the Phase 2 exit wave: finance stakeholders sign off a closed period produced entirely from Passage.

Out of scope: group consolidation with eliminations and translation (wave 40), budgets (wave 38), lakehouse analytics and dashboards (wave 46), XBRL/iXBRL (wave 48).

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
Management Reporter reads from its own data mart refreshed by an integration service; statements lag the GL by 15–60 min and the mart silently breaks after AX upgrades or dimension changes	Separate ETL (MR integration) with no "as of" stamping	Read model fed by `journal.posted` events with per-ledger HWM; every statement shows the sequence it reflects; nightly zero-diff verify	Statement lag p95 < 10 s (vs 15–60 min); "mart out of sync" incidents → 0
SAP F.01/RFBILA00 and FSV (OB58) drill to FAGLL03 but lose the FSV context; reaching the source document from a balance-sheet line is 7+ screens and often impossible for migrated items	Hierarchy, totals and line items are separate programs without a shared key	Drill-down contract (BR-15.4): cell → balance keys → lines → `source_uri` → trace id, with sums that must equal the cell	Clicks balance → document 7 → 3; drill sum mismatches → 0 (property-tested)
Report designer in MR requires a Windows client, separate security (tree security) and definitions that cannot be versioned or promoted between environments except by manual export	Desktop tooling, no API, no versioning	Web designer, JSON export/import with schema version, immutable published versions, OPA dimension security shared with the rest of Passage	Definition promotion dev → prod 1 h manual → < 1 min API call; security rule sets 2 → 1
Cash flow statement is hand-built in Excel from the trial balance because MR/FSV cash flow setups are fragile and do not reconcile	No tagging model linking balance movements to cash flow categories with an enforced check	`cash_flow_tag` on rows, `CF-STD` indirect derivation with `CF_UNRECONCILED` failure and a "not classified" check row	Cash flow preparation 1–2 days/period → generated in < 20 s with 0.00 reconciliation enforced
Audit requests ("who posted, who approved, when was the period reopened") require pulling `SysDatabaseLog` / `CDHDR` extracts and workflow history separately, usually by IT	Audit data spread across logs with no finance-facing report	Audit trail report over CDC audit + ledger events with hashed export	Audit evidence turnaround days → minutes; controller self-service, 0 IT tickets

2.15.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Report definitions	Management Reporter row/column/tree definitions, report definitions	Financial statement version (OB58, `T011`, `FAGL_011PC/ZC`), Report Painter/Writer	`reporting.ReportDefinition` (rows, columns, tree)	full
Row definitions	MR row: description, link to financial dimensions, format codes (TOT, CAL), normal balance	FSV nodes with account intervals, debit/credit split, net result	`ReportRow` with kind ∈ {account_range, dimension_filter, total, calculation, header}	full
Column definitions	MR column: FD (period), CALC, comparative, YTD, budget	Period/comparison columns in F.01 / Fiori	`ReportColumn` with period expressions (`P`, `P-1`, `YTD`, `PY`, `PYTD`, `CALC`)	full (budget columns in wave 38)
Reporting tree	MR tree of reporting units (dimension values)	Profit center hierarchy (KE5X), FSV per company	`ReportTree` over dimension hierarchies (wave 6)	full
Trial balance	Trial balance list page, `LedgerTrialBalanceListPage`	FAGLB03, S_ALR_87012277, F.08	Trial balance statement (standard definition)	full
Balance sheet / P&L	MR default reports	F.01 (RFBILA00), Fiori Balance Sheet / P&L	Standard definitions `BS-STD`, `PL-STD`	full
Cash flow	MR cash flow (manual definitions)	Cash flow via FSV + S/4 Cash Flow app	`CF-STD` indirect with cash-account tagging and non-cash adjustments	full
Drill-down	MR drill to account/transactions; ledger transaction inquiry; voucher transactions	Document flow (FB03), FAGLL03 line items, drill from Fiori statements	Statement cell → balance keys → lines → source document URI → trace id	improved: trace id
Distribution	MR report library, scheduled generation, email	Report scheduling (SM36), SAP Analytics Cloud publication	`StatementRun` schedules with PDF/XLSX/CSV, email, link	full

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Security	MR tree security, AX dimension security	Authorization objects (F_BKPF_BUK, K_CSKS), FSV authorization	OPA dimension-value policies applied to every balance query	full
Audit trail	Database log, voucher audit, workflow history	Change documents (CDHDR/CDPOS), FB03 header changes, SE16 on BKPF	Audit trail report over CDC audit (wave 5) + ledger events	full
Main account categories and derived hierarchies	Main account categories (`MainAccountCategory`), D365 derived financial hierarchies (`DimensionHierarchy` type Derived), Financial dimension sets	Account groups / G/L account hierarchies (KDH1–KDH3, `SETHEADER`/`SETNODE`), FSV nodes, profit center groups (KCH1)	`reporting.DerivedHierarchy` over main account categories and dimension values, effective-dated versions, usable as row sets and trees (FR-15.13)	full
P&L by function of expense (cost of sales accounting)	Custom MR rows by dimension	FSV with functional area (`RFAREA`), S_ALR_87012284 with FSV for cost of sales	Standard definition `PL-FUNC` over `FUNC_AREA` (FR-15.14)	full

2.15.3 Functional requirements

- **FR-15.1 Reporting read model** — Must. The system shall maintain in `reporting-db` a `ReportingBalance` fact (ledger × account × dimension combination × period × currency type) built from `ledger.journal.posted/reversed/balance.rebuilt/year-end.closed` events, with the covered `posting_sequence` high-water mark per ledger.
  - Lag SLO: p95 < 10 s after posting; every statement records the HWM it reflects and shows "as of sequence N / time T".
  - A nightly comparison against `ledger.Balance` must show zero differences.
- **FR-15.2 Report designer: rows** — Must. Row definitions contain ordered rows of kind header, account_range (account from/to, optional dimension filter), dimension_filter (any dimension values with wildcards), total (sum of row references), calculation (expression over row references with + − × ÷ and constants), with format (bold, indent, sign flip for normal credit balance, print zero, page break).
  - Maximum 2,000 rows per definition; expressions validated on save (unknown references, division by zero handled → blank).
- **FR-15.3 Report designer: columns** — Must. Column definitions specify period expressions relative to the run period (`P`, `P-n`, `YTD`, `PY`, `PYTD`, `Q`, `FY`), currency type (acct/rpt/txn with currency filter), ledger, dimension filter, variance/percent calculations between columns, and formatting.
  - Maximum 60 columns; comparative column sets (actual vs prior year) are templates.
- **FR-15.4 Reporting trees** — Must. Trees list reporting units (dimension value or hierarchy node from wave 6 hierarchies) with roll-up; a statement run produces one report per unit plus the roll-up, honoring OPA dimension security per viewer.
- **FR-15.5 Standard statements** — Must. The system shall ship definitions `TB-STD` (trial balance: opening, debit, credit, closing, net), `BS-STD`, `PL-STD`, `CF-STD` (indirect method: net income + non-cash adjustments + working-capital changes derived from balance movements of tagged accounts + investing + financing = change in cash), `TB-DIM` (trial balance by dimension), each parameterized by ledger, period, currency type, and tree.
  - Statements mark `is_closing_entry` / `is_opening_entry` handling: P&L excludes closing entries; BS includes opening entries.
  - Consolidated-by-entity view: side-by-side columns per legal entity and a simple sum column in reporting currency (no eliminations; wave 40).
- **FR-15.6 Statement runs** — Must. A run evaluates a definition for parameters and stores `StatementCell` values with the balance keys used, the HWM, duration, and a SHA-256 of the result; outputs rendered as HTML (interactive), PDF, XLSX and CSV.
  - 2,000-row × 12-column statement over 200k balances completes in < 20 s.
- **FR-15.7 Drill-down** — Must. From any cell: (1) balances view listing the (account, combination, period) keys with amounts summing to the cell; (2) journal lines for a selected key or the whole cell, paginated, with `voucher`, date, D/C, amounts, source; (3) source document link (`source_uri` resolved to a Passage route or external URL) and `trace_id` link to Tempo.
  - Drill honors the viewer's dimension security; the line sum shown equals the cell value exactly or the UI displays a reconciliation warning with the filtered-out amount (never silently).
- **FR-15.8 Scheduling and distribution** — Must. Definitions can be scheduled (cron or close-checklist hook) to run per entity set and distribute via email (PDF/XLSX attachments ≤ 20 MB, else link), shared link with expiry, and a report library with retention (default 7 years for statements run against closed periods, 90 days for ad-hoc).
- **FR-15.9 Row-level security on dimensions** — Must. OPA policies grant dimension values (e.g., cost centers) per user; balance queries, statements, drill-down and exports are filtered server-side; a report run by a scheduler uses the recipient's permissions per rendered copy.
- **FR-15.10 Audit trail report** — Must. The system shall report for a period and ledger: entries posted (who, when, source, idempotency replay flag), batch approvals (submitter, approvers, timestamps), reversals, period status changes including reopen approvals, rate overrides, tax fallbacks, allocation and year-end runs; exportable to CSV/PDF with a hash.
- **FR-15.11 Definition import/export** — Must. Definitions round-trip as JSON (schema-versioned) for backup, environment promotion and Management Reporter conversion.
- **FR-15.12 Management Reporter and FSV converters** — Should. The migration framework shall convert MR row/column/tree definitions (from the MR database `ControlRowDetail`, `ControlColumnDetail`, `ControlTreeDetail`) and SAP FSV (`T011`, `FAGL_011PC`, `FAGL_011ZC`) into Passage definitions with a conversion report of unsupported constructs.
- **FR-15.13 Derived financial hierarchies** — Must. The system shall maintain derived hierarchies: trees whose leaf assignment is derived by rules rather than listed, over (a) main account categories (each main account carries `category_id`; categories nest under hierarchy nodes) and (b) dimension values (nodes with membership rules: value ranges, wildcards, attribute filters such as `cost_center.region = EMEA`), with effective-dated versions.
  - A derived hierarchy can be used as a row set (one row per node, totals rolled up, leaves expanded on demand) and as a reporting tree (FR-15.4); statements record the hierarchy version used.
  - Validation on publish: every postable account (or every active dimension value) maps to exactly one leaf node, or is listed in an "unassigned" check node that must be empty for `strict = true` hierarchies (`REPORT_HIERARCHY_UNASSIGNED`); overlaps are rejected (`REPORT_HIERARCHY_OVERLAP`).
  - Membership is re-evaluated when accounts or dimension values change (`ledger.account.changed`, dimension events); a new value that matches no rule appears in the unassigned node within 60 s and raises a notification to the hierarchy owner.
  - Up to 12 levels and 20,000 nodes per hierarchy; JSON import/export like FR-15.11.
- **FR-15.14 P&L by function of expense** — Should. The system shall ship `PL-FUNC` (revenue, cost of sales, distribution costs, administrative expenses, other operating income/expense, financial result) whose expense rows filter on the `FUNC_AREA` dimension (FR-11.22) instead of account ranges, with a check row that lists P&L lines without `FUNC_AREA` and must be 0.00.

2.15.4 Data model

ReportDefinition, **ReportRow**, **ReportColumn**

Field	Type	Required	Notes
definition: id	uuid	yes	PK
definition: code / name / version	text(30) / text(120) / int	yes	unique (tenant, code, version)

Field	Type	Required	Notes
definition: kind	enum	yes	trial_balance, balance_sheet, income_statement, cash_flow, custom
definition: row_set_id / column_set_id / tree_id	uuid	yes/yes/no	
definition: default_ledger_id / currency_type	uuid / enum	yes	
definition: status	enum	yes	draft, published, retired
definition: schema_version	text	yes	for JSON import/export
row: id, row_set_id, sequence	uuid, uuid, int	yes	
row: kind	enum	yes	header, account_range, dimension_filter, total, calculation
row: label	text(200)	yes	
row: account_from / account_to	text(20)	conditional	
row: dimension_filter	jsonb	no	{attr: [values or ranges or *]}
row: references / expression	uuid[] / text	conditional	for total / calculation
row: normal_balance	enum	yes	debit, credit (sign presentation)
row: format	jsonb	no	bold, indent, print_zero, page_break, underline
row: cash_flow_tag	enum	no	operating_adjustment, working_capital, investing, financing, cash
column: id, column_set_id, sequence, label		yes	
column: period_expr	text	yes	`P`, `P-1`, `YTD`, `PY`, `PYTD`, `Q`, `FY`, `CALC`
column: currency_type / currency	enum / char(3)	yes/no	
column: ledger_code_override	text	no	compare ledgers side by side
column: dimension_filter	jsonb	no	
column: calc_expression	text	no	`C2-C1`, `(C2-C1)/C1`
column: format	jsonb	no	decimals, percent, width

StatementRun and **StatementCell**

Field	Type	Required	Notes
run: id	uuid	yes	PK
run: definition_id / version	uuid / int	yes	
run: parameters	jsonb	yes	ledger(s), period, tree unit, currency type, entities
run: hwm_by_ledger	jsonb	yes	{ledger_id: posting_sequence}
run: status	enum	yes	queued, running, completed, failed
run: started_at / completed_at / duration_ms		yes	
run: result_hash	bytea(32)	yes	SHA-256 over cells
run: outputs	jsonb	yes	[{format, uri, size}]
run: requested_by / security_principal	uuid	yes	whose dimension security applied
cell: run_id, row_id, column_id		yes	PK
cell: value	numeric(23,6)	yes	
cell: balance_keys	jsonb	yes	[{ledger, account, combination, period, currency_type}] (compressed; up to 50k keys, overflow stored as a query spec)
cell: line_count	int	yes	

DerivedHierarchy and **HierarchyNode** (FR-15.13)

Field	Type	Required	Notes
hierarchy: id / code / name	uuid / text(30) / text(120)	yes	unique (tenant, code, version)
hierarchy: subject	enum	yes	main_account_category, main_account, dimension_value
hierarchy: dimension_attribute_id	uuid	conditional	when subject = dimension_value
hierarchy: version / effective_from / status	int / date / enum	yes	draft, published, retired
hierarchy: strict	bool	yes	unassigned must be empty to publish
hierarchy: owner_user_id	uuid	yes	notified on unassigned members
node: id / hierarchy_id / parent_id / sequence	uuid	yes	depth ≤ 12
node: label / code	text(120) / text(30)	yes	
node: membership_rules	jsonb	no	leaves only: ranges, lists, wildcards, attribute filters, category ids
node: normal_balance / cash_flow_tag	enum	no	inherited by generated rows
membership (materialized): hierarchy_version, node_id, member_id		yes	rebuilt on change; PK (hierarchy_version, member_id)

MainAccountCategory: `id`, `code` text(20), `name`, `account_type` (must match member accounts' type), `sequence`; `MainAccount.category_id` FK (wave 11 entity extended).

AuditTrailEntry (materialized view over audit store + ledger events): `occurred_at`, `ledger_id`, `kind` (posted, replayed, reversed, batch_submitted, batch_approved, batch_rejected, period_changed, reopen_approved, rate_override, tax_fallback, allocation_run, year_end_run, rebuild), `actor_id`, `object_ref`, `details` jsonb, `trace_id`.

Invariants: for every cell, Σ ReportingBalance over `balance_keys` = `value` (property-tested); total rows equal Σ referenced rows; `TB-STD` closing per account = opening + debit − credit; `CF-STD` change in cash = Σ cash-tagged account movements; `result_hash` is reproducible for the same HWM and definition version. Indexing: `reporting_balance` PK (ledger, period, account, combination, currency_type) plus (ledger, account, period); `statement_cell` PK (run_id, row_id, column_id); audit view indexed on (ledger_id, occurred_at).

2.15.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
GET/POST/PUT	/api/v1/reporting/definitions[/{code}] and /{code}:publish	Definitions CRUD and publish	PUT idempotent	Maintain report definitions
GET/PUT	/api/v1/reporting/row-sets[/{id}], /column-sets[/{id}], /trees[/{id}]	Designer parts	PUT idempotent	Maintain report definitions
POST	/api/v1/reporting/definitions/{code}:validate	Validate expressions, references	stateless	Maintain report definitions
GET/POST	/api/v1/reporting/definitions/{code}/export, /import	JSON round-trip	import `Idempotency-Key`	Maintain report definitions
POST	/api/v1/reporting/runs	Run a statement	`Idempotency-Key`	Run financial statements
GET	/api/v1/reporting/runs/{id}[/cells] and /outputs/{format}	Results and files	n/a	View financial statements
GET	/api/v1/reporting/runs/{id}/cells/{row}/{col}/balances	Drill level 1	n/a	View financial statements
GET	/api/v1/reporting/runs/{id}/cells/{row}/{col}/lines?cursor=	Drill level 2 (lines)	n/a	View ledger transactions
GET	/api/v1/reporting/balances?ledger=&period=&account_from=&… &group_by=	Ad-hoc balance query (secured)	n/a	View ledger balances
GET/PUT	/api/v1/reporting/schedules[/{id}]	Distribution schedules	PUT idempotent	Schedule financial statements
GET	/api/v1/reporting/audit-trail?ledger=&period=&kind= and /audit-trail:export	Audit trail report	export run id	View audit trail
GET	/api/v1/reporting/lag	Read-model lag per ledger	n/a	View financial statements
GET/PUT	/api/v1/reporting/hierarchies[/{code}] and /{code}:publish, /{code}/members?version=	Derived hierarchies, publish, materialized membership (FR-15.13)	PUT idempotent	Maintain report definitions
GET/PUT	/api/v1/ledger/main-account-categories[/{code}]	Main account categories	PUT idempotent	Maintain chart of accounts

Queries and validation: `RunStatement` requires a published definition, period exists for every selected ledger, viewer has at least one permitted dimension value when a tree is used, and read-model lag ≤ `max_lag_seconds` (default 30) unless `allow_stale = true` (result flagged). `ImportDefinition` validates schema version and rejects duplicate codes without `overwrite`.

Event	Trigger	Payload fields	Consumers
dev.passage.reporting.statement.generated.v1	run completed	run_id, definition code/version, parameters, hwm_by_ledger, result_hash, outputs[]	distribution, close (automation hook), audit
dev.passage.reporting.statement.failed.v1	run failed	run_id, error, stage	ops, requester notification
dev.passage.reporting.definition.published.v1	publish	code, version, actor, diff_summary	audit, cache
dev.passage.reporting.lag.exceeded.v1	lag > threshold for 60 s	ledger_id, lag_seconds, hwm_ledger, hwm_reporting	ops alerting, close board
dev.passage.reporting.distribution.sent.v1	email/link delivered	run_id, recipients (hashed), format, size	audit
dev.passage.reporting.hierarchy.unassigned.v1	new account or dimension value matches no leaf	hierarchy code, version, member_id, member kind	hierarchy owner notification, close board

2.15.6 User experience

Screen	Primary actions	Key fields/columns	Duty required
Report designer	Create definition, edit rows/columns/tree in split panes, preview with live data, validate, publish, export/import	row label, kind, accounts, dimension filter, expression, format; column label, period expr, currency type	Maintain report definitions
Financial statements	Run (ledger, period, tree, currency), view interactive statement, compare runs, export	row, columns, as-of HWM, run status	Run / View financial statements
Drill-down panel	Cell → balances → lines → source document, open trace	account, combination, period, amount; voucher, date, D/C, amounts, source link	View ledger transactions
Trial balance (standard)	Period range, dimension filters, drill, export	account, opening, debit, credit, closing	View ledger balances
Report library	Browse outputs by entity/period/definition, share link, retention	definition, period, entity, generated at, hash	View financial statements
Schedules	Define cron/close hook, recipients, formats	definition, parameters, cron, recipients, last run	Schedule financial statements
Audit trail	Filter period/ledger/kind/actor, export with hash	occurred at, kind, actor, object, details, trace id	View audit trail
Derived hierarchies	Build tree, define membership rules per leaf, view unassigned/overlaps, publish version, use as row set or tree	node, level, rules, members count, unassigned count, version	Maintain report definitions

Interaction rules: designer previews render within 3 s against the demo dataset and update on each save; row grid supports drag-reorder, multi-select indent and "insert total of selection"; statements are keyboard navigable cell-by-cell (arrow keys) with Enter to drill; drill panels stack as breadcrumbs (Statement › Cell › Balances › Lines › Document); exports preserve number formatting and include an "as of" footer with HWM, definition version and result hash; all screens pass axe WCAG 2.1 AA.

2.15.7 Business rules and edge cases

- **BR-15.1 Period expression evaluation.** `P` = run period; `P-n` = n periods earlier in the ledger calendar (crossing fiscal years, adjustment periods skipped unless `include_adjustment_periods`); `YTD` = periods from fiscal year start through P, including adjustment periods ≤ P's year when flagged; `PY` = same period prior year; `Q` = fiscal quarter containing P.
- **BR-15.2 Balance-sheet amounts** are cumulative: Σ ReportingBalance.net from period 0 (opening) through the column's period; P&L amounts are the sum over the column's period range only and exclude `is_closing_entry` lines.
- **BR-15.3 Sign presentation.** Stored net = debit – credit; rows with `normal_balance = credit` display `-net`; calculation rows use displayed values unless the expression is prefixed `raw:`.
- **BR-15.4 Statement drill-down contract.** Level 1 returns balance keys whose Σ equals the cell value exactly (including rounding of the cell to the currency scale — none is applied since balances are already at scale). Level 2 returns lines for one key or the whole cell with keyset pagination (page size 500, max

1,000) ordered by (posting_date, posting_sequence, line_number); a `sum_of_lines` field accompanies every page and the final page's cumulative sum must equal the cell value; when dimension security filters lines, the response includes `filtered_amount` and the UI shows a warning.

- **BR-15.5 Cash flow (indirect) derivation.** Net income = P&L total for the range; operating adjustments = movements of rows tagged `operating_adjustment` (depreciation, provisions); working capital = −Δ of asset rows and +Δ of liability rows tagged `working_capital`; investing and financing = movements of tagged rows; cash = Δ of rows tagged `cash`. The statement fails validation (`CF_UNRECONCILED`) if net cash flow ≠ Δ cash by more than 0.00; untagged balance-sheet accounts appear in a "not classified" check row that must be zero.
- **BR-15.6 Read-model consistency.** A run captures HWM per ledger at start and evaluates only lines with `posting_sequence ≤ HWM`; two runs with equal HWM and definition version produce equal `result_hash`.
- **BR-15.7 Security.** Dimension security is applied as a filter on `ReportingBalance` queries (OPA returns allowed value sets per attribute, cached 60 s); a scheduled run renders per recipient; totals never include values the viewer cannot see; an "unrestricted" copy is produced only for recipients holding `View all dimensions`.
- **BR-15.8 Definition versioning.** Publishing creates an immutable version; runs reference the version; editing a published definition creates a draft of version n+1; retiring prevents new runs but keeps history.
- **BR-15.9 Comparative columns across calendars.** If `PY` period does not exist (calendar changed), the column shows blank with a footnote, not zero.
- **BR-15.10 Multi-ledger columns.** Columns with `ledger_code_override` are allowed only when the ledgers share the chart of accounts; otherwise `REPORT_LEDGER_INCOMPATIBLE`.
- **BR-15.11 Large cells.** Cells with > 50k balance keys store a query spec instead of the key list; drill level 1 re-executes the query at the run's HWM.
- **BR-15.12 Audit trail completeness.** Every `journal.posted` event must have an audit row within 60 s; a daily job counts events vs rows and alerts on any difference.
- **BR-15.13 Derived hierarchy resolution.** A statement run uses the hierarchy version effective on the run period's end date (or an explicit version); membership is materialized per version so re-running at the same HWM and version reproduces `result_hash`; a member matching several leaves blocks publish; for non-strict hierarchies unassigned members roll into an "Unassigned" node shown last with a footnote; a member's category change after publish takes effect only in the next version (or immediately when the hierarchy sets `follow_master_data = true`, which then records the change time in the run).

2.15.8 Acceptance criteria

- **AC-15.1** (FR-15.5) Given the demo entities' closed March 2026, when `BS-STD` and `PL-STD` run, then total assets = liabilities + equity (including current-period net income) to the cent and the P&L net equals `TB-STD` net of P&L accounts.
- **AC-15.2** (FR-15.5, BR-15.5) Given `CF-STD` for the same period, when run, then net cash flow equals the change in cash-tagged accounts to the cent and the "not classified" row is 0.00.
- **AC-15.3** (FR-15.7, BR-15.4) Given any cell of a run, when drilled to lines across all pages, then the cumulative sum equals the cell value exactly (property test over 1,000 random cells).
- **AC-15.4** (FR-15.7) Given a line from an AP-sourced entry (stub), when the source link is opened, then it resolves to the document route and the trace id opens in Tempo.
- **AC-15.5** (FR-15.11) Given a 200-row, 12-column definition, when exported to JSON and re-imported under a new code, then the two definitions produce identical cell values for the same parameters.
- **AC-15.6** (FR-15.9) Given a user permitted only cost center C200, when they run `TB-DIM`, then only C200 rows appear and drill-down lines are limited to C200 with `filtered_amount` shown on mixed cells.
- **AC-15.7** (FR-15.1, BR-15.6) Given postings continue during a run, when the run completes, then its `result_hash` is reproducible by re-running at the same HWM.
- **AC-15.8** (FR-15.8) Given a nightly schedule for 3 entities, when it fires, then PDF and XLSX outputs are in the library and the email is sent with attachments < 20 MB.
- **AC-15.9** (FR-15.10) Given a reopened period with a posting and re-close, when the audit trail runs, then it lists the reopen with both approvers, the posting, and the re-close in order with trace ids.
- **AC-15.10** (FR-15.6) Given 200k balances, when a 2,000 × 12 statement runs, then it completes in < 20 s.
- **AC-15.11** (Phase exit) Given the finance stakeholders' review, when they compare the Passage statement pack to the AX/SAP-derived expectations for the demo period, then every line ties and sign-off is recorded in the wave 15 issue.
- **AC-15.12** (FR-15.13, BR-15.13) Given a derived hierarchy over main account categories with `strict = true`, when a new postable account without a category is created, then publish of the next version is rejected with `REPORT_HIERARCHY_UNASSIGNED` naming the account and `hierarchy.unassigned` is emitted; after assigning the category, `BS-STD` run with the hierarchy as row set ties to `TB-STD` to the cent.
- **AC-15.13** (FR-15.14) Given the demo period with every P&L line carrying `FUNC_AREA`, when `PL-FUNC` runs, then its net result equals `PL-STD` net result to the cent and the check row is 0.00.

2.15.9 Test plan and fixtures

- Fixtures: `demo-fy2026-closed` (the dataset produced by waves 11–14 for the demo entities, three ledgers, EUR reporting currency); `definitions-std` (TB-STD, BS-STD, PL-STD, CF-STD, TB-DIM); `definition-200x12` (designer round-trip fixture); `mr-sample-definitions` (Management Reporter export of 10 definitions); `fsv-sample` (SAP `T011/FAGL_011PC` extract for 2 FSVs); `security-cases` (8 users with distinct dimension grants).

Test	Type	Target	Pass criterion
Statement tie-out	integration	standard definitions	BS balances; P&L = TB; CF reconciles
Drill-down sum property	property	drill API	Σ lines = cell for 1,000 random cells
Period expression unit tests	unit	evaluator	40 cases incl. adjustment periods and calendar change
Designer round-trip	contract	export/import	equal cell values
MR/FSV converters	unit	migration converters	10 MR + 2 FSV definitions convert; unsupported constructs listed
Security filtering	integration	OPA + reporting	8 users see only permitted values; totals exclude
Read-model lag	integration	event consumer	p95 < 10 s under 5k lines/s
Statement performance	performance	run engine	2,000 × 12 over 200k balances < 20 s
Reporting UI	Playwright + axe	designer, statements, drill	WCAG AA; keyboard drill works

Reconciliation: `ReportingBalance` = `ledger.Balance` nightly (0 diffs); TB closing = opening + movements; BS = L + E; CF net = Δ cash; audit rows = posted events.

2.15.10 Deployment and operations

Helm chart `passage-reporting` (Go service 3–8 pods, CloudNativePG `reporting-db` 3 instances with 1 read replica for statement runs, Kafka consumer group `reporting-balances`, renderer sidecar for PDF (Chromium headless) with 2 CPU limit). Config: `REPORTING_MAX_LAG_S=30`, `REPORTING_PAGE_SIZE=500`, `REPORTING_CELL_KEY_LIMIT=50000`, `REPORTING_RETENTION_CLOSED_YEARS=7`, `REPORTING_RETENTION_ADHOC_DAYS=90`. Migrations: reporting schema; backfill of `ReportingBalance` from the ledger via a one-time replay of `ledger.journal` topic (compacted snapshot + replay). Feature flags: `reporting.cash_flow`, `reporting.multi_ledger_columns`, `reporting.pdf`. Scheduled jobs: nightly `reporting-balance-verify`, nightly statement pack for demo entities (23:00 UTC), library retention sweep (weekly), audit completeness check (daily). SLOs: read-model lag p95 < 10 s; statement run p95 < 20 s (reference size); drill level 2 first page p95 < 300 ms; availability 99.9%. Alerts: lag > 60 s (P2), verify diff > 0 (P1), audit completeness diff (P1), PDF renderer failures > 5% (P3). Runbook: rebuild read model from ledger replay (≈ 15 min per 10M lines), stuck run cancellation, retention restore from object storage. Rollback: digest rollback; read model can be rebuilt from the journal at any time, so no data rollback is needed.

2.15.11 Migration from AX / SAP

Source	Passage entity	Notes
Management Reporter `ControlRowDetail`, `ControlColumnDetail`, `ControlTreeDetail`, `ControlReport`	ReportRow, ReportColumn, ReportTree, ReportDefinition	row link types (FD, dimension sets) → account_range/dimension_filter; CALC with + −×÷ converted; unsupported: XBRL tags, cross-report links (listed)
AX trial balance / inquiry saved queries	not migrated	standard definitions replace them
SAP `T011`, `T011T`, `FAGL_011PC`, `FAGL_011ZC`, `FAGL_011QT` (FSV)	ReportDefinition (BS/P&L), ReportRow	account intervals → account_range; debit/credit split nodes → two rows with sign rules; net result node → calculation row
SAP Report Painter libraries	not migrated	re-authored in the designer; conversion report lists them
AX `MainAccountCategory`, `DimensionHierarchy` (derived hierarchies), MR reporting trees	MainAccountCategory, DerivedHierarchy, HierarchyNode	category → `MainAccount.category_id`; derived hierarchy rules copied as membership rules
SAP account groups / G/L hierarchies (`SETHEADER` / `SETNODE` / `SETLEAF` class 0109), profit center groups (KCH1)	DerivedHierarchy (subject main_account or dimension_value)	set intervals → range rules
AX database log / SAP CDHDR history	not migrated	legacy audit remains in the archive; Passage audit begins at cutover

Validation: converted definitions run against migrated opening balances and are compared to the legacy final statements for the cutover period (tolerance 0.00 after sign normalization); conversion report reviewed by the controller.

2.15.12 Dependencies, risks, open questions

Depends on: wave 11 (journal events, balances), wave 12 (reporting currency amounts), wave 13 (tax audit events), wave 14 (period events, closing/opening flags, close-checklist hooks), wave 6 (dimension hierarchies for trees), wave 5 (audit store, Tempo trace links), wave 2 (OPA).

Risk	Likelihood	Impact	Mitigation
Read model lag at month-end peak invalidates "as of" statements	Medium	Medium	HWM stamping; close task waits for lag = 0; replica for runs
MR definitions use constructs with no equivalent	High	Low	Conversion report; manual re-authoring budgeted in migration plan
PDF rendering resource spikes	Medium	Low	Renderer sidecar limits; queue with concurrency 4 per pod
Stakeholder sign-off depends on accountant availability	Medium	High	Sign-off session scheduled at wave start; fixtures reviewed incrementally

Open questions: (1) Should the reporting read model live in `reporting-db` (default) or query `ledger.Balance` directly with replicas? Default separate read model; decide by wave 15 start. (2) Cash flow direct method in v1? Default no (indirect only); revisit at wave 36 (cash and bank). (3) Retention of ad-hoc runs 90 days vs 1 year? Default 90 days; decide by wave 15 exit.

2.15.13 Parameters and setup

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
`reporting.max_lag_seconds`	tenant	int	30	0–600	Run blocked above lag unless `allow_stale` (§2.15.5)	Financial reporting parameters > data mart refresh	—
`reporting.page_size`	tenant	int	500	100–1,000	Drill level 2 page size (BR-15.4)	—	ALV page size
`reporting.cell_key_limit`	tenant	int	50,000	1,000–200,000	BR-15.11 key list vs query spec	—	—
`reporting.retention_closed_years`	legal entity	int	7	1–30	Library retention for closed-period runs (FR-15.8)	Report library retention	Spool retention (SP01)
`reporting.retention_adhoc_days`	tenant	int	90	7–730	Ad-hoc run retention	—	Spool retention
`reporting.email_attachment_limit_mb`	tenant	int	20	1–25	Attach vs link (FR-15.8)	Report distribution email settings	SCOT / SOST size limits
`reporting.share_link_expiry_days`	tenant	int	14	1–90	Shared link lifetime	—	—
`reporting.include_adjustment_periods` default	definition	bool	false	true / false	BR-15.1	MR column "Include closing/adjustment periods"	F.01 "special periods" selection
`reporting.opa_cache_seconds`	tenant	int	60	5–600	BR-15.7 security cache	MR tree security sync	Authorization buffer
`reporting.pdf_concurrency_per_pod`	tenant	int	4	1–16	Renderer queue	—	—
`definition.currency_type` default	definition	enum	acct	txn / acct / rpt	Column currency	MR report > Currency	F.01 currency type selection
`definition.rounding_display`	definition	enum	units	units / thousands / millions	Display rounding (cells keep exact values; rounding difference row shown)	MR "Rounding" (thousands)	F.01 "Display in thousands" / RFBILA00 scale
`definition.zero_rows`	definition	enum	hide	hide / show	Print-zero default	MR row format "Print zero"	FSV "Display zero balances"
`hierarchy.strict`	hierarchy	bool	true for account hierarchies	true / false	FR-15.13 publish check	Derived hierarchies (D365) validation	FSV "Not assigned" node check (OB58)
`hierarchy.follow_master_data`	hierarchy	bool	false	true / false	BR-15.13	—	Set maintenance dynamic sets
`audit_trail.export_hash_algorithm`	tenant	enum	sha256	sha256	Export integrity (FR-15.10)	—	—

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
`schedule.timezone`	schedule	tz	entity time zone	IANA	Cron evaluation	Batch job time zone	SM36 server time

2.15.14 Inquiries and reports

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
Trial balance `TB-STD` / `TB-DIM`	statutory report	ledger, period range, currency type, dimension filter, tree	opening, debit, credit, closing, net per account (per dimension)	`ReportingBalance`	Trial balance list page; SSRS Trial balance / Trial balance summary	FAGLB03, S_ALR_87012277, S_ALR_87012301, F.08, Fiori Trial Balance
Balance sheet `BS-STD`	statutory report	ledger, period, comparison (PY), tree, currency type	rows per FSV-like definition, comparison, variance	`ReportingBalance`	MR Balance sheet; SSRS Balance control	F.01 (RFBILA00), S_ALR_87012284, Fiori Display Financial Statement
Income statement `PL-STD` / `PL-FUNC`	statutory report	ledger, period / YTD, comparison, tree	rows, current, PY, variance, %	`ReportingBalance`	MR Income statement; SSRS Dimension statement	S_ALR_87012284, S_PL0_86000028/29
Cash flow `CF-STD`	statutory report	ledger, period range	operating, investing, financing, net change, check rows	`ReportingBalance`	MR cash flow definitions	S_ALR_87012382 (FSV-based), S/4 Cash Flow app
Consolidated-by-entity view	operational report	legal entities, period, reporting currency	per-entity columns, sum column	`ReportingBalance`	MR multi-company report	S_ALR_87012284 multiple company codes
G/L account statement	operational report	account range, period, dimension	opening, lines, running balance, closing	`ReportingBalance` + journal lines	SSRS Ledger account balance	S_ALR_87012332
Document journal / line item journal	operational report	ledger, posting date range, voucher range	voucher, date, lines with accounts and amounts, totals	journal line API	SSRS Posted journals / Voucher	S_ALR_87012287, S_ALR_87012289, S_ALR_87012291
Statement drill-down (cell → balances → lines → document)	drill-down	run, row, column	keys, amounts, lines, source link, trace id	`StatementCell` + ledger API	MR drill-down; Transaction origin	FS10NA, FAGLB03 → FAGLL03 → FB03
Audit trail	operational report	ledger, period, kind, actor	occurred at, kind, actor, object, details, trace id	`AuditTrailEntry`	SSRS Audit trail; Database log	Fiori Audit Journal, RSSCD100 (change documents), S_ALR_87012287
Receivables/payables by profit center	operational report	ledger, period, profit center tree	AR/AP reconciliation balances per PC (requires FR-11.23 splitting)	`ReportingBalance`	—	S_AC0_52000887 / 52000888
Balance sheet by profit center / segment	statutory report	ledger, period, segment tree	BS per segment (IFRS 8)	`ReportingBalance` with splitting dimensions	MR tree by dimension	S_ALR_87013336, FSV by segment
Derived hierarchy membership	list inquiry	hierarchy, version	node, members, unassigned, overlaps	`HierarchyNode` membership	Derived financial hierarchies form	KDH3 / GS03 set display
Read-model lag KPI	KPI	ledger	lag seconds, HWM ledger vs reporting	`/reporting/lag`	MR data mart integration status	—
Report library	list inquiry	definition, entity, period	run, generated at, formats, hash, retention until	`StatementRun`	MR report library	Spool / SAP Analytics Cloud stories

2.15.15 Printed and electronic documents

Document	Trigger	Layout elements	Formats	Numbering sequence	Legal / retention requirement
Financial statement pack (TB, BS, P&L, CF)	close checklist hook, schedule or user	header: entity, ledger, period, currency, definition code/version, as-of HWM; rows/columns; footer: result hash, generated at/by, "as of sequence N"	PDF, XLSX, CSV, interactive HTML	statement run id	annual statements: statutory (DE HGB §257 10 years, US 7 years); monthly packs: internal, 7 years
Trial balance printout	user / schedule	accounts with opening, debit, credit, closing; totals; hash	PDF, XLSX, CSV	run id	supporting record; 10 years for year-end TB
G/L account statement	user	account header, lines with running balance, closing	PDF, XLSX	run id	supporting record
Audit trail export	user / auditor request	filters used, entries, hash of the file	CSV, PDF	export run id	audit evidence; 10 years
Statement distribution email	schedule	subject with entity/period, body with as-of and link; attachments ≤ 20 MB	email (SMTP via wave 4)	—	distribution log retained 7 years
Definition export	user	JSON definition with schema version	JSON	definition version	configuration record

XBRL / iXBRL filings are wave 48.

2.15.16 Periodic and batch jobs

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
`reporting-balance-consumer`	continuous	ledger (Kafka partition)	upsert by event id with HWM per ledger	lag p95 < 10 s	DLQ after 5 attempts; replay	lag > 60 s → P2
`reporting-balance-verify`	daily 01:30	ledger	compare with `ledger.Balance` at HWM	10M balances < 10 min	rebuild ledger from replay	diff > 0 → P1
`statement-schedules`	per schedule cron (demo pack 23:00 UTC)	schedule × entity	run per (schedule, fire time)	2,000 × 12 < 20 s each	retry once; notify owner	failures > 5% → P3
`library-retention-sweep`	weekly Sunday 04:00	legal entity	deletes outputs past retention; legal hold respected	< 10 min	skip and retry	—
`audit-completeness-check`	daily 02:00	ledger	count events vs audit rows per day	< 2 min	—	diff > 0 → P1
`hierarchy-membership-refresh`	on account/dimension events; full nightly 03:00	hierarchy	rebuild per version	20k nodes < 1 min	—	unassigned > 0 on strict → notification

2.15.17 Security duties and privileges

Duty	Privileges (entry points)	Segregation-of-duties conflicts	Default roles that include it
Maintain report definitions	definitions, row/column sets, trees, hierarchies CRUD, publish, import/export	Post ledger journals (for published statutory definitions)	Financial reporting analyst, Financial controller
Run financial statements	POST /reporting/runs	—	Accountant, Financial controller, FP&A analyst
View financial statements	GET runs, cells, outputs, library, lag	—	Finance roles, Executives (via OPA dimension grants)
Schedule financial statements	schedules CRUD	—	Financial reporting analyst
View all dimensions	bypass of dimension filtering for unrestricted copies (BR-15.7)	Maintain dimension security policies	CFO, Group controller, External auditor (time-boxed)
View audit trail	audit-trail query and export	Post ledger journals; Maintain period status	Internal auditor, External auditor, Financial controller
View ledger balances / transactions (drill)	balances, drill level 2	—	as wave 11

2.15.18 Message catalog

Code	Severity	User text	Cause	Remediation	Raised by
REPORT-0001 `REPORT_DEFINITION_NOT_PUBLISHED`	error	Definition {code} has no published version.	RunStatement	Publish the definition	FR-15.6
REPORT-0002 `REPORT_EXPRESSION_INVALID`	error	Row {row}: {detail} in expression {expr}.	FR-15.2 validation	Fix references	FR-15.2
REPORT-0003 `REPORT_PERIOD_NOT_FOUND`	error	Period {period} does not exist in ledger {ledger}.	Parameters	Choose an existing period	FR-15.6
REPORT-0004 `REPORT_STALE`	warning	Read model is {lag} s behind ledger {ledger}; results flagged as stale.	lag > max	Wait or rerun	FR-15.1
REPORT-0005 `REPORT_LEDGER_INCOMPATIBLE`	error	Ledgers {a} and {b} do not share a chart of accounts.	BR-15.10	Remove the column override	BR-15.10
REPORT-0006 `REPORT_NO_PERMITTED_VALUES`	error (403)	You have no permitted values for {attribute} in tree {tree}.	BR-15.7	Request dimension access	FR-15.9
REPORT-0007 `REPORT_DRILL_FILTERED`	warning	{amount} of this cell is outside your dimension permissions.	BR-15.4	None	FR-15.7
REPORT-0008 `CF_UNRECONCILED`	error	Net cash flow {cf} differs from change in cash {delta}.	BR-15.5	Tag accounts; fix "not classified" row	FR-15.5
REPORT-0009 `CF_UNCLASSIFIED_ACCOUNTS`	error	{count} balance-sheet accounts have no cash flow tag.	BR-15.5	Tag the listed accounts	FR-15.5
REPORT-0010 `REPORT_PY_PERIOD_MISSING`	info	Prior-year period not found; column left blank.	BR-15.9	None	BR-15.9
REPORT-0011 `REPORT_IMPORT_DUPLICATE`	error	Definition code {code} exists; use overwrite to replace.	FR-15.11	Rename or overwrite	FR-15.11
REPORT-0012 `REPORT_IMPORT_SCHEMA`	error	Schema version {v} is not supported (supported: {list}).	FR-15.11	Export from a compatible version	FR-15.11
REPORT-0013 `REPORT_HIERARCHY_UNASSIGNED`	error	{count} members are not assigned to any leaf of {hierarchy}: {sample}.	FR-15.13 strict	Assign members or relax `strict`	FR-15.13
REPORT-0014 `REPORT_HIERARCHY_OVERLAP`	error	Member {member} matches leaves {a} and {b}.	BR-15.13	Narrow membership rules	FR-15.13
REPORT-0015 `REPORT_PLFUNC_MISSING_FUNC_AREA`	warning	P&L lines totaling {amount} have no functional area.	FR-15.14	Add derivation steps (FR-11.22)	FR-15.14
REPORT-0016 `REPORT_RENDER_FAILED`	error	{format} rendering failed for run {run}.	Renderer	Retry; other formats unaffected	FR-15.6
REPORT-0017 `REPORT_ATTACHMENT_TOO_LARGE`	info	Output exceeds {limit} MB; a link was sent instead.	FR-15.8	None	FR-15.8

2.15.19 Performance budgets and capacity

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
Read-model update	5,000 lines/s peak	lag 2 / 10 / 30 s	5,000 lines/s	`reporting_balance` ≈ ledger Balance size (≈ 5 GB per 10M combinations × periods)	PK (ledger, period, account, combination, currency_type)	lag grows; runs flagged stale or wait
Statement run 2,000 × 12	500 runs/day; 50 concurrent at close	6 / 20 / 35 s	50 concurrent on replica	cells 60 B × 24k × 500 × 365 ≈ 260 GB raw → kept per retention, compressed	replica; per-run query plans by row kind	queued with concurrency limit; p95 40 s
Drill level 1 / 2	20k/day	80 / 300 / 500 ms	200 req/s	—	cell keys / query spec; journal line indexes	page size 250
PDF render	500/day	2 / 6 / 12 s	4 per pod	outputs 1 MB avg × 180k/year = 180 GB object storage	—	queue
Audit trail query (one month)	2k/day	200 ms / 1 s / 2 s	—	audit view 1 KB/event × 50M = 50 GB	(ledger_id, occurred_at)	narrowed date range enforced
Hierarchy membership rebuild	1,000 events/day	< 5 s per event; nightly < 1 min	—	small	(hierarchy_version, member_id)	—

2.15.20 Localization and compliance hooks

- Statutory statement layouts by country: HGB §266/§275 (DE balance sheet and P&L by nature/function), French PCG "bilan / compte de résultat" formats, UK FRS 102 formats, Indian Schedule III, Spanish PGC models, US GAAP/SEC Regulation S-X ordering; wave 48 packs ship `ReportDefinition` JSON per format and language.
- Presentation: number formats, negative-number display (parentheses vs minus), thousands scaling and statement language come from wave 5 locale settings; definitions carry translatable labels.
- Segment reporting (IFRS 8 / ASC 280) relies on document splitting (FR-11.23) and segment trees.
- XBRL/iXBRL tagging (ESEF in the EU, SEC EDGAR, HMRC CT600 iXBRL, MCA India) is wave 48; `ReportRow` reserves `taxonomy_concept` for tagging.
- Audit-file exports (FEC FR, GoBD DE, SAF-T) use the ledger line API; wave 15's audit trail adds the who/when/approval layer auditors request (ISA 315/330 journal-entry testing).
- Retention: statements and audit exports per §2.15.15; legal hold suspends `library-retention-sweep` per entity.

- Privacy: audit trail contains user ids and names; exports to external auditors are scoped by time-boxed duty and logged; data-subject requests mask user display names in exports older than retention when required (actor ids remain).
- Extension points: `reporting.definition_pack`, `reporting.renderer` (statutory PDF templates), `reporting.taxonomy_mapping`.

2.15.21 Coverage closure

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
AX §12.1.4 Setup — Chart of accounts → Derived financial hierarchies (R3) (AX register row 4)	PARTIAL-15	ADDED as FR-15.13	derived hierarchies over main account categories and dimension values, versioned, usable as row sets and trees; AC-15.12

Part 3 — Phase 3: Inventory & Procure-to-Pay (waves 16–20)

3.0 Phase overview

Business outcome at phase exit. At the end of wave 20 the demo plant buys, receives, pays for and values physical goods on Passage with no AX or SAP system in the loop. Every quantity movement is an immutable inventory transaction carrying physical and financial status plus storage and tracking dimensions (the InventTrans / MSEG role). Buyers run requisition → RFQ → agreement → purchase order under policy-driven approval (PurchReqTable / EBAN through PurchTable / EKKO). Receiving posts inventory and a GR/IR accrual to the universal journal; vendor invoices match 2-way or 3-way inside tolerances or route to an exception queue (VendInvoiceInfoTable / RBKP-RSEG). Open vendor items settle against payment runs that emit ISO 20022 pain.001 and NACHA files (VendSettlement / F110-REGUH). Inventory is valued under FIFO, LIFO, weighted average or standard cost with a close/recalculation job whose value report ties to the GL inventory accounts (InventClosing / CKMLCP). Suppliers acknowledge POs, send ASNs and submit invoices through a portal.

Phase-exit sign-off criteria

- Inventory on-hand projection equals SUM(inventory transactions) for a 1M-transaction fixture after a full rebuild; zero rows differ.
- Each of the 11 journal/posting types in this phase (movement, adjustment, transfer, BOM, counting, product receipt, vendor invoice, payment, settlement, close adjustment, revaluation) produces a balanced universal-journal entry; the daily subledger-to-GL reconciliation for inventory, GR/IR and AP control accounts reports a difference of 0.00 in accounting currency for the demo entity.
- 30 requisitions in the approval matrix route to the expected chain; 200 matching scenarios yield the expected match status and postings; 300 settlement scenarios post the expected discount and FX gain/loss; 100 costing sequences per method tie to the reference workbook to the cent.
- pain.001.001.09 output validates against the ISO 20022 XSD and is accepted by the bank test harness; a payment run killed mid-flight and resumed pays each open item exactly once.
- Inventory close on 1M transactions completes in under 20 minutes on the stage cluster (4 vCPU / 16 GiB inventory pod, Postgres 8 vCPU).
- Recorded end-to-end walkthrough (buy → receive → match → pay → close) signed off by both owners and the reviewing accountant.

Cross-wave data model summary

Entity	Owning service	Key relationships
InventoryTransaction (InventTrans / MSEG)	inventory (Go, `inventory` Postgres)	→ InventoryTransactionOrigin, → Dimension set, → Product (wave 8), → Site/Warehouse (wave 6)
InventoryTransactionOrigin (InventTransOrigin / MKPF)	inventory	1:N InventoryTransaction; references source document id+type (journal line, PO line, receipt line, production order line)
OnHand (InventSum / MARD+MCHB)	inventory (projection)	Keyed by product × dimension hash; rebuilt from InventoryTransaction
InventoryJournal / JournalLine (InventJournalTable/Trans)	inventory	Lines → InventoryTransactionOrigin; posts via ledger `Post(JournalEntry)` (wave 11)
Reservation	inventory	→ InventoryTransaction (status change), → batch/serial
CountPlan / CountSheet	inventory	→ JournalLine (variance)
PurchaseRequisition / Line (PurchReqTable / EBAN)	procurement (Go, `procurement` Postgres)	→ PurchaseOrderLine on consolidation; → Temporal approval workflow
RFQ / RFQReply (PurchRFQTable / EKKO type AN)	procurement	→ PurchaseOrder on award
PurchaseAgreement (PurchAgreementHeader / EKKO type K/L)	procurement	→ PurchaseOrderLine releases
TradeAgreement (PriceDiscTable / A017-KONP)	procurement	Vendor pricing lookup
PurchaseOrder / Line / Version (PurchTable/PurchLine, EKKO/EKPO)	procurement	→ InventoryTransaction (OnOrder), → Receipt, → VendorInvoice
ProductReceipt / Line (VendPackingSlipJour/Trans, MKPF/MSEG 101)	receiving (Go, `procurement` Postgres)	→ PurchaseOrderLine, → InventoryTransaction (Received), → GR/IR journal entry
VendorInvoice / Line (VendInvoiceInfoTable/Line → VendInvoiceJour, RBKP/RSEG)	payables (Go, `payables` Postgres)	→ ReceiptLine (3-way), → PurchaseOrderLine (2-way), → VendorTransaction, → GR/IR clearing
MatchResult	payables	→ VendorInvoiceLine; stores price/qty/total variance and status
VendorTransaction (VendTrans / BSIK→BSAK)	payables	Open item; → Settlement
Settlement (VendSettlement / BSE_CLR)	payables	Links payment/credit/invoice transactions with discount and FX
PaymentProposal / Payment / PaymentFile (LedgerJournalTrans payment journal, REGUH/REGUP)	payables	→ VendorTransaction, → bank account (wave 36 placeholder: bank master lite)
CostTransaction (InventCostTrans / CKMLPP-CKMLCR)	costing (Go, `inventory` Postgres schema `costing`)	→ InventoryTransaction; produced by close/recalc
CostingVersion / ItemCost (CostingVersion/InventItemPrice, MBEW)	costing	Standard and planned costs per product × site
SupplierPortalUser / Acknowledgement / ASN	supplier-portal (TypeScript BFF + `supplier` Postgres)	→ PurchaseOrder, → ProductReceipt (expected)

Cross-wave event catalog

Event (CloudEvents type)	Producer	Consumers	Payload summary
`dev.passage.inventory.transaction.posted.v1`	inventory	costing, planning (w22), analytics	txn id, origin, product, dims, qty, issue/receipt status, physical/financial dates
`dev.passage.inventory.onhand.changed.v1`	inventory	procurement (ATP for PO), sales (w27), warehouse (w31)	product, dim hash, avail_physical, avail_ordered, delta
`dev.passage.inventory.journal.posted.v1`	inventory	ledger (reconciliation), costing	journal id, type, line count, ledger entry id
`dev.passage.procurement.requisition.approved.v1`	procurement	procurement consolidation, budget control (w38)	req id, lines, approver chain
`dev.passage.procurement.po.confirmed.v1`	procurement	inventory (OnOrder txns), supplier-portal, EDI (w35)	po id, version, lines, vendor
`dev.passage.procurement.po.version.created.v1`	procurement	supplier-portal, receiving	po id, version, diff summary
`dev.passage.receiving.receipt.posted.v1`	receiving	inventory, payables (match candidates), costing	receipt id, lines, po lines, qty, GR/IR amount

Event (CloudEvents type)	Producer	Consumers	Payload summary
`dev.passage.payables.invoice.posted.v1`	payables	ledger, costing (PPV/invoice-cost settle), tax (w13)	invoice id, vendor, lines, match status, amounts
`dev.passage.payables.invoice.match.exception.v1`	payables	workflow (Temporal), notifications	invoice id, line, variance type, amounts
`dev.passage.payables.settlement.posted.v1`	payables	ledger, analytics	settlement id, items, discount, fx gain/loss
`dev.passage.payables.payment.sent.v1`	payables	bank connectivity (w36), supplier-portal, cash (w36)	payment id, file id, amount, method, vendor
`dev.passage.payables.payment.status.changed.v1`	payables	notifications, analytics	payment id, old/new status, pain.002 reason code
`dev.passage.costing.close.completed.v1`	costing	ledger, analytics	close id, period, adjustments, duration
`dev.passage.costing.cost.changed.v1`	costing	inventory, planning, product costing (w39)	product, site, version, old/new cost, effective date
`dev.passage.supplier.asn.submitted.v1`	supplier-portal	receiving, warehouse (w31)	asn id, po lines, expected qty, carrier

Phase-level risks

Risk	Likelihood	Impact	Mitigation	Owner
On-hand projection drifts from transactions under concurrency	Medium	High	Single-writer per product × dimension partition (advisory lock), nightly rebuild-and-compare job, alert on any diff	Engineering
Matching tolerance semantics differ between AX (per item/vendor %) and SAP (tolerance keys) and users expect their old behavior	High	Medium	Tolerance model supports both percentage and absolute limits at vendor, item, vendor×item and entity levels; migration maps both	Product
FX gain/loss and discount postings fail accountant review	Medium	High	300-scenario fixture set reviewed by accountant before wave 19 close; property test that settlement always balances	Product + accountant
Inventory close performance on large transaction history	Medium	Medium	Settlement by product partition in Temporal child workflows; incremental close from last closed date; 1M-txn perf gate	Engineering
Bank file rejection in production (schema or bank-specific rules)	Medium	High	XSD validation in CI, bank test harness, per-bank profile overrides (SEPA, CH, UK)	Engineering
Supplier portal becomes an attack surface	Medium	High	Separate Keycloak realm, OPA policies scoped to vendor id, rate limits 60 req/min, no inbound write to GL	Security

3.16 Wave 16: Inventory Ledger, Dimensions & On-Hand

3.16.1 Scope and business context

Wave 16 creates the inventory ledger that every later quantity-bearing module (purchasing, receiving, production, sales, warehouse) writes to. In AX this is InventTrans with InventTransOrigin, InventSum and InventDim; in SAP it is the material document (MKPF/MSEG) with stock segments in MARD (storage location), MCHB (batch) and MSKA/MSPR (special stock). Before this wave Passage has products with dimension groups (wave 8) and sites/warehouses (wave 6) but no quantities.

At the end of the wave a user can: load opening balances through a movement journal; move, adjust, transfer and count stock; reserve stock manually or by FEFO/FIFO policy; block or quarantine a batch; run a cycle-count plan; and see on-hand by any combination of site, warehouse, location, batch, serial, inventory status. Every posting produces a balanced universal-journal entry through the wave 11 `Post(JournalEntry)` API.

Out of scope: purchase/sales-driven transactions (waves 17–18, 27), production consumption (wave 21), warehouse work and license plates (wave 31), quality orders (wave 33), costing and value adjustments beyond the running cost price captured on receipt (wave 20). Inventory in this wave values at the item's current cost price on receipt and issues at the running average; wave 20 replaces that with the full costing engine.

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
AX On-hand form (InventOnhand) requires choosing a dimension display (InventDimParm) and re-querying per combination; SAP MMBE shows plant/storage location/batch only, MB52 is a batch report; users export to Excel to get location × batch × status	InventSum is pre-aggregated per InventDimId and queried through fixed display sets; MARD/MCHB are separate tables with no common query	Single `GET /onhand` with `groupBy` any dimension subset, served from one projection; shell grid pivots client-side	Clicks to answer "how much of X in batch B at location L": 9 → 2; query p95 < 50 ms vs 3–10 s
InventSum drift from InventTrans after failed batch or kernel patch; fix is the "Check inventory on-hand" consistency check run at night with users off the system	Dual-write of InventTrans and InventSum under X++ ttsbegin with retry-on-deadlock; no automated compare	Projection updated in the same Postgres transaction; weekly rebuild-and-compare; diff event alerts	Reconciliation effort: 2 h/month manual → 0 (automated, 0 diffs); detection latency: weeks → < 24 h
SAP MIGO posts synchronously but stock overview in BW/analytics lags the nightly extract; AX entity store refresh is hourly at best	Analytics copies instead of event stream	`onhand.changed` CloudEvent via outbox within 5 s; any consumer (BI, MES, WMS) subscribes without middleware	Data latency to external systems: 1–24 h → < 5 s
Negative inventory silently allowed per InventModelGroup; errors surface at inventory close as unsettled issues (InventClosing "Cannot settle") months later	Check done at posting with a flag, no alerting; financial negative evaluated only at close	Negative check atomic under lock; negative rows surfaced on workspace tile and in daily reconciliation	Time to detect unauthorized negative stock: 30–90 days → same day; close-time settlement errors from negatives: 0
Cycle counting in AX needs the Counting journal, InventCountGroup setup and the "Create lines" dialog with 14 fields; SAP MI01/MI04/MI07 is three transactions and a printed count list	Journal-centric design with no plan object; count execution not mobile	`CountPlan` generates sheets on a cron; PWA count screen with blind count and offline queue; one `:post`	Steps from plan to posted variance: 3 transactions / ~25 clicks → 1 plan + 1 tap per line; counts per hour per operator ×3

3.16.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity level
Inventory transaction record	InventTrans, InventTransOrigin, InventTransPosting; form InventTrans	MSEG/MKPF (material document), MATDOC in S/4; MB03/MIGO display	`inventory.InventoryTransaction`, `InventoryTransactionOrigin`; screen Inventory transactions	full
On-hand by dimension	InventSum, InventOnhand form, InventDimParm	MARD, MCHB, MSKA; MMBE stock overview, MB52	`inventory.OnHand` projection; On-hand inquiry	improved (any dimension combination, real time)

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity level
Dimensions	InventDim (InventSiteId, InventLocationId, wMSLocationId, InventBatchId, InventSerialId, InventStatusId, LicensePlateId, ConfigId/Size/Color/Style)	Plant (WERKS), storage location (LGORT), batch (CHARG), serial (SERNR via SERI), special stock indicator, valuation type	`DimensionSet` (site, warehouse, location, batch, serial, status, config/size/color/style, license_plate reserved for w31)	full
Movement / adjustment journal	InventJournalTable/Trans types Movement, LossProfit; InventJournalCheckPost	MIGO movement types 501/502 (receipt w/o PO), 551/552 (scrapping), 561/562 (initial stock)	`InventoryJournal` type MOVEMENT, ADJUSTMENT	full
Transfer journal	InventJournalTrans type Transfer	301/302 (plant to plant), 311/312 (storage loc), MB1B	`InventoryJournal` type TRANSFER (paired issue/receipt txns)	full
BOM journal	InventJournalTrans type BOM (InventBOMJournal)	261/262 consumption to order, 201 cost center	`InventoryJournal` type BOM (explode wave 9 BOM, issue components, receive parent)	partial (no route/overhead until w21)
Counting	InventJournalTrans type Count, InventCountJournal, counting groups (InventCountGroup)	Physical inventory MI01/MI04/MI07, IKPF/ISEG, cycle counting indicator ABC (MIBC)	`CountPlan`, `CountSheet`, journal type COUNT	full
Item model group	InventModelGroup (InventModel FIFO/LIFO/WeightedAvg/Std, PhysNegative, FinancialNegative, PostPhysicalInvent)	MBEW price control (S/V), negative stock allowed per plant/storage location (OMJ1)	`ItemModelGroup` (wave 8 entity, enforced here)	full
Reservation	InventTrans status ReservPhysical/ReservOrdered, InventMovement, reservation form, FEFO date-controlled (InventBatch expiry, PdsFEFO)	Stock reservations (MB21, RESB), batch determination (FEFO via strategy), batch status	`Reservation` with policy FEFO/FIFO/MANUAL	full
Blocking / quarantine	Inventory blocking (InventBlocking), quarantine order (InventQuarantineOrder), inventory status (D365)	Blocked stock (movement 344/343), quality inspection stock, batch restricted status	Inventory status `AVAILABLE`, `BLOCKED`, `QUARANTINE`; `Blocking` record	full
Unit conversion on movement	UnitOfMeasureConversion (intra/inter-class, product-specific)	MARM alternative UoM, conversion on MIGO	Wave 6/8 UoM service; quantity stored in inventory unit plus entered unit and qty	full
Inventory closing/recalc	InventClosing	CKMLCP	Deferred to wave 20	dropped-with-reason (wave 20)
Transfer orders	InventTransferTable/InventTransferLine, InventTransferJour (shipment, receipt), in-transit warehouse (InventLocation type Transit), Transfer order parameters, Transfer order picking release	Stock transport order (ME21N item category U, document type UB intra-company / NB cross-company), replenishment delivery NL/NLCC via VL10B, movement 351/641 to stock in transit, GR 101, MB5T	`TransferOrder`, `TransferOrderLine`, `TransferShipment`, `TransferReceipt`; in-transit warehouse dimension (FR-16.15, FR-16.16)	full (cross-company STO pricing and intercompany invoice in wave 40; picking work in wave 31)
Vendor consignment	D365 consignment replenishment orders (ConsignmentReplenishmentOrder), inventory ownership change journal (InventOwnershipChangeJournal), owner inventory dimension (InventDim.InventOwnerId), Consignment parameters	Item category K, special stock K (MKOL), MB54, PI for consignment MIK1, settlement MRKO, stock determination OSPX/OSPW, consignment info record price	`owner` dimension, `ConsignmentReplenishmentOrder`, journal type OWNERSHIP_CHANGE (FR-16.17); settlement invoice in wave 18 FR-18.16; portal view wave 20 FR-20.22	full
Customer consignment	Not standard in AX 2012 (warehouse per customer convention)	Special stock W (MSKU), MB58, fill-up 631 / issue 633	Warehouse type `CUSTOMER_CONSIGNMENT` with `customer_id` (FR-16.17); fill-up and consumption documents in wave 27	partial (documents in wave 27)
Sales-order / project stock	Not in AX 2012 (marking only)	Special stock E (MSKA) / Q (MSPR), valuated/non-valuated, MBBS	`segment` dimension (SALES_ORDER / PROJECT + reference) (FR-16.20)	full (value report by segment in wave 20)
Tag counting	InventJournalTable type TagCounting (InventJournalTrans with TagId), Create tag counting, Transfer to counting journal	No direct equivalent (MI09 count without reference, count tags printed from MI21)	Journal type TAG_COUNT with `CountTag` rows → COUNT journal (FR-16.18)	full
ABC classification	InventTable ABCRevenue/ABCValue/ABCMargin/ABCContribution, periodic ABC classification (InventABCUpdate), ABC classification report	MIBC ABC analysis for cycle counting (MARC-ABCIN), cycle counting indicators OMCO	`AbcClassification` per product × site with periodic job (FR-16.19); feeds CountPlan selection	full
Statistical inventory sampling	n/a	MIS1 / MIS2 inventory sampling	Not provided; CountPlan `sample_pct` counts a random sample without extrapolation	dropped-with-reason (see 3.16.21)

3.16.3 Functional requirements

- **FR-16.1 Immutable inventory transactions** — Must. The system shall record every quantity movement as an append-only `InventoryTransaction` row linked to an `InventoryTransactionOrigin`; updates only change status fields and dates, never quantity or identity.
    - Status changes are written as a new `InventoryTransactionStatusChange` audit row; the current status lives on the transaction for query speed.
    - A transaction has exactly one of `issue_status` or `receipt_status` set (sign determined by quantity).
    - Corrections are new transactions with opposite sign referencing `corrects_transaction_id`.
    - Partition key: tenant_id, product_id; up to 50M transactions per tenant supported before range partitioning by `physical_date` year is required.
- **FR-16.2 Transaction status model** — Must. The system shall implement the AX issue/receipt status model: issue statuses `ON_ORDER → RESERVED_ORDERED → RESERVED_PHYSICAL → PICKED → DEDUCTED → SOLD`; receipt statuses `ORDERED → ARRIVED → REGISTERED → RECEIVED → PURCHASED`.
    - Physical statuses (affect physical on-hand): PICKED, DEDUCTED, REGISTERED, RECEIVED. Financial statuses: SOLD, PURCHASED.
    - Transitions may skip forward (ORDERED → RECEIVED directly) but never go backward except via the explicit `Unpick`, `Unregister`, `CancelReservation` commands.
    - SAP mapping on migration: 101 → RECEIVED, 102 → reversal, 261 → DEDUCTED, 301 → DEDUCTED+RECEIVED pair, 561 → RECEIVED+PURCHASED opening.
- **FR-16.3 On-hand projection** — Must. The system shall maintain `OnHand` per product × dimension set with the columns `posted_qty, posted_value, received, registered, arrived, ordered, deducted, picked, reserved_physical, reserved_ordered, on_order` and computed `avail_physical`, `avail_ordered`,

`physical_invent`.

  - `physical_invent = posted_qty + received + registered − deducted − picked`.
  - `avail_physical = physical_invent − reserved_physical`.
  - `avail_ordered = avail_physical + ordered + arrived − on_order − reserved_ordered`.
  - Projection is updated in the same Postgres transaction as the inventory transaction (not via event) to guarantee the negative-stock check; the event is emitted from the outbox afterward.
  - Query at any dimension subset: aggregation over the finest-grain rows, p95 < 50 ms for ≤ 10k rows.

- **FR-16.4 Negative inventory policy** — Must. The system shall reject an issue that would make `avail_physical` (physical negative forbidden) or `avail_ordered` (financial negative forbidden) negative when the item model group forbids it.

  - Enforcement uses `SELECT … FOR UPDATE` on the OnHand row; the check and the write are atomic.
  - When allowed, negative on-hand is flagged in the On-hand inquiry and in the daily reconciliation.
  - Error code `INV-NEG-001` with product, dimension set and shortfall quantity.

- **FR-16.5 Inventory dimensions** — Must. The system shall store the dimension set as a normalized `DimensionSet` row keyed by a SHA-256 hash of its canonical values (AX InventDimId pattern), with active dimensions determined by the product's storage and tracking dimension groups.

  - Dimensions: site, warehouse, location, batch, serial, inventory_status, config, size, color, style, license_plate (reserved), owner (activated by FR-16.17 consignment).
  - Site is mandatory on every transaction; warehouse mandatory if the storage dimension group marks it mandatory.
  - A serial-tracked product requires quantity 1 per transaction and a unique serial per product in physical stock (duplicate serial → `INV-SER-001`).

- **FR-16.6 Inventory journals** — Must. The system shall support journal types MOVEMENT, ADJUSTMENT, TRANSFER, BOM, COUNT, OPENING_BALANCE with header/lines, validate, approval workflow (Temporal template from wave 4), and post.

  - Posting creates transactions, updates on-hand and calls `Post(JournalEntry)` with the journal id as idempotency key; a ledger failure rolls back the inventory posting (saga compensating step with explicit reversal if the ledger acknowledged).
  - Journal offset accounts: MOVEMENT requires a user-entered offset account; ADJUSTMENT uses the posting profile's inventory adjustment account; TRANSFER posts no GL unless cost differs by site (wave 20).
  - Maximum 10,000 lines per journal; posting throughput target 2,000 lines/s.

- **FR-16.7 Reservations** — Must. The system shall reserve quantity against on-hand (RESERVED_PHYSICAL) or expected receipts (RESERVED_ORDERED) by manual choice or by policy FIFO, FEFO, LIFO, with batch/serial selection.

  - FEFO orders candidate batches by `expiry_date ASC, receipt_date ASC`; batches with status BLOCKED or QUARANTINE or `expiry_date < required_date + shelf_life_margin_days` are excluded.
  - Reservation holds for `reservation_ttl_hours` (default 0 = until released or consumed).
  - Over-reservation is rejected; partial reservation returns the shortfall.

- **FR-16.8 Blocking and quarantine** — Must. The system shall allow blocking a quantity, batch or serial with reason code; blocked quantity is excluded from `avail_physical` and from policy-based reservation.

  - Blocking is implemented as inventory status change (status dimension) producing a status-transfer transaction pair.
  - Quarantine requires a disposition (release, scrap, return) to exit.

- **FR-16.9 Cycle counting** — Must. The system shall generate count sheets from a `CountPlan` (ABC class frequency, location range, last-count age, random sample) and post counted variances as COUNT journal lines.

  - Counting freezes on-hand for the counted dimension set (`count_lock`) while a sheet is open unless the plan allows movement with recount.
  - Variance tolerance per plan (qty % and value); above tolerance requires supervisor approval before posting.
  - Blind count option hides expected quantity.

- **FR-16.10 Unit conversions on movements** — Must. The system shall accept quantity in any unit with a conversion to the product's inventory unit, storing `qty` (inventory unit), `entered_qty`, `entered_unit`.

  - Rounding to the product's inventory unit decimals (default 2, max 6); residual beyond precision is rejected (`INV-UOM-002`).
  - Catch-weight is deferred to wave 24.

- **FR-16.11 Physical and financial dates** — Must. The system shall store `physical_date` (goods movement) and `financial_date` (value recognition) separately; the ledger entry uses `financial_date` and is validated against period control (wave 14) for module INVENTORY.

- **FR-16.12 Daily reconciliation** — Must. The system shall run a job that compares SUM(OnHand.posted_value) by inventory account and dimension to the ledger balance projection and raises `dev.passage.inventory.reconciliation.diff.v1` on any non-zero difference.

- **FR-16.13 Inventory transaction inquiry** — Should. The system shall provide a filterable, exportable inquiry over transactions with origin, status, dates and GL voucher drill-down.

- **FR-16.14 Opening balance load** — Should. The system shall load opening balances from AX InventSum/InventTrans or SAP MARD/MCHB/MBEW extracts through the wave 10 migration framework into an OPENING_BALANCE journal.

- **FR-16.15 Transfer orders with in-transit stock** — Must. The system shall provide a `TransferOrder` document (AX InventTransferTable; SAP stock transport order UB) with header `from_warehouse_id`, `to_warehouse_id`, `transit_warehouse_id`, `ship_date`, `receipt_date`, `delivery_terms`, `mode_of_delivery`, status `DRAFT, CREATED, SHIPPED, PARTIALLY_RECEIVED, RECEIVED, CANCELLED`, and lines with `qty`, `shipped_qty`, `received_qty`, `remaining_qty`, `underdelivery_pct`, `overdelivery_pct`, `close_short` and tracking dimensions.

  - Creation writes an ON_ORDER issue at the from-warehouse and an ORDERED receipt at the to-warehouse (supply and demand for wave 22 planning).
  - `:ship` (AX "Ship transfer order", SAP VL10B + PGI 641) posts in one database transaction a DEDUCTED issue at the from-dimension and a RECEIVED receipt at the transit dimension (`warehouse = transit_warehouse_id`, status `IN_TRANSIT`); cost of the transit receipt equals the cost of the issue (BR-16.3).
  - `:receive` (AX "Receive", SAP MIGO 101 against STO) posts a DEDUCTED issue at the transit dimension and a RECEIVED receipt at the to-dimension with the registered batch/serial/location; under-delivery within `underdelivery_pct` with `close_short=true` closes the line; over-receipt beyond

`overdelivery_pct` is rejected with `INV-TRF-002`.
  - `transit_warehouse_id` is mandatory when the legal-entity parameter `transfer_use_transit=true`; otherwise `:ship` performs ship-and-receive in one step (SAP one-step 301).
  - Transfer order picking release emits `dev.passage.inventory.transfer.release.v1` for wave 31 warehouse work (and wave 28 outbound picking); until those waves exist the shipment is posted from the transfer order screen or PWA.
  - Cancellation of unshipped remaining quantity cancels the ON_ORDER/ORDERED pair; delete of CREATED orders with no postings is allowed (AX "Delete transfer orders").
  - Documents: transfer shipping document and transfer receiving document (3.16.15).

- **FR-16.16 In-transit stock inquiry** — Should. The system shall list stock in transit by transfer order, product, from/to warehouse, ship date and days in transit (SAP MB5T), sourced from OnHand rows at transit warehouses, with drill-down to the transfer order.

- **FR-16.17 Ownership dimension, vendor consignment and customer consignment** — Must. The system shall activate the `owner` dimension (D365 InventOwnerId; SAP special stock indicator K) through the tracking dimension group, with `owner = legal entity` by default or a vendor id for vendor-owned stock.

  - `ConsignmentReplenishmentOrder` (vendor, lines product/qty/date/warehouse) receives vendor-owned quantity as RECEIVED transactions with `owner = vendor`, `posted_value = 0`, no ledger entry and no GR/IR (quantity-only stock).
  - Journal type OWNERSHIP_CHANGE moves quantity from `owner = vendor` to `owner = legal entity` as a paired issue/receipt at the consignment price (wave 17 trade agreement with `consignment=true`, else the replenishment order price), posting Dr inventory / Cr consignment accrual (posting profile account `consignment_accrual`; SAP OBYC KON) and emitting `dev.passage.inventory.ownership.changed.v1`; wave 18 FR-18.16 consumes it to create the consignment settlement invoice (SAP MRKO).
  - When the item model group sets `auto_ownership_change_on_issue=true`, an issue that would consume vendor-owned stock creates the ownership change automatically before the issue; stock determination order (`OWN_FIRST` / `CONSIGNMENT_FIRST`, SAP OSPX) is set per warehouse.
  - A periodic ownership-change batch (3.16.16) converts consumption-driven and age-driven (`max_consignment_days`) quantities.
  - Vendor-owned stock is counted in cycle counts (SAP MIK1) and is excluded from the inventory value report; consignment inventory reports (3.16.14) list vendor-owned quantity by vendor, warehouse and age.
  - Customer consignment: a warehouse of type `CUSTOMER_CONSIGNMENT` carries `customer_id`; stock there remains `owner = legal entity`, is reported by customer (SAP MB58), and is consumed by wave 27 consignment fill-up/issue documents.

- **FR-16.18 Tag counting** — Should. The system shall support two-step tag counting (AX tag counting journal): a `CountTag` range is generated per plan or warehouse with sequence `TAG-`, each tag printed with a barcode; a tag entry records product, dimensions and counted quantity per tag with status `USED`, `VOID`, `MISSING`; "transfer to counting journal" aggregates USED tags by product × dimension set into a COUNT journal where expected quantity is compared; missing and void tags are listed before transfer and each tag number is used at most once (`INV-TAG-001`).

- **FR-16.19 ABC classification** — Should. The system shall compute `AbcClassification` per product × site for criteria `VALUE` (on-hand value), `REVENUE`, `MARGIN`, `CARRYING_COST` over a lookback (default 365 days) with cumulative-percentage thresholds (default A 80 %, B 15 %, C 5 %, must sum to 100 — `INV-ABC-001`), store the class on the product (AX InventTable ABC fields; SAP MARC-ABCIN), run it as a monthly job and expose a report; CountPlan selection by `abc_class[]` uses the latest run.

- **FR-16.20 Segregated stock (sales-order and project stock)** — Should. The system shall support a `segment` dimension with `segment_type` (`NONE`, `SALES_ORDER`, `PROJECT`) and `segment_ref_id` (SAP special stock E / Q), activated per tracking dimension group, with an item model group flag `segment_valuated` (valuated vs non-valuated special stock); policy-based reservation for a demand carrying a segment considers only matching-segment stock first, then unsegmented stock when `segment_fallback=true`; the wave 20 value report groups by segment (SAP MBBS).

3.16.4 Data model

InventoryTransaction

Field	Type	Required	Notes
id	uuid	yes	PK
tenant_id	uuid	yes	RLS
origin_id	uuid	yes	FK InventoryTransactionOrigin
product_id	uuid	yes	FK product (wave 8)
dimension_set_id	bytea(32)	yes	FK DimensionSet hash
qty	numeric(28,6)	yes	signed; inventory unit; ≠ 0
entered_qty / entered_unit	numeric(28,6) / text	yes	as keyed
issue_status	enum	cond.	ON_ORDER, RESERVED_ORDERED, RESERVED_PHYSICAL, PICKED, DEDUCTED, SOLD; null for receipts
receipt_status	enum	cond.	ORDERED, ARRIVED, REGISTERED, RECEIVED, PURCHASED; null for issues
physical_date	date	yes	goods movement date
financial_date	date	no	set when financial status reached
cost_amount_physical	numeric(19,4)	no	accounting currency, at physical posting
cost_amount_posted	numeric(19,4)	no	accounting currency, financial
cost_amount_adjustment	numeric(19,4)	no	written by wave 20 close
ledger_entry_id	uuid	no	voucher in universal journal
corrects_transaction_id	uuid	no	reversal/correction link
marked_transaction_id	uuid	no	explicit issue→receipt marking (wave 20)
created_at	timestamptz	yes	append-only

InventoryTransactionOrigin

Field	Type	Required	Notes
id	uuid	yes	PK
source_type	enum	yes	INVENT_JOURNAL_LINE, PURCH_LINE, RECEIPT_LINE, SALES_LINE, PROD_LINE, COUNT_LINE, TRANSFER_LINE, OPENING
source_id	uuid	yes	polymorphic FK; unique (source_type, source_id)

Field	Type	Required	Notes
product_id	uuid	yes	denormalized
reference_number	text	no	PO number, journal number
direction	enum	yes	ISSUE / RECEIPT
created_at	timestamptz	yes	

OnHand

Field	Type	Required	Notes
tenant_id, product_id, dimension_set_id	composite PK	yes	
posted_qty, posted_value	numeric	yes	financially posted
received, registered, arrived, ordered	numeric	yes	receipt-side buckets
deducted, picked, reserved_physical, reserved_ordered, on_order	numeric	yes	issue-side buckets
last_txn_seq	bigint	yes	monotonic per row for rebuild diff
updated_at	timestamptz	yes	

InventoryJournal / InventoryJournalLine

Field	Type	Required	Notes
id, journal_number	uuid, text	yes	number sequence `INVJ-` gap-free optional
journal_type	enum	yes	MOVEMENT, ADJUSTMENT, TRANSFER, BOM, COUNT, OPENING_BALANCE
status	enum	yes	DRAFT, SUBMITTED, APPROVED, POSTING, POSTED, REJECTED, CANCELLED
posting_date	date	yes	financial_date default
offset_account_id	uuid	cond.	MOVEMENT mandatory
line: line_no, product_id, dimension_set_id, qty, entered_unit, cost_price, counted_qty, expected_qty, to_dimension_set_id (TRANSFER), bom_id (BOM)			
ledger_entry_id	uuid	no	after posting

Reservation: id, product_id, dimension_set_id, qty, demand_type, demand_id, policy (MANUAL/FIFO/FEFO/LIFO), status (ACTIVE, RELEASED, CONSUMED), expires_at, created_by.

CountPlan / CountSheet: plan id, name, selection (abc_class[], warehouse_ids[], location_range, max_days_since_count, sample_pct), frequency (cron), tolerance_qty_pct, tolerance_value, blind (bool); sheet id, plan_id, status (OPEN, COUNTED, APPROVED, POSTED), lines (product, dims, expected_qty, counted_qty, variance_qty, counted_by, counted_at).

Invariants: Σ qty over transactions with physical status for a (product, dimension set) = OnHand.physical_invent; posted_value changes only through financial status transitions and wave 20 adjustments; a serial has at most one open physical receipt not matched by an issue; DimensionSet hash is deterministic across services (shared Go package `passage/invdim`). Indexing: InventoryTransaction (tenant, product, dimension_set, physical_date), (origin_id), partial index on open statuses; OnHand clustered by (tenant, product); monthly range partitions on InventoryTransaction by physical_date when a tenant exceeds 20M rows.

3.16.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
POST	/api/v1/inventory/journals	Create journal header	client key	InventoryJournalMaintain
POST	/api/v1/inventory/journals/{id}/lines:bulk	Add up to 10,000 lines	per-line client key	InventoryJournalMaintain
POST	/api/v1/inventory/journals/{id}:validate	Dry-run validation	n/a	InventoryJournalMaintain
POST	/api/v1/inventory/journals/{id}:post	Post (starts Temporal `PostInventoryJournal`)	journal id	InventoryJournalPost
GET	/api/v1/inventory/onhand?product=&site=&warehouse=&batch=&groupBy=	On-hand inquiry	n/a	InventoryInquire
GET	/api/v1/inventory/transactions?product=&status=&from=&to=	Transaction inquiry	n/a	InventoryInquire
POST	/api/v1/inventory/reservations	Reserve (manual or policy)	client key	InventoryReserve
DELETE	/api/v1/inventory/reservations/{id}	Release	idempotent	InventoryReserve
POST	/api/v1/inventory/blockings	Block qty/batch/serial	client key	InventoryBlock
POST	/api/v1/inventory/count-plans/{id}:generate	Create count sheets	plan+date	CycleCountMaintain
POST	/api/v1/inventory/count-sheets/{id}:post	Post variance journal	sheet id	CycleCountPost
POST	/internal/v1/inventory/transactions:apply	Service-to-service status transition (used by waves 17–20)	origin+step	service account
POST	/internal/v1/inventory/onhand:rebuild	Rebuild projection from transactions	run id	InventoryAdmin

Commands: `CreateJournal`, `AddLines`, `PostJournal` (validates period control, negative policy, dimension mandatory flags, UoM conversion existence, offset account structure), `Reserve` (validates qty > 0, policy-eligible batches, status), `Block`, `ApplyTransactionStep` (validates monotonic status order, quantity ≤ remaining at previous status).

Event	Trigger	Payload fields	Consumers
`dev.passage.inventory.transaction.posted.v1`	any transaction insert or status change	transaction_id, origin, product_id, dimension_set, qty, issue_status, receipt_status, physical_date, financial_date, cost_amount_*	costing, analytics, planning
`dev.passage.inventory.onhand.changed.v1`	OnHand row update	product_id, dimension_set, avail_physical, avail_ordered, delta_bucket, delta_qty	procurement, sales, warehouse
`dev.passage.inventory.journal.posted.v1`	journal reaches POSTED	journal_id, type, lines, ledger_entry_id, posting_date	ledger reconciliation, costing
`dev.passage.inventory.reservation.created.v1` / `.released.v1`	reservation lifecycle	reservation_id, demand, product, dims, qty, policy	sales, production

Event	Trigger	Payload fields	Consumers
`dev.passage.inventory.reconciliation.diff.v1`	daily job finds diff ≠ 0	account, dimension, inventory_value, ledger_balance, diff	alerting
`dev.passage.inventory.transfer.shipped.v1` / `.received.v1` / `.release.v1`	transfer order ship / receive / picking release	transfer_order_id, lines (product, dims, qty), from/to/transit warehouse, ship_date, receipt_date	planning (w22), warehouse (w31), fulfillment (w28), analytics
`dev.passage.inventory.ownership.changed.v1`	OWNERSHIP_CHANGE journal posted	journal_id, vendor_id, lines (product, dims, qty, consignment_price, amount_acct), ledger_entry_id	payables (w18 consignment settlement), supplier-portal (w20), analytics

3.16.6 User experience

Screen	Primary actions	Key fields/columns	Duty required
Inventory management workspace	Tiles: journals awaiting approval, negative on-hand, open count sheets, reconciliation diffs	counts, last run	InventoryInquire
On-hand inquiry	Filter, group by any dimension, drill to transactions, export	product, site, warehouse, location, batch, serial, status, physical_invent, avail_physical, avail_ordered, posted_value	InventoryInquire
Inventory journal (header + grid)	New, add lines, validate, submit, post, copy, import CSV	journal_number, type, status, line grid: product, dims, qty, unit, cost_price, offset account	InventoryJournalMaintain
Transaction inquiry	Filter by status/date/origin, drill to voucher	reference, status, qty, dates, cost amounts	InventoryInquire
Reservation dialog	Reserve by policy or pick batches/serials	candidate batches with expiry, available qty	InventoryReserve
Count plan / count sheet	Generate, assign, count (mobile-friendly), approve, post	expected (hidden when blind), counted, variance	CycleCountMaintain
Blocking	Block / release with reason	product, dims, qty, reason, expected release date	InventoryBlock

Interaction rules: grid supports keyboard row entry (Tab across cells, Ctrl+Enter to add line), paste from spreadsheet with dimension column mapping, inline validation on blur for product/dimension and deferred validation (`:validate`) for on-hand and period checks; column sets and filters personalized per user (wave 5 shell). Count sheet works on the PWA shell with offline queue of counted quantities (synced on reconnect, conflict = latest count wins with audit).

3.16.7 Business rules and edge cases

- **BR-16.1** Status transitions are monotonic per transaction: issue `ON_ORDER(0) < RESERVED_ORDERED(1) < RESERVED_PHYSICAL(2) < PICKED(3) < DEDUCTED(4) < SOLD(5)`; receipt `ORDERED(0) < ARRIVED(1) < REGISTERED(2) < RECEIVED(3) < PURCHASED(4)`. Backward moves only through named commands that create a status-change audit row and an on-hand delta.
- **BR-16.2** Splitting: applying a step for a quantity less than the transaction quantity splits the transaction into two rows with the same origin (AX InventTrans split); sum of split quantities equals the original.
- **BR-16.3** Transfers create an issue (DEDUCTED) at the from-dimension and a receipt (RECEIVED) at the to-dimension in one database transaction; cost of the receipt equals the cost of the issue at the time of posting.
- **BR-16.4** Negative-policy check reads `avail_physical` under row lock; two concurrent issues against the last unit serialize, the second fails with `INV-NEG-001`. Deadlock avoidance: locks acquired in ascending (product_id, dimension_set_id) order within a journal.
- **BR-16.5** Rounding: quantities rounded half-up to the inventory unit's decimals; values to the accounting currency's minor unit (wave 12 rounding rules). Transfer of 1/3 of a 1.000-unit batch under 3 decimals yields 0.333 and leaves 0.667.
- **BR-16.6** Physical date may be in a closed inventory period only if financial date is in an open period and the item model group allows backdated physical posting; otherwise `INV-PER-001`.
- **BR-16.7** FEFO tie-break: equal expiry → earliest receipt_date → lowest batch_id (lexical). Batches with no expiry sort last.
- **BR-16.8** Count sheet posting posts only lines where counted_qty differs from expected_qty at the time of posting (not generation); movements after generation trigger a recount flag when the plan has `freeze=false`.
- **BR-16.9** Serial-tracked products reject quantities other than ±1 and reject a receipt of a serial already in physical stock for the same product (across all warehouses in the legal entity).
- **BR-16.10** Blocking never changes physical_invent; it moves quantity between inventory statuses so `physical_invent` is unchanged and `avail_physical` decreases.
- **BR-16.11** Journal state machine: `DRAFT → SUBMITTED → APPROVED → POSTING → POSTED`; `SUBMITTED → REJECTED → DRAFT`; `DRAFT|REJECTED → CANCELLED`. POSTING is a crash-safe intermediate state; the Temporal workflow owns it and is the only writer.
- **BR-16.12** Reversal of a posted journal creates a new journal of the same type with negated quantities, referencing the original; original rows are never modified.
- **BR-16.13** Transfer order state machine: `DRAFT → CREATED → SHIPPED → PARTIALLY_RECEIVED → RECEIVED`; `CREATED|SHIPPED → CANCELLED` only for unshipped remaining quantity (shipped quantity in transit must be received or returned by a reverse transfer); `received_qty ≤ shipped_qty` per line; the transit dimension never carries reservations.
- **BR-16.14** Vendor-owned stock (`owner ≠ legal entity`) never carries `posted_value` and never reaches a financial status; an OWNERSHIP_CHANGE line cannot exceed the vendor-owned physical quantity at the dimension set (`INV-OWN-002`); the ownership change is a paired issue/receipt whose only difference is the owner dimension, so `physical_invent` summed across owners is unchanged.
- **BR-16.15** Tag counting: a tag number is consumed once per count tag range; a USED tag with zero quantity is a valid count of zero; the transfer to the COUNT journal rejects when any tag is still OPEN unless the supervisor marks remaining tags MISSING.
- **BR-16.16** ABC thresholds are cumulative percentages of the ranked criterion; ties at a boundary go to the higher class; products with zero activity in the lookback are class `C` unless `abc_zero_class` is set to `N` (not classified).
- **BR-16.17** Segmented stock: an issue for demand with segment S may consume stock with segment S, or unsegmented stock when `segment_fallback=true`; it never consumes stock of a different segment; transfers between segments are TRANSFER journal lines with `to_dimension_set_id` differing only in segment.

3.16.8 Acceptance criteria

- **AC-16.1** (FR-16.4) Given item model group forbids physical negative and on-hand 1,000 units, when 10,000 concurrent issues of 1 unit are submitted, then exactly 1,000 succeed, 9,000 return `INV-NEG-001`, and on-hand is 0.
- **AC-16.2** (FR-16.3) Given 1,000,000 posted transactions, when the rebuild job runs, then the rebuilt OnHand table equals the live table row-for-row and the job completes in < 10 minutes.
- **AC-16.3** (FR-16.6) Given a MOVEMENT journal of 100 lines with offset account 500100, when posted, then one ledger entry exists with Σ debits = Σ credits, inventory account per posting profile, and `ledger_entry_id` set on all 100 transactions.
- **AC-16.4** (FR-16.7) Given 100 batches with distinct expiry dates and a FEFO reservation of 50 units, when reserved, then the batch with the earliest non-blocked expiry is selected first and the reservation spans batches in expiry order until 50 units are reached.
- **AC-16.5** (FR-16.5) Given a serial-tracked product with serial S-001 in stock, when a receipt of S-001 is posted, then it is rejected with `INV-SER-001`.

- **AC-16.6** (FR-16.9) Given a count plan with 5% qty tolerance, when a sheet line variance is 8%, then posting requires an approver with CycleCountApprove and the posted journal line equals counted − expected.
- **AC-16.7** (FR-16.11, FR-16.6) Given inventory period 2026-09 closed for module INVENTORY, when a journal with financial_date 2026-09-30 is posted, then it is rejected with the period-control error from wave 14 and no transaction is written.
- **AC-16.8** (FR-16.2) Given a receipt transaction at REGISTERED, when `Unregister` is called, then status returns to ARRIVED, registered bucket decreases, and a status-change audit row exists.
- **AC-16.9** (FR-16.12) Given a manual ledger journal posted to the inventory account without an inventory transaction, when the daily reconciliation runs, then a diff event is emitted with the exact amount.
- **AC-16.10** (FR-16.10) Given product unit EA with conversion 1 BOX = 12 EA, when a line of 2.5 BOX is posted, then qty = 30 EA, entered_qty = 2.5, entered_unit = BOX.
- **AC-16.11** (FR-16.15) Given a transfer order of 100 EA from warehouse W1 to W2 with transit warehouse T1 and `transfer_use_transit=true`, when shipped and then 95 EA received with `close_short=true` and `underdelivery_pct=10`, then on-hand is W1 −100, T1 +5 in transit (flagged for investigation), W2 +95, the line is closed, and both postings have `ledger_entry_id` null when the sites share a cost (no GL effect).
- **AC-16.12** (FR-16.17) Given 500 EA vendor-owned stock (owner = V1) and an OWNERSHIP_CHANGE journal of 120 EA at consignment price 4.00 USD, when posted, then on-hand shows 380 EA owner V1 (value 0) and 120 EA owner legal entity (value 480.00), the ledger entry is Dr inventory 480.00 / Cr consignment accrual 480.00, and `ownership.changed` is emitted with amount 480.00.
- **AC-16.13** (FR-16.18) Given 50 tags generated for warehouse W1, when 48 are entered as USED, 1 VOID and 1 left open, then transfer to the COUNT journal is rejected until the open tag is marked MISSING, after which the COUNT journal contains one line per product × dimension set with the summed tag quantities.
- **AC-16.14** (FR-16.19) Given 1,000 products with on-hand value following a Zipf distribution, when ABC classification by VALUE runs with 80/15/5, then the cumulative value of class A products is ≥ 80 % and the class is visible on the product and usable as a CountPlan filter.

3.16.9 Test plan and fixtures

Fixtures: `inv-demo-plant` (200 products, 3 sites, 6 warehouses, 400 locations, 5,000 opening lines; generated); `inv-1m-txn` (1M synthetic transactions over 12 months, Zipf-distributed across 2,000 products; generated by `scripts/fixtures/inv_txn_gen.py`); `inv-fefo-100` (100 batches with expiry grid, 10 blocked); `inv-ax-extract` (InventSum/InventTrans/InventDim CSV sample from AX 2012 demo company USMF, 50k rows); `inv-sap-extract` (MARD/MCHB/MBEW/MSEG sample, 50k rows).

Test	Type	Target	Pass criterion
Status transition monotonicity	property (Go rapid)	ApplyTransactionStep	no sequence of commands produces a backward step without a named reversal command
On-hand formula	unit	OnHand compute	formulas in FR-16.3 hold for 10k random bucket vectors
Concurrency negative	E2E (k6)	journals:post	AC-16.1
Rebuild equality	performance	onhand:rebuild on inv-1m-txn	zero diff, < 10 min
Journal GL balance	contract	ledger Post	every journal type → balanced entry
FEFO selection	unit + E2E	reservations	AC-16.4
Outbox event schema	contract (AsyncAPI)	all 5 events	schema registry compatibility BACKWARD
Period control	contract	journals:post	AC-16.7
PWA offline count	E2E (Playwright)	count sheet	counts queued offline sync without loss

Reconciliation checks: Σ OnHand.posted_value per inventory account = ledger balance; Σ transaction qty (physical) = OnHand.physical_invent; count sheet variance total = COUNT journal total; AX migration: InventSum.PostedQty + Received + Registered − Deducted − Picked = Passage physical_invent per InventDimId.

3.16.10 Deployment and operations

Helm chart `passage-inventory` (Deployment ×3, HPA 3–12 on CPU 70%, Postgres CloudNativePG cluster `inventory-db` 3 instances, outbox Debezium connector `inventory-outbox`). Config: `INV_NEGATIVE_DEFAULT=forbid`, `INV_RESERVATION_TTL_HOURS=0`, `INV_JOURNAL_MAX_LINES=10000`, `INV_RECON_CRON=0 2 * * *`. Migrations via Atlas from entity metadata (`inventory/v16.*`). Feature flags: `inv.fefo_policy`, `inv.count_pwa`, `inv.transfer_cost_diff` (off until w20). Scheduled jobs (Temporal cron): daily reconciliation 02:00 tenant local, count sheet generation per plan cron, weekly rebuild-and-compare Sunday 03:00. SLOs: journal post p95 < 2 s for 1,000 lines; on-hand query p95 < 50 ms; event lag p95 < 5 s. Alerts: reconciliation diff ≠ 0 (page), outbox lag > 60 s (ticket), negative on-hand where forbidden (page, indicates bug). Runbook: rebuild projection, replay outbox, reverse journal. Rollback: Argo CD digest rollback; migrations are additive in this wave (no destructive change), so downgrade is safe.

3.16.11 Migration from AX / SAP

Source	Passage entity	Notes
AX InventSum (per InventDimId)	OPENING_BALANCE journal lines → InventoryTransaction + OnHand	PostedQty+Received+Registered−Deducted−Picked → qty; PostedValue+PhysicalValue → cost; reserved/ordered buckets not migrated (open orders re-created in w17/w27)
AX InventDim	DimensionSet	map InventSiteId→site, InventLocationId→warehouse, wMSLocationId→location, InventBatchId→batch, InventSerialId→serial, InventStatusId→inventory_status
AX InventTrans (closed history)	InventoryTransaction (read-only history, flag `migrated=true`)	optional; last 24 months; StatusIssue/StatusReceipt mapped 1:1
AX InventBatch, InventSerial	Batch, Serial (wave 8 tracking entities)	expiry, shelf-life advice
AX InventModelGroup	ItemModelGroup (wave 8)	already migrated; verified here
SAP MARD (LABST unrestricted, INSME quality, SPEME blocked)	OpeningBalance per plant/storage location with inventory_status AVAILABLE / QUARANTINE / BLOCKED	
SAP MCHB (CLABS per batch)	OpeningBalance with batch dim	batch master from MCH1/MCHA
SAP MBEW (LBKUM, SALK3, VERPR/STPRS)	cost on opening lines	value = SALK3 split proportionally by qty
SAP MSEG/MKPF history	InventoryTransaction history	BWART → status mapping table (101, 102, 261, 262, 301, 311, 551, 561)

Transformation notes: dimension hash computed after mapping; quantities converted to Passage inventory unit via MARM/UnitOfMeasureConversion; opening journal posts with financial_date = cutover date − 1 and offset account = migration clearing account. Validation: Σ migrated qty per product/site equals source extract; Σ value equals source within 0.01 × product count; no serial duplicates. Not migrated: InventSum reservation buckets (recreated by open documents), AX quarantine orders

(re-entered manually; typically < 50), SAP special stock O (subcontracting; wave 21); special stock K migrates as `owner = vendor` stock per FR-16.17, InventClosing history (wave 20 decides).

3.16.12 Dependencies, risks, open questions

Depends on: wave 6 (sites, warehouses, UoM), wave 8 (products, dimension groups, item model groups, batch/serial masters), wave 11 (`Post(JournalEntry)`, posting profiles), wave 12 (currency rounding), wave 14 (period control module INVENTORY), wave 4 (Temporal, outbox), wave 10 (migration framework).

Risk	Likelihood	Impact	Mitigation
Row-lock contention on hot SKUs (one dimension set)	Medium	Medium	Lock per OnHand row only; batch issues in a journal sorted; measured by k6 at 10k concurrent
Dimension hash collision semantics across services	Low	High	Shared package with golden test vectors; hash includes dimension names
Count PWA offline conflicts	Medium	Low	Last-write-wins with audit; recount flag

Open questions:

1. Store license plate as a dimension now or add in wave 31? Default: reserve the column, null until wave 31. Decide by wave 17 close.
2. Should RESERVED_ORDERED be supported in wave 16 or only when sales/production demand exists? Default: implement now with manual demand type. Decide by wave 16 mid-point.
3. Monthly vs yearly partitioning threshold? Default: monthly when > 20M rows. Decide by wave 20.

3.16.13 Parameters and setup

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent
`negative_physical_allowed`	item model group	bool	false	true/false	FR-16.4 rejects issues below zero `avail_physical` when false	InventModelGroup.PhysNegative ("Physical negative inventory")
`negative_financial_allowed`	item model group	bool	false	true/false	FR-16.4 on `avail_ordered`	InventModelGroup.FinancialNegativ
`post_physical_inventory`	item model group	bool	true	true/false	Physical statuses post `cost_amount_physical` to the ledger (accrual accounts)	InventModelGroup.PostPhysicalInv ("Post physical inventory")
`backdated_physical_posting`	item model group	bool	false	true/false	BR-16.6 physical date in closed inventory period	n/a
`reservation_policy_default`	legal entity	enum	FIFO	MANUAL, FIFO, FEFO, LIFO	FR-16.7 default when the caller passes none	Inventory parameters → Date-contr reservation; Batch reservation parameters (FEFO date-controlled)
`reservation_ttl_hours`	tenant	int	0	0–720	FR-16.7 auto-release of stale reservations	n/a
`shelf_life_margin_days`	product tracking group	int	0	0–365	FEFO excludes batches expiring inside margin	PdsShelfAdvice / best-before margi
`journal_names`	legal entity	table	6 seeded (MOV, ADJ, TRF, BOM, CNT, OPN)	journal type, voucher sequence, posting restriction (USER/GROUP), approval workflow id, delete lines after posting	FR-16.6 header defaults and approval routing	Inventory → Journals → Journal na
`journal_max_lines`	tenant	int	10,000	1,000–50,000	FR-16.6 line cap (`INV-JNL-001`)	Inventory parameters → Journals – Journal size
`inventory_posting_profile`	legal entity	table	seeded from wave 11 chart	item code (table/group/all) × account code → inventory, adjustment, loss/profit, consignment accrual, transit accounts	FR-16.6 account resolution	Inventory → Posting → Inventory posting profiles (Inventory tab)

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent
`count_tolerance_qty_pct` / `count_tolerance_value`	count plan	numeric	5 / 100.00 acct ccy	0–100 / ≥ 0	FR-16.9 supervisor approval threshold	Counting groups (InventCountGrou counting reason codes
`count_freeze`	count plan	bool	true	true/false	BR-16.8 count lock vs recount flag	n/a (uses inventory blocking)
`blind_count`	count plan	bool	false	true/false	FR-16.9 hides expected quantity	n/a
`blocking_reason_codes`	legal entity	list	QUALITY, DAMAGE, RECALL, LEGAL, OTHER	user-defined	FR-16.8 mandatory reason	Inventory blocking reasons
`inventory_status_transitions`	legal entity	matrix	AVAILABLE↔BLOCKED, AVAILABLE→QUARANTINE, QUARANTINE→AVAILABLE/BLOCKED (disposition)	allowed pairs	FR-16.8 status change validation	Inventory statuses / inventory statu transitions (D365)
`serial_number_groups`	product	table	none	prefix, counter, length, auto-on-receipt	FR-16.5 auto serial assignment	Serial number groups
`recon_cron`	tenant	cron	`0 2 * * *` (tenant local)	valid cron	FR-16.12 schedule	n/a (Check inventory consistency, manual)
`transfer_use_transit`	legal entity	bool	true	true/false	FR-16.15 two-step vs one-step transfer	Transfer order parameters → In-tra warehouse required
`transit_warehouse_id`	warehouse (from)	reference	none	warehouse of type TRANSIT	FR-16.15 transit dimension per shipping warehouse	Warehouse → "Transit" warehouse assignment (InventLocation.InventLocationIdTra
`transfer_underdelivery_pct` / `transfer_overdelivery_pct`	product, overridable per line	numeric	0 / 0	0–100	FR-16.15 close-short and over-receipt check	Released product → Deliver → Underdelivery/Overdelivery
`owner_dimension_active`	tracking dimension group	bool	false	true/false	FR-16.17 enables `owner` on the hash	Tracking dimension group → Owne (D365)
`auto_ownership_change_on_issue` / `stock_determination`	item model group / warehouse	bool / enum	false / OWN_FIRST	OWN_FIRST, CONSIGNMENT_FIRST	FR-16.17 consumption-driven ownership change	Consignment parameters (D365)
`max_consignment_days`	vendor × product (trade agreement)	int	0 (off)	0–365	Ownership change batch converts stock older than N days	n/a
`abc_thresholds` / `abc_criterion` / `abc_lookback_days`	legal entity	numeric triple / enum / int	80-15-5 / VALUE / 365	sum = 100; VALUE, REVENUE, MARGIN, CARRYING_COST	FR-16.19	Inventory → ABC classification setu
`segment_dimension_active` / `segment_valuated` / `segment_fallback`	tracking dimension group / item model group / legal entity	bool	false / true / true	true/false	FR-16.20	n/a
`tag_number_sequence`	legal entity	number sequence	`TAG-`	wave 5 sequence	FR-16.18	Tag counting journal name

3.16.14 Inquiries and reports

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
On-hand inquiry	list inquiry	product, site, warehouse, location, batch, serial, status, owner, segment, `groupBy`, as-of date	physical_invent, avail_physical, avail_ordered, ordered, on_order, reserved_*, posted_value	`inventory.OnHand` (as-of replays transactions)	On-hand inventory (InventOnhand), Physical inventory by inventory dimension	MMBE, MB52, MB53 plant availability, MB5B stocks on posting date

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
Inventory transactions	drill-down	product, dims, status, origin type, physical/financial date range, voucher	reference, direction, qty, statuses, dates, cost amounts, ledger voucher	`InventoryTransaction`	Inventory transactions (InventTrans), Transaction origin	MB51 material document list, MB03 / MIGO display, MBGR by reason
Posted journals by type	list inquiry	journal type, status, date, posted by	journal number, lines, total qty, voucher	`InventoryJournal`	Journal inquiries (posted journals by type)	MB51 by movement type / document type
Count variance report	operational report	plan, sheet, warehouse, date, counter	expected, counted, variance qty, variance value, approval status	`CountSheet`	Counting history / Count variance inquiry	MI20 / MI24 difference list
Reservation inquiry	list inquiry	product, demand type/id, policy, status	reserved qty, batch/serial, expires_at	`Reservation`	Reservation form (InventTransReservation)	MB24 / MB25 reservations list
Blocking and quarantine inquiry	list inquiry	product, reason, status, expected release	blocked qty, reason, created by, release date, disposition	`Blocking` + OnHand status buckets	Inventory blocking inquiry, Quarantine order inquiry	MMBE blocked / quality stock columns
Negative on-hand list	KPI / list	site, warehouse	product, dims, shortfall qty, first negative date	`OnHand` where `physical_invent < 0`	Inventory management workspace tile	MB52 with negative filter
Inventory-to-ledger reconciliation	operational report (daily)	legal entity, account, dimension, date	inventory value, ledger balance, difference, sample vouchers	FR-16.12 job output	Ledger reconciliation inquiry (Inventory/ledger)	MB5L stock values vs G/L
Dimension combinations inquiry	list inquiry	product	dimension set hash, active dimensions, first/last use	`DimensionSet`	Inventory dimension inquiry	n/a
Batch / serial trace	drill-down	batch or serial, direction (forward/backward)	transactions, documents, locations through time	`InventoryTransaction` by tracking dimension	Batch/serial trace (Item tracing)	MB56 batch where-used list
Transfer order lines (shipped / received)	list inquiry	from/to warehouse, status, dates, product	ordered, shipped, received, remaining, days in transit	`TransferOrderLine`	Transfer order lines inquiry (InventTransferLine)	ME2N (document type UB), VL06O STO deliveries
Stock in transit	list inquiry	product, from/to warehouse, days in transit > N	qty, value at from-cost, transfer order, ship date	`OnHand` at TRANSIT warehouses	On-hand at transit warehouse	MB5T stock in transit
Consignment stock by vendor	operational report	vendor, warehouse, product, age	vendor-owned qty, consignment price, extended value (statistical), age buckets	`OnHand` where `owner ≠ legal entity`	Consignment inventory reports (D365)	MB54 consignment stocks
Customer consignment stock	operational report	customer, warehouse	qty, value, last movement	`OnHand` at CUSTOMER_CONSIGNMENT warehouses	n/a	MB58 customer consignment
Sales-order / project stock	list inquiry	segment type, segment reference	qty, value (if valuated), reservations	`OnHand` by `segment`	n/a	MBBS valuated special stock, MMBE special stock view
ABC classification report	operational report	site, criterion, run date	product, criterion value, cumulative %, class, previous class	`AbcClassification`	ABC classification report (SSRS)	MIBC result list
Tag status / missing tags	list inquiry	tag range, plan	tag number, status, product, qty, entered by	`CountTag`	Tag counting journal	n/a
Transfer order overview	operational report	legal entity, date range, status	orders by status, late shipments, late receipts	`TransferOrder`	SSRS Transfer order overview	ME2N + VL06I inbound delivery monitor

3.16.15 Printed and electronic documents

Document	Trigger	Layout elements (header / line / footer)	Formats	Numbering sequence	Legal / retention requirement
Inventory journal posting list	journal POSTED (on demand)	header: journal number, type, posting date, posted by, voucher; lines: product, dimensions, qty, unit, cost; footer: totals, offset account	PDF (A4/Letter), CSV	journal number `INVJ–`	Accounting record; retain with ledger vouchers (10 years DE/FR, 7 years US)
Count sheet / count list	count sheet generated	header: plan, sheet number, warehouse, counter, generated at; lines: location, product, batch/serial, expected (blank when blind), counted; footer: signature line	PDF, PWA screen	sheet number `CNT–`	Physical inventory evidence (HGB §240/§257, French CGI annual inventory); retain 10 years
Count tags	tag range generated	tag number barcode (Code 128), warehouse, range id, product/qty entry boxes	PDF (tag strips), ZPL	`TAG–`	Same as count sheet
Transfer shipping document (packing slip)	transfer order `:ship`	header: transfer number, from/to/transit warehouse, ship date, carrier, delivery terms; lines: product, qty, batch/serial, weight; footer: package count, signatures	PDF, email; EDI DESADV via wave 35 hook	shipment number `TRS–`	Transport document (CMR-like data for cross-border; Intrastat source, see 3.16.20)
Transfer receiving document	transfer order `:receive`	header: transfer number, receipt date, receiver; lines: shipped qty, received qty, variance, location	PDF	receipt number `TRR–`	Goods receipt evidence; retain 10 years
Consignment replenishment order	order confirmed	header: vendor, warehouse, requested date; lines: product, qty, consignment price	PDF, email, portal (wave 20)	`CRO–`	Commercial document; retain 10 years
Batch / serial / location label	registration or on demand	product, batch, expiry, serial, GS1-128 barcode (AI 01/10/17/21)	ZPL (4×6 in, 100×150 mm), PDF	none	GS1 compliance where required (FMD serial for pharma, wave 33)
Blocking / quarantine notice	block created	product, dims, qty, reason, expected release, approver	email (wave 4 notifications)	none	none

3.16.16 Periodic and batch jobs

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
Inventory-to-ledger reconciliation (FR-16.12)	daily 02:00 tenant local	legal entity × inventory account	run id = (entity, date); recomputes fully, upserts result rows	< 5 min per 1M transactions	retry 3× with 10 min backoff; then alert	diff ≠ 0 pages inventory accountant; missed run ticket

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
On-hand rebuild-and-compare	weekly Sunday 03:00	tenant × product range (1,000 products per child workflow)	checkpoint per child; compare table keyed by run id	< 10 min per 1M transactions	child retry; whole run resumable from last child	any row diff pages engineering (indicates bug)
Count sheet generation per plan	plan cron (e.g., `0 6 * * 1-5`)	count plan	key = (plan id, run date); re-run returns existing sheets	< 30 s per 10k lines	alert plan owner	sheets generated = 0 for an active plan → warning
Reservation TTL expiry	every 5 min	tenant	selects `expires_at < now()`; release is idempotent	< 10 s	retry next tick	expired-but-active reservations > 100 → ticket
ABC classification recalculation (FR-16.19)	monthly, 1st 04:00	legal entity × site	key = (entity, site, period); overwrites class with previous retained	< 2 min per 100k products	retry 3×	class churn > 30 % → warning to inventory manager
Ownership change batch (FR-16.17)	daily 23:00	vendor × warehouse	key = (vendor, warehouse, date); converts consumption-driven and aged quantities once	< 5 min	failed vendor skipped and listed	lines failed > 0 → ticket
Transfer order batch ship / receive (from confirmed shipments or ASNs)	hourly	legal entity	key = (transfer line, step)	< 1 min per 1k lines	line-level errors reported, rest posted	error lines > 0 → ticket
Journal and projection cleanup	weekly Sunday 05:00	tenant	deletes journal line drafts older than `journal_draft_retention_days` (90) and OnHand rows with all-zero buckets older than 30 days	< 2 min	skip and retry	none
Partition maintenance	monthly 1st 01:00	tenant	creates next-month partition on InventoryTransaction when over the row threshold; idempotent DDL	< 1 min	page (future inserts would fail)	partition missing for next month → page

3.16.17 Security duties and privileges

Duty	Privileges (entry points: API paths / screens / jobs)	Segregation-of-duties conflicts	Default roles that include it	AX duty / SAP authorization reference
InventoryInquire	GET /inventory/onhand, /transactions, /reservations; all inquiries in 3.16.14; workspace tiles	none	Inventory clerk, Warehouse supervisor, Inventory accountant, Buyer, Planner	AX "Inquire into inventory status" (InventOnhandInquire); SAP M_MSEG_LGO display, S_ALR stock reports
InventoryJournalMaintain	POST /inventory/journals, lines:bulk, :validate; Inventory journal screen (create/edit/submit)	with InventoryJournalPost when `journal_names.posting_restriction=SEGREGATED`	Inventory clerk	AX "Maintain inventory journals" (InventJournalMaintain); SAP M_MSEG_BWA activity 01
InventoryJournalPost	POST /inventory/journals/{id}:post; approval task	with InventoryJournalMaintain (same journal), with InventorySetupMaintain	Warehouse supervisor, Inventory accountant	AX "Post inventory journals"; SAP M_MSEG_BWA activity 02 per movement type
InventoryReserve	POST/DELETE /inventory/reservations; reservation dialog	none	Inventory clerk, Order processor (w27), Production planner (w21)	AX "Maintain inventory reservations"; SAP M_MRES_BWA
InventoryBlock	POST /inventory/blockings, status change; blocking screen; quarantine disposition	with CycleCountPost for the same dimension set (hides shrinkage)	Quality inspector (w33), Warehouse supervisor	AX "Maintain inventory blocking"; SAP M_MSEG_BWA for 343/344, QM stock
CycleCountMaintain	count-plans CRUD, :generate; count sheet entry (desktop/PWA); tag entry	with CycleCountApprove	Inventory clerk, Counter	AX "Maintain counting journals"; SAP M_ISEG_WIB (PI count)
CycleCountApprove	approve sheet lines above tolerance	with CycleCountMaintain, CycleCountPost (when policy `four_eyes_count=true`)	Warehouse supervisor	AX "Approve counting variances"; SAP M_ISEG_WDB (post differences)
CycleCountPost	POST /count-sheets/{id}:post; tag transfer to journal	with CycleCountMaintain under four-eyes	Warehouse supervisor, Inventory accountant	AX "Post counting journals"; SAP MI07 M_ISEG_WDB
TransferOrderMaintain	transfer orders CRUD, :cancel, delete; transfer order screen	none	Inventory clerk, Planner	AX "Maintain transfer orders" (InventTransferOrderMaintain); SAP M_BEST_BSA document type UB
TransferOrderPost	:ship, :receive; batch ship/receive job	with TransferOrderMaintain when `transfer_four_eyes=true`	Warehouse supervisor	AX "Ship and receive transfer orders"; SAP M_MSEG_BWA 641/101, V_VLIK
ConsignmentMaintain	consignment replenishment orders, OWNERSHIP_CHANGE journals, ownership change batch	with VendorInvoicePost (w18) for the same vendor	Inventory clerk, Buyer	D365 "Maintain consignment inventory"; SAP M_BEST_WRK item cat K, MRKO
InventoryAdmin	/internal/onhand:rebuild, partition maintenance, reconciliation re-run	with InventoryJournalPost	Inventory system administrator	AX "Maintain inventory parameters" + batch; SAP S_BTCH_ADM, MB5L
InventorySetupMaintain	parameters in 3.16.13, journal names, posting profiles, status transitions, ABC setup	with InventoryJournalPost, TransferOrderPost	Inventory system administrator, Inventory accountant (posting profiles only)	AX "Maintain inventory setup" (InventParameters); SAP SPRO MM-IM customizing (S_TABU_DIS)

3.16.18 Message catalog

Code	Severity	User text	Cause	Remediation	Raised by
INV-NEG-001	error	Issue of {qty} {unit} would make available physical stock negative for {product} at {dims} (shortfall {shortfall})	Item model group forbids physical negative	Receive stock, reduce quantity or change item model group policy	FR-16.4, BR-16.4
INV-NEG-002	error	Issue would make financial (ordered) stock negative for {product} at {dims}	Item model group forbids financial negative	Confirm the expected receipt first or allow financial negative	FR-16.4
INV-SER-001	error	Serial {serial} of {product} is already in physical stock at {warehouse}	Duplicate serial receipt	Correct the serial or issue the existing one first	FR-16.5, BR-16.9
INV-SER-002	error	Serial-tracked product {product} requires quantity ±1 per transaction	Quantity not ±1	Split the line into one row per serial	BR-16.9
INV-UOM-002	error	Quantity {entered_qty} {entered_unit} converts to {qty} with residual beyond {decimals} decimals	Conversion residual	Enter a quantity that converts exactly or adjust unit decimals	FR-16.10

Code	Severity	User text	Cause	Remediation	Raised by
INV-DIM-001	error	Dimension {dimension} is mandatory for {product}	Storage/tracking dimension group marks dimension mandatory	Fill the dimension	FR-16.5
INV-PER-001	error	Physical date {date} is in a closed inventory period and backdated posting is not allowed	BR-16.6	Change the physical date or allow backdated posting on the item model group	BR-16.6
INV-RES-001	error	Only {available} of {requested} {unit} available to reserve for {product}	Over-reservation	Reserve the partial quantity returned or wait for receipts	FR-16.7
INV-RES-002	warning	No eligible batch found for FEFO reservation (expiry margin {days} days)	All batches blocked, quarantined or expiring	Review blocked batches or reduce the shelf-life margin	FR-16.7
INV-BLK-001	error	Quarantined quantity requires a disposition (release, scrap, return) before exit	Missing disposition	Choose a disposition	FR-16.8
INV-JNL-001	error	Journal exceeds {max} lines	`journal_max_lines`	Split the journal	FR-16.6
INV-JNL-002	error	Movement journal line {line} requires an offset account	Missing offset	Enter an offset account valid for the account structure	FR-16.6
INV-JNL-003	error	Journal {journal} is already posting (workflow {id})	Concurrent post	Wait for the workflow to finish	BR-16.11
INV-CNT-001	warning	Variance {pct} % exceeds tolerance {tol} %; supervisor approval required	FR-16.9	Request approval from a user with CycleCountApprove	FR-16.9
INV-CNT-002	error	Dimension set {dims} is locked by open count sheet {sheet}	Count freeze	Post or cancel the sheet, or allow movement with recount on the plan	FR-16.9
INV-TRF-001	error	Shipping warehouse {warehouse} has no transit warehouse configured	`transit_warehouse_id` missing	Assign a transit warehouse or disable `transfer_use_transit`	FR-16.15
INV-TRF-002	error	Received quantity {qty} exceeds shipped quantity {shipped} plus tolerance {pct} %	Over-receipt on transfer	Correct the quantity or raise the tolerance on the line	FR-16.15
INV-TRF-003	error	Transfer order {number} cannot be cancelled: {qty} in transit	BR-16.13	Receive the in-transit quantity or create a reverse transfer	BR-16.13
INV-OWN-001	error	Vendor-owned stock cannot be financially posted or valued	Attempt to post value on `owner ≠ legal entity`	Post an ownership change journal first	BR-16.14
INV-OWN-002	error	Ownership change of {qty} exceeds vendor-owned quantity {available} at {dims}	BR-16.14	Reduce the quantity	FR-16.17
INV-TAG-001	error	Tag {tag} has already been used	Duplicate tag entry	Void the earlier entry or use a different tag	FR-16.18
INV-TAG-002	error	{n} tags are still open; mark them MISSING or enter them before transferring	BR-16.15	Resolve open tags	FR-16.18
INV-ABC-001	error	ABC thresholds must sum to 100 (got {sum})	Setup error	Correct the thresholds	FR-16.19
INV-SEG-001	error	Stock with segment {segment} cannot be issued to demand with segment {demand_segment}	BR-16.17	Transfer between segments or enable fallback	FR-16.20
INV-LCK-001	error	Could not lock on-hand row for {product} at {dims} within {ms} ms	Lock contention	Retry; the client should back off 200 ms × attempt	BR-16.4

3.16.19 Performance budgets and capacity

Operation	Volume assumption (per tenant per day / peak per minute)	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
Journal post (1,000 lines)	500 journals / 20 per min	0.8 s / 2 s / 4 s	2,000 lines/s per pod	InventoryTransaction ≈ 420 B/row + 280 B indexes; 50M rows ≈ 35 GB	(tenant, product, dimension_set, physical_date) B-tree; partial index on open statuses; monthly range partitions over 20M rows	Temporal task queue absorbs backlog; HPA 3→12 pods; posting latency rises to ≤ 10 s p95, no rejections
Internal `transactions:apply` (waves 17–20)	200k steps / 1,500 per min	15 ms / 40 ms / 80 ms	1,500 rps sustained	counted above	OnHand PK (tenant, product, dimension_set); `FOR UPDATE` per row	429 with `Retry-After` beyond 2,500 rps; callers (receiving, PO confirm) retry with jitter
On-hand query (≤ 10k rows aggregated)	50k queries / 600 per min	12 ms / 50 ms / 120 ms	1,000 rps	OnHand ≈ 300 B/row; ≤ 2M rows per tenant	clustered by (tenant, product); covering index on (tenant, site, warehouse, product)	Reads shift to the Postgres read replica (`inventory-db-ro`); stale-by ≤ 2 s shown in UI
Reservation (policy FEFO over 100 batches)	30k / 300 per min	25 ms / 80 ms / 150 ms	500 rps	Reservation ≈ 200 B/row	index (product, dimension_set, status)	Serializes per product; p95 ≤ 300 ms
Count sheet generation (10k lines)	20 sheets	5 s / 30 s / 60 s	n/a	CountSheet lines ≈ 250 B/row	(plan_id, status)	Queued per plan; no user-facing path
Rebuild-and-compare (1M transactions)	weekly	6 min / 10 min / 15 min	2,000 rows/s	temp compare table dropped after run	parallel by product range, 32 children	Runs on replica snapshot; skipped if lag > 60 s and retried next hour
Reconciliation (per entity)	daily	1 min / 5 min / 8 min	n/a	result rows ≈ 1 KB × accounts × days	aggregate on (ledger_entry_id) index	Off-peak only; alert if > 15 min
Transfer order ship / receive (100 lines)	2,000 orders / 50 per min	0.4 s / 1.2 s / 2.5 s	200 orders/min	TransferOrder ≈ 1.5 KB + lines 300 B	(from_warehouse, status), (to_warehouse, status)	Same as journal post (paired transactions)
Outbox event publish	300k events / 3,000 per min	lag 1 s / 5 s / 10 s	5,000 events/s per Debezium connector	Kafka retention 7 days	partition by tenant_id + product_id	Lag alert at 60 s; consumers idempotent on transaction id

3.16.20 Localization and compliance hooks

Concern	Varies by	Country packs touching it (wave 48)	Extension point used
Statutory stock ledger / inventory book (Italy libro giornale di magazzino, Portugal/Spain stock register, India stock register, Russia stock card)	Country reporting rules	IT, ES, PT, IN, RU, TR	Report projection `inventory.transaction_ledger` (wave 15 report definitions) with country layout; SAP S_P00_07000139 / AX country-specific inventory reports
Annual physical inventory obligation and evidence retention	HGB §240/§257 (10 years), French CGI, US GAAP evidence	DE, FR, US	`CountSheet` retention policy from wave 5 audit retention; immutable PDF archive in object store
Electronic signature on count approval, blocking release and quarantine disposition	FDA 21 CFR Part 11, EU GMP Annex 11	US (pharma), EU (pharma)	Wave 4 approval step with `signature_required=true`; wave 33 extends to quality orders
Batch and serial regulatory tracing (EU FMD, DSCSA, food lot tracing FSMA 204)	Industry regulation	EU, US	GS1 label template (3.16.15) and batch trace inquiry (3.16.14); key data elements stored on batch (wave 8)
Intrastat and cross-border transfers (intra-EU transfer orders between warehouses in different member states, STO cross-border)	EU Intrastat thresholds	All EU packs	`transfer.received` event carries country of dispatch/arrival, commodity code (wave 8), net mass; wave 48 Intrastat consumer
Consignment stock VAT and call-off stock simplification (EU "quick fixes" 2020)	EU VAT directive Art. 17a	EU packs	`ownership.changed` event feeds wave 13 tax engine for supply point; call-off register report hook
Units of measure, decimals and quantity rounding	Metric vs imperial; product decimals	n/a (product-level)	Wave 6 UoM service; BR-16.5 rounding
Currency rounding of `posted_value`	Accounting currency minor unit (JPY 0, KWD 3)	n/a	Wave 12 rounding rules
Calendar and time zone for cron jobs and physical date default	Tenant/site local time, local holidays	All	Wave 6 site calendar; jobs scheduled in site time zone
Language of journal types, statuses, reason codes, PWA count screen	User language	n/a	Wave 3 metadata labels (en, de, fr, es in v1)
Privacy of counter identity (`counted_by`) and PWA device identifiers	GDPR, state privacy laws	EU, US-CA	Wave 2 pseudonymization hook on worker references after retention

3.16.21 Coverage closure

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
AX 12.2.1 — Vendor → Consignment (D365 consignment replenishment orders) [#2]	GAP	ADDED as FR-16.17	`ConsignmentReplenishmentOrder`; settlement invoice in wave 18 FR-18.16

AX 12.14.2 — Transfer order inquiries (lines, shipped/received) [#125]	PARTIAL	ADDED as FR-16.15	3.16.14 "Transfer order lines"
AX 12.14.2 — SSRS: Transfer order (shipping document, receiving document, overview) [#127]	PARTIAL	ADDED as FR-16.15	3.16.15 shipping/receiving documents; 3.16.14 overview
AX 12.14.2 — SSRS: ABC classification report [#129]	PARTIAL	ADDED as FR-16.19	3.16.14
AX 12.14.2 — SSRS: Packing slip (inventory transfer) [#130]	PARTIAL	ADDED as FR-16.15	Transfer shipping document (3.16.15)
AX 12.14.3 — Tag counting → Create tag counting / Transfer to counting journal [#131]	PARTIAL	ADDED as FR-16.18	Tag range generation and transfer
AX 12.14.3 — Transfer orders → Ship / Receive (batch) / Transfer order picking release [#132]	PARTIAL	ADDED as FR-16.15	Batch ship/receive job (3.16.16); picking release event for wave 31
AX 12.14.3 — Transfer orders → Delete transfer orders [#133]	PARTIAL	ADDED as FR-16.15	Delete of CREATED orders without postings
AX 12.14.3 — ABC classification (periodic calculation) [#134]	PARTIAL	ADDED as FR-16.19	Monthly job (3.16.16)
AX 12.14.4 — Inventory and warehouse management parameters — Transfer orders [#136]	PARTIAL	ADDED as FR-16.15	`transfer_use_transit`, tolerances (3.16.13)
AX 12.14.4 — Inventory → ABC classification setup [#138]	PARTIAL	ADDED as FR-16.19	`abc_thresholds`, criterion, lookback (3.16.13)

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
AX 12.14.4 — Inventory → Transfer orders → Transfer order parameters, In-transit warehouses [#139]	PARTIAL	ADDED as FR-16.15	`transit_warehouse_id` per shipping warehouse
SAP 13.12 — ME21N item category K (consignment) [#126]	PARTIAL-16	ADDED as FR-16.17	Replenishment order replaces consignment PO; price from trade agreement `consignment=true` (wave 17)
SAP 13.12 — ME21N item category U / UB STO / NB cross-company STO [#127]	PARTIAL-16	ADDED as FR-16.15	Intra-company STO full; cross-company pricing and intercompany invoice in wave 40
SAP 13.12 — MRKO consignment settlement [#134]	PARTIAL-16	ADDED as FR-16.17	Ownership change emits event; invoice creation in wave 18 FR-18.16
SAP 13.12 — OMGN set up stock transport order [#136]	PARTIAL-16	ADDED as FR-16.15	`transfer_use_transit`, transit warehouse, tolerances
SAP 13.13 — MB53 / MB54 plant availability / consignment stock [#140]	PARTIAL-16	ADDED as FR-16.17	On-hand inquiry with `owner`; consignment report (3.16.14)
SAP 13.13 — MIK1 / MIQ1 / MIM1 PI for consignment / project stock / RTP [#142]	PARTIAL-16	ADDED as FR-16.17, FR-16.20	Count plans filter by owner and segment; returnable transport packaging OUT-OF-SCOPE (handled as ordinary product with owner dimension in v1)
SAP 13.13 — MIS1 / MIS2 inventory sampling [#144]	GAP (propose 16)	OUT-OF-SCOPE statistical sampling with extrapolation is not provided in v1; random-sample counting without extrapolation exists via CountPlan `sample_pct`	Revisit if a customer requires sampling-based book adjustment
SAP 13.13 — Special stock: sales order stock (E), project stock (Q) [#145]	PARTIAL-16	ADDED as FR-16.20	`segment` dimension, valuated flag
SAP 13.13 — Stock in transit (MB5T; S/4 stock in transit for STO) [#146]	PARTIAL-16	ADDED as FR-16.15, FR-16.16	Transit warehouse dimension and inquiry
SAP 13.13 — MB5T stock in transit report [#148]	PARTIAL-16	ADDED as FR-16.16	3.16.14
SAP 13.13 — MB54 / MB58 / MBLB consignment / customer consignment / subcontractor stock [#149]	PARTIAL-16	ADDED as FR-16.17	MB54 and MB58 reports added; subcontractor stock (MBLB) DEFERRED to wave 21 subcontracting
SAP 13.13 — MBBS valuated special stock [#150]	PARTIAL-16	ADDED as FR-16.20	Inquiry in 3.16.14; valued grouping in wave 20 value report
SAP 13.13 — MRKO consignment and pipeline settlement [#151]	PARTIAL-16	ADDED as FR-16.17	Pipeline material (utilities without stock) OUT-OF-SCOPE; settlement in wave 18
SAP 13.13 — Special stock settings (consignment price determination, pipeline) [#153]	PARTIAL-16	ADDED as FR-16.17	Consignment price via trade agreement flag; pipeline OUT-OF-SCOPE
SAP 13.13 — OSPX / OSPW stock determination strategies [#154]	PARTIAL-16	ADDED as FR-16.17	`stock_determination` OWN_FIRST / CONSIGNMENT_FIRST per warehouse
SAP 13.14 — MRKO consignment settlement (MM-IV) [#155]	PARTIAL-16	ADDED as FR-16.17	Invoice side in wave 18 FR-18.16
SAP 13.14 — MRKO scheduled [#158]	PARTIAL-16	ADDED as FR-16.17	Ownership change batch (3.16.16) + wave 18 settlement job
SAP 13.17 — VL10 → STO deliveries (NL/NLCC) [#203]	PARTIAL-16	ADDED as FR-16.15	`TransferShipment` with shipping document; carrier/freight in wave 34

3.17 Wave 17: Purchasing: Requisitions, RFQs, Agreements & Purchase Orders

3.17.1 Scope and business context

Wave 17 gives buyers the procurement document chain: purchase requisition (AX PurchReqTable/PurchReqLine, SAP EBAN), request for quotation with supplier replies (PurchRFQCaseTable/PurchRFQTable/PurchRFQReplyTable, SAP EKKO document type AN with quotation maintenance ME47), purchase agreements with release tracking (PurchAgreementHeader/PurchAgreementLine, SAP contracts type MK/WK and scheduling agreements LP via ME31K/ME31L), vendor trade agreements (PriceDiscTable journal type PriceDiscAdmTrans relation PurchPrice/PurchLineDisc, SAP condition records A017/KONP via MEK1), and purchase orders with versioned change management (PurchTable/PurchLine with PurchTableHistory and change-management parameters, SAP EKKO/EKPO with change documents CDHDR/CDPOS and version management in EREV). Purchase order confirmation writes ON_ORDER/ORDERED inventory transactions from wave 16.

At the end of the wave a requester can raise a requisition that routes by amount band and category to the right approvers, a buyer can consolidate approved requisition lines into POs, run an RFQ to several suppliers and award, create blanket agreements that POs release against, and send a PO as PDF/email with an EDI 850/ORDERS hook stubbed for wave 35. Out of scope: receiving (wave 18), invoice (wave 18), budget control on commitments (wave 38), subcontracting POs from production (wave 21), landed cost (wave 34), supplier portal acknowledgement (wave 20), catalog punch-out (v1.x).

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
AX purchase order confirmation runs PurchFormLetter with totals recalculation and PDF through SSRS; 20–90 s per PO on a loaded AOS; ME21N saves fast but output (NEU message, ME9F) depends on a scheduled RSNAST00 job	Synchronous document class chain plus report server; SAP output via NAST condition technique and batch	Confirmation is a state transition that enqueues rendering (Temporal activity) and emits `po.confirmed`; PDF rendered by a stateless worker within 3 s	Confirm latency: 20–90 s → < 2 s UI, PDF < 5 s; no batch wait
Price lookup in AX (PriceDisc class, PriceDiscTable search over 3 account codes × 3 item codes) is opaque; buyers cannot see why a price was chosen; SAP condition analysis (ME23N > Conditions > Analysis) exists but is 6 clicks deep	No explain output; access sequence hidden	Every PO line carries `price_source` (agreement id, trade agreement id, last price, manual) with an "explain" popover; `GET /pricing/explain`	Clicks to see why a price applied: 6–8 → 1; price disputes per 1,000 POs: tracked, target –80%
Change management in AX creates a full PurchTableHistory copy only when the parameter is on; comparing versions is a manual form; SAP version management requires EREV config and a reason per change	Version stored as whole-document copies without diff	Versions are stored as JSON-patch diffs against the previous version with a rendered side-by-side diff; re-approval rule evaluated per diff	Time to identify what changed between PO versions: 5 min → 10 s
Requisition approval in AX workflow (PurchReqReview) evaluates in the batch workflow processor every 60 s; escalation and delegation are per-user configuration pages; SAP release strategy (CL20N/CL24N classification) is nearly impossible to change without a consultant	Batch-polled workflow runtime; classification-based release strategy	Temporal approval workflow started synchronously on submit; policy is a declarative matrix (amount band × category × org) editable by a procurement admin	Submit-to-first-approver latency: 60–120 s → < 2 s; policy change lead time: days (consultant) → minutes (admin)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
PO total in AX recomputed by PurchTotals class on demand; header/line totals can disagree until "Totals" is opened; SAP EKKO has no stored total	Totals derived lazily	Totals persisted on every line change with a database constraint test `header.total = Σ lines + charges + tax`	Total mismatches: non-zero → 0 across 1,000 random POs

3.17.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity level
Purchase requisition	PurchReqTable, PurchReqLine; forms PurchReqTable, PurchReqReview workflow; policies (PurchReqControlRule)	EBAN/EBKN; ME51N/ME52N/ME53N; release strategy ME54N; ME57 assign source	`procurement.PurchaseRequisition`, `RequisitionLine`; Requisition workspace; policy matrix	full
Approval policy	Purchasing policies (PurchPolicy), amount bands via workflow conditions, category access policy	Release strategy (release groups/codes, classification characteristics CEBAN)	`ApprovalPolicy` (bands, category, org unit, requester role) compiled to Temporal workflow input	improved
Consolidation into PO	PurchReqConsolidation (consolidation opportunities), release approved lines (PurchReqPurchaseOrderCreate)	ME57/ME58 (assign and process), automatic PO creation ME59N	`POST /requisitions:consolidate` grouping by vendor × currency × site × delivery date window	full
RFQ	PurchRFQCaseTable, PurchRFQTable (per vendor), PurchRFQReplyTable, PurchRFQCompare; vendor collaboration portal reply (D365)	RFQ ME41/ME42/ME43 (EKKO BSTYP A), quotation ME47, price comparison ME49, rejection ME9A	`RFQ`, `RFQInvitation`, `RFQReply`; compare screen; award creates PO or agreement	full
Purchase agreement	PurchAgreementHeader, PurchAgreementLine, AgreementLineReleasedLine (release tracking); commitment types (product qty/value, category value, value)	Contracts (EKKO BSTYP K, ME31K/ME32K/ME33K), release orders, scheduling agreements (L, ME31L) with delivery schedules ME38	`PurchaseAgreement`, `AgreementLine` (commitment types QUANTITY, VALUE, CATEGORY_VALUE, TOTAL_VALUE); release tracking	full (scheduling agreement delivery schedules partial until w22 MRP)
Vendor pricing	Trade agreements PriceDiscTable (PurchPrice, PurchLineDisc, PurchMultiLnDisc, PurchEndDisc), account/item code hierarchy, date validity, quantity breaks	Conditions A017 (material info record), A018, A019, A025; KONP; info record EINA/EINE; MEK1	`TradeAgreement` (vendor > vendor group > all; product > product group > all; qty breaks; validity; currency) with explain	full
Purchase order	PurchTable, PurchLine, PurchTableHistory/PurchLineHistory (versions), PurchOrderStatus, DocumentStatus, PurchFormLetter_PurchOrder (confirm)	EKKO/EKPO/EKET (schedule lines)/EKKN (account assignment), ME21N/ME22N/ME23N, EREV versions	`PurchaseOrder`, `PurchaseOrderLine`, `DeliverySchedule`, `PurchaseOrderVersion`	full
Charges	MarkupTrans (misc. charges header/line), MarkupTable, auto charges (MarkupAutoTable)	Pricing conditions FRA1 (freight), ZOA1 (customs), header/item conditions	`Charge` (header/line; fixed, per unit, percent; debit/credit to item, vendor, ledger)	full
Delivery schedules	PurchLine delivery schedule (multiple delivery lines), confirmed delivery date	EKET schedule lines	`DeliverySchedule` rows per PO line	full
PO output	Print management (PrintMgmt), SSRS PurchPurchaseOrder report, email, AIF service PurchPurchaseOrderService	Message output NAST, forms MEDRUCK, IDoc ORDERS05	PDF via render worker, email via wave 4 notification service; EDI hook emits `po.confirmed` for wave 35	partial (EDI transport in w35)
Category hierarchy procurement	EcoResCategory procurement hierarchy, category policy	Material groups (T023), product categories	Wave 8 category hierarchy with procurement purpose	full
Vendor on-hold / status	VendTable Blocked (invoice/payment/all)	LFA1 SPERR/LOEVM, purchasing block LFM1 SPERM	Vendor role status (wave 7) checked on PO create/confirm	full
Scheduling agreements and releases	Purchase agreement with delivery schedule lines (partial); D365 no FRC/JIT releases	Scheduling agreement ME31L/ME38 delivery schedule, release creation profile (T163M), firm/trade-off zones, FRC/JIT releases ME84, release documentation ME85/ME86, Monitor SA Releases	`SchedulingAgreement` + `ReleaseSchedule` + `Release` (FRC/JIT) with cumulative quantities (FR-17.15)	full (EDI DELFOR/DELJIT transport in wave 35)
Policy framework	Policy framework (SysPolicy): Purchasing policies, Expense policies, Audit policies, Vendor invoice policies, Signing limit policies scoped by organization hierarchy purpose	Release strategy classification; no generic policy framework	`Policy` / `PolicyRule` engine scoped by org hierarchy purpose (FR-17.16); reused by waves 43, 48	improved
Signing limits	Signing limit policies, default signing limits by job/compensation level, worker signing limit requests, recertification	Release codes per user (CL24N classification by amount)	`SigningLimit` per worker with request workflow and recertification (FR-17.17)	full
Procurement catalog	Procurement catalogs (CatProcurementCatalog), catalog policy rule, catalog images, vendor catalog import (CMR XML), external catalogs (cXML/OCI punch-out)	Fiori self-service requisition with catalogs; OCI/cXML punch-out; SRM-MDM catalog	`ProcurementCatalog` with publication by org unit, images, vendor catalog import (FR-17.18); vendor upload via portal (wave 20 FR-20.19); punch-out in wave 35	partial (punch-out in wave 35)
RFQ bidding (sealed bids, scoring)	RFQ types, scoring criteria/groups, reply templates, sealed bids, amendments, solicitation types (D365 public sector)	ME47 quotation, ME49 price comparison; weighted scoring only in Ariba Sourcing	`RfqType`, `ScoringCriterion`, sealed reply storage, amendments (FR-17.19)	full (reverse auctions OUT-OF-SCOPE)
Category setup depth	Procurement categories, category policy rules, category managers, category vendor assignment, category questionnaires	Material groups T023, source list ME01, purchasing group	`CategoryVendorAssignment`, `CategoryManager`, `CategoryQuestionnaire` (FR-17.20)	full
Invoicing plans	n/a (prepayments only)	Invoicing plan on PO item (periodic/partial), MRIS settlement run, invoicing plan types T163*	`InvoicingPlan` on PO line (FR-17.21); run in wave 18 FR-18.17	full
Subsequent price change	n/a	MEI1/MEI2/MEI4 document index and automatic document adjustment; MRNB revaluation of invoiced items	`:reprice` run over open PO lines (FR-17.22); invoiced items via wave 18 FR-18.18 subsequent debit/credit	full
Service purchase orders and service specifications	Procurement category lines (no hierarchy)	ME21N item category D with service outline, value limits, contract limits; model service specifications ML10–ML12; standard service catalog; service conditions ML33–ML48, calculation schema MS0000	Service lines with `ServiceOutline` hierarchy, limits, `ModelServiceSpecification` templates, service prices via TradeAgreement (FR-17.23)	full
Consignment price agreements	Trade agreement with consignment flag (D365)	Consignment info record (ME11 info category K), price determination for consignment	TradeAgreement `consignment=true` consumed by wave 16 ownership change (FR-17.24)	full
Legal contract authoring	n/a	SAP CLM / Ariba Contracts clause library, obligations	Not provided; agreements carry attachments, validity and expiry alerts	dropped-with-reason (3.17.21)

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity level
Configurable PO items	n/a	Configuration in purchasing (LO-VC configured items on PO)	Deferred to the wave that introduces the configurator (wave 24/27); PO line stores `configuration_id` placeholder	dropped-with-reason (3.17.21)

3.17.3 Functional requirements

- **FR-17.1 Purchase requisition** — Must. The system shall let any user with RequisitionCreate raise a requisition with lines for catalog products, non-catalog items (description + category) or services, with requested date, quantity, unit, estimated price, site/warehouse, financial dimensions and attachments.
    - Statuses: DRAFT, IN_REVIEW, APPROVED, REJECTED, CLOSED (all lines consolidated), CANCELLED.
    - Estimated price defaults from TradeAgreement lookup for the preferred vendor, else last PO price, else zero with warning.
    - Maximum 500 lines; account structure validated at submit using wave 11 rules.
- **FR-17.2 Approval policy matrix** — Must. The system shall evaluate an `ApprovalPolicy` with rules (amount band in accounting currency, category, operating unit, requester role) producing an ordered approver chain, executed by the wave 4 Temporal approval template with 48 h SLA timers, escalation and delegation.
    - Bands default: 0–1,000 USD auto-approve, 1,000–10,000 manager, 10,000–100,000 manager + category owner, > 100,000 + CFO.
    - Policy versions are effective-dated; the version at submit time governs the whole instance.
    - Any line edit after submit restarts the workflow.
- **FR-17.3 Consolidation into purchase orders** — Must. The system shall group approved requisition lines into POs by vendor × currency × site × delivery window (default 7 days) with buyer override of vendor and the ability to split lines.
    - Lines with no vendor route to a "Needs sourcing" queue from which an RFQ can be started.
    - Consolidated lines keep `requisition_line_id` on the PO line for commitment tracking.
- **FR-17.4 RFQ cycle** — Must. The system shall create an RFQ with lines, invite N vendors, capture replies (price, lead time, quantity breaks, validity, notes, attachments) manually or via the supplier portal (wave 20), compare, and award whole or per line to create a PO or a purchase agreement.
    - Statuses: DRAFT, SENT, REPLIES_OPEN, CLOSED, AWARDED, CANCELLED; reply deadline enforced (late replies flagged, accepted only with override).
    - Compare view ranks by total landed estimate = price × qty + charges; ranking rule configurable (lowest price, shortest lead time, weighted score).
- **FR-17.5 Purchase agreements** — Must. The system shall support blanket agreements with commitment types QUANTITY (product × qty), VALUE (product × amount), CATEGORY_VALUE and TOTAL_VALUE, validity dates, price/discount terms, max enforcement (hard/soft) and release tracking.
    - A PO line referencing an agreement line draws down `released_qty` / `released_amount`; exceeding a hard limit rejects with `PRC-AGR-003`.
    - Agreement prices override trade agreements when `price_override=true`.
- **FR-17.6 Vendor pricing (trade agreements)** — Must. The system shall resolve unit price and line discount from `TradeAgreement` rows by most-specific match: vendor > vendor group > all vendors, product > product group > all products, with currency, unit, quantity break (from_qty) and validity (from/to dates).
    - Deterministic ordering: specificity score (vendor 4/group 2/all 0 + product 4/group 2/all 0), then latest from_date, then lowest price when still tied (configurable `tie_rule`).
    - Returns `explain` listing considered rows and the winner.
    - Lookup p95 < 20 ms (aligns with wave 26 pricing SLO; wave 26 replaces this implementation with the condition engine while keeping the API).
- **FR-17.7 Purchase order lifecycle** — Must. The system shall manage POs with approval status (DRAFT, IN_REVIEW, APPROVED, REJECTED, CONFIRMED, FINALIZED, CANCELLED) and document status (NONE, RECEIVED_PARTIAL, RECEIVED, INVOICED_PARTIAL, INVOICED) derived from downstream documents.
    - Confirmation requires approval status APPROVED and vendor not blocked; on confirm the service calls inventory `transactions:apply` to create ORDERED receipts (one per delivery schedule line) and renders output.
    - Lines carry product or category, qty, unit, unit price, discount %, line amount, delivery date, confirmed delivery date, site, warehouse, financial dimensions, tax group/item tax group (wave 13), agreement line, requisition line.
- **FR-17.8 Versioned change management** — Must. The system shall snapshot a `PurchaseOrderVersion` at each confirmation and, when change management is enabled for the vendor or legal entity, require re-approval of changes after confirmation according to the policy's `reapproval_rules` (any change / price or qty increase > X % / new line / delivery date change).
    - Version numbers monotonic from 1; diff stored as JSON Patch (RFC 6902); version document rendered and sent to vendor marked "Change order v{n}".
    - Received or invoiced quantities cannot be reduced below received/invoiced totals (`PRC-PO-007`).
- **FR-17.9 Charges** — Must. The system shall support header and line charges with calculation (FIXED, PER_UNIT, PERCENT), debit/credit sides (ITEM = capitalize into inventory cost; LEDGER = expense account; VENDOR = payable to a different vendor), and auto-charges by vendor/product group.
    - Header charges allocate to lines at invoice time by quantity, amount or line count (wave 18 consumes).
- **FR-17.10 Delivery schedules** — Must. The system shall allow one PO line to have multiple delivery schedule rows (qty, date, confirmed date) summing to line qty, each producing its own ORDERED inventory transaction.
- **FR-17.11 Totals and tax** — Must. The system shall persist header totals (`subtotal`, `discount_total`, `charges_total`, `tax_total`, `total`) recalculated on every line/charge change, calling the wave 13 tax engine, with `total = subtotal − discount_total + charges_total + tax_total` to the cent.
- **FR-17.12 PO output** — Must. The system shall render the PO/change order to PDF (template per legal entity, wave 15 document designer basics), email it to the vendor's purchasing contact, and emit `po.confirmed` for EDI/portal consumers; rendering failures do not block confirmation (retry with backoff, alert after 3 failures).
- **FR-17.13 Purchasing policies** — Should. The system shall provide entity-level policy settings: change management on/off, requisition required for PO creation (yes/no per category), PO required before invoice (consumed by wave 18), reapproval rules, consolidation window.

- **FR-17.14 Buyer workspace** — Should. The system shall show the buyer the queue of approved requisition lines, RFQs awaiting replies, POs awaiting confirmation, agreements near expiry (< 30 days) or near limit (> 90 %).
- **FR-17.15 Scheduling agreements and releases** — Must. The system shall support a `SchedulingAgreement` (SAP ME31L type LP/LPA; AX agreement with delivery schedule) per vendor × product × site with target quantity, validity, price terms, `release_profile` (FRC forecast horizon days, JIT horizon days, firm zone days, trade-off zone days, release frequency), and a `ReleaseSchedule` of dated quantities maintained manually in this wave and by wave 22 MRP later.
    - A release run (manual `:release` or the job in 3.17.16; SAP ME84) snapshots the schedule into a numbered `Release` (kind FRC or JIT) carrying per-line cumulative released quantity, cumulative received quantity (from wave 18 receipts) and the last receipt reference; the release document is rendered (3.17.15) and emitted as `dev.passage.procurement.sa.release.created.v1` for wave 35 EDI DELFOR/DELJIT.
    - Schedule lines inside the firm zone cannot be reduced without a reason code; lines in the trade-off zone warn; beyond it they are forecast only.
    - Each schedule line writes an ORDERED inventory transaction (wave 16) like a PO delivery schedule; receipts reference the schedule line.
    - Inquiry "Monitor scheduling agreement releases" lists agreements with open cumulative quantity, last release date, next release due, and release documentation per release number (SAP ME85/ME86).
- **FR-17.16 Policy framework** — Must. The system shall implement a reusable `Policy` engine (AX SysPolicy framework): policy types `PURCHASING`, `SIGNING_LIMIT`, `VENDOR_INVOICE` (consumed by wave 18), `EXPENSE` (wave 43), `AUDIT` (wave 48); each policy has an organization hierarchy purpose (wave 6), effective dates, and ordered `PolicyRule` rows of a rule type (e.g., purchasing: catalog policy, category access, purchase agreement policy, PO creation and demand consolidation, requisition control, RFQ control) with a JSON body validated by a per-rule-type schema.
    - Resolution: the most specific organization node in the hierarchy wins; rule evaluation is exposed as `POST /policies:evaluate` (pure, used by FR-17.2 and the policy tester).
    - Policies are versioned; the version at document submit time governs the instance; a "re-evaluate policies on open requisitions" job exists (AX Procurement → Policy evaluation).
    - Reports: policy rules per hierarchy node (AX SSRS Policies report) in 3.17.14.
- **FR-17.17 Signing limits** — Must. The system shall maintain `SigningLimit` per worker (wave 7/42 worker) with document types REQUISITION, PURCHASE_ORDER, INVOICE (wave 18), EXPENSE (wave 43), amount per currency, `spending_limit` and `approval_limit`, derived from `DefaultSigningLimit` rows by job and compensation level (policy type SIGNING_LIMIT) with worker-level overrides approved through a `SigningLimitRequest` workflow (wave 4), annual recertification job, and a signing limits report; FR-17.2 approval routing uses `approval_limit` so an approver whose limit is below the document amount is skipped to the next level.
- **FR-17.18 Procurement catalog** — Must. The system shall provide `ProcurementCatalog` objects (name, org units published to, validity, category navigation tree from the wave 8 procurement hierarchy, product entries with images, vendor, price source, unit, lead time, `preferred` flag) with publication status DRAFT/PUBLISHED/RETIRED; the requisition line picker searches published catalogs for the requester's org unit (catalog policy rule in FR-17.16), shows images and prices, and marks non-catalog lines.
    - Vendor catalog import: `POST /catalogs/{id}/vendor-import` accepts CSV/JSON (columns vendor product number, name, category, unit, price, currency, validity, image URL, lead time) in a staging table with buyer review (accept/reject per row) before publication; the same endpoint is used by the wave 20 supplier portal upload (FR-20.19); AX CMR XML is accepted through a mapping in the wave 10 migration framework.
    - External catalog punch-out (cXML/OCI) is a wave 35 integration hub capability; the requisition line carries `external_catalog_ref` reserved for it.
- **FR-17.19 RFQ types, sealed bids and scoring** — Should. The system shall add `RfqType` (sealed yes/no, amendment allowed, default scoring group, reply template), sealed bidding (replies encrypted at rest with a per-RFQ key and unreadable to buyers until `reply_deadline`, opening logged with user and time), `ScoringCriterion` groups (criterion, weight, scale 1–10) with buyer scoring per reply and a weighted total used by the compare view's `WEIGHTED_SCORE` ranking rule, amendments/addenda (new RFQ version re-sent to invited vendors with acknowledgement), and reply templates (questions the vendor must answer, rendered in the wave 20 portal).
- **FR-17.20 Category vendor assignment, category managers and questionnaires** — Should. The system shall allow per procurement category: `CategoryManager` (worker), `CategoryVendorAssignment` (vendor, status APPROVED/PROVISIONAL/BLOCKED, validity) enforced by the category access rule (`PRC-CAT-002` when a requisition or PO line uses a non-assigned vendor and the rule is HARD), and `CategoryQuestionnaire` (questions attached to a category, answered on the requisition line and shown to approvers).
- **FR-17.21 Invoicing plans on purchase order lines** — Should. The system shall allow a PO line (service or category line) to carry an `InvoicingPlan` of type PERIODIC (start, end, frequency MONTHLY/QUARTERLY, amount per period, billing day) or PARTIAL (milestone rows with date, percent or amount), with `settle_without_receipt=true` so that wave 18 FR-18.17 generates the invoice (SAP MRIS) on each due date without a product receipt; Σ partial percents = 100 and the plan total equals the line amount.
- **FR-17.22 Subsequent price change on open purchase orders** — Should. The system shall provide `POST /purchase-orders:reprice` (SAP MEI1/MEI2 document index; AX has no equivalent) selecting open, un-invoiced PO lines whose `price_source` is a trade agreement or agreement line changed since confirmation, previewing old/new price and amount deltas, and applying the change as a PO version (FR-17.8) with reapproval per policy; lines already received or invoiced at the old price are passed to wave 18 FR-18.18 for a subsequent debit/credit when `reprice_invoiced=true`.
- **FR-17.23 Service purchase orders, service outlines and model service specifications** — Must. The system shall support PO lines of kind SERVICE (SAP item category D; AX procurement category line) with an optional `ServiceOutline` hierarchy (outline levels with description, and service items with service product or free text, quantity, unit, unit price), `value_limit` and `expected_value` for unplanned services (SAP limit items), an optional reference to an agreement line whose remaining value constrains the limit (`contract_limit`), and reusable `ModelServiceSpecification` templates (SAP ML10–ML12, standard service catalog) copied into a PO or RFQ line.
    - Service prices resolve through FR-17.6 with `item_code=PRODUCT` on service products (SAP service conditions ML33–ML48, calculation schema MS0000); source determination picks an agreement for the service product and site when one exists.
    - Wave 18 FR-18.14 receives against service lines through service entry sheets.
- **FR-17.24 Consignment price agreements** — Should. The system shall allow a TradeAgreement row with `consignment=true` (SAP consignment info record; D365 consignment trade agreement) used by wave 16 FR-16.17 ownership changes and ignored by PO pricing unless the PO line is a consignment replenishment order line.

3.17.4 Data model

PurchaseRequisition / RequisitionLine

Field	Type	Required	Notes
id, requisition_number	uuid, text	yes	sequence `PR–`
requester_id, on_behalf_of_id	uuid	yes/no	wave 7 worker/user
legal_entity_id, operating_unit_id	uuid	yes	
status	enum	yes	DRAFT, IN_REVIEW, APPROVED, REJECTED, CLOSED, CANCELLED
policy_version_id	uuid	cond.	set at submit
total_estimated (acct ccy)	numeric(19,4)	yes	recomputed
line: line_no, product_id or (description, category_id), qty, unit, estimated_unit_price, currency, requested_date, site_id, warehouse_id, preferred_vendor_id, dimension_default_id, agreement_line_id, status (OPEN, CONSOLIDATED, CANCELLED), po_line_id			

PurchaseOrder / PurchaseOrderLine / DeliverySchedule / PurchaseOrderVersion

Field	Type	Required	Notes
id, po_number	uuid, text	yes	sequence `PO–`, gap-free optional
vendor_id, invoice_vendor_id	uuid	yes	wave 7 vendor role; invoice vendor defaults to vendor
legal_entity_id, site_id, warehouse_id	uuid	yes	
currency, exchange_rate_type	text	yes	wave 12
approval_status	enum	yes	DRAFT, IN_REVIEW, APPROVED, REJECTED, CONFIRMED, FINALIZED, CANCELLED
document_status	enum	yes	derived (FR-17.7)
version_no	int	yes	current confirmed version; 0 before first confirmation
change_management	bool	yes	copied from policy at creation
payment_terms_id, delivery_terms_id, mode_of_delivery	uuid/text	yes/no	wave 7
subtotal, discount_total, charges_total, tax_total, total	numeric(19,4)	yes	transaction currency
line: line_no, product_id or category_id, description, qty, unit, unit_price, price_unit (per 1/100/1000), discount_pct, discount_amount, line_amount, delivery_date, confirmed_delivery_date, site_id, warehouse_id, dimension_set_defaults, tax_group_id, item_tax_group_id, agreement_line_id, requisition_line_id, price_source, received_qty, invoiced_qty, remaining_qty, status (OPEN, RECEIVED, INVOICED, CANCELLED)			
schedule: po_line_id, seq, qty, delivery_date, confirmed_date, inventory_transaction_id			Σ qty = line qty
version: po_id, version_no, confirmed_at, confirmed_by, snapshot (jsonb), patch (jsonb RFC 6902), reapproval_required (bool)			

PurchaseAgreement / AgreementLine: id, agreement_number, vendor_id, legal_entity_id, currency, valid_from, valid_to, status (DRAFT, EFFECTIVE, ON_HOLD, CLOSED), default_commitment_type; line: commitment_type, product_id/category_id, committed_qty/committed_amount, unit, unit_price, discount_pct, max_enforced (HARD/SOFT/NONE), price_override (bool), released_qty, released_amount, remaining.

TradeAgreement: id, relation (PRICE, LINE_DISC, MULTILINE_DISC, TOTAL_DISC), account_code (VENDOR/GROUP/ALL), account_id, item_code (PRODUCT/GROUP/ALL), item_id, currency, unit, from_qty, to_qty, amount or percent, price_unit, valid_from, valid_to, site_id (optional), lead_time_days, status (DRAFT, ACTIVE, EXPIRED).

RFQ / RFQInvitation / RFQReply: rfq id, number, status, reply_deadline, lines (product/category, qty, unit, required_date); invitation (vendor_id, sent_at, channel EMAIL/PORTAL, status INVITED, DECLINED, REPLIED); reply (invitation_id, line_id, unit_price, currency, lead_time_days, qty_breaks jsonb, valid_until, notes, attachments, awarded (bool)).

Charge: id, owner_type (PO_HEADER, PO_LINE, RECEIPT, INVOICE), owner_id, charge_code_id, calc (FIXED, PER_UNIT, PERCENT), value, amount, currency, debit_type (ITEM, LEDGER, VENDOR), credit_type, debit_account_id, credit_account_id, allocation_rule.

Invariants: `po.total = Σ line_amount − discount + charges + tax` enforced by a deferred constraint trigger; Σ schedule qty = line qty; `received_qty ≤ qty` and `invoiced_qty ≤ max(received_qty, qty)`; agreement `released ≤ committed` when HARD; exactly one ACTIVE TradeAgreement wins per lookup (ties resolved by `tie_rule`). Indexes: PO (tenant, vendor, approval_status), line (po_id, line_no), schedule (po_line_id), TradeAgreement (tenant, relation, account_code, account_id, item_code, item_id, valid_from) for lookup; requisitions by requester and status.

3.17.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
POST	/api/v1/procurement/requisitions	Create requisition	client key	RequisitionCreate
POST	/api/v1/procurement/requisitions/{id}:submit	Submit for approval	req id + version	RequisitionCreate
POST	/api/v1/procurement/requisitions:consolidate	Create POs from approved lines	line id set hash	PurchaseOrderMaintain
POST	/api/v1/procurement/rfqs	Create RFQ	client key	RFQMaintain
POST	/api/v1/procurement/rfqs/{id}:send	Send invitations	rfq id	RFQMaintain
POST	/api/v1/procurement/rfqs/{id}/replies	Record a reply	invitation+line	RFQMaintain / portal vendor
POST	/api/v1/procurement/rfqs/{id}:award	Award to vendor(s)	rfq id	RFQAward
POST	/api/v1/procurement/agreements	Create agreement	client key	AgreementMaintain
GET	/api/v1/procurement/pricing/lookup?vendor=&product=&qty=&date=&currency=	Resolve price/discount with explain	n/a	PurchaseOrderMaintain
POST	/api/v1/procurement/purchase-orders	Create PO	client key	PurchaseOrderMaintain
PATCH	/api/v1/procurement/purchase-orders/{id}	Edit header/lines (creates pending change)	ETag	PurchaseOrderMaintain
POST	/api/v1/procurement/purchase-orders/{id}:confirm	Confirm (new version)	po id + version_no+1	PurchaseOrderConfirm
POST	/api/v1/procurement/purchase-orders/{id}:cancel	Cancel remaining	po id	PurchaseOrderMaintain
GET	/api/v1/procurement/purchase-orders/{id}/versions/{n}/diff	JSON Patch and rendered diff	n/a	PurchaseOrderInquire
GET	/api/v1/procurement/purchase-orders/{id}/document.pdf	Rendered PO	n/a	PurchaseOrderInquire

Commands: `SubmitRequisition` (account structure valid, lines ≥ 1, no closed category), `ConsolidateLines` (same vendor/currency/site/entity, vendor not blocked), `AwardRFQ` (reply not expired, award qty ≤ RFQ qty), `ConfirmPO` (approved, vendor active, agreement limits, delivery schedules sum, tax calculated, totals constraint), `ApplyChange` (post-confirmation changes evaluated against reapproval rules; sets approval_status back to IN_REVIEW if required).

Event	Trigger	Payload fields	Consumers
`dev.passage.procurement.requisition.submitted.v1` / `.approved.v1` / `.rejected.v1`	workflow transitions	requisition_id, lines (product, qty, amount), total, approver chain, policy_version	notifications, budget (w38), analytics
`dev.passage.procurement.rfq.sent.v1` / `.awarded.v1`	RFQ send/award	rfq_id, vendors, lines, awarded vendor per line	supplier-portal (w20), notifications
`dev.passage.procurement.po.confirmed.v1`	confirm	po_id, version_no, vendor_id, lines (product, qty, unit, price, delivery dates, site/warehouse), totals, output channel	inventory, receiving (w18), supplier-portal, EDI (w35), analytics
`dev.passage.procurement.po.version.created.v1`	any confirmed version > 1	po_id, version_no, patch, reapproval_required	supplier-portal, receiving
`dev.passage.procurement.po.cancelled.v1`	cancel	po_id, lines cancelled, remaining qty	inventory (cancel ORDERED), supplier-portal
`dev.passage.procurement.agreement.threshold.v1`	released ≥ 90 % or expiry < 30 d	agreement_id, line, pct, expiry	notifications
`dev.passage.procurement.sa.release.created.v1`	scheduling agreement release run	agreement_id, release_number, kind (FRC/JIT), vendor_id, lines (product, schedule dates, qty, cumulative released, cumulative received)	EDI (w35 DELFOR/DELJIT), supplier-portal (w20), planning (w22)
`dev.passage.procurement.policy.changed.v1` / `signinglimit.changed.v1`	policy version activated / signing limit approved	policy_id, type, version, hierarchy purpose; worker_id, document type, limits	procurement (re-evaluation), expense (w43), audit (w48)
`dev.passage.procurement.po.repriced.v1`	`:reprice` applied	po_id, version_no, lines (old price, new price, delta), invoiced lines passed to payables	payables (w18 subsequent debit/credit), analytics

3.17.6 User experience

Screen	Primary actions	Key fields/columns	Duty required
Procurement workspace (buyer)	Tiles and lists: lines to source, RFQs open, POs to confirm, agreements expiring, change orders pending re-approval	counts, aging	PurchaseOrderInquire
Requisition (requester, self-service)	Add product from catalog search, non-catalog line, submit, track approval	product, qty, price est., date, dimensions, approval timeline	RequisitionCreate
Approval task (shell inbox)	Approve, reject, delegate, request change, comment	requisition summary, lines, policy band hit, attachments	RequisitionApprove
Consolidation board	Group suggestions, drag lines between POs, change vendor, create POs	vendor, currency, site, lines, estimated total	PurchaseOrderMaintain
RFQ	Create, invite vendors, record replies, compare, award	lines, invitations, replies grid (price, lead time, validity), ranking	RFQMaintain
Purchase agreement	Create, add lines, view releases	commitment type, committed, released, remaining %, validity	AgreementMaintain
Purchase order	Create, add lines (price explain), charges, delivery schedules, confirm, view versions diff, print/email	header, lines grid, totals panel live, version timeline	PurchaseOrderMaintain
Trade agreement journal	Create rows in grid, validate overlap, post (activate)	relation, account/item codes, qty break, price, validity	TradeAgreementMaintain

Interaction rules: line grid keyboard entry with product search-as-you-type (p95 < 100 ms via wave 8 search index); price lookup fires on product/qty/vendor/date change and shows source badge; totals panel updates within 200 ms of any edit (server computed, optimistic client); bulk edit on selected lines (delivery date, site, dimensions); validation timing: inline for required/format, on `:confirm` for agreement limits and tax; approvers can act from email deep links with Keycloak session; personalization: saved views per buyer.

3.17.7 Business rules and edge cases

- **BR-17.1** Requisition state machine: `DRAFT → IN_REVIEW → APPROVED → CLOSED`; `IN_REVIEW → REJECTED → DRAFT`; `DRAFT|REJECTED → CANCELLED`; `APPROVED` lines may be individually CANCELLED by the requester before consolidation.
- **BR-17.2** PO approval state machine: `DRAFT → IN_REVIEW → APPROVED → CONFIRMED`; `CONFIRMED −(change requiring re-approval)→ IN_REVIEW`; `CONFIRMED −(change not requiring)→ CONFIRMED (version+1)`; `CONFIRMED → FINALIZED` when document_status = INVOICED and remaining = 0; any non-finalized → CANCELLED if received_qty = 0 and invoiced_qty = 0.
- **BR-17.3** Price resolution date is the PO line creation date by default, switchable to delivery date per policy; a trade agreement with `valid_to` null is open-ended; overlapping rows with equal specificity and dates are rejected at activation (`PRC-TA-002`).
- **BR-17.4** Quantity breaks use `from_qty ≤ qty < to_qty` in the agreement's unit after conversion; conversion failure falls back to the next less-specific row and records the fallback in explain.
- **BR-17.5** Rounding: unit price stored to 4 decimals of currency minor units (e.g., 12.3456 USD per price_unit); line_amount = round_half_even(qty × unit_price / price_unit × (1 − discount_pct/100), minor units); header totals are sums of rounded line amounts (never re-rounded), matching AX PurchTotals and SAP KOMP netwr behavior.
- **BR-17.6** Confirmation in a different fiscal period than creation is allowed; commitment date for budget (wave 38) is the confirmation date.
- **BR-17.7** Reducing PO line qty below `received_qty` is rejected; reducing below `invoiced_qty` but above `received_qty` is allowed only when the policy flag `allow_invoice_before_receipt` is true.
- **BR-17.8** Concurrency: PO edits use optimistic concurrency via ETag (`row_version`); a stale PATCH returns 412 with the current version and diff.
- **BR-17.9** Deleting a line on a confirmed PO cancels its remaining ORDERED inventory transactions; the line remains with status CANCELLED in versions.
- **BR-17.10** Agreement validity: a PO line may reference an agreement line only if the PO's requested delivery date falls within `valid_from..valid_to`; SOFT limit overrun emits a warning and `agreement.threshold`; HARD rejects.
- **BR-17.11** RFQ replies received after `reply_deadline` are stored with `late=true` and excluded from ranking unless the buyer overrides with a reason.
- **BR-17.12** Vendor currency differing from PO currency: PO currency defaults from the vendor's purchase currency; overriding requires an exchange rate available on the PO date (wave 12), else `PRC-FX-001`.
- **BR-17.13** Scheduling agreement zones: a schedule line with date ≤ today + `firm_zone_days` is FIRM (reduction requires reason code and emits a change release), ≤ today + `tradeoff_zone_days` is TRADEOFF (reduction warns), otherwise FORECAST; cumulative released quantity on a release never decreases unless a cumulative reset (new agreement year) is recorded explicitly.

- **BR-17.14** Policy resolution walks the organization hierarchy of the policy type's purpose from the document's operating unit upward; the first node with an active policy version wins; if no node has one, the legal-entity default policy applies; absence of a rule type in the winning policy means "no restriction".
- **BR-17.15** Signing limits are evaluated in the document currency converted to the worker's limit currency at the document date rate; an approver whose `approval_limit < amount` is skipped and the chain continues upward; a requester whose `spending_limit < amount` triggers an additional approval level rather than a rejection.
- **BR-17.16** Sealed RFQ replies cannot be read, scored or compared before `reply_deadline`; opening early requires two users with RFQAward and is logged as a sealed-bid exception; a late reply to a sealed RFQ is rejected (not merely flagged).
- **BR-17.17** Invoicing plan totals: PERIODIC plan total = periods × amount and must equal the line amount; PARTIAL plan percents sum to 100; changing the line amount after plan generation reproportions ungenerated plan rows only.
- **BR-17.18** Reprice selects only lines with `invoiced_qty = 0` by default; lines with receipts but no invoice reprice the GR/IR expectation (wave 18 GrirOpenItem keeps the receipt-side amount; difference flows at invoice); the run never changes manually priced lines (`price_source = MANUAL`).
- **BR-17.19** Service outline items sum to the outline parent; `value_limit` applies to the sum of unplanned service entry sheet amounts (wave 18) and `contract_limit` to the referenced agreement line's remaining value; exceeding either rejects the entry sheet with `PRC-SRV-003`.

3.17.8 Acceptance criteria

- **AC-17.1** (FR-17.2) Given the default band policy, when 30 requisitions spanning 6 amount bands × 5 categories are submitted, then each routes to the expected approver chain per the test matrix in `fixtures/procurement/approval-matrix.csv`.
- **AC-17.2** (FR-17.8) Given a confirmed PO with change management on and rule "qty increase > 5 % requires re-approval", when a line qty is raised from 100 to 110, then version 2 is created with a JSON Patch on `/lines/0/qty`, approval_status = IN_REVIEW, and the vendor is not notified until re-confirmation.
- **AC-17.3** (FR-17.8) Given the same PO, when the delivery date moves by one day and the rule excludes dates, then version 2 is created with approval_status CONFIRMED and the change order PDF is emailed.
- **AC-17.4** (FR-17.6) Given rows for vendor V (price 10), vendor group G containing V (price 9), and all vendors (price 8), all valid, when lookup for V runs, then price 10 is returned and explain lists all three rows (property test over random overlapping sets: most specific valid row always wins).
- **AC-17.5** (FR-17.11) Given 1,000 random POs with 1–50 lines, charges and tax, when totals are read, then `total = subtotal − discount_total + charges_total + tax_total` to the cent for all 1,000.
- **AC-17.6** (FR-17.7) Given an approved PO with 2 delivery schedule rows, when confirmed, then 2 inventory transactions at ORDERED exist with matching quantities and dates and on-hand `ordered` increases accordingly.
- **AC-17.7** (FR-17.5) Given a QUANTITY agreement line of 1,000 EA with HARD enforcement and 950 released, when a PO line of 100 EA references it, then confirmation fails with `PRC-AGR-003`.
- **AC-17.8** (FR-17.4) Given an RFQ sent to 3 vendors with 2 replies before deadline and 1 after, when compared, then the late reply is excluded and awarding to the lowest creates a PO with the reply price and lead time.
- **AC-17.9** (FR-17.3) Given 10 approved requisition lines across 2 vendors and 2 sites, when consolidated with the default window, then 4 POs are created and each requisition line references its PO line.
- **AC-17.10** (FR-17.12) Given the PDF renderer is down, when a PO is confirmed, then confirmation succeeds, `po.confirmed` is emitted, and the render activity retries 3 times before alerting.
- **AC-17.11** (FR-17.15) Given a scheduling agreement with schedule lines of 100 EA weekly for 12 weeks, firm zone 14 days, when a JIT release is created on day 0 and 100 EA are received against week 1, then release 1 shows cumulative released 1,200 and cumulative received 0, release 2 (run on day 8) shows cumulative received 100, and reducing week-2 quantity to 50 requires a reason code.
- **AC-17.12** (FR-17.16, FR-17.17) Given a purchasing policy on operating unit "Plant A" with category access rule blocking category "IT hardware" for requesters outside IT, and a requester with approval limit 5,000 USD, when a 7,000 USD requisition for IT hardware is submitted from Plant A by a non-IT requester, then it is rejected with `PRC-CAT-002`; submitted by an IT requester, it routes past the requester's manager (limit 5,000) to the next approver with limit ≥ 7,000.
- **AC-17.13** (FR-17.18) Given a published catalog for org unit "Finance" with 200 items and a vendor import file of 50 rows of which 3 lack a unit, when imported, then 47 rows stage as ACCEPTABLE and 3 as ERROR with reason, and after buyer acceptance the 47 appear in the catalog and in the requisition picker for Finance requesters only.
- **AC-17.14** (FR-17.19) Given a sealed RFQ with deadline 2026-11-01T17:00Z and 3 replies, when a buyer opens the compare view at 2026-11-01T16:59Z, then no reply prices are returned (403 `PRC-RFQ-004`); at 17:00:01Z all three are visible and the opening is logged.
- **AC-17.15** (FR-17.21) Given a service PO line of 12,000.00 EUR with a PERIODIC plan monthly 1,000.00 from 2027-01-01, when generated, then 12 plan rows exist with `due_date` on the billing day and Σ amount = 12,000.00; changing the line to 13,200.00 before any invoice reproportions all 12 rows to 1,100.00.
- **AC-17.16** (FR-17.22) Given 100 open PO lines priced from trade agreement T1 and T1's price changed from 10.00 to 9.50, when `:reprice` previews and applies, then 100 PO versions are created with patch `/lines/n/unit_price` 10.00 → 9.50, lines with invoices are excluded from the version and listed for wave 18 subsequent credit, and manually priced lines are untouched.
- **AC-17.17** (FR-17.23) Given a service PO line with outline "Maintenance" containing 3 service items and `value_limit` 2,000.00 for unplanned work, when wave 18 service entry sheets total 1,900.00 unplanned, then a further 200.00 unplanned entry is rejected with `PRC-SRV-003`.

3.17.9 Test plan and fixtures

Fixtures: `proc-demo-vendors` (40 vendors with groups, payment terms, currencies USD/EUR; 300 trade agreement rows); `proc-approval-matrix` (30 requisitions, expected chains); `proc-po-1000` (1,000 random POs generated with seed for totals test); `proc-rfq-cases` (12 RFQs); `proc-ax-extract` (PurchTable/PurchLine/PurchAgreementHeader/PriceDiscTable from USMF); `proc-sap-extract` (EKKO/EKPO/EKET/KONP/A017 samples).

Test	Type	Target	Pass criterion
Price specificity	property	pricing/lookup	most-specific valid row wins over 10k random sets
Totals identity	property + E2E	PO totals	AC-17.5
Approval routing	E2E (Temporal test server)	requisition workflow	AC-17.1
Version diff	unit	JSON Patch generation/apply	apply(patch, v_n) = v_{n+1} for all fixtures
Confirm → inventory	contract	inventory `transactions:apply`	AC-17.6
Agreement limits	unit	ConfirmPO	AC-17.7
PDF render	E2E	render worker	PDF/A-2b valid, < 5 s
Lookup latency	performance	pricing/lookup at 500 rps	p95 < 20 ms
Event schemas	contract	6 events	AsyncAPI BACKWARD compatible

Reconciliation checks: Σ requisition lines CONSOLIDATED = Σ PO lines with requisition_line_id; Σ agreement released = Σ confirmed PO line qty/amount referencing it; Σ inventory ORDERED qty per PO line = remaining open schedule qty.

3.17.10 Deployment and operations

Helm chart `passage-procurement` (API Deployment ×3, render worker ×2, Temporal worker ×2, CloudNativePG `procurement-db`, outbox connector). Config: `PRC_CONSOLIDATION_WINDOW_DAYS=7`, `PRC_CHANGE_MGMT_DEFAULT=true`, `PRC_RFQ_LATE_POLICY=flag`, `PRC_PDF_TIMEOUT_S=20`. Migrations `procurement/v17.*`. Feature flags: `prc.rfq_portal_replies` (on in w20), `prc.edi_output` (w35), `prc.delivery_date_pricing`. Jobs: agreement threshold scan daily 06:00; RFQ deadline closer hourly; approval SLA escalation (Temporal timers). SLOs: PO create/confirm API p95 < 500 ms; requisition submit to workflow start < 2 s; PDF < 5 s p95. Alerts: workflow task backlog > 100 for 10 min; render failures > 5/h; pricing lookup p95 > 50 ms. Runbook: re-render document, restart stuck approval (Temporal signal), re-emit `po.confirmed`. Rollback: additive migrations; flag off `prc.change_mgmt` if version logic misbehaves (POs remain confirmable without versions).

3.17.11 Migration from AX / SAP

Source	Passage entity	Notes
AX PurchTable/PurchLine (open: PurchStatus Backorder, open qty > 0)	PurchaseOrder/Line version 1, approval_status CONFIRMED	remaining qty = PurchQty – received; received history not migrated (opening on-hand covers stock)
AX PurchAgreementHeader/Line, AgreementLineReleasedLine	PurchaseAgreement/Line with released totals	released computed from source releases
AX PriceDiscTable (relation PurchPrice, PurchLineDisc)	TradeAgreement	AccountCode/ItemCode map 1:1; QuantityAmountFrom/To → from_qty/to_qty
AX PurchReqTable approved-not-consolidated	PurchaseRequisition APPROVED	in-review requisitions re-submitted after cutover
AX PurchRFQ*	not migrated	open RFQs re-issued
SAP EKKO/EKPO/EKET (BSTYP F, open per EKPO ELIKZ ≠ X)	PurchaseOrder/Line/DeliverySchedule	NETPR/PEINH → unit_price/price_unit; MENGE – delivered
SAP EKKO BSTYP K/L, EKAB release docs	PurchaseAgreement/Line	KTMNG target qty, KTWRT target value
SAP A017/A018 + KONP (PB00, RA01)	TradeAgreement	KBETR/KPEIN; KONM scales → qty breaks
SAP EBAN open (BANPR approved)	PurchaseRequisition	

Validation: count and Σ open amount per vendor equal source; sample 50 POs compared field-by-field; price lookup for 200 random vendor/product pairs matches source price. Not migrated: closed POs (reporting only, in lakehouse wave 46), PurchTableHistory versions, SAP change documents, NAST output logs.

3.17.12 Dependencies, risks, open questions

Depends on: wave 16 (ORDERED transactions, on-hand), wave 7 (vendors, groups, terms, blocking), wave 8 (products, categories, search), wave 11–13 (dimensions, currency, tax), wave 4 (approval workflow, notifications), wave 5 (shell inbox, document templates basics).

Risk	Likelihood	Impact	Mitigation
Wave 26 pricing engine replaces trade agreement lookup; behavior drift	Medium	Medium	Keep `pricing/lookup` contract and fixture set; wave 26 must pass wave 17 tests
Re-approval rule complexity grows	High	Low	Rules are a small DSL with fixtures; defaults cover 90 %
PDF template per legal entity before document designer (w15 basics only)	Medium	Low	One default template plus logo/address substitution

Open questions:

1. Should requisitions support punch-out catalogs in v1? Default: no, v1.x. Decide by wave 20.
2. Gap-free PO numbering per legal entity by default? Default: off (sequence with gaps allowed); on for countries requiring it. Decide by wave 18.
3. Scheduling-agreement delivery schedules from MRP: wave 22 or wave 17 manual only? Default: manual only now. Decide by wave 21.

3.17.13 Parameters and setup

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
`change_management_enabled` / `change_management_vendor_override`	legal entity / vendor	bool	true / inherit	true/false/inherit	FR-17.8 versioning and re-approval	Procurement and sourcing parameters → Purchase order change management; Vendor → "Activate change management"	OMFI/OMFJ version management per document type (T160VS)
`reapproval_rules`	legal entity (policy)	rule set	any price or qty increase > 5 %, new line	DSL (field, operator, threshold)	FR-17.8	Purchase order approval workflow conditions	Release strategy re-triggering (CEKKO changes)
`requisition_required_categories`	legal entity	category list	none	procurement categories	FR-17.13 PO creation requires requisition	Purchasing policy rule "Purchase order creation and demand consolidation"	n/a (PR-to-PO link enforced by T161 "PR required")
`po_required_before_invoice`	legal entity	bool	false	true/false	consumed by wave 18 expense invoices	Accounts payable parameters → "Require purchase order"	n/a
`consolidation_window_days`	legal entity	int	7	1–60	FR-17.3 grouping	Purchasing policy → Demand consolidation	ME59N grouping by delivery date (variant)
`approval_bands`	policy (PURCHASING)	table	0–1k auto; 1k–10k manager; 10k–100k + category owner; >100k + CFO	amount band × category × org unit × role	FR-17.2	Purchase requisition workflow conditions; purchasing policy	Release strategy CL24N characteristics (amount, material group)
`price_resolution_date`	legal entity	enum	ORDER_DATE	ORDER_DATE, DELIVERY_DATE	BR-17.3	Procurement parameters → Prices → "Price date"	Pricing date control on vendor master (LFM1-MEPRF)
`tie_rule`	legal entity	enum	LOWEST_PRICE	LOWEST_PRICE, LATEST_FROM_DATE	FR-17.6	Trade agreement "Find next" / search precedence	Access sequence exclusion flags

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
`rfq_late_policy` / `rfq_default_ranking`	legal entity	enum	FLAG / LOWEST_PRICE	FLAG, REJECT; LOWEST_PRICE, LEAD_TIME, WEIGHTED_SCORE	FR-17.4, BR-17.11	RFQ parameters, bidding parameters	n/a (ME49 ranking manual)
`rfq_types`	legal entity	table	STANDARD, SEALED	sealed flag, amendments allowed, scoring group, reply template	FR-17.19	RFQ types, solicitation types, scoring criteria/groups, reply templates	Document types for RFQ (OMEB)
`agreement_threshold_pct` / `agreement_expiry_days`	legal entity	numeric / int	90 / 30	50–100 / 1–180	FR-17.14 alerts	Purchase agreements → Agreement classifications (expiry)	ME3M validity monitoring (custom)
`charge_codes` / `auto_charges`	legal entity	table	seeded FREIGHT, HANDLING, CUSTOMS	code, calc, debit/credit types, accounts; auto charge by vendor/item group	FR-17.9	Charges codes, Auto charges, Charges groups	Condition types FRA1/ZOA1, calculation schema RM0000
`pdf_template_id` / `po_email_from`	legal entity	reference / email	default template / entity address	wave 15 templates	FR-17.12	Form setup (purchase documents), Print management	NACE EF output type NEU, MEDRUCK form
`po_number_gap_free`	legal entity	bool	false	true/false	number sequence continuity (open question 2)	Number sequence "Continuous"	Number range internal, no gaps (T161 ext. numbering)
`sa_release_profile`	scheduling agreement (default per legal entity)	record	FRC 90 d / JIT 14 d / firm 14 d / trade-off 28 d / weekly	horizons in days; frequency	FR-17.15	n/a	T163M release creation profile; firm zone / trade-off zone on SA
`policy_types` / `hierarchy_purpose_per_type`	tenant / legal entity	table	PURCHASING → "Procurement internal control"; SIGNING_LIMIT → "Signing limit"	wave 6 hierarchy purposes	FR-17.16	Policy parameters (organization hierarchy purpose per policy type)	n/a
`default_signing_limits`	policy (SIGNING_LIMIT)	table	none	job, compensation level, document type, currency, spending/approval limit	FR-17.17	Default signing limits (per job / compensation level), Signing limit parameters	Release codes per user
`signing_limit_recertification_months`	legal entity	int	12	3–24	FR-17.17 job	Signing limit request workflow (recertification)	n/a
`catalog_policy_rule`	policy (PURCHASING)	rule	catalog required for categories X	categories, org units, allow non-catalog	FR-17.18	Catalog policy rule	n/a
`vendor_catalog_import_params`	legal entity	record	max 50,000 rows; image max 2 MB; currencies allowed		FR-17.18	Vendor catalog import parameters, Catalog images	n/a
`category_access_mode`	policy (PURCHASING)	enum	SOFT	HARD, SOFT, OFF	FR-17.20 `PRC–CAT–002`	Category access policy rule, Category vendor assignment	Source list "fixed/blocked" (ME01)
`invoicing_plan_types`	legal entity	table	MONTHLY, QUARTERLY, MILESTONE	type, frequency, billing day, settle without receipt	FR-17.21	n/a	Invoicing plan types (T163*), OMEC
`reprice_invoiced`	legal entity	bool	false	true/false	FR-17.22 passes invoiced lines to wave 18	n/a	MRNB revaluation activation
`service_limit_defaults`	legal entity	record	expected value = 0, limit = 0 (must be set), overall limit check HARD		FR-17.23	n/a	Limit item defaults, MM-SRV screen layout, value limits
`model_service_specifications`	legal entity	table	none	outline template rows	FR-17.23	n/a	ML10–ML12 model service specs, standard service catalog

3.17.14 Inquiries and reports

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
Purchase orders (all / open / received not invoiced / backordered)	list inquiry	vendor, status, document status, site, buyer, date range	PO number, vendor, approval status, document status, total, version	`PurchaseOrder`	Purchase orders list page; Backordered purchase lines; Received but not invoiced	ME2L / ME2M / ME2N with selection parameters WE101 / RECHNUNG; ME80FN
Purchase order lines and history	drill-down	product, vendor, delivery date, status	line qty, received, invoiced, remaining, price, price source, versions	`PurchaseOrderLine`, `PurchaseOrderVersion`	Purchase order lines / Purchase order history / Versions	ME23N purchase order history (EKBE), ME2N line view
Requisitions by requester / status / consolidation	list inquiry	requester, status, org unit, category, date	requisition, lines, estimated total, approver chain position, PO link	`PurchaseRequisition`	Purchase requisition inquiries; My requisitions	ME5A / ME5K / ME5J, Monitor Purchase Requisitions
Approval status and SLA	drill-down	document, approver, overdue	step, approver, assigned at, due, decision	Temporal workflow projection	Workflow history	SWI1 / release log
RFQ status, replies and award history	list inquiry	RFQ, vendor, status, deadline	invitations, replies, ranking, scores, awarded	`RFQ`, `RFQReply`	RFQ inquiries; Compare replies	ME4L / ME4M / ME4N, ME49 price comparison, ME47

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
Purchase agreement fulfillment	list inquiry	agreement, vendor, product, validity	committed, released, remaining %, expiry	`PurchaseAgreement`	Purchase agreement inquiries (fulfillment / released quantities)	ME3L / ME3M / ME3N release documentation, ME80RN
Pricing explain	drill-down	vendor, product, qty, date, currency	candidate rows, specificity, winner	FR-17.6 explain	Trade agreement "Find prices"	ME23N → Conditions → Analysis (condition analysis)
Trade agreement list by vendor / product	list inquiry	relation, account/item codes, validity	price, breaks, currency, validity	`TradeAgreement`	Trade agreements (PriceDiscTable) inquiry	MEKA / MEKB / MEKC / MEKD condition lists, ME1L / ME1M info records
Order price history	operational report	product, vendor, date range	PO date, vendor, price, qty, agreement	`PurchaseOrderLine`	n/a (PurchLine query)	ME1P order price history
Charges inquiry	list inquiry	PO, charge code, vendor	charge, calc, amount, debit/credit sides	`Charge`	Charges inquiry	Condition records on PO (KONV)
Vendor delivery performance (confirmed vs actual)	KPI	vendor, period	on-time %, average days late, lines	`DeliverySchedule` + receipts (w18)	Vendor delivery performance (D365)	ME2V goods receipt forecast; vendor evaluation ME6H
Buyer workspace queues	KPI	buyer	lines to source, RFQs open, POs to confirm, agreements expiring, change orders pending	FR-17.14	Procurement workspace	Fiori Procurement Overview
Scheduling agreement releases monitor	list inquiry	agreement, vendor, release kind, date	release number, cumulative released, cumulative received, next release due	`Release`	n/a	Monitor Scheduling Agreement Releases; ME85 / ME86 release documentation
Policy rules per hierarchy node	operational report	policy type, hierarchy, date	node, policy version, rule type, rule body	`Policy`	SSRS Policies report	n/a
Signing limits report	operational report	org unit, document type, as-of	worker, job, spending limit, approval limit, source (default/override), recertified at	`SigningLimit`	SSRS Signing limits report	Release codes assignment list
Procurement catalog report	operational report	catalog, category, org unit	items, vendor, price, publication status, missing images	`ProcurementCatalog`	SSRS Procurement catalog report	n/a
Services per purchase order	list inquiry	PO, vendor, service product	outline, planned value, entered (w18), invoiced, limit remaining	`ServiceOutline`	n/a	ME2S services per PO, MSRV1–MSRV6 service lists
Invoicing plan schedule	list inquiry	PO, vendor, due date range	plan row, due date, amount, status (OPEN/INVOICED)	`InvoicingPlan`	n/a	MRIS selection list

3.17.15 Printed and electronic documents

Document	Trigger	Layout elements (header / line / footer)	Formats	Numbering sequence	Legal / retention requirement
Purchase order / change order	`:confirm` (every version)	header: PO number, version, vendor name/address, ship-to, bill-to, buyer, currency, payment and delivery terms, dates; lines: line no, product/vendor item no, description, qty, unit, price, discount, amount, delivery date, agreement ref; footer: subtotal, charges, tax, total, terms text, signature	PDF/A-2b, email (wave 4), EDI 850/ORDERS via `po.confirmed` (wave 35), portal (wave 20)	PO number `PO-` + `v{n}`	Commercial document; retain 10 years (DE/FR), 7 years (US); e-signature optional
Request for quotation	`:send`	header: RFQ number, deadline, terms, contact; lines: product/description, qty, unit, required date; questions from reply template	PDF, email, portal	RFQ number `RFQ-`	Public-sector solicitation rules where applicable (wave 48)
RFQ amendment / addendum	amendment issued	as RFQ with change summary	PDF, email, portal	`RFQ-{n}-A{k}`	Same
Purchase agreement document	agreement EFFECTIVE	header: agreement number, vendor, validity, commitment type; lines: product/category, committed qty/amount, price terms	PDF, email	`PA-`	Contract; retain 10 years after expiry
Scheduling agreement release (FRC / JIT)	release run	header: agreement, release number, kind, vendor, cumulative received, last receipt; lines: schedule date, qty, cumulative qty	PDF, email; EDI DELFOR (FRC) / DELJIT (JIT) via wave 35	`REL-{agreement}-{n}`	Commercial; retain with agreement
Consolidated requisition approval summary	approval task	requisition header, lines, policy band, approver chain	HTML email with deep link	n/a	none
Requisition printout	on demand	header, lines, dimensions, approval history	PDF	`PR-`	none (internal)
Vendor catalog import result	import finished	accepted/rejected rows with reasons	CSV	n/a	none

3.17.16 Periodic and batch jobs

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
Agreement threshold and expiry scan	daily 06:00	legal entity	key = (agreement line, date); emits each threshold once	< 1 min per 10k lines	retry 3×	missed run ticket
RFQ deadline closer	hourly	legal entity	sets REPLIES_OPEN → CLOSED where deadline passed; idempotent	< 10 s	retry next hour	RFQs past deadline still open > 2 h → ticket
Approval SLA escalation	Temporal timers per instance	workflow id	timer fires once per step	n/a	workflow retry	task backlog > 100 → ticket
Release approved requisitions (auto-create POs)	daily 07:00 (opt-in)	legal entity × vendor	key = line id set hash; lines already consolidated skipped	< 2 min per 5k lines	lines with errors left in queue	errors > 0 → buyer notification
Scheduling agreement release run (FR-17.15)	per profile frequency (default weekly Monday 05:00; JIT daily)	agreement	key = (agreement, kind, run date); unchanged schedule produces no new release	< 1 min per 1k agreements	failed agreement listed, rest released	releases failed > 0 → buyer ticket
Policy re-evaluation on open requisitions (FR-17.16)	on policy version activation + nightly 01:00	legal entity	key = (policy version, requisition); re-routes only when chain differs	< 2 min per 10k requisitions	retry 3×	re-routed count reported

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
Signing limit recertification (FR-17.17)	yearly per `signing_limit_recertification_months` + daily sweep	legal entity	key = (worker, cycle); creates one request per worker per cycle	< 1 min	retry	unrecertified limits past due → manager notification
Catalog publication / vendor import processing (FR-17.18)	on demand + nightly 02:00	catalog	key = (import file hash); rows staged once	< 5 min per 50k rows	row-level errors	errors > 5 % → import marked FAILED
Subsequent price change run (FR-17.22)	on demand; optional weekly Sunday 06:00	legal entity × trade agreement	key = (agreement version, run); lines already repriced skipped	< 5 min per 10k lines	per-PO failure isolated	versions created / failed reported
Delete and clean-up (cancelled POs older than N days, expired requisitions, update history)	monthly 1st 03:00	legal entity	idempotent delete by cut-off	< 5 min	skip	none

3.17.17 Security duties and privileges

Duty	Privileges (entry points: API paths / screens / jobs)	Segregation-of-duties conflicts	Default roles that include it	AX duty / SAP authorization reference
RequisitionCreate	POST /requisitions, :submit; requisition screen; catalog picker	none	Employee (all), Requester	AX "Maintain purchase requisitions" (PurchReqMaintain); SAP M_BANF_BSA, M_BANF_WRK
RequisitionApprove	approval tasks for requisitions; delegate	with RequisitionCreate on own requisitions (self-approval blocked by workflow)	Manager, Category owner, CFO	AX "Approve purchase requisitions"; SAP M_BANF_FRG release codes
PurchaseOrderInquire	GET purchase orders, versions, diff, document.pdf; buyer workspace; inquiries 3.17.14	none	Buyer, Receiving clerk, AP clerk, Controller	AX "Inquire into purchase orders"; SAP M_BEST_BSA activity 03
PurchaseOrderMaintain	POST/PATCH purchase orders, :cancel, requisitions:consolidate, pricing/lookup, charges	with PurchaseOrderConfirm when `po_four_eyes=true`; with ReceivingPost (w18) and VendorInvoicePost (w18)	Buyer	AX "Maintain purchase orders" (PurchTableMaintain); SAP M_BEST_BSA 01/02, M_BEST_EKG purchasing group
PurchaseOrderConfirm	:confirm; approval tasks for POs; :reprice apply	with PurchaseOrderMaintain under four-eyes; with VendorMaintain (w7)	Senior buyer, Purchasing manager	AX "Confirm purchase orders"; SAP M_EINK_FRG release PO (ME28/ME29N)
RFQMaintain	POST rfqs, :send, replies; RFQ screen; amendments	with RFQAward on same RFQ when sealed	Buyer	AX "Maintain requests for quotation"; SAP M_ANFR_BSA, M_ANGB_BSA
RFQAward	:award; sealed-bid opening; scoring	with RFQMaintain (sealed)	Purchasing manager	AX "Award RFQ"; SAP M_ANGB_FRG
AgreementMaintain	POST agreements, lines; scheduling agreements, release schedules	with PurchaseOrderConfirm when policy requires	Buyer, Contract manager	AX "Maintain purchase agreements"; SAP M_RAHM_BSA, M_RAHM_FRG
TradeAgreementMaintain	trade agreement journal create/post; consignment price rows	with PurchaseOrderConfirm (price manipulation)	Pricing analyst, Purchasing manager	AX "Maintain trade agreements" (PriceDiscAdm); SAP M_EINF_EKO conditions, MEK1
ProcurementPolicyMaintain	policies, policy rules, approval bands, category access, catalog policy, signing limit defaults	with RequisitionApprove, PurchaseOrderConfirm	Procurement administrator	AX "Maintain purchasing policies" (PurchPolicy); SAP release strategy customizing (S_TABU_DIS, CL24N)
SigningLimitApprove	signing limit requests approval; recertification	with own SigningLimitRequest	HR manager, Procurement administrator	AX "Approve signing limit requests"; n/a
CatalogMaintain	catalogs CRUD, vendor import review, publication	none	Catalog manager, Buyer	AX "Maintain procurement catalogs" (CatProcurementCatalogMaintain); SAP SRM catalog admin
CategoryMaintain	category managers, vendor assignments, questionnaires	with VendorMaintain (w7) when assignment approval required	Category manager, Procurement administrator	AX "Maintain procurement categories"; SAP source list ME01 (M_ORDR_WRK)
ProcurementSetupMaintain	parameters in 3.17.13, charge codes, number sequences, templates	with PurchaseOrderConfirm, TradeAgreementMaintain	Procurement administrator	AX "Maintain procurement parameters" (PurchParameters); SAP SPRO MM-PUR (S_TABU_DIS)

3.17.18 Message catalog

Code	Severity	User text	Cause	Remediation	Raised by

3.17.19 Performance budgets and capacity

Operation	Volume assumption (per tenant per day / peak per minute)	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
PO create / line edit with totals and tax	5,000 POs, 40k line edits / 200 per min	120 ms / 500 ms / 900 ms	100 rps	PO ≈ 3 KB + lines 600 B + versions 2–20 KB (JSON patch); 5k POs/day ≈ 6 GB/year	PO (tenant, vendor, approval_status); line (po_id, line_no); versions by (po_id, version_no)	Totals recalculation batched per request; tax engine timeout 2 s → totals marked STALE and recomputed on confirm
PO confirm (incl. inventory apply + render enqueue)	4,000 / 100 per min	200 ms / 500 ms / 1.5 s (render async < 5 s)	60 rps	documents ≈ 150 KB PDF each in object store ≈ 220 GB/year	render worker queue	Render queue grows; confirmation unaffected; PDF SLO relaxed to 60 s with user notice
Pricing lookup / explain	300k / 2,000 per min	5 ms / 20 ms / 40 ms	500 rps	TradeAgreement ≤ 1M rows ≈ 400 MB	composite (tenant, relation, account_code, account_id, item_code, item_id, valid_from) + currency	Served from in-pod cache (5 s TTL) of agreement rows per vendor; p95 ≤ 50 ms
Requisition submit → workflow start	2,000 / 60 per min	300 ms / 2 s / 4 s	30 rps	requisition ≈ 2 KB + lines	by requester, status	Temporal queue; submit returns 202 with workflow id
Consolidation board (5k open lines)	50 runs	1 s / 4 s / 8 s	n/a	n/a	lines (status, vendor, site, delivery_date)	Paginated grouping; hard cap 20k lines per run
RFQ compare (50 replies × 200 lines)	100	300 ms / 1 s / 2 s	n/a	replies ≈ 1 KB/line	reply (rfq_id, line_id)	Server-side ranking cached per RFQ until a reply changes
Scheduling agreement release run (1k agreements)	weekly	20 s / 60 s / 120 s	n/a	release ≈ 5 KB	(agreement_id, release_number)	Child workflows per 100 agreements
Policy evaluate	10k / 300 per min	3 ms / 10 ms / 25 ms	1,000 rps	policies ≈ 50 KB each	hierarchy path materialized (wave 6)	Cached compiled policy per version in pod memory
Catalog search (requisition picker)	100k / 1,000 per min	30 ms / 100 ms / 200 ms	300 rps	catalog entries ≈ 1 KB + images in object store	wave 8 search index with catalog filter	Falls back to product search without images
Reprice run (10k lines)	monthly	1 min / 5 min / 10 min	n/a	versions as above	(price_source_id, status)	Chunked 500 lines per activity

3.17.20 Localization and compliance hooks

Concern	Varies by	Country packs touching it (wave 48)	Extension point used
PO document legal content (company registration numbers, VAT ids, mandatory clauses, language)	Country commercial law; vendor language	All packs	Wave 15 template per legal entity with country block; vendor language from wave 7 party preferences
Tax group defaulting and reverse charge on PO lines	VAT/GST regimes, US sales/use tax	EU, UK, CA, AU, IN, BR	Wave 13 tax engine via tax group / item tax group on line; `tax_total` in FR-17.11
Public procurement rules (sealed bids, solicitation types, bid protests, thresholds)	Public sector regulations (US FAR, EU directives 2014/24)	US-PS, EU-PS	FR-17.19 `RfqType` with pack-supplied solicitation types; audit log of sealed-bid opening
Gap-free document numbering for POs/RFQs	IT, ES, PT, TR, some LATAM	IT, ES, PT, TR, BR	`po_number_gap_free` per legal entity (wave 5 sequences)
Currency and rounding of unit price (4 decimals) and line amounts	Currency minor units	n/a	BR-17.5 using wave 12 rounding rules
Calendar: delivery dates and SLA timers on business days	Site calendar and holidays	All	Wave 6 calendars; approval SLA timers skip non-working days
Signing limits and approval evidence (SOX 404, internal control)	Audit regimes	US (SOX), JP (J-SOX)	FR-17.17 recertification report; wave 48 audit policy consumes `signinglimit.changed`

Concern	Varies by	Country packs touching it (wave 48)	Extension point used
Vendor sanctions / denied-party screening before PO confirmation	OFAC, EU sanctions lists	US, EU	Wave 7 party screening hook invoked in `ConfirmPO` (vendor status)
EDI/e-order formats (EDIFACT ORDERS, X12 850, Peppol Order 3.0)	Trading-partner region	n/a (wave 35)	`po.confirmed` event payload complete enough for each format (wave 35 mapping)
Data residency of PO documents and attachments	Tenant region	n/a	Object store bucket per region (wave 1)
Privacy of requester and approver identities in printed documents	GDPR	EU	Template fields default to role names, not personal names, in EU packs

3.17.21 Coverage closure

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
AX 12.16.1 — RFQ → Bidding (vendor portal RFQ reply, sealed bids, scoring criteria) [#152]	PARTIAL	ADDED as FR-17.19	Sealed bids, scoring groups, amendments; portal reply in wave 20 FR-20.13
AX 12.16.1 — Procurement catalogs [#153]	PARTIAL	ADDED as FR-17.18	Catalog with images, category navigation, publication by org unit
AX 12.16.1 — Procurement → Signing limits (link to Org admin) [#156]	PARTIAL	ADDED as FR-17.17	Signing limits with requests and recertification
AX 12.16.2 — SSRS: Procurement catalog report [#159]	PARTIAL	ADDED as FR-17.18	3.17.14
AX 12.16.3 — Catalog → Import vendor catalogs (CMR) / Publish procurement catalog [#160]	PARTIAL	ADDED as FR-17.18	CSV/JSON import with staging; CMR XML mapped by wave 10 framework; job in 3.17.16
AX 12.16.4 — Policies → Purchase requisition approval amount thresholds / Signing limit policies [#161]	PARTIAL	ADDED as FR-17.16, FR-17.17	Approval bands as policy rules; default signing limits
AX 12.16.4 — Categories → Procurement categories, Category policy rules, Category managers, Category vendor assignment, Category questionnaires [#162]	PARTIAL	ADDED as FR-17.20	Managers, vendor assignment with HARD/SOFT mode, questionnaires
AX 12.16.4 — Catalogs → Procurement catalogs, Catalog policies, External catalogs (cXML config), Vendor catalog import parameters, Catalog images [#163]	PARTIAL	ADDED as FR-17.18	Catalog policy rule and import parameters in 3.17.13; external catalog (cXML/OCI) configuration DEFERRED to wave 35
AX 12.16.4 — RFQ → RFQ types, RFQ scoring criteria/groups, Reply templates, Solicitation types, Bidding parameters [#166]	PARTIAL	ADDED as FR-17.19	`rfq_types` setup in 3.17.13
AX 12.29.1 — Policies → Signing limits (policies, worker requests, defaults by job/compensation) [#237]	PARTIAL	ADDED as FR-17.17	
AX 12.29.1 — Policies → Policy framework forms (Purchasing, Expense, Audit, Vendor invoice, Signing limit) [#238]	PARTIAL	ADDED as FR-17.16	Policy types PURCHASING and SIGNING_LIMIT implemented here; VENDOR_INVOICE used by wave 18; EXPENSE (wave 43) and AUDIT (wave 48) reuse the engine
AX 12.29.2 — SSRS: Signing limits report [#245]	PARTIAL	ADDED as FR-17.17	3.17.14
AX 12.29.2 — SSRS: Policies report (policy rules per hierarchy) [#246]	PARTIAL	ADDED as FR-17.16	3.17.14
AX 12.29.3 — Signing limits → Signing limit request processing (annual recertification) [#250]	PARTIAL	ADDED as FR-17.17	Recertification job (3.17.16)
AX 12.29.4 — Policies → Signing limit policies / parameters / default signing limits / request workflow [#256]	PARTIAL	ADDED as FR-17.17	3.17.13 `default_signing_limits`, `signing_limit_recertification_months`
AX 12.29.4 — Policies → Policy parameters (organization hierarchy purpose per policy type) [#257]	PARTIAL	ADDED as FR-17.16	3.17.13 `hierarchy_purpose_per_type`
SAP 13.12 — ME84 / ME85 / ME86 SA releases (FRC/JIT), renumber, release documentation [#124]	PARTIAL-17	ADDED as FR-17.15	Releases with cumulative quantities; DELFOR/DELJIT transport in wave 35
SAP 13.12 — Fiori: Create Purchase Requisition (self-service, catalog, free text) with OCI punch-out [#129]	PARTIAL-17	ADDED as FR-17.18	Catalog item selection added; OCI/cXML punch-out DEFERRED to wave 35
SAP 13.12 — Fiori: Monitor Supplier Confirmations / Monitor Scheduling Agreement Releases [#132]	PARTIAL-17	ADDED as FR-17.15	Releases monitor in 3.17.14; supplier confirmations monitor from FR-17.7 confirmed dates and wave 20 acknowledgements
SAP 13.12 — ME84 batch SA release creation run [#133]	PARTIAL-17	ADDED as FR-17.15	Job in 3.17.16
SAP 13.12 — MEI1 / MEI2 / MEI4 subsequent price change [#135]	PARTIAL-17	ADDED as FR-17.22	Open lines repriced via PO version; invoiced lines via wave 18 FR-18.18
SAP 13.12 — Scheduling agreement release creation profile, firm/trade-off zone, JIT indicator (T163M) [#138]	PARTIAL-17	ADDED as FR-17.15	`sa_release_profile` in 3.17.13
SAP 13.14 — MRIS invoicing plan settlement [#156]	PARTIAL-17	ADDED as FR-17.21	Plan on PO line; settlement run in wave 18 FR-18.17
SAP 13.14 — MRNB revaluation (retroactive price change on invoiced items) [#157]	PARTIAL-17	ADDED as FR-17.22	`reprice_invoiced` hands invoiced lines to wave 18 FR-18.18
SAP 13.14 — MRIS scheduled invoicing plan run [#159]	PARTIAL-17	ADDED as FR-17.21	Run defined in wave 18 (3.18.16)
SAP 13.14 — MRNB scheduled revaluation run [#160]	PARTIAL-17	ADDED as FR-17.22	Job in 3.17.16 (weekly, opt-in)
SAP 13.14 — Invoicing plan types (periodic/partial) [#162]	PARTIAL-17	ADDED as FR-17.21	`invoicing_plan_types` in 3.17.13

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
SAP 13.15 — ML10 / ML11 / ML12 model service specifications [#164]	GAP (propose 17)	ADDED as FR-17.23	`ModelServiceSpecification` templates
SAP 13.15 — Standard service catalog (SSC) [#165]	GAP (propose 17)	ADDED as FR-17.23	Standard texts as service products (wave 8) referenced from templates
SAP 13.15 — ME21N item category D with service lines, value limits, contract limits [#166]	PARTIAL-17	ADDED as FR-17.23	Service outline, `value_limit`, `contract_limit`
SAP 13.15 — ML33 … ML48 service conditions (vendor / service / vendor+plant) [#168]	PARTIAL-17	ADDED as FR-17.23	Service prices via FR-17.6 trade agreements on service products with site
SAP 13.15 — Fiori: Manage Purchase Orders (service items), Manage Supplier Quotations for services [#173]	PARTIAL-17	ADDED as FR-17.23	PO and RFQ lines of kind SERVICE with outline
SAP 13.15 — Service conditions calculation schema MS0000, condition types PRS [#183]	PARTIAL-17	ADDED as FR-17.23	Trade agreement relation PRICE on service products; schema concept SUPERSEDED by wave 26 condition engine
SAP 13.15 — Source determination for services (contracts) [#185]	PARTIAL-17	ADDED as FR-17.23	Agreement lookup for service product × site
SAP 13.31 — Legal Content Management / contract management (CLM, Ariba Contracts) [#351]	PARTIAL-17	OUT-OF-SCOPE clause library, obligation tracking and contract authoring are not an ERP v1 capability; agreements keep attachments, validity and expiry alerts (FR-17.5, FR-17.14)	Candidate for v1.x or external CLM integration via wave 35
SAP 13.32 — Configuration in purchasing (configurable PO items) [#361]	PARTIAL-17	DEFERRED to wave 24	Depends on the product configurator (wave 24 process/variant configuration); PO line reserves `configuration_id`

3.18 Wave 18: Receiving, Product Receipts & Three-Way Match

3.18.1 Scope and business context

Wave 18 closes the physical and financial loop on a purchase order. Receiving moves a PO line's inventory transaction from ORDERED through ARRIVED (arrival journal, SAP inbound delivery VL31N), REGISTERED (registration, SAP GR to quality/blocked stock) to RECEIVED by posting a product receipt (AX VendPackingSlipJour/VendPackingSlipTrans, SAP MKPF/MSEG movement type 101 with EKBE history). The product receipt posts inventory value against the GR/IR accrual account (AX "Purchase, accrual" / "Accrued purchases" in the posting profile, SAP WRX GR/IR clearing via OBYC). A vendor invoice (AX VendInvoiceInfoTable/VendInvoiceInfoLine pending invoice → VendInvoiceJour/VendInvoiceTrans; SAP RBKP/RSEG via MIRO) is captured manually, from an OCR/AP-automation adapter, or (wave 35) as UBL/Peppol, and the matching engine compares invoice price, quantity and total to PO and receipt within tolerances (AX price tolerance per item/vendor, quantity tolerance, invoice totals tolerance; SAP tolerance keys PP, DQ, BD, AN/AP, DW, KW). Matched invoices post the vendor liability (VendTrans / BSIK) and clear GR/IR; exceptions route to a Temporal resolution workflow. Evaluated receipt settlement (ERS / MRRL) generates invoices from receipts for vendors flagged for self-billing.

Out of scope: payment (wave 19), warehouse-directed put-away and license plates (wave 31), quality orders on receipt (wave 33), landed cost (wave 34), Peppol transport (wave 35), invoice-cost adjustments to inventory beyond the direct posting (wave 20 settles invoice-receipt cost differences), non-PO expense invoices with GL distribution (included here as 0-way "invoice register" with coding, approval by wave 4 workflow).

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
AX pending vendor invoice form (VendInvoiceInfoTable) runs "Match product receipts" as a dialog, then matching icons update only after "Update match status"; users re-key invoice lines from paper; SAP MIRO proposes lines but the tolerance log (RBKP block indicator, MRBR release) is a separate transaction	Matching is a form-triggered class (VendInvoiceMatch), not an engine; capture is manual	Matching engine runs on every invoice save and on every receipt posting (re-match candidates), status visible inline; OCR adapter pre-fills lines; `MatchResult` per line with variances	Invoice entry time: 4–6 min → < 60 s; manual re-match steps: 3 → 0
GR/IR reconciliation: AX "Accrued purchases" report and SAP MR11 (GR/IR maintenance) plus F.19 regrouping are month-end chores; differences hide for months	GR/IR balance is an account balance with no per-PO-line open-item ledger in AX; SAP EKBE requires MR11 to clear residuals	`GrirOpenItem` per PO line × receipt, cleared by invoice line; GR/IR report = Σ open items and must equal the account balance (daily reconciliation)	Month-end GR/IR effort: 4–8 h → < 15 min; unexplained residual: non-zero → 0
Receipt posting latency: AX product receipt via PurchFormLetter_PackingSlip takes 10–40 s per receipt; SAP MIGO posts in ~1 s but inventory valuation updates MBEW synchronously causing lock waits (table lock on MBEW/MARD during month-end)	Document class chain and serialized valuation updates	Receipt posting is one inventory `transactions:apply` + one ledger `Post`; value updated per transaction, no material-level lock	Receipt post p95: 10–40 s (AX) / lock waits at close (SAP) → < 1.5 s, no cross-document locks
Tolerance configuration: AX has three separate forms (price tolerance per item/vendor/company, quantity tolerance on item, totals tolerance in parameters) with "Allow price tolerance" flags scattered; SAP OMR6 tolerance keys use cryptic codes and a company-code-level default	Settings scattered without a single evaluation order	One `MatchingPolicy` entity with ordered scopes (vendor×item > vendor > item > entity) and explicit percent/absolute limits, previewable with "test an invoice"	Time to configure and verify a tolerance change: 1–2 h with testing → 5 min with the policy tester
ERS/self-billing in AX requires a batch "Generate invoices from product receipts"; SAP MRRL is a batch run; both mis-handle partial receipts with price changes	Batch design; invoice creation decoupled from the receipt event	ERS invoice created by the `receipt.posted` consumer within seconds using the price at receipt date and locked PO price	ERS invoice latency: nightly batch → < 10 s; ERS price mismatches: tracked, target 0

3.18.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity level
Arrival / registration	Arrival overview (WMSArrivalOverview), arrival journal (WMSJournalTable type Reception), registration (InventTransRegister)	Inbound delivery VL31N, GR into blocked stock (103/105), quality inspection stock	`Arrival` (ARRIVED), `Registration` (REGISTERED) steps on ReceiptLine; arrival overview screen	full
Product receipt	PurchFormLetter_PackingSlip → VendPackingSlipJour/Trans, InventTrans Received, ledger posting PurchPackingSlip/accrual	MIGO 101 → MKPF/MSEG, EKBE (VGABE 1), GR/IR via WRX, inventory BSX	`ProductReceipt`/`ReceiptLine`; RECEIVED transactions; ledger entry Dr inventory / Cr GR/IR	full

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity level
Receipt reversal / correction	Product receipt correction, cancel (VendPackingSlipJour cancel)	102 reversal, MBST cancel document	`:correct` (new receipt with delta qty), `:cancel` (full reversal)	full
Vendor invoice (PO)	VendInvoiceInfoTable/Line (pending), VendInvoiceJour/Trans (posted), invoice register/approval journals	MIRO → RBKP/RSEG, EKBE VGABE 2; invoice park MIR7	`VendorInvoice`/`VendorInvoiceLine` (DRAFT → POSTED)	full
Non-PO invoice	Invoice journal (LedgerJournalTrans type VendInvoiceRegister / Vend), invoice register + approval	FB60, MIRO without PO	`VendorInvoice` kind EXPENSE with GL distribution lines	full
Matching	VendInvoiceMatch, match status (VendInvoiceMatchingStatus), price/qty/totals tolerances (VendInvoicePriceTolerance, InventTable quantity tolerance, Accounts payable parameters)	LIV tolerance keys OMR6 (PP, DQ, BD, AN, AP, DW, KW, ST, VP), blocking indicator RBKP ZLSPR, MRBR release	`MatchingEngine`, `MatchingPolicy`, `MatchResult`; exception workflow	full
Accrued purchases / GR/IR	Accrued purchases report (PurchAccrual), posting types PurchaseAccrual/PurchasePackingSlip	GR/IR clearing WRX, MR11, F.19, MB5S	`GrirOpenItem`, GR/IR report	improved
ERS	Vendor self-billing: "Generate invoices from product receipts" (PurchFormLetter with VendInvoiceInfoTable auto)	MRRL evaluated receipt settlement, LFM1 XERSY	`ErsPolicy` on vendor; consumer creates invoice from receipt	full
Invoice capture adapters	Invoice capture (D365 add-in), AIF VendVendInvoiceService	OpenText VIM, SAP Invoice Management, IDoc INVOIC	`POST /invoices:capture` with OCR adapter interface (JSON), UBL mapping stub	partial (Peppol w35)
Charges allocation at invoice	MarkupTrans allocation on invoice	Unplanned delivery costs, planned conditions FRA1	`Charge` allocation rules applied to invoice lines	full
Period control AP	Ledger calendar module Accounts payable	OB52 posting periods account type K	wave 14 period control module AP at `:post`	full
Service entry sheets	n/a (service lines invoiced directly)	ML81N service entry sheet, ML82/ML83/ML84 display/list/accept, ML85 collective release, ESSR, lean services (S/4 Manage Service Entry Sheets), MSRV lists, ME2S, MRRL for services, MIRO with SES reference	`ServiceEntrySheet` with acceptance workflow, partial and unplanned entries within limits, collective acceptance, ERS for services, invoice match to SES (FR-18.14)	full
Stochastic invoice block	n/a	OMRX stochastic block (threshold amount, percentage), RBKP ZLSPR = S, MRBR release	`stochastic_block` policy (FR-18.15) producing status `AUDIT_SAMPLE`	full
Consignment settlement	D365 consignment: vendor invoice from ownership change	MRKO consignment and pipeline settlement	Consignment settlement run creating `VendorInvoice` kind CONSIGNMENT from wave 16 ownership changes (FR-18.16)	full (pipeline OUT-OF-SCOPE)
Invoicing plan settlement	n/a	MRIS invoicing plan settlement (periodic/partial)	Invoicing plan run creating invoices without receipt (FR-18.17)	full
Subsequent debit / credit	Invoice with reference to invoiced PO line (price adjustment)	MIRO subsequent debit/credit; MRNB revaluation	`VendorInvoice` kind SUBSEQUENT_DEBIT / SUBSEQUENT_CREDIT (FR-18.18)	full
One-time vendor invoice	VendTable one-time supplier (OneTimeVendor flag, VendParameters one-time vendor account)	Account group CPD, one-time account with address/bank on document (OBD3)	`VendorInvoice.one_time_payee` with document-level name, address, tax id and bank account (FR-18.19); payment in wave 19 FR-19.23	full

3.18.3 Functional requirements

- **FR-18.1 Arrival and registration** — Must. The system shall record arrival (ARRIVED) with carrier, packing slip number, pallet count and expected PO lines, then registration (REGISTERED) with quantity, batch, serial, location and inventory status, for any confirmed PO line with remaining quantity.
  - Over-receipt beyond `qty × (1 + over_delivery_pct)` (item default 0 %, policy per vendor×item) is rejected with `RCV-OVR-001`; under-delivery below `under_delivery_pct` closes the line only if `close_short=true`.
  - Serial-tracked lines require one serial per unit; duplicate serial rejected by inventory (`INV-SER-001`).
- **FR-18.2 Product receipt posting** — Must. The system shall post a `ProductReceipt` for registered or directly received quantities, moving inventory transactions to RECEIVED, writing `cost_amount_physical = qty × PO unit price (converted to accounting currency at the receipt date rate) + ITEM charges`, and posting Dr inventory (posting profile) / Cr GR/IR accrual through `Post(JournalEntry)` with idempotency key = receipt id.
  - For category (non-stock) lines the debit goes to the line's expense account; GR/IR credit is unchanged.
  - A `GrirOpenItem` is created per receipt line with amount in transaction and accounting currency.
  - Receipt date must be in an open INVENTORY period; packing slip number unique per vendor (`RCV-DUP-001`).
- **FR-18.3 Receipt correction and cancellation** — Must. The system shall support correction (delta quantity, positive or negative) and cancellation (full reversal) of a posted receipt while the receipt line has not been invoiced; invoiced lines require an invoice credit first.
- **FR-18.4 Vendor invoice capture** — Must. The system shall create a `VendorInvoice` in DRAFT from manual entry, from the capture adapter (`:capture` JSON with header fields, lines, confidence scores, page images) or from ERS, with vendor, invoice number, dates, currency, totals, lines linked to PO lines and/or receipt lines, charges, tax groups.
  - Duplicate check: same vendor + invoice number (case-insensitive, whitespace-stripped) within 24 months → `AP-DUP-001`.
  - Lines may be proposed from open receipts (3-way) or open PO lines (2-way); proposal fills qty = uninvoiced received qty.
  - Expense invoices (no PO) carry GL distribution lines validated by account structure.
- **FR-18.5 Matching policy** — Must. The system shall evaluate a `MatchingPolicy` resolved by scope precedence vendor×item > vendor > item > legal entity with fields: `match_level` (NONE, TWO_WAY, THREE_WAY), `price_tol_pct` (default 2.0), `price_tol_abs` (default 25.00 acct ccy per line), `qty_tol_pct` (default 5.0), `total_tol_pct` (default 1.0), `total_tol_abs` (default 50.00), `small_diff_abs` (default 0.50, auto-posted to small-differences account), `price_tol_mode` (UPPER_ONLY / BOTH), `date_tol_days` (0 = off).
  - A line passes price if `|invoice_unit_price − po_unit_price| ≤ max(po_price × pct, abs)` (lower prices always pass in UPPER_ONLY).
  - A line passes quantity (3-way) if `invoice_qty ≤ received_uninvoiced_qty × (1 + qty_tol_pct/100)`; 2-way compares to PO remaining qty.

- Total passes if `|invoice_total − Σ matched line totals − charges − tax| ≤ max(total_tol_pct, total_tol_abs)`.

- **FR-18.6 Matching engine and status** — Must. The system shall compute `MatchResult` per line and header with statuses `NOT_MATCHED`, `MATCHED`, `PRICE_VARIANCE`, `QTY_VARIANCE`, `TOTAL_VARIANCE`, `NO_RECEIPT`, `WAITING_RECEIPT`; header status is the worst line status; the engine re-runs automatically when a receipt posts for a referenced PO line.
  - Engine is pure (inputs → result) and exposed at `POST /matching:evaluate` for the policy tester.
  - Price variance within tolerance posts the difference to the purchase price variance account (standard-cost items, wave 20 PPV) or to inventory/expense (actual-cost items).
- **FR-18.7 Exception workflow** — Must. The system shall start a Temporal `InvoiceMatchException` workflow for any invoice with a variance status, assigning to the buyer of the PO (price) or receiving supervisor (quantity) with actions: accept variance (post with reason code), request credit note, adjust PO price (creates PO version via wave 17), wait for receipt (timer, re-evaluate), reject invoice.
  - SLA 3 business days then escalation to AP manager; all actions audited on the invoice.
- **FR-18.8 Invoice posting** — Must. The system shall post a matched or accepted invoice: Dr GR/IR (clearing `GrirOpenItem` to the invoiced amount) or Dr expense/inventory (2-way/expense), Dr tax recoverable (wave 13), Cr vendor control account (posting profile) creating a `VendorTransaction` open item with due date and cash discount date per payment terms, moving PO inventory transactions to PURCHASED for invoiced quantity and setting `cost_amount_posted` from the invoice.
  - Idempotency key = invoice id; AP period must be open; posting date ≠ invoice date allowed (both stored).
  - Differences between receipt value and invoice value for stock items post to inventory (actual cost methods) or PPV (standard), and are recorded on the transaction as `cost_amount_adjustment` for wave 20.
- **FR-18.9 GR/IR reconciliation** — Must. The system shall provide the GR/IR report listing open items (received not invoiced, invoiced not received) by vendor, PO, line, age, with totals that equal the GR/IR ledger balance; a daily job emits `reconciliation.diff` if they differ.
- **FR-18.10 Evaluated receipt settlement** — Must. The system shall, for vendors with `ers_enabled`, create and post an invoice from each receipt within 10 s using PO price and the vendor's ERS invoice number format (`ERS-{receipt_number}`), tax per PO line, and send the self-billing document to the vendor.
- **FR-18.11 Charges on receipt and invoice** — Must. The system shall allocate header charges to lines by the rule on the charge (QTY, AMOUNT, LINES) at invoice posting, with ITEM-type charges capitalized into `cost_amount_posted`.
- **FR-18.12 Invoice credit notes** — Should. The system shall create a credit note (negative invoice) referencing an invoice and optionally a receipt correction; it posts the reverse entries and creates a negative `VendorTransaction` for wave 19 settlement.
- **FR-18.13 Receiving workspace and mobile receipt** — Should. The system shall provide a receiving workspace (expected today, overdue, registered not posted) and a PWA receipt screen scanning PO number, product GTIN and batch/serial barcodes (GS1 parsing from wave 8).
- **FR-18.14 Service entry sheets (service receipts)** — Must. The system shall provide a `ServiceEntrySheet` (SAP ML81N / ESSR; S/4 lean service entry sheet) against a SERVICE PO line (wave 17 FR-17.23) with header (vendor, PO, period from/to, external reference, entered by), lines referencing outline service items (planned) or free-text unplanned services with quantity, unit, unit price and amount, status `DRAFT, SUBMITTED, ACCEPTED, REJECTED, REVOKED`, and an acceptance workflow (wave 4 template; approver = PO requester or cost owner from the policy type VENDOR_INVOICE of FR-17.16).
  - Acceptance posts the service receipt: Dr expense / cost object per line account assignment, Cr GR/IR accrual, creating a `GrirOpenItem` per sheet line (SAP "GR for SES"); the PO line's `received_qty` / `received_amount` and `document_status` update; for lines with `settle_without_receipt=false` the invoice (FR-18.4) proposes lines from accepted sheets and matching (FR-18.5) compares to the sheet amount (quantity tolerance applies to amount for services).
  - Unplanned services are limited by the PO line `value_limit` and `contract_limit` (BR-17.19, `PRC-SRV-003`); partial entries accumulate against planned quantities.
  - Collective acceptance (`POST /service-entry-sheets:accept-bulk`, SAP ML85) and revoke (reverses the posting if not invoiced).
  - ERS vendors (FR-18.10) get an invoice per accepted sheet (SAP MRRL for services) with number `ERS-{sheet_number}`.
  - Lists: by service, by PO, by sheet, by vendor, by agreement (SAP MSRV1–MSRV6), acceptance list (ML83/ML84); the wave 20 portal lets vendors enter sheets (FR-20.20).
- **FR-18.15 Stochastic (random-sample) invoice block** — Must. The system shall evaluate on every invoice reaching MATCHED a `stochastic_block` rule from the matching policy scope (SAP OMRX T169P): `threshold_amount` (acct ccy) and `percentage`; invoices with total ≥ threshold are blocked with probability `percentage` % (linear decrease below threshold proportional to total/threshold), using a seeded CSPRNG with the invoice id so the decision is reproducible; a blocked invoice gets match status `AUDIT_SAMPLE`, is routed to the AP auditor queue (duty InvoiceAuditRelease), and is released or rejected with reason; the sample rate actually achieved is reported monthly.
- **FR-18.16 Consignment settlement** — Must. The system shall consume `dev.passage.inventory.ownership.changed.v1` (wave 16 FR-16.17) and, per vendor and settlement frequency (`consignment_settlement_frequency` DAILY/WEEKLY/MONTHLY, SAP MRKO), create and post a `VendorInvoice` of kind CONSIGNMENT with one line per ownership change line (product, qty, consignment price, tax group from the trade agreement), clearing the consignment accrual (Dr consignment accrual / Cr vendor control), skipping matching (status MATCHED by construction), and sending a consignment settlement statement (3.18.15) to the vendor; when `consignment_self_billing=false` the vendor's own invoice is matched against the ownership change lines instead (2-way to accrual).
- **FR-18.17 Invoicing plan settlement run** — Should. The system shall run daily (3.18.16; SAP MRIS) over wave 17 invoicing plan rows with `due_date ≤ run date` and status OPEN, creating per vendor a `VendorInvoice` kind PLAN with lines for each due row (amount, tax group of the PO line, account assignment), posting it when `settle_without_receipt=true` and the plan is marked ERS-like (`auto_post=true`), otherwise leaving it in DRAFT for the vendor's invoice to be matched 2-way to the plan row; plan rows move to INVOICED with the invoice reference.
- **FR-18.18 Subsequent debit and credit** — Should. The system shall support `VendorInvoice` kinds SUBSEQUENT_DEBIT and SUBSEQUENT_CREDIT (SAP MIRO subsequent debit/credit; AX price-adjustment invoice) referencing invoiced PO lines with a value-only change (quantity 0): posting Dr/Cr inventory (actual-cost items, via `cost_amount_adjustment` for wave 20) or PPV (standard cost) against the vendor control account; wave 17 FR-17.22 `:reprice` with `reprice_invoiced=true` creates SUBSEQUENT_CREDIT drafts for repriced invoiced lines (SAP MRNB).
- **FR-18.19 One-time vendor invoices** — Should. The system shall allow an invoice (kind EXPENSE or PO with the legal entity's one-time vendor account; AX VendParameters one-time vendor; SAP CPD account group) to carry a document-level `one_time_payee` block (name, address, country, tax id, email, bank

account IBAN/BIC or routing/account) validated like vendor bank accounts (BR-19 IBAN mod-97 / ABA), stored encrypted, printed on the payment advice and used by wave 19 FR-19.23 for payment; duplicate check uses payee name + invoice number; one-time payees exceeding `one_time_payee_max_amount` (default 10,000 USD) or appearing more than `one_time_payee_max_count` times (default 3 per 12 months) are rejected with `AP-OTV-001` and must be set up as vendors (wave 7).

3.18.4 Data model

ProductReceipt / ReceiptLine

Field	Type	Required	Notes
id, receipt_number	uuid, text	yes	sequence `RCV-`
vendor_id, po_id	uuid	yes	one PO per receipt (multi-PO receipts split)
packing_slip_number	text	yes	unique per vendor
receipt_date, posting_date	date	yes	inventory physical/financial dates
status	enum	yes	ARRIVED, REGISTERED, POSTED, CORRECTED, CANCELLED
ledger_entry_id	uuid	no	
exchange_rate	numeric(18,8)	yes	PO currency → accounting at receipt_date
line: po_line_id, schedule_id, qty, unit, dimension_set_id, batch_id, serial_ids[], inventory_status, unit_price (from PO), amount_txn, amount_acct, charges_item_amount, inventory_transaction_id, invoiced_qty, grir_open_item_id			

VendorInvoice / VendorInvoiceLine / MatchResult

Field	Type	Required	Notes
id, internal_number	uuid, text	yes	sequence `VI-`
vendor_id, invoice_vendor_id	uuid	yes	
vendor_invoice_number	text	yes	duplicate check
kind	enum	yes	PO, EXPENSE, CREDIT_NOTE, ERS
invoice_date, posting_date, due_date, discount_date	date	yes/no	from payment terms
currency, exchange_rate	text, numeric	yes	
status	enum	yes	DRAFT, IN_MATCHING, EXCEPTION, APPROVED, POSTED, REJECTED, CANCELLED
match_status	enum	yes	header worst-of
subtotal, charges_total, tax_total, total, total_entered	numeric(19,4)	yes	`total_entered` keyed from paper; must equal computed total within small_diff
source	enum	yes	MANUAL, OCR, UBL, ERS, PORTAL
capture_confidence	numeric(5,2)	no	from adapter
ledger_entry_id, vendor_transaction_id	uuid	no	after post
line: po_line_id, receipt_line_id, product_id/description, qty, unit, unit_price, line_amount, tax_group_id, item_tax_group_id, gl_account_id (expense), dimension_default_id, charges_allocated			
match_result: line_id, policy_id, price_variance_amt, price_variance_pct, qty_variance, total_variance, status, evaluated_at, accepted_by, reason_code			

GrirOpenItem

Field	Type	Required	Notes
id	uuid	yes	
po_line_id, receipt_line_id	uuid	yes	
vendor_id	uuid	yes	
received_qty, invoiced_qty	numeric	yes	
received_amount_acct, invoiced_amount_acct	numeric(19,4)	yes	
status	enum	yes	OPEN, PARTIAL, CLEARED, WRITTEN_OFF
cleared_at	timestamptz	no	

MatchingPolicy: id, scope (ENTITY, ITEM, VENDOR, VENDOR_ITEM), vendor_id, product_id, match_level, price_tol_pct, price_tol_abs, qty_tol_pct, total_tol_pct, total_tol_abs, small_diff_abs, price_tol_mode, date_tol_days, valid_from, valid_to.

Invariants: Σ GrirOpenItem (received – invoiced) in accounting currency = GR/IR ledger balance; receipt line `invoiced_qty ≤ qty`; invoice POSTED implies every line has MATCHED or accepted status; VendorTransaction amount = invoice total in transaction currency. Indexes: receipts (tenant, vendor, packing_slip_number) unique; invoices (tenant, vendor_id, lower(vendor_invoice_number)) unique partial where status ≠ CANCELLED; GrirOpenItem (po_line_id, status).

3.18.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
POST	/api/v1/receiving/arrivals	Record arrival	client key	ReceivingMaintain
POST	/api/v1/receiving/receipts	Create receipt (register lines)	client key	ReceivingMaintain
POST	/api/v1/receiving/receipts/{id}:post	Post product receipt	receipt id	ReceivingPost
POST	/api/v1/receiving/receipts/{id}:correct	Delta correction	receipt id + seq	ReceivingPost
POST	/api/v1/receiving/receipts/{id}:cancel	Reverse	receipt id	ReceivingPost
POST	/api/v1/payables/invoices	Create invoice (manual)	client key	VendorInvoiceMaintain
POST	/api/v1/payables/invoices:capture	Adapter/OCR intake	adapter doc id	service account / VendorInvoiceCapture
POST	/api/v1/payables/invoices/{id}:propose-lines	Propose from receipts/PO	n/a	VendorInvoiceMaintain

Method	Path	Purpose	Idempotency	Auth duty
POST	/api/v1/payables/invoices/{id}:match	Run matching now	n/a	VendorInvoiceMaintain
POST	/api/v1/payables/invoices/{id}:post	Post	invoice id	VendorInvoicePost
POST	/api/v1/payables/matching:evaluate	Policy tester (pure)	n/a	MatchingPolicyMaintain
GET	/api/v1/payables/grir?vendor=&age_gt=	GR/IR open items	n/a	APInquire
POST	/api/v1/payables/invoices/{id}/exceptions/{line}:accept	Accept variance	line+reason	InvoiceExceptionResolve

Commands: `PostReceipt` (open period, over-delivery, serial uniqueness, PO confirmed, exchange rate exists), `PostInvoice` (AP period open, match status acceptable, totals within small_diff, tax calculated, duplicate check), `AcceptVariance` (reason code required, amount ≤ approver limit from policy).

Event	Trigger	Payload fields	Consumers
`dev.passage.receiving.receipt.posted.v1`	receipt POSTED	receipt_id, po_id, lines (po_line, qty, dims, batch, serials, amount_acct), ledger_entry_id	inventory, payables (re-match, ERS), costing, supplier-portal
`dev.passage.receiving.receipt.corrected.v1`	correction/cancel	receipt_id, delta lines	payables, costing
`dev.passage.payables.invoice.captured.v1`	DRAFT created from adapter	invoice_id, vendor, source, confidence	notifications
`dev.passage.payables.invoice.match.exception.v1`	variance status	invoice_id, line_id, status, variances, assignee	workflow, notifications
`dev.passage.payables.invoice.posted.v1`	POSTED	invoice_id, vendor_transaction_id, lines, totals, grir cleared amounts, ledger_entry_id	ledger reconciliation, costing, tax, analytics
`dev.passage.payables.grir.cleared.v1`	GrirOpenItem CLEARED/WRITTEN_OFF	open_item_id, amounts	analytics
`dev.passage.receiving.service-entry-sheet.accepted.v1` / `.revoked.v1`	sheet accepted / revoked	sheet_id, po_id, po_line_id, vendor_id, lines (service item, qty, amount, account assignment), grir amounts, ledger_entry_id	payables (match, ERS), costing (expense), project accounting (w41), supplier-portal (w20)
`dev.passage.payables.invoice.audit-sampled.v1`	stochastic block applied	invoice_id, vendor_id, total, rule (threshold, percentage), assignee	workflow, notifications, audit (w48)
`dev.passage.payables.consignment.settled.v1`	consignment settlement invoice posted	invoice_id, vendor_id, ownership change journal ids, lines, total	supplier-portal (w20), analytics

3.18.6 User experience

Screen	Primary actions	Key fields/columns	Duty required
Receiving workspace	Expected today/overdue, arrivals, registered-not-posted, post	PO, vendor, line, expected qty, arrived qty	ReceivingMaintain
Receipt (desktop + PWA)	Scan PO/GTIN/batch/serial, register, post, print receipt label	lines with remaining qty, batch/serial entry, location, status	ReceivingMaintain
Vendor invoice	Enter/review captured header, propose lines, match status badges, resolve, post	header, lines with PO/receipt links, variance columns, totals vs entered	VendorInvoiceMaintain
Invoice exception task	Accept, request credit, adjust PO, wait, reject	variance detail, policy limits, history	InvoiceExceptionResolve
Matching policy + tester	Create policy rows, "test an invoice"	scopes, tolerances, sample invoice result	MatchingPolicyMaintain
GR/IR report	Filter by age/vendor, drill to PO/receipt/invoice, write-off	open items, totals vs ledger balance	APInquire

Interaction rules: captured fields with confidence < 0.85 are highlighted and require explicit confirmation; totals-entered vs computed difference shown live; keyboard: Ctrl+M match, Ctrl+P post; PWA receipt supports camera scan and offline registration queue; bulk post of registered receipts; personalization of invoice line columns.

3.18.7 Business rules and edge cases

- **BR-18.1** Receipt state machine: `ARRIVED → REGISTERED → POSTED`; `POSTED → CORRECTED` (new correction receipt, original unchanged); `POSTED → CANCELLED` only if invoiced_qty = 0 on all lines; `ARRIVED|REGISTERED → CANCELLED` releases inventory statuses back to ORDERED.
- **BR-18.2** Invoice state machine: `DRAFT → IN_MATCHING → (MATCHED→) APPROVED → POSTED`; `IN_MATCHING → EXCEPTION → APPROVED|REJECTED`; `DRAFT|EXCEPTION → CANCELLED`; POSTED is terminal (reverse via credit note).
- **BR-18.3** Price comparison uses PO unit price in PO currency normalized to invoice price unit; invoice in a different currency than the PO is compared after conversion at the invoice date rate and flagged `currency_mismatch=true` (always exception unless policy allows).
- **BR-18.4** Quantity tolerance applies to over-invoicing only; under-invoicing leaves the receipt line partially open (`PARTIAL`) for a later invoice.
- **BR-18.5** Small differences: if the header total variance ≤ `small_diff_abs` the difference posts to the small-differences account and the invoice is MATCHED; the amount is recorded on `MatchResult`.
- **BR-18.6** Rounding: variance percent computed on unrounded values and compared at 4 decimals; amounts rounded half-even to minor unit; the GR/IR clearing amount is the receipt-side accounting amount for the invoiced quantity (pro-rata, rounded), so GR/IR residual after full invoicing of a line is exactly 0.
- **BR-18.7** Receipt date rate vs invoice date rate: GR/IR is cleared at the receipt-side accounting amount; the difference between invoice accounting amount and that clearing amount posts to inventory/expense (not FX gain/loss), matching SAP KDM/AX exchange adjustment on purchase.
- **BR-18.8** Concurrency: posting a receipt and an invoice for the same PO line serializes on the PO line row lock (`SELECT … FOR UPDATE` on `purchase_order_line`); the invoice's matching always sees the committed receipt state.
- **BR-18.9** ERS invoices skip matching (status MATCHED by construction) and are blocked if the PO price has changed since receipt until a buyer confirms the price.
- **BR-18.10** Invoice posting date in a closed AP period is rejected (`PER-AP-001`) even when the invoice date is open; the user may change posting date to the first open day with an audit note.
- **BR-18.11** Invoice vendor ≠ ordering vendor (factoring) is allowed when the ordering vendor's `invoice_account` points to the invoice vendor; the VendorTransaction belongs to the invoice vendor.
- **BR-18.12** Credit note quantity cannot exceed invoiced quantity on the referenced line; posting a credit note re-opens the GR/IR item and reverts inventory transaction status from PURCHASED to RECEIVED for that quantity.
- **BR-18.13** Service entry sheet state machine: `DRAFT → SUBMITTED → ACCEPTED`; `SUBMITTED → REJECTED → DRAFT`; `ACCEPTED → REVOKED` only while `invoiced_amount = 0` on all its lines; acceptance is the posting event (SAP "GR for SES"); a sheet period may not overlap another ACCEPTED sheet of the same PO line for the same planned service item unless the item is quantity-based.
- **BR-18.14** Stochastic block decision = `hash(invoice_id ‖ rule_version) mod 10,000 < percentage × 100 × min(1, total / threshold)`; the decision is recorded with rule version so re-matching does not re-draw; an invoice already in a variance exception is not additionally sampled.
- **BR-18.15** Consignment settlement invoices are always posted in the vendor's currency at the trade-agreement price captured on the ownership change line (not re-priced at settlement); price changes after the ownership change are handled as SUBSEQUENT_DEBIT/CREDIT.

- **BR-18.16** Invoicing plan rows generate at most one invoice line each; a plan row whose PO line is cancelled is cancelled with it; plan invoices for lines with `settle_without_receipt=false` require an accepted service entry sheet or product receipt covering the period before posting.
- **BR-18.17** Subsequent debit/credit lines have quantity 0 and reference an invoiced PO line; the amount is capped at the invoiced amount for credits (`AP-SUB-001`); GR/IR is not touched; for actual-cost items the adjustment is written to the receipt transaction's `cost_amount_adjustment` and flows to issues at the next wave 20 close (BR-20.6).
- **BR-18.18** One-time payee data is stored encrypted (wave 2 field-level encryption) and never copied to the party model; the payee block is immutable after posting; payment to a one-time payee requires the bank account to pass the same validation as vendor bank accounts and the invoice to have passed a four-eyes approval regardless of amount band.

3.18.8 Acceptance criteria

- **AC-18.1** (FR-18.5, FR-18.6) Given the 200-scenario matching fixture, when each invoice is evaluated and posted, then every match status, variance amount and ledger posting equals the expected row (0 mismatches).
- **AC-18.2** (FR-18.2, FR-18.8) Given 1,000 random PO lines received then fully invoiced at PO price, when GR/IR open items and the ledger balance are compared, then both are 0.00.
- **AC-18.3** (FR-18.1) Given a serial-tracked PO line of 3 units, when serials S1, S2, S2 are registered, then registration fails on the duplicate and records S1, S2 only after correction.
- **AC-18.4** (FR-18.8) Given AP period 2026-08 closed, when an invoice with posting date 2026-08-15 is posted, then it is rejected with `PER-AP-001` and no VendorTransaction or ledger entry exists.
- **AC-18.5** (FR-18.5) Given policy price_tol_pct 2 and price_tol_abs 25 and a PO price 100.00 USD, when an invoice line at 101.50 is matched, then status MATCHED with price variance 1.50 posted to PPV/inventory; at 103.00 status PRICE_VARIANCE and an exception workflow starts.
- **AC-18.6** (FR-18.7) Given a PRICE_VARIANCE exception, when the buyer accepts with reason "AGREED", then the invoice posts, the variance posts to the variance account, and the audit shows actor, reason and amount.
- **AC-18.7** (FR-18.10) Given an ERS vendor, when a receipt of 50 units at 10.00 EUR posts, then an invoice `ERS-{receipt}` of 500.00 EUR plus tax is posted within 10 s and a self-billing PDF is emailed.
- **AC-18.8** (FR-18.3) Given a posted receipt of 100 with 40 invoiced, when a correction of −70 is attempted, then it is rejected; −60 succeeds and GR/IR open item received_qty becomes 40.
- **AC-18.9** (FR-18.4) Given an invoice captured with confidence 0.6 on the total field, when opened, then the field is flagged and posting is blocked until confirmed.
- **AC-18.10** (FR-18.9) Given a manual journal posted to the GR/IR account, when the daily GR/IR reconciliation runs, then a diff event with the journal amount is emitted.
- **AC-18.11** (FR-18.14) Given a service PO line with planned items A (10 h × 100.00 EUR) and B (1 × 500.00 EUR) and unplanned limit 300.00, when a sheet with A 6 h, B 1 and unplanned 250.00 is submitted and accepted, then a ledger entry Dr expense 1,350.00 / Cr GR/IR 1,350.00 posts, three GrirOpenItem rows exist, and an invoice proposed from the sheet matches with status MATCHED; a second sheet with unplanned 100.00 is rejected with `PRC-SRV-003`.
- **AC-18.12** (FR-18.15) Given a stochastic rule threshold 10,000.00 USD and percentage 10, when 10,000 matched invoices of 20,000.00 USD are evaluated, then between 900 and 1,100 receive `AUDIT_SAMPLE`, re-matching any invoice yields the same decision, and released invoices post normally.
- **AC-18.13** (FR-18.16) Given 3 ownership changes for vendor V1 in a week (120 EA × 4.00, 50 EA × 4.00, 30 EA × 4.20 USD) and weekly settlement, when the settlement run executes, then one CONSIGNMENT invoice of 806.00 USD plus tax posts, the consignment accrual account nets to 0.00 for those lines, and the settlement statement is emailed.
- **AC-18.14** (FR-18.17) Given a PERIODIC plan of 1,000.00 EUR monthly with `auto_post=true`, when the run executes on the due date twice (rerun), then exactly one invoice per due row exists and the plan row is INVOICED.
- **AC-18.15** (FR-18.18) Given an invoiced line of 100 EA at 10.00 USD for a FIFO item with 60 EA still on hand, when a SUBSEQUENT_CREDIT of 50.00 USD posts, then AP is debited 50.00, inventory credited 50.00, the receipt transaction carries `cost_amount_adjustment` −50.00, and GR/IR is unchanged.
- **AC-18.16** (FR-18.19) Given a one-time payee with an invalid IBAN checksum, when the invoice is saved, then it is rejected with `AP-BNK-001`; with a valid IBAN and amount 12,000.00 USD (> 10,000.00 limit), it is rejected with `AP-OTV-001`.

3.18.9 Test plan and fixtures

Fixtures: `match-200` (200 invoice scenarios CSV with expected status/postings, authored with the reviewing accountant; covers over/under-delivery, price up/down, multi-receipt, partial, currency mismatch, small difference, ERS, credit note); `grir-1000` (1,000 PO lines generated); `rcv-serial-batch` (tracked items); `ap-period-closed`; `ocr-samples` (25 invoice JSON payloads with confidence scores).

Test	Type	Target	Pass criterion
Matching engine	unit (table-driven)	matching:evaluate	match-200 all pass
Tolerance monotonicity	property	engine	increasing invoice price never moves status from variance to matched
GR/IR zero	E2E	receipt+invoice flow	AC-18.2
Receipt → inventory	contract	inventory apply	RECEIVED qty and cost equal receipt
Invoice → ledger	contract	Post	balanced entry; accounts per posting profile
Period control	contract	invoices:post	AC-18.4
ERS latency	E2E	receipt.posted consumer	< 10 s p95
Receipt post latency	performance (k6, 200 receipts/min)	receipts:post	p95 < 1.5 s
PWA scan	E2E (Playwright)	receipt screen	GS1 barcode → line, batch, serial filled

Reconciliation checks: Σ GrirOpenItem = GR/IR ledger balance; Σ VendorTransaction created in period = Σ invoice totals posted; Σ receipt amount_acct = Δ inventory account from receipts; invoiced_qty on receipt lines = Σ invoice line qty referencing them.

3.18.10 Deployment and operations

Helm charts: `passage-procurement` gains the receiving module (same Postgres, separate Deployment `receiving-api` ×2); `passage-payables` (API ×3, matching worker ×2, Temporal worker ×2, CloudNativePG `payables-db`, outbox connector). Config: `AP_SMALL_DIFF_DEFAULT=0.50`, `AP_PRICE_TOL_PCT=2.0`, `AP_QTY_TOL_PCT=5.0`, `AP_DUP_WINDOW_MONTHS=24`, `AP_EXCEPTION_SLA_DAYS=3`, `RCV_OVER_DELIVERY_PCT=0`. Migrations `procurement/v18.*`, `payables/v18.*`. Flags: `ap.ocr_adapter`, `ap.ers`, `ap.ubl_intake` (w35), `rcv.pwa`. Jobs: GR/IR reconciliation daily 02:30; exception SLA timers (Temporal); ERS consumer (Kafka consumer group `payables-ers`). SLOs: receipt post p95 < 1.5 s; invoice post p95 < 2 s; matching evaluate p95 < 100 ms; event lag < 5 s. Alerts: GR/IR diff ≠ 0 (page); exception backlog > 50 (ticket); ERS consumer lag > 100 messages. Runbook: re-run match for invoice set, reprocess failed capture payloads from DLQ topic `payables.capture.dlq`, write off GR/IR residual with approval. Rollback: additive migrations; disable `ap.ers` consumer; invoices in EXCEPTION are unaffected by rollback of the matching worker.

3.18.11 Migration from AX / SAP

Source	Passage entity	Notes
AX VendPackingSlipJour/Trans for open PO lines (received not invoiced)	ProductReceipt POSTED + GrirOpenItem	amount from VendPackingSlipTrans value; creates GR/IR opening balance matched to GL migration
AX VendInvoiceInfoTable (pending invoices)	VendorInvoice DRAFT	re-matched on load
AX VendInvoicePriceTolerance, InventTable tolerance fields, AP parameters	MatchingPolicy rows	scope mapping: item+vendor → VENDOR_ITEM etc.
AX VendTable self-billing flags	Vendor `ers_enabled`	
SAP EKBE VGABE 1 without matching VGABE 2 (GR not IR)	ProductReceipt + GrirOpenItem	WRX balance per PO item
SAP RBKP/RSEG parked (RBSTAT A/B) or blocked (ZLSPR)	VendorInvoice DRAFT / EXCEPTION	
SAP OMR6 tolerance keys (T169G) PP, DQ, BD, AN/AP	MatchingPolicy ENTITY scope	PP → price_tol; DQ → qty_tol; BD → small_diff; AN/AP → total_tol
SAP LFM1 XERSY	ers_enabled	

Validation: GR/IR opening Σ equals GL migrated balance per legal entity; count of open receipt lines equals source; parked invoices re-matched produce the same block/no-block result as SAP for a 50-invoice sample. Not migrated: posted invoice history (becomes VendorTransaction open items in wave 19 migration; line detail stays in lakehouse), MRBR release logs, AX invoice register journals already approved (post before cutover).

3.18.12 Dependencies, risks, open questions

Depends on: wave 17 (PO lines, versions, charges), wave 16 (transaction steps, serial/batch), wave 11–14 (posting profiles, currency, tax, period control), wave 4 (Temporal workflows), wave 8 (GS1 parsing).

Risk	Likelihood	Impact	Mitigation
Accountant disagrees with GR/IR FX treatment (BR-18.7)	Medium	Medium	Confirm with accountant in match-200 review before posting logic is frozen
OCR adapter quality varies; low-confidence fields	High	Low	Confidence threshold gating; no auto-post below 0.95
Multi-PO invoices	Medium	Low	Supported by line-level PO links; receipts stay one PO per document

Open questions:

1. Auto-post invoices with 100 % match and confidence ≥ 0.95 without human review? Default: configurable per vendor, off by default. Decide by wave 19.
2. Should quantity tolerance also apply to under-invoicing close-out (auto-close residual GR/IR)? Default: no; manual write-off. Decide by wave 20.
3. Non-PO invoice approval: route by GL account owner or by amount only? Default: amount bands reuse of the wave 17 policy. Decide by wave 18 mid-point.

3.18.13 Parameters and setup

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent
`match_level`	matching policy scope	enum	THREE_WAY	NONE, TWO_WAY, THREE_WAY	FR-18.5	Accounts payable parameters → Invoice validation → "Enable invoice matching validation", line matching policy
`price_tol_pct` / `price_tol_abs` / `price_tol_mode`	matching policy scope	numeric / numeric / enum	2.0 / 25.00 / UPPER_ONLY	≥ 0; UPPER_ONLY, BOTH	FR-18.5 price check	Price tolerances (VendInvoicePriceTolerance) per item/vendor/group
`qty_tol_pct`	matching policy scope	numeric	5.0	0–100	FR-18.5 quantity check	Released product → quantity tolerance
`total_tol_pct` / `total_tol_abs`	matching policy scope	numeric	1.0 / 50.00	≥ 0	FR-18.5 total check	Invoice totals tolerances (D365 invoice totals matching)
`small_diff_abs`	matching policy scope	numeric	0.50	≥ 0	BR-18.5 auto-posting to small-differences account	Accounts payable parameters → "Maximum penny difference"
`date_tol_days`	matching policy scope	int	0 (off)	0–90	invoice before planned delivery date	n/a
`charges_tol_pct`	matching policy scope	numeric	5.0	≥ 0	FR-18.11 charge variance	Invoice matching → Charges tolerances
`stochastic_block`	matching policy scope	record	off (threshold 0, percentage 0)	threshold_amount ≥ 0, percentage 0–100	FR-18.15	n/a
`over_delivery_pct` / `under_delivery_pct` / `close_short`	product, vendor × product	numeric / numeric / bool	0 / 0 / false	0–100	FR-18.1 receiving tolerance	Released product → Over/underdelivery

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent
`receipt_requirements`	item model group	enum	RECEIPT	NONE, REGISTRATION, RECEIPT	FR-18.1 registration mandatory before receipt	Item model group → Registration requirements / Receiving requirements
`default_receipt_status`	warehouse	enum	AVAILABLE	AVAILABLE, QUARANTINE, BLOCKED	inventory status on registration	Default inventory status on warehouse
`duplicate_check_window_months` / `duplicate_check_fields`	legal entity	int / set	24 / vendor + invoice number	+ invoice date, + amount	FR-18.4 `AP-DUP-001`	Accounts payable parameters → "Check for invoice numbers used"
`capture_confidence_threshold` / `auto_post_confidence`	legal entity	numeric	0.85 / off (0.95 when enabled)	0–1	UX highlight and auto-post gate	Invoice capture parameters (D365)
`ers_enabled` / `ers_invoice_number_format`	vendor	bool / pattern	false / `ERS-{receipt_number}`		FR-18.10	Vendor → "Self-billing"; Generate invoices from product receipts
`exception_sla_days` / `exception_assignee_rule`	legal entity	int / enum	3 / BUYER_FOR_PRICE_RECEIVER_FOR_QTY	1–30	FR-18.7	Vendor invoice workflow escalation
`grir_writeoff_limit` / `grir_writeoff_age_days`	legal entity	numeric / int	5.00 / 180	≥ 0	GR/IR maintenance proposal (3.18.16)	Accrued purchases write-off (manual)
`posting_profile.grir_account` / `ppv_account` / `small_diff_account` / `consignment_accrual`	posting profile	account	seeded	ledger accounts	FR-18.2, FR-18.6, FR-18.16	Posting profiles: Purchase expenditure un-invoiced, Price variance, Penny difference
`ses_acceptance_workflow` / `ses_approver_rule`	policy (VENDOR_INVOICE)	workflow id / enum	wave 4 default / PO_REQUESTER	PO_REQUESTER, COST_CENTER_OWNER, PROJECT_MANAGER	FR-18.14	n/a
`ses_number_sequence`	legal entity	sequence	`SES-`	wave 5 sequences	FR-18.14	n/a
`consignment_settlement_frequency` / `consignment_self_billing`	vendor	enum / bool	WEEKLY / true	DAILY, WEEKLY, MONTHLY	FR-18.16	Consignment parameters (D365)
`invoicing_plan_run_time`	legal entity	time	04:00		FR-18.17	n/a
`one_time_vendor_account` / `one_time_payee_max_amount` / `one_time_payee_max_count`	legal entity	reference / numeric / int	none / 10,000.00 USD / 3 per 12 months		FR-18.19	Accounts payable parameters → One-time supplier account
`non_po_invoice_approval`	policy (VENDOR_INVOICE)	enum	AMOUNT_BANDS	AMOUNT_BANDS, GL_ACCOUNT_OWNER	open question 3	Invoice register approval journal

3.18.14 Inquiries and reports

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
Expected receipts (arrival overview)	list inquiry	site, warehouse, vendor, date range, ASN	PO, line, expected qty, arrived, registered, ASN	PO schedules + `ProductReceipt`	Arrival overview (WMSArrivalOverview)	ME2V goods receipt forecast, VL06I inbound delivery monitor
Product receipt journal	list inquiry	vendor, PO, packing slip, date	receipt number, lines, qty, amount, voucher	`ProductReceipt`	Product receipt journal inquiry (VendPackingSlipJour)	MB51 movement 101, ME23N PO history
Vendor invoice list / status	list inquiry	vendor, status, match status, source, date	invoice, vendor invoice number, total, match status, assignee	`VendorInvoice`	Pending vendor invoices; Invoice journal inquiry	MIR5 / MIR6 invoice overview (parked, held, blocked, posted)
Match details	drill-down	invoice	per line PO price, invoice price, qty received/invoiced, variances, policy applied	`MatchResult`	Invoice history and matching details	MIRO tolerance log, MRBR block reasons
Exception queue	operational report	assignee, variance type, age	invoice, line, variance, SLA due	Temporal workflow projection	Vendor invoice workflow history	MRBR blocked invoices list
GR/IR open items (accrued purchases)	operational report	vendor, PO, age, as-of	received not invoiced, invoiced not received, totals vs ledger	`GrirOpenItem`	Accrued purchases report (Received not invoiced)	MB5S GR/IR balances, F.19 GR/IR analysis
Received not invoiced by PO	list inquiry	vendor, buyer	PO line, received qty/amount, invoiced, days open	`GrirOpenItem` + PO	Purchase orders → Received but not invoiced	ME2L with RECHNUNG, ME80FN
Duplicate invoice suspects	KPI / list	vendor, window	pairs with same normalized number or same amount/date	`VendorInvoice`	n/a	OMRDC report (custom)
Invoice capture quality	KPI	adapter, vendor, period	invoices captured, fields corrected %, avg confidence, touchless %	`VendorInvoice.source`, audit	Invoice capture dashboard (D365)	VIM analytics
Service entry sheets (by service / PO / sheet / vendor / contract)	list inquiry	vendor, PO, status, period	sheet, lines planned/unplanned, amount, accepted by, invoiced	`ServiceEntrySheet`	n/a	MSRV1–MSRV6, MSRV3 entry sheets, ME2S
SES acceptance list	list inquiry	approver, status	sheet, amount, submitted at, SLA	`ServiceEntrySheet`	n/a	ML83 / ML84
Audit-sampled invoices	operational report	period, vendor, result	invoice, total, sampled at, released/rejected, reason	`MatchResult` status AUDIT_SAMPLE	n/a	MRBR filtered on stochastic block (ZLSPR S)

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
Consignment settlement history	list inquiry	vendor, period	invoice, ownership change journals, qty, amount	`VendorInvoice` kind CONSIGNMENT	Consignment vendor invoices (D365)	MRKO settlement list
ERS / self-billing log	list inquiry	vendor, date	receipt or sheet, ERS invoice, status	`VendorInvoice` kind ERS	Self-billing invoices	MR90 ERS output, MRRL log

3.18.15 Printed and electronic documents

Document	Trigger	Layout elements (header / line / footer)	Formats	Numbering sequence	Legal / retention requirement
Goods receipt slip / product receipt	receipt POSTED	header: receipt number, PO, vendor, packing slip, receipt date, receiver; lines: product, qty, unit, batch/serial, location, status; footer: signature	PDF, PWA print	`RCV-`	Goods receipt evidence; retain 10 years
Receipt label	registration	product, batch, expiry, serial, PO, GS1-128	ZPL, PDF	none	GS1 where required
Self-billing (ERS) invoice	ERS invoice POSTED	header: "Self-billed invoice" legend, vendor and buyer VAT ids, invoice number, date, receipt reference; lines: product, qty, price, tax; footer: totals per tax rate, self-billing agreement reference	PDF/A-3, email; Peppol self-billing (wave 35)	`ERS-{receipt}` / `ERS-{sheet}`	EU VAT Directive Art. 224 (prior self-billing agreement, acceptance procedure); retain 10 years
Consignment settlement statement / self-billing invoice	consignment invoice POSTED	header: vendor, period, settlement number; lines: ownership change date, product, qty, price, amount; footer: tax, total	PDF/A-3, email, portal (wave 20)	`CSS-`	Same as ERS (self-billing rules)
Service entry sheet	sheet SUBMITTED / ACCEPTED	header: sheet number, PO line, period, vendor, accepted by/at; lines: service item, qty, unit, price, amount, planned/unplanned; footer: totals, limit remaining	PDF, email, portal	`SES-`	Service acceptance evidence; retain 10 years
Invoice reduction / debit note to vendor	exception resolved with "request credit note"	header: invoice reference, reason; lines: disputed lines, expected vs invoiced	PDF, email	`DN-`	Commercial correspondence
Invoice approval cover (non-PO)	approval task	invoice image link, coding lines, approver chain	HTML email	n/a	none
GR/IR reconciliation report	month end (on demand)	open items with totals vs ledger	PDF, XLSX	n/a	Audit workpaper; retain with period close

3.18.16 Periodic and batch jobs

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
GR/IR reconciliation (FR-18.9)	daily 02:30	legal entity × GR/IR account	run id (entity, date); full recompute	< 3 min per 1M open items	retry 3×	diff ≠ 0 pages AP lead
Post pending matched invoices (batch, opt-in)	every 15 min	legal entity	key = invoice id; POSTED skipped	< 1 min per 1k	invoice-level errors left in queue	errors > 20 → ticket
Automatic release of blocked invoices	hourly	legal entity	re-evaluates EXCEPTION invoices whose cause cleared (receipt arrived, PO price changed); idempotent	< 2 min	retry	none
ERS run (receipts and sheets missed by the consumer)	daily 05:00	vendor	key = receipt line / sheet line; existing ERS invoice skipped	< 5 min	vendor skipped	ERS invoices created by batch > 0 indicates consumer lag → ticket
Consignment settlement run (FR-18.16)	per vendor frequency (default Monday 04:30)	vendor	key = (vendor, period); ownership change lines settled once	< 2 min per 1k lines	vendor skipped and listed	failures > 0 → ticket
Invoicing plan run (FR-18.17)	daily 04:00	legal entity	key = plan row id	< 1 min per 5k rows	row-level error	errors > 0 → ticket
GR/IR maintenance proposal (write-off of aged residuals)	monthly, day 1 06:00	legal entity	key = (open item, period); proposal reviewed before posting	< 2 min	n/a	proposal ready notification
Capture DLQ reprocessing	every 30 min	adapter	key = adapter document id	< 1 min	after 5 attempts park	DLQ depth > 50 → ticket
Stochastic sample rate report	monthly day 2	legal entity	key = period	< 30 s	retry	achieved rate deviates > 2 points from configured → warning
SES acceptance reminders and escalation	Temporal timers	sheet	timer per step	n/a	workflow retry	sheets pending > SLA → manager notification

3.18.17 Security duties and privileges

Duty	Privileges (entry points: API paths / screens / jobs)	Segregation-of-duties conflicts	Default roles that include it	AX duty / SAP authorization reference
ReceivingMaintain	arrivals, receipts create/register; receiving workspace; PWA	none	Receiving clerk	AX "Maintain product receipts" (VendPackingSlipMaintain); SAP M_MSEG_BWE 101 activity 01
ReceivingPost	receipts :post, :correct, :cancel	with PurchaseOrderMaintain (w17), VendorInvoicePost	Receiving supervisor	AX "Post product receipts"; SAP M_MSEG_BWE post
ServiceEntryMaintain	service entry sheets create/submit; portal entry (w20)	with ServiceEntryAccept on same sheet	Requester, Vendor user (portal), Project manager	n/a; SAP ML81N (M_SRV_LS activity 01)
ServiceEntryAccept	accept, revoke, accept-bulk	with ServiceEntryMaintain (same sheet), PurchaseOrderMaintain (same PO)	Cost center owner, Project manager	SAP ML85 / M_SRV_LS release (activity 43)
VendorInvoiceMaintain	invoices create, :propose-lines, :match; invoice screen	with VendorMaintain (w7), PaymentProposalMaintain (w19)	AP clerk	AX "Maintain vendor invoices" (VendInvoiceInfoTableMaintain); SAP M_RECH_WRK, MIRO/MIR7
VendorInvoiceCapture	invoices:capture (adapter/service), capture review	none	AP clerk, service account	AX "Process vendor invoice capture" (D365); SAP VIM roles

Duty	Privileges (entry points: API paths / screens / jobs)	Segregation-of-duties conflicts	Default roles that include it	AX duty / SAP authorization reference
VendorInvoicePost	invoices :post; credit notes; subsequent debit/credit; ERS, consignment, plan runs	with VendorInvoiceMaintain when `ap_four_eyes=true`, ReceivingPost, PaymentRunExecute (w19)	AP supervisor	AX "Post vendor invoices"; SAP M_RECH_WRK post, FB60
InvoiceExceptionResolve	exception tasks :accept, request credit, adjust PO, reject	with VendorInvoicePost under four-eyes; amount ≤ approver limit (FR-17.17)	Buyer, Receiving supervisor, AP manager	AX "Approve vendor invoice variances"; SAP MRBR (M_RECH_SPG release blocked invoices)
InvoiceAuditRelease	audit-sampled invoices release/reject	with VendorInvoicePost (same invoice)	Internal auditor, AP manager	SAP MRBR stochastic block release (M_RECH_SPG)
MatchingPolicyMaintain	matching policies, stochastic rule, matching:evaluate tester	with InvoiceExceptionResolve	AP administrator	AX "Maintain invoice matching setup"; SAP OMR6/OMRX (S_TABU_DIS)
APInquire	GR/IR report, invoice lists, match details, SES lists	none	AP clerk, Controller, Auditor	AX "Inquire into vendor invoices"; SAP F_BKPF_BUK display, MB5S
GrirWriteOff	GR/IR maintenance proposal post	with VendorInvoicePost	AP manager, Controller	SAP MR11 (M_RECH_WRK + F_BKPF_BUK)

3.18.18 Message catalog

Code	Severity	User text	Cause	Remediation	Raised by
RCV-OVR-001	error	Receipt of {qty} exceeds ordered {ordered} plus over-delivery tolerance {pct} %	FR-18.1	Reduce quantity or raise tolerance on the PO line	FR-18.1
RCV-UND-001	warning	Line {line} received {qty} below under-delivery tolerance; line stays open	FR-18.1	Set close short or await remaining delivery	FR-18.1
RCV-DUP-001	error	Packing slip {number} already used for vendor {vendor} on receipt {receipt}	FR-18.2	Correct the packing slip number	FR-18.2
RCV-PER-001	error	Receipt date {date} is in a closed INVENTORY period	Period control	Use the first open date	FR-18.2
RCV-COR-001	error	Correction {delta} would reduce received quantity below invoiced {invoiced}	FR-18.3	Post a credit note first	FR-18.3, BR-18.12
RCV-REG-001	error	Registration is required before receipt for {product}	`receipt_requirements`	Register the line first	FR-18.1
AP-DUP-001	error	Invoice {number} from {vendor} already exists ({existing}, {date})	Duplicate check	Verify with vendor; cancel the duplicate	FR-18.4
AP-CAP-001	warning	{n} captured fields below confidence {threshold}; confirm before posting	OCR confidence	Review highlighted fields	FR-18.4
AP-TOT-001	error	Entered total {entered} differs from computed total {computed} by more than {small_diff}	Keying error	Correct the total or lines	FR-18.4, BR-18.5
AP-MAT-001	warning	Line {line}: price variance {amount} ({pct} %) exceeds tolerance	FR-18.5	Accept, adjust PO or request credit	FR-18.5, FR-18.7
AP-MAT-002	warning	Line {line}: invoiced quantity {qty} exceeds received uninvoiced {received}	FR-18.5	Wait for receipt or request credit	FR-18.5
AP-MAT-003	warning	Invoice total variance {amount} exceeds tolerance	FR-18.5	Review charges and tax	FR-18.5
AP-MAT-004	warning	Invoice currency {inv_ccy} differs from PO currency {po_ccy}	BR-18.3	Confirm or request corrected invoice	BR-18.3
AP-MAT-005	info	Invoice selected for audit sample (rule {rule}); posting held for release	FR-18.15	Internal auditor releases or rejects	FR-18.15
AP-ACC-001	error	Variance {amount} exceeds your approval limit {limit}	AcceptVariance limit	Escalate to an approver with a higher limit	FR-18.7
PER-AP-001	error	Posting date {date} is in a closed AP period	BR-18.10	Change posting date to first open day	BR-18.10
AP-ERS-001	error	ERS invoice blocked: PO price changed since receipt ({old} → {new})	BR-18.9	Buyer confirms price	BR-18.9
AP-SES-001	error	Service entry sheet {sheet} overlaps accepted sheet {other} for item {item}	BR-18.13	Adjust period or item	BR-18.13
AP-SES-002	error	Sheet {sheet} cannot be revoked: {amount} already invoiced	BR-18.13	Credit the invoice first	FR-18.14
AP-CON-001	error	Consignment settlement for {vendor}: no trade agreement price for {product} on {date}	Missing consignment price	Create consignment trade agreement row	FR-18.16
AP-IP-001	error	Invoicing plan row {row} requires an accepted receipt or service entry sheet for the period	BR-18.16	Accept the sheet or set settle without receipt	FR-18.17
AP-SUB-001	error	Subsequent credit {amount} exceeds invoiced amount {invoiced} on line {line}	BR-18.17	Reduce the amount	FR-18.18
AP-OTV-001	error	One-time payee {name} exceeds limits ({amount} / {count} uses); create a vendor	FR-18.19	Create a vendor in the party model	FR-18.19
AP-BNK-001	error	Bank account {account} fails validation ({rule})	IBAN mod-97 / ABA checksum	Correct the bank account	FR-18.19
AP-GRIR-001	error	GR/IR report total {report} differs from ledger balance {ledger} by {diff}	Manual journal or defect	Investigate vouchers listed in the diff event	FR-18.9

3.18.19 Performance budgets and capacity

Operation	Volume assumption (per tenant per day / peak per minute)	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
Receipt post	8,000 receipts / 200 per min	400 ms / 1.5 s / 3 s	200 receipts/min	receipt ≈ 1.5 KB + lines 500 B; GrirOpenItem 300 B	(tenant, vendor, packing_slip_number) unique; GrirOpenItem (po_line_id, status)	Ledger `Post` queued in Temporal; receipt returns POSTING then POSTED ≤ 10 s
Invoice create + match	10,000 invoices / 150 per min	80 ms / 300 ms / 700 ms	150 rps	invoice ≈ 3 KB + lines 600 B + page images 300 KB in object store (≈ 1 TB/year at 10k/day)	invoices (tenant, vendor_id, lower(vendor_invoice_number)) partial unique	Matching moved to async worker; UI shows MATCHING spinner ≤ 5 s
Matching evaluate (pure)	50k / 1,000 per min	10 ms / 100 ms / 200 ms	500 rps	none	in-memory policy cache by scope	Policy cache warm; p95 ≤ 250 ms
Invoice post	10,000 / 150 per min	500 ms / 2 s / 4 s	100 rps	VendorTransaction (w19) 400 B	n/a	Ledger post backpressure via Temporal
ERS consumer	3,000 receipts / 100 per min	lag 2 s / 10 s / 30 s	50 invoices/s	as invoices	consumer group `payables-ers` partitions = 12	lag alert at 100 messages; batch job catches up

Operation	Volume assumption (per tenant per day / peak per minute)	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
Service entry sheet accept	2,000 / 50 per min	300 ms / 1 s / 2 s	50 rps	sheet ≈ 2 KB	(po_line_id, status)	same as receipt post
GR/IR report (1M open items)	50 runs	1 s / 4 s / 8 s	n/a	n/a	aggregate on (vendor_id, status)	Served from materialized daily snapshot + intraday delta
Capture intake (OCR adapter)	5,000 / 100 per min	200 ms / 800 ms / 2 s	100 rps	payload JSON 20 KB + images	DLQ topic `payables.capture.dlq`	429 to adapter with `Retry-After`

3.18.20 Localization and compliance hooks

Concern	Varies by	Country packs touching it (wave 48)	Extension point used
E-invoice intake formats (Peppol BIS 3.0, XRechnung, FatturaPA/SDI, Factur-X, CFDI, NF-e) and mandatory clearance	Country e-invoicing mandates	DE, IT, FR, ES, PL, MX, BR, IN	`:capture` source UBL/structured (wave 35 adapters); invoice keeps original XML as legal archive
Self-billing rules (prior agreement, "self-billing" legend, vendor acceptance)	EU VAT Art. 224, UK HMRC self-billing	EU, UK	ERS/consignment templates (3.18.15) with country legend; vendor `self_billing_agreement_ref`
Invoice archiving (original format, integrity, 8–10 year retention; GoBD, French PAF)	Country retention law	DE, FR, IT, ES	Object store write-once bucket with retention lock; hash on VendorInvoice
Tax determination on receipt and invoice (reverse charge, use tax accrual, import VAT)	VAT/GST/sales tax regimes	all	Wave 13 tax engine call in `PostInvoice`; use-tax accrual on 2-way invoices
GR/IR and accrual presentation (balance sheet regrouping for GR/IR debit balances)	Local GAAP	DE (HGB), FR (PCG)	F.19-style regrouping job hook in wave 14 close; GrirOpenItem sign split
Withholding on services (e.g., IN TDS, BR ISS/IRRF, US backup withholding) at invoice	Country withholding	IN, BR, MX, US	Wave 13 withholding engine invoked on invoice lines with service products; payment-time withholding in wave 19
Invoice numbering of self-billed documents (gap-free)	IT, ES, PT	IT, ES, PT	Number sequence per legal entity with `gap_free=true`
Language of vendor-facing documents	Vendor language	all	Wave 15 templates per language
Date and amount formats in capture parsing	Locale	all	Capture adapter locale hint per vendor
Privacy of one-time payee data	GDPR, CCPA	EU, US-CA	Field-level encryption, retention purge after legal retention (wave 2)

3.18.21 Coverage closure

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
SAP 13.12 — ME21N service item (D) services PO [#128]	PARTIAL-18	ADDED as FR-17.23 (order) and FR-18.14 (receipt)	Service PO defined in wave 17; acceptance and posting here
SAP 13.12 — MSRV1 / MSRV3 service reports [#131]	PARTIAL-18	ADDED as FR-18.14	3.18.14 service entry sheet lists
SAP 13.14 — OMRX stochastic block (T169P) [#161]	GAP (propose 18)	ADDED as FR-18.15	Deterministic seeded sampling, auditor release
SAP 13.15 — ML81N / ML82 / ML83 / ML84 / ML85 service entry sheet create, display, list, accept/revoke, collective release [#167]	PARTIAL-18	ADDED as FR-18.14	Acceptance workflow, revoke, accept-bulk
SAP 13.15 — MSRV1 … MSRV6 service lists (master data) [#169]	PARTIAL-18	ADDED as FR-18.14	3.18.14
SAP 13.15 — MIRO with SES reference [#170]	PARTIAL-18	ADDED as FR-18.14	Invoice proposes lines from accepted sheets; match to sheet amount
SAP 13.15 — ML91 / ML92 / ML93 SES archiving / lists [#171]	PARTIAL-18	SUPERSEDED by wave 46 archiving policy	Lists covered in 3.18.14; archiving uses the platform retention/archival service rather than a per-object archive run
SAP 13.15 — Fiori: Manage Service Entry Sheets – Lean Services / Create Service Entry Sheet [#172]	PARTIAL-18	ADDED as FR-18.14	Desktop and portal (FR-20.20) entry
SAP 13.15 — MSRV1 … MSRV6 service lists (reports) [#175]	PARTIAL-18	ADDED as FR-18.14	3.18.14
SAP 13.15 — ME2S services per purchase order [#176]	PARTIAL-18	ADDED as FR-18.14	3.17.14 "Services per purchase order" and 3.18.14
SAP 13.15 — MSRV3 entry sheets list [#177]	PARTIAL-18	ADDED as FR-18.14	3.18.14
SAP 13.15 — ML83 / ML84 SES acceptance list [#178]	PARTIAL-18	ADDED as FR-18.14	3.18.14 "SES acceptance list"
SAP 13.15 — ML85 collective release of SES [#179]	PARTIAL-18	ADDED as FR-18.14	`:accept-bulk`
SAP 13.15 — MRRL for services (ERS for SES) [#180]	PARTIAL-18	ADDED as FR-18.14	ERS invoice per accepted sheet
SAP 13.15 — Service specification screen layout, SES number ranges, SES release procedure (ESSR) [#182]	PARTIAL-18	ADDED as FR-18.14	`ses_number_sequence`, `ses_acceptance_workflow` (3.18.13); screen layout SUPERSEDED by wave 3 metadata form layouts
SAP 13.15 — Default values for SES acceptance (immediate GR, account assignment) [#184]	PARTIAL-18	ADDED as FR-18.14	Acceptance is the posting; account assignment defaults from the PO line
SAP 13.15 — Lean services activation, product type service, lean SES settings [#186]	PARTIAL-18	ADDED as FR-18.14	Service products (wave 8 product type SERVICE) and SES settings in 3.18.13
SAP 13.2 — One-time vendor (account group CPD) [#23, register wave 7]	PARTIAL-7	ADDED as FR-18.19 (document-level payee on invoice)	Register assigns the party role to wave 7; the document-level capture and payment use are closed here and in FR-19.23
SAP 13.2 — OBD3 one-time account (T077K) [#37, register wave 7]	PARTIAL-7	ADDED as FR-18.19	`one_time_vendor_account` parameter (3.18.13)

3.19 Wave 19: Accounts Payable, Settlement & Payments

3.19.1 Scope and business context

Wave 19 turns posted vendor invoices into paid liabilities. Invoices from wave 18 are open items (AX VendTrans with VendTransOpen; SAP BSIK) that settle against payments, credit notes and prepayments (AX VendSettlement / SpecTrans marking; SAP clearing to BSAK with BSE_CLR, F-53/F-44). A payment proposal (AX LedgerJournalTrans payment journal with VendPaymProposal; SAP F110 proposal run producing REGUH/REGUP) selects items by due date and cash discount, applies holds, approves, generates payment media (ISO 20022 pain.001 for SEPA/ACH-via-ISO, NACHA for US ACH, check print, positive pay file; SAP DMEE /

PMW, AX payment formats via ER), posts the payment to the bank clearing account and vendor control account, and ingests bank status (pain.002) to update payment status. Prepayments, credit notes, reversals and vendor aging complete the AP subledger.

Out of scope: bank statement reconciliation and cash positioning (wave 36, which consumes this wave's payment events), bank connectivity transport (wave 36; this wave writes files to an object store path and exposes them for download), customer-side settlement (wave 30), 1099/withholding statutory reporting beyond withholding calculation (wave 13 provides calculation; reporting in wave 48), intercompany payments (wave 40).

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
AX payment proposal (VendPaymProposal) runs as a modal dialog from the payment journal, locks the journal while running, and must be re-run from scratch to change selection; SAP F110 parameters → proposal → edit proposal → payment run → print is five screens, with proposal logs (REGUP exceptions) read in a separate list	Proposal is a transient batch producing journal lines; no proposal entity	`PaymentProposal` is a persisted entity with selection criteria, line-level include/exclude, holds, and re-selection diff; approve → run is one action	Screens per payment run: 5–7 → 2; time from "select" to "approved file": 45 min → < 5 min
Settlement in AX via "Settle open transactions" (CustVendOpenTransManager) silently computes discount and FX differences; users discover realized gain/loss or discount-lost postings only in the ledger; SAP F-53 shows the clearing document but FX difference accounts (OB09) are hidden until posted	No preview of settlement postings	`POST /settlements:preview` returns the exact journal (discount, FX gain/loss, write-off) before commit; UI shows it inline	Unexpected settlement postings found at month-end: typical 5–20/month → 0; review time per settlement: 2 min → 10 s
Payment formats: AX requires Electronic Reporting configurations per bank (hundreds of nodes), SAP DMEE trees; a bank-specific tag change takes a consultant day	Format defined in a proprietary tree editor	Canonical pain.001.001.09 generator with per-bank profile overrides as JSON (≤ 20 keys), validated against the XSD in CI and a bank harness	Time to onboard a new bank profile: 2–5 days → < 2 h; file rejections at bank: tracked, target < 0.1 %
Payment run idempotency: AX journal posting interrupted mid-batch leaves half-posted lines and a generated file; re-posting can pay twice; SAP F110 "restart" needs SM37 analysis	No durable workflow; file generation and posting are separate steps without a shared idempotent record	Temporal `PaymentRun` workflow with idempotency keys per open item; file is derived from posted payments, never the reverse	Duplicate payments from crash/retry: non-zero historical → 0 by test
Vendor aging in AX (VendAgingReport) is an SSRS batch over VendTrans; SAP S_ALR_87012078 runs minutes for large vendors; neither reconciles to the control account automatically	Report computed from open items with no tie to GL	Aging served from the `VendorTransaction` projection with bucket config; daily job asserts Σ open = AP control balance per vendor group	Aging report time: 2–10 min → < 2 s; monthly AP-to-GL reconciliation: 2 h → automated, 0 diff

3.19.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity level
Vendor open items	VendTrans, VendTransOpen; Vendor transactions form; VendTable balance	BSIK (open), BSAK (cleared), FBL1N	`VendorTransaction` with `open_amount`; vendor transactions screen	full
Settlement	VendSettlement, CustVendOpenTransManager (Settle open transactions), marking (SpecTrans), partial settlement, cross-rate	Clearing F-44/F-53/F-51, residual/partial payment, BSE_CLR, AUGBL	`Settlement`, `SettlementLine`; manual, during payment, automatic	full
Cash discount	CashDisc (terms), VendTrans CashDiscDate, discount taken/lost accounts, "use cash discount" normal/always/never	Payment terms T052 ZBD1T/ZBD1P, SKTO/SKE accounts, OBXU/OBXV	`PaymentTerms` (wave 7) extended with discount tiers; settlement algorithm	full
FX on settlement	Exchange adjustment realized gain/loss (LedgerParameters, CurrencyExchangeAdjustment)	OB09 realized gain/loss accounts, KDF	realized gain/loss in settlement journal (wave 12 accounts)	full
Payment journal / proposal	LedgerJournalTable type Payment, LedgerJournalTrans, VendPaymProposal (by due date / cash discount / both), VendPaymModeTable (method of payment), payment specification, CustVendPaymJournal	F110 (FBZP config), REGUH/REGUP, payment methods T042Z, house banks FI12	`PaymentProposal`, `PaymentMethod`, `Payment`, `PaymentRun` (Temporal)	full
Payment media	ER formats (ISO 20022 credit transfer, NACHA CCD/CTX, check layout), VendOutPaym classes	DMEE/PMW formats, F110 print program RFFOUS_T, check lot FCHI	`PaymentFile` generators: pain.001.001.09, NACHA (PPD/CCD/CTX), check PDF + MICR, positive pay CSV	full
Bank status ingestion	Return file import (ER pain.002), payment status	pain.002 via bank communication management (BCM)	`POST /payments/status:ingest` pain.002 parser	full
Positive pay	Positive pay format (BankPositivePayExport)	Not standard (custom/BCM)	positive pay CSV per bank profile	full
Prepayments	Prepayment invoice on PO (PurchPrepayTable), prepayment journal with posting profile	Down payment request F-47, down payment F-48 (special G/L A), clearing F-54	`Prepayment` (PO-linked or free) with separate posting profile, applied at invoice posting or settlement	full
Credit notes and reversal	Negative invoice, reversal (TransactionReversal), void check	Credit memo MIRO/FB65, reverse FB08, void FCH8/FCH9	wave 18 credit note; `Payment:reverse`, `Payment:void`	full
Vendor aging	Vendor aging report (VendAgingReport), aging period definitions	Aging S_ALR_87012078, due date analysis	`GET /aging` with bucket definitions; ties to control account	improved
Withholding tax at payment	Withholding tax (TaxWithhold*) calculated at payment	Extended withholding at payment (T059P)	wave 13 withholding engine invoked in settlement; posts withholding payable	full
Payment advice	Vendor payment advice (print management)	Payment advice RFFOAVIS	email/portal advice PDF with settled invoices	full
ACH prenotes	Payments → Prenotes (ACH), vendor bank account prenote status, "Update vendor bank accounts status", Bank account → Prenote setup	Not standard (DMEE custom zero-dollar entry)	`Prenote` (NACHA transaction code 23/33, zero amount) with bank account status lifecycle (FR-19.15)	full
Payment calendar and bank holidays	Payment calendar (D365), Payment days, bank holidays / calendar per bank	Factory calendar on house bank / payment method (FBZP "bank calendar"), T052 payment terms "next business day"	`PaymentCalendar` rules shifting due dates and execution dates by bank calendar (FR-19.16)	full
Balance confirmations	n/a (vendor statement only)	F.18 / F.98 balance confirmation (vendor), reply processing F.19-style	`BalanceConfirmation` runs with reply capture (FR-19.17)	full
AP correspondence	Vendor account statement (VendAccountStatement), payment advice	Correspondence F.64, types OB77/OB78/OB79 (account statement, payment notice, open items list)	`CorrespondenceType` (statement, payment notice, open items, balance confirmation) with template and trigger (FR-19.18)	full (conditional print routing in wave 46)
Special G/L transactions (vendors)	Prepayment posting profiles; no guarantees / noted items	OBYR special G/L indicators A (down payment), F (down payment request), G (guarantee), noted items; bill of exchange W	`VendorTransaction` types NOTED_ITEM (statistical) and GUARANTEE with separate reconciliation accounts (FR-19.19); bills of exchange in wave 36	partial (bills of exchange in wave 36)

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity level
Installment payment terms	Payment schedules (PaymSched, multiple due dates per invoice)	OBB9 installment terms (T052R)	Installment split of vendor open items (FR-19.20)	full
Vendor-initiated direct debits (SEPA B2B)	Method of payment with "vendor collects"; no mandate register	Payment method for direct debit at vendor; mandate reference stored as text	`VendorDebitMandate` and payment method `DEBIT_BY_VENDOR` (FR-19.21)	full
Bank account change control	D365 vendor bank account change workflow / approval	Dual control on sensitive fields (FK08 confirm, S_ALR_87010039 list, FI12)	Dual approval and payment cooling-off on vendor bank account changes (FR-19.22)	improved
One-time payee payment	One-time supplier payment via payment journal	CPD account paid via F110 with document-level bank details	Payment to `one_time_payee` (FR-19.23)	full

3.19.3 Functional requirements

- **FR-19.1 Vendor open items** — Must. The system shall maintain a `VendorTransaction` for every posted invoice, credit note, payment and prepayment with `amount_txn`, `amount_acct`, `open_amount_txn`, `open_amount_acct`, `due_date`, `discount_date`, `discount_amount`, `status` (OPEN, PARTIALLY_SETTLED, SETTLED), and a `hold` flag with reason.
  - Open amount is updated only by settlement rows; `Σ open_amount_acct` per posting profile account equals the AP control balance (daily assertion).
  - Vendor balance query p95 < 50 ms for vendors with ≤ 100k transactions.
- **FR-19.2 Settlement algorithm** — Must. The system shall settle a set of credit-side items (payment, credit note, prepayment) against debit-side items (invoices) per vendor with the following algorithm, previewable before commit:
  1. Order target invoices by `settlement_priority` (user marks first, then due_date ASC, then amount DESC).
  2. For each invoice, `discount = round(invoice_amount_txn × discount_pct, minor)` if `settlement_date ≤ discount_date` (or terms are `ALWAYS`), else 0; for partial settlement, discount is pro-rated by `settled/invoice_amount` unless policy `discount_on_partial=false`.
  3. `applied_txn = min(available_credit, open_amount_txn − discount)`; invoice open amount reduces by `applied_txn + discount` (discount closes the item only when `applied_txn = open − discount`).
  4. Accounting amounts: `applied_acct_invoice = applied_txn × invoice_rate`, `applied_acct_credit = applied_txn × credit_rate`; `fx_diff = applied_acct_credit − applied_acct_invoice`; positive = realized loss for a vendor payable, negative = realized gain (wave 12 accounts).
  5. If a residual `|open_amount_txn| ≤ write_off_limit` (default 1.00 in transaction currency) and `auto_write_off=true`, post the residual to the write-off account and close the item.
  6. Cross-currency settlement (credit currency ≠ invoice currency) converts both to accounting currency at their own rates; the settlement unit is accounting currency; residuals follow step 5.
  7. Withholding (wave 13) is computed on `applied_txn` and reduces the payment, posting withholding payable.
  - Worked example: invoice 1,000.00 EUR posted at 1.1000 USD/EUR (1,100.00 USD), terms 2 % 10 net 30, paid on day 8 at rate 1.0800. Discount = 20.00 EUR. Applied = 980.00 EUR. Invoice-side acct = 980 × 1.10 = 1,078.00 USD; discount acct = 20 × 1.10 = 22.00; payment acct = 980 × 1.08 = 1,058.40. Journal: Dr AP control 1,100.00; Cr bank clearing 1,058.40; Cr discount taken 22.00; Cr realized FX gain 19.60. Balanced to the cent.
- **FR-19.3 Payment terms and discounts** — Must. The system shall compute `due_date` and up to two discount tiers (e.g., 2/10, 1/20, net 30) from the wave 7 payment terms, with `discount_basis` (gross, net of tax) and `use_cash_discount` (NORMAL, ALWAYS, NEVER) per vendor.
- **FR-19.4 Payment proposal** — Must. The system shall create a `PaymentProposal` from criteria (legal entity, vendor range/group, method of payment, due date to, discount date to, selection rule BY_DUE_DATE / BY_DISCOUNT / BOTH, minimum/maximum payment, currency, bank account), listing candidate open items with proposed amount and discount, excluding held vendors/items, and allowing line-level include/exclude, amount change and reselection with diff.
  - Discount optimization: when `BY_DISCOUNT`, items whose discount date is within `discount_lookahead_days` (default 7) are included; annualized discount value vs `cost_of_capital_pct` (default 8 %) decides early payment when `optimize=true`.
  - Proposal approval uses the wave 4 workflow with amount bands (default: > 100,000 USD two approvers).
- **FR-19.5 Payment run** — Must. The system shall execute an approved proposal as a Temporal `PaymentRun` workflow: for each vendor group create `Payment` records (one per vendor × currency × bank account × method), settle items (FR-19.2), post the payment journal (Dr AP control, Cr bank clearing per method), generate the `PaymentFile`, and mark payments SENT.
  - Each activity is idempotent on `(proposal_id, vendor_transaction_id)`; a resumed run skips already-settled items and already-generated files; the file is regenerated from posted payments if missing.
  - Throughput target: 10,000 open items settled and 2,000 payments generated in < 5 minutes.
- **FR-19.6 ISO 20022 pain.001** — Must. The system shall generate pain.001.001.09 files validated against the XSD with the following mapping:
  - `GrpHdr/MsgId` = `PaymentFile.file_number` (≤ 35 chars); `CreDtTm` = generation timestamp; `NbOfTxs` = count of CdtTrfTxInf; `CtrlSum` = Σ InstdAmt; `InitgPty/Nm` = legal entity name; `InitgPty/Id/OrgId/Othr/Id` = bank-assigned customer id from bank profile.
  - `PmtInf` per (debtor account × execution date × method): `PmtInfId` = `{file_number}-{seq}`; `PmtMtd` = `TRF`; `BtchBookg` = profile `batch_booking` (default true); `PmtTpInf/SvcLvl/Cd` = `SEPA` for SEPA profiles else `NURG/URGP`; `ReqdExctnDt/Dt` = payment date; `Dbtr/Nm`, `Dbtr/PstlAdr` = legal entity; `DbtrAcct/Id/IBAN` (or `Othr/Id` for non-IBAN) = bank account; `DbtrAgt/FinInstnId/BICFI` = bank BIC; `ChrgBr` = `SLEV` (SEPA) or profile default `SHAR`.
  - `CdtTrfTxInf` per Payment: `PmtId/InstrId` = payment number; `PmtId/EndToEndId` = payment number (≤ 35 chars, alphanumeric); `Amt/InstdAmt @Ccy` = amount and currency; `CdtrAgt/FinInstnId/BICFI` = vendor bank BIC (omitted when IBAN-only SEPA and profile allows); `Cdtr/Nm` = vendor name (≤ 140 chars, transliterated to the Latin character set required by the bank profile); `Cdtr/PstlAdr/Ctry` plus structured address when profile requires; `CdtrAcct/Id/IBAN` or `Othr/Id` + `CdtrAgt/.../ClrSysMmbId` for routing-number countries; `RmtInf/Ustrd` = concatenated invoice numbers (≤ 140 chars) or `RmtInf/Strd/RfrdDocInf/Nb` + `RfrdDocAmt` per settled invoice when `structured_remittance=true`; `Purp/Cd` = `SUPP`.
  - AX/SAP lineage: REGUH ZBNKN/ZBNKL → CdtrAcct, REGUH VBLNR → EndToEndId, REGUP BELNR → RfrdDocInf/Nb; AX LedgerJournalTrans PaymReference → EndToEndId.
- **FR-19.7 NACHA, checks, positive pay** — Must. The system shall generate NACHA files (file header 1, batch header 5 with SEC code PPD/CCD/CTX, entry detail 6, addenda 7 for CTX remittance, batch control 8, file control 9, blocking factor 10, 94-char records, hash of routing numbers), check PDFs with MICR line and check number from a check lot, and positive pay CSV (bank account, check number, amount, payee, issue date, void flag) per bank profile.
- **FR-19.8 Payment status and pain.002** — Must. The system shall ingest pain.002.001.10 status reports and map `GrpSts`/`TxSts` (ACCP, ACSC, ACSP, PDNG, RJCT) with `StsRsnInf/Rsn/Cd` (AC01, AC04, AM04, …) to payment statuses, moving RJCT payments to REJECTED, reversing settlement and re-opening items; NACHA returns (R01–R85) map likewise.

- **FR-19.9 Payment reversal and void** — Must. The system shall reverse a posted payment (new journal, settlement undone, items re-opened, file not regenerated) and void a check (check status VOID, positive pay void record), with reason codes and audit.
- **FR-19.10 Prepayments** — Must. The system shall post prepayment invoices (PO-linked, with prepayment posting profile and tax) and prepayment journals; at vendor invoice posting or manual settlement the prepayment applies against the invoice, reclassifying from the prepayment account to AP control.
- **FR-19.11 Vendor aging** — Must. The system shall produce aging by vendor/group with configurable buckets (default 0–30, 31–60, 61–90, 91–180, > 180 by due date or document date), as of any date, in transaction and accounting currency; totals tie to the AP control account per vendor group (daily job + report footer).
- **FR-19.12 Payment advice** — Should. The system shall email (or publish to the portal, wave 20) a payment advice PDF per payment listing settled invoices, discounts and withholding.
- **FR-19.13 Holds** — Should. The system shall support vendor-level holds (INVOICE, PAYMENT, ALL, from wave 7 status) and item-level holds with release date; held items are excluded from proposals and listed on the AP workspace.
- **FR-19.14 Automatic settlement** — Could. The system shall optionally settle credit notes against the oldest open invoices of the same vendor at posting (`auto_settle_credit_notes`).
- **FR-19.15 ACH prenotes** — Should. The system shall generate prenote entries (NACHA entry detail with transaction code 23 checking / 33 savings, amount 0.00, SEC code per method) for new or changed vendor bank accounts whose payment method requires a prenote, set the bank account `prenote_status` to `PENDING` with `prenote_sent_at`, and move it to `CONFIRMED` automatically after `prenote_wait_days` (default 6 banking days, per NACHA) unless a return (R03, R04, C01–C13 NOC) is ingested via FR-19.8, which sets `REJECTED` or applies the notification of change; payment proposals exclude vendors whose required prenote is not CONFIRMED (`AP-PRN-001`) and a periodic job updates statuses (AX "Update vendor bank accounts status").
- **FR-19.16 Payment calendar and bank-holiday shifting** — Must. The system shall maintain `PaymentCalendar` rules per legal entity, payment method and bank account (AX payment calendar / payment days; SAP bank calendar on house bank) referencing wave 6 calendars with bank holidays (TARGET2, US Federal Reserve, UK BACS etc.) and apply them: (a) invoice due dates computed from terms that fall on a non-banking day shift per rule `NEXT`, `PREVIOUS` or `NEXT_UNLESS_MONTH_CHANGE`; (b) proposal `payment_date` and pain.001 `ReqdExctnDt` are validated to be banking days of the debtor bank (`AP-CAL-001`), with `cutoff_time` per method; (c) payment days (e.g., pay only on Tuesdays) restrict proposal payment dates. The same rule set is used by AR (wave 30) for customer due dates.
- **FR-19.17 Vendor balance confirmations** — Should. The system shall run a balance confirmation (SAP F.18 / F.98) for selected vendors as of a key date, rendering a confirmation letter per vendor (open items and balance, reply slip), sending it by email or portal (wave 20), capturing replies (AGREED, DISAGREED with vendor balance and comment, NO_REPLY) with a reconciliation list of differences, and storing the run as audit evidence; the same framework serves AR in wave 30.
- **FR-19.18 AP correspondence types** — Should. The system shall define `CorrespondenceType` records (VENDOR_STATEMENT, PAYMENT_NOTICE, OPEN_ITEMS_LIST, BALANCE_CONFIRMATION, PAYMENT_ADVICE) each with a wave 15 template, channel (email, portal, print), trigger (on demand, on event such as `payment.posted`, or scheduled), and a correspondence log per vendor (SAP F.64 maintain/print, OB77–OB79); conditional routing per recipient is extended in wave 46.
- **FR-19.19 Noted items and guarantees** — Could. The system shall support vendor transaction types NOTED_ITEM (statistical, no ledger posting, visible in open items and proposals as reminders, e.g., expected down payment requests; SAP special G/L F) and GUARANTEE (guarantee received from vendor, posted to a statistical guarantee account pair with expiry date and alert; SAP special G/L G), both excluded from AP control reconciliation and shown separately in aging; bills of exchange and promissory notes (SAP W, AX promissory note journals) are wave 36.
- **FR-19.20 Installment payment terms** — Should. The system shall split a posted invoice's vendor transaction into installment open items when its payment terms (wave 7) define installments (AX payment schedule; SAP OBB9 T052R: installment n, percent, own terms per installment), each installment carrying its own due date, discount date and amount, with rounding residual on the last installment; settlement, proposals and aging operate on installments; the invoice header shows total and installment status.
- **FR-19.21 Vendor-initiated direct debits** — Could. The system shall record `VendorDebitMandate` (vendor, creditor identifier, mandate reference, scheme SEPA CORE/B2B or US ACH debit authorization, max amount, valid from/to, status) for vendors that collect by direct debit, a payment method of type `DEBIT_BY_VENDOR` whose proposals create Payments without a file (status SENT on the pre-notified collection date), and expected-debit lines for bank reconciliation in wave 36; a debit without an active mandate or above `max_amount` is flagged on the AP workspace.
- **FR-19.22 Vendor bank account change control** — Must. The system shall require dual approval (approver ≠ requester) for any create/change of a vendor bank account (wave 7 data) used by payment, log old/new values, notify the vendor's primary contact through a channel other than the one used for the change request, and block payment to the changed account for `bank_change_cooling_days` (default 3) after approval unless an AP manager overrides with reason (`AP-BNK-003`); the sensitive-field change report lists changes per period (SAP S_ALR_87010039 / FK08).
- **FR-19.23 Payment to one-time payees** — Should. The system shall pay invoices carrying a `one_time_payee` (wave 18 FR-18.19) as one Payment per invoice using the document-level bank account, include them in proposals only after four-eyes approval of the invoice, emit them in pain.001/NACHA with the payee name and address from the document, and print the payee on the advice and positive-pay record.

3.19.4 Data model

VendorTransaction

Field	Type	Required	Notes
id, voucher	uuid, text	yes	ledger entry voucher
vendor_id, legal_entity_id	uuid	yes	
type	enum	yes	INVOICE, CREDIT_NOTE, PAYMENT, PREPAYMENT, PREPAYMENT_INVOICE, WRITE_OFF, FX_ADJ
source_id	uuid	yes	invoice/payment id
document_date, posting_date, due_date, discount_date, discount_date_2	date	yes/no	
currency, exchange_rate	text, numeric(18,8)	yes	

Field	Type	Required	Notes
amount_txn, amount_acct	numeric(19,4)	yes	signed (invoice negative = credit to vendor)
open_amount_txn, open_amount_acct	numeric(19,4)	yes	
discount_amount, discount_amount_2	numeric(19,4)	no	
status	enum	yes	OPEN, PARTIALLY_SETTLED, SETTLED
hold_reason, hold_release_date	text, date	no	
posting_profile_id, control_account_id	uuid	yes	
payment_method_id, bank_account_id (vendor)	uuid	no	default from vendor

Settlement / SettlementLine

Field	Type	Required	Notes
id, settlement_number	uuid, text	yes	
vendor_id, settlement_date	uuid, date	yes	
kind	enum	yes	MANUAL, PAYMENT_RUN, AUTO, REVERSAL
ledger_entry_id	uuid	yes	discount/FX/write-off/withholding postings
reversed_by_id	uuid	no	
line: credit_transaction_id, debit_transaction_id, applied_txn, applied_acct_debit, applied_acct_credit, discount_txn, discount_acct, fx_diff_acct, write_off_txn, withholding_txn, closes_debit (bool), closes_credit (bool)			

PaymentProposal / Payment / PaymentFile

Field	Type	Required	Notes
proposal: id, number, criteria (jsonb), status (DRAFT, SELECTED, IN_APPROVAL, APPROVED, RUNNING, COMPLETED, CANCELLED), payment_date, bank_account_id, method_id, total_by_currency (jsonb), approved_by[]			
proposal_line: proposal_id, vendor_transaction_id, proposed_txn, discount_txn, included (bool), hold (bool), exclusion_reason			
payment: id, payment_number, proposal_id, vendor_id, vendor_bank_account_id, method_id, currency, amount_txn, amount_acct, payment_date, status (CREATED, POSTED, SENT, ACCEPTED, SETTLED_AT_BANK, REJECTED, REVERSED, VOID), end_to_end_id, check_number, settlement_id, ledger_entry_id, file_id, status_reason_code			
file: id, file_number, format (PAIN001, NACHA, CHECK_PDF, POSITIVE_PAY), bank_profile_id, generated_at, payment_count, control_sum, sha256, storage_uri, status (GENERATED, DOWNLOADED, TRANSMITTED, ACKNOWLEDGED, REJECTED)			

PaymentMethod / BankProfile: method (id, code, type TRANSFER/ACH/CHECK/CARD/WIRE, format, bank_account_id, clearing_account_id, check_lot_id, grace_days, cutoff_time); bank profile (id, bank, format variant SEPA/CH/UK/US, overrides jsonb ≤ 20 keys: charge bearer, batch booking, BIC required, structured remittance, char set, max Ustrd length).

Invariants: for every settlement line `applied_acct_credit − applied_acct_debit − fx_diff_acct = 0`; `Σ settlement lines applied on a transaction ≤ |amount|`; transaction SETTLED ⇔ open_amount = 0; `PaymentFile.control_sum = Σ payments in file`; one Payment per (proposal, vendor, currency, bank account, method). Indexes: VendorTransaction (tenant, vendor_id, status, due_date), (control_account_id, status); payments (proposal_id), (end_to_end_id) unique; settlements by transaction ids.

3.19.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
GET	/api/v1/payables/vendors/{id}/transactions?status=open	Open items	n/a	APInquire
POST	/api/v1/payables/settlements:preview	Compute settlement journal	n/a	APSettle
POST	/api/v1/payables/settlements	Commit manual settlement	client key	APSettle
POST	/api/v1/payables/settlements/{id}:reverse	Reverse	settlement id	APSettle
POST	/api/v1/payables/payment-proposals	Create and select	client key	PaymentProposalMaintain
POST	/api/v1/payables/payment-proposals/{id}:reselect	Re-run selection with diff	proposal id + criteria hash	PaymentProposalMaintain
PATCH	/api/v1/payables/payment-proposals/{id}/lines/{lineId}	Include/exclude/amount	ETag	PaymentProposalMaintain
POST	/api/v1/payables/payment-proposals/{id}:submit	Start approval	proposal id	PaymentProposalMaintain
POST	/api/v1/payables/payment-proposals/{id}:run	Execute PaymentRun	proposal id	PaymentRunExecute
GET	/api/v1/payables/payment-files/{id}/content	Download file	n/a	PaymentFileDownload
POST	/api/v1/payables/payments/status:ingest	pain.002 / NACHA return intake	message id	service account / PaymentStatusIngest
POST	/api/v1/payables/payments/{id}:reverse	Reverse payment	payment id	APSettle
POST	/api/v1/payables/payments/{id}:void	Void check	payment id	APSettle
POST	/api/v1/payables/prepayments	Prepayment invoice/journal	client key	VendorInvoicePost
GET	/api/v1/payables/aging?asOf=&by=due	document&buckets=	Aging	n/a

Commands: `CommitSettlement` (same vendor, no held items, rates available, AP period open, Σ applied ≤ available credit), `RunPayment` (proposal APPROVED, bank account active, cutoff time, vendor bank account validated — IBAN mod-97, ABA checksum), `IngestStatus` (file matches known MsgId/OrgnlEndToEndId; unknown ids → DLQ).

Event	Trigger	Payload fields	Consumers
`dev.passage.payables.settlement.posted.v1` / `.reversed.v1`	settlement commit/reverse	settlement_id, vendor_id, lines (ids, applied, discount, fx_diff), ledger_entry_id	ledger reconciliation, analytics
`dev.passage.payables.proposal.approved.v1`	approval complete	proposal_id, totals by currency, payment_date	notifications
`dev.passage.payables.payment.posted.v1`	payment journal posted	payment_id, vendor, amount, method, bank account, settled items	cash (w36), analytics

Event	Trigger	Payload fields	Consumers
`dev.passage.payables.payment.sent.v1`	file generated & marked sent	payment_id, file_id, format, end_to_end_id	bank connectivity (w36), supplier-portal (w20)
`dev.passage.payables.payment.status.changed.v1`	pain.002/NACHA return	payment_id, old_status, new_status, reason_code	notifications, supplier-portal
`dev.passage.payables.aging.reconciled.v1`	daily job	as_of, vendor_group, open_total, control_balance, diff	alerting
`dev.passage.payables.prenote.status.changed.v1`	prenote sent / confirmed / rejected / NOC applied	vendor_id, bank_account_id, old_status, new_status, return_code	notifications, vendor master (w7)
`dev.passage.payables.vendor-bank-account.changed.v1`	bank account change approved	vendor_id, bank_account_id, changed fields (masked), approved_by, cooling_until	notifications (vendor contact), audit (w48), security monitoring
`dev.passage.payables.balance-confirmation.replied.v1`	vendor reply captured	run_id, vendor_id, our_balance, vendor_balance, status	notifications, audit (w48)

3.19.6 User experience

Screen	Primary actions	Key fields/columns	Duty required
AP workspace	Due this week, discounts expiring, held items, proposals awaiting approval, rejected payments	counts, amounts by currency	APInquire
Vendor transactions	Filter open/all, settle (opens preview), hold/release, view voucher	document, dates, amounts, open, discount available, status	APInquire / APSettle
Settlement dialog	Mark items, set date, preview journal, commit	credit/debit items, applied, discount, FX diff, write-off, resulting journal	APSettle
Payment proposal	Criteria form, selection grid, include/exclude, reselect diff, submit, run	vendor, item, due, discount, proposed amount, hold reason	PaymentProposalMaintain
Payment run monitor	Progress, failures, retry, download files, advices	payments by status, file list, control sums	PaymentRunExecute
Payment files / bank profiles	Download, mark transmitted, configure profile overrides, test generate	format, bank, count, control sum, status	PaymentFileDownload / BankProfileMaintain
Aging	Bucket view, drill to items, export	vendor group, buckets, total, control balance, diff	APInquire

Interaction rules: settlement preview updates within 300 ms of marking an item; proposal grid supports multi-select include/exclude and keyboard navigation; amounts always shown with currency code; approvals from shell inbox; bank profile editor validates with a sample file generation and XSD check before save; personalization of buckets and columns.

3.19.7 Business rules and edge cases

- **BR-19.1** Payment state machine: `CREATED → POSTED → SENT → ACCEPTED → SETTLED_AT_BANK`; `SENT|ACCEPTED → REJECTED` (settlement reversed, items re-opened, payment stays for audit); `POSTED|SENT → REVERSED` (manual); `SENT (check) → VOID`. Proposal: `DRAFT → SELECTED → IN_APPROVAL → APPROVED → RUNNING → COMPLETED`; `IN_APPROVAL → SELECTED` on rejection; `DRAFT|SELECTED → CANCELLED`.
- **BR-19.2** Discount eligibility uses `settlement_date` (payment date), not run date; a proposal with payment_date ≤ discount_date takes the discount even if generated after it; `use_cash_discount=ALWAYS` takes it regardless of date, `NEVER` never.
- **BR-19.3** Partial payment discount: default `discount_on_partial=true` pro-rata; residual item keeps the remaining discount entitlement with the same discount date.
- **BR-19.4** Rounding: discount and FX amounts rounded half-even to the currency minor unit; the FX difference is computed as the balancing figure so the settlement journal always balances by construction; any rounding residual ≤ 0.01 in accounting currency posts to the rounding account (wave 12).
- **BR-19.5** Cross-currency: when credit and debit currencies differ, `applied` is expressed in accounting currency; the transaction-currency open amounts are reduced by `applied_acct / own_rate`; residual below `write_off_limit` closes the item.
- **BR-19.6** Settlement in a closed AP period is rejected; reversal posts in the current open period with a reversal voucher referencing the original.
- **BR-19.7** Concurrency: settlement locks VendorTransaction rows in ascending id order; a payment run and a manual settlement on the same item serialize; the loser sees `AP-SET-009 item no longer open` and the proposal line is marked excluded with reason.
- **BR-19.8** Idempotency: `PaymentRun` activities key on `(proposal_id, vendor_transaction_id)`; the file activity keys on `(proposal_id, bank_account_id, method_id, payment_date)` and is deterministic (same payments → same bytes except `CreDtTm`), so a regenerated file is byte-identical in content fields and carries the same `MsgId`.
- **BR-19.9** `EndToEndId` and `MsgId` are restricted to `[A-Za-z0-9/-?:().,'+ ]` ≤ 35 chars; vendor names are transliterated per bank profile (e.g., `ß → ss`); failure to transliterate rejects the payment line before file generation.
- **BR-19.10** Minimum payment amount (default 1.00) and negative vendor balance: a vendor whose included items net to ≤ 0 is excluded from the proposal with reason `NET_CREDIT`; credit notes are settled against invoices inside the proposal before amounts are computed.
- **BR-19.11** Prepayment applied at invoice posting cannot exceed the invoice total; the remainder stays open as a prepayment transaction.
- **BR-19.12** Rejected payment (pain.002 RJCT AC01 invalid account) re-opens items with a `hold_reason=BANK_DETAILS` on the vendor's bank account until corrected.
- **BR-19.13** Prenote status machine: `NONE → PENDING → CONFIRMED`; `PENDING → REJECTED` on return R02/R03/R04; NOC (C01–C13) updates the bank account fields and restarts at PENDING when the account number or routing changed; any change to account or routing number of a CONFIRMED account resets to NONE and requires a new prenote.
- **BR-19.14** Due-date shifting applies to the due date and to discount dates only when `shift_discount_dates=true` (default false, matching SAP behavior of not shifting discount days); a shifted due date never crosses the next due-date of another installment of the same invoice.
- **BR-19.15** Installments: amount of installment k = round(total × pct_k, minor) for k < n; the last installment absorbs the residual so Σ installments = invoice total exactly; cash discount applies per installment from its own terms.
- **BR-19.16** Bank account change cooling-off is measured in banking days of the paying bank calendar; payments already in a SENT file are unaffected; an override records approver, reason and the out-of-band confirmation reference.
- **BR-19.17** Noted items and guarantees never affect `open_amount_acct` totals reconciled to the AP control account; they cannot be settled against invoices and are closed by explicit release or expiry.

3.19.8 Acceptance criteria

- **AC-19.1** (FR-19.2) Given the 300-scenario settlement fixture, when each scenario is previewed and committed, then discount, FX gain/loss, write-off and withholding amounts and accounts equal expected values for all 300, and every settlement journal balances.

- **AC-19.2** (FR-19.2) Given the worked example in FR-19.2, when settled, then the journal lines are exactly Dr AP 1,100.00; Cr bank clearing 1,058.40; Cr discount 22.00; Cr FX gain 19.60.
- **AC-19.3** (FR-19.6) Given a proposal of 50 SEPA payments, when the run completes, then the pain.001.001.09 file validates against the XSD, `CtrlSum` equals Σ amounts, and the bank test harness returns ACCP for all 50.
- **AC-19.4** (FR-19.5) Given a run of 2,000 payments killed after 1,200 payments are posted, when the workflow resumes, then exactly 2,000 payments exist, no item is settled twice, and the file contains 2,000 transactions.
- **AC-19.5** (FR-19.11) Given open items across 3 vendor groups, when aging is run as of today, then Σ buckets per group equals the AP control account balance per posting profile and the daily job emits diff = 0.
- **AC-19.6** (FR-19.4) Given an invoice with 2 % discount expiring in 5 days and cost of capital 8 %, when a BY_DISCOUNT proposal with optimize=true runs, then the item is included with the discount (annualized 2 % × 365/20 ≈ 36.5 % > 8 %).
- **AC-19.7** (FR-19.8) Given a SENT payment, when a pain.002 with TxSts RJCT and Rsn AC01 is ingested, then the payment is REJECTED, its settlement reversed, the invoice re-opened with hold BANK_DETAILS, and `payment.status.changed` emitted.
- **AC-19.8** (FR-19.7) Given 10 US vendors paid by ACH CCD, when the NACHA file is generated, then record counts, block count (multiple of 10), entry hash and total debit/credit match the file control record and a NACHA validator passes.
- **AC-19.9** (FR-19.10) Given a PO prepayment of 300.00 USD and a later invoice of 1,000.00 USD, when the invoice posts, then 300.00 is applied, AP open = 700.00, and the prepayment account is reduced by 300.00.
- **AC-19.10** (FR-19.9) Given a posted check payment, when voided, then the check status is VOID, the positive pay file contains a void record, items are re-opened, and the payment journal is reversed.
- **AC-19.11** (FR-19.15) Given a new vendor bank account with ACH method requiring a prenote, when the prenote file is generated and no return arrives for 6 banking days, then status becomes CONFIRMED and the vendor is included in the next proposal; when an R03 return is ingested on day 2, status is REJECTED and the proposal excludes the vendor with `AP-PRN-001`.
- **AC-19.12** (FR-19.16) Given terms net 30 producing due date Saturday 2026-12-26 and rule NEXT with the TARGET2 calendar (2026-12-28 is a banking day), when the invoice posts, then the due date is 2026-12-28; a proposal with payment date 2026-12-25 is rejected with `AP-CAL-001`.
- **AC-19.13** (FR-19.20) Given an invoice of 1,000.00 USD with installment terms 3 × 33.33 %, when posted, then three open items of 333.33, 333.33 and 333.34 exist with due dates 30/60/90 days, and aging shows each in its bucket.
- **AC-19.14** (FR-19.22) Given a vendor bank account change requested by user A, when user A tries to approve it, then it is rejected; approved by user B, a payment proposal on the next banking day excludes the vendor with `AP-BNK-003` until 3 banking days pass, and the change report lists the change with old/new masked values.
- **AC-19.15** (FR-19.17) Given a balance confirmation run for 20 vendors, when 15 reply AGREED, 3 DISAGREED with balances and 2 do not reply, then the reconciliation list shows 3 differences with amounts and 2 NO_REPLY after the reply deadline.

3.19.9 Test plan and fixtures

Fixtures: `ap-settle-300` (300 scenarios authored with the accountant: full/partial, discount taken/lost/always, cross-currency, write-off, withholding, prepayment, credit note netting); `ap-pain001-bank-profiles` (SEPA, UK, CH, US-ISO) with expected XML; `ap-nacha-10`; `ap-aging-demo` (3 vendor groups, 5,000 items); `ap-pain002-samples` (ACCP, RJCT codes); `ap-crash-run` (2,000 payments with injected failure).

Test	Type	Target	Pass criterion
Settlement scenarios	unit (table-driven)	settlement engine	AC-19.1
Settlement balances	property	engine	random items/rates/dates: journal always balances; Σ applied ≤ credit
pain.001 XSD	contract	file generator	valid against `pain.001.001.09.xsd` for all profiles
Bank harness	E2E	sandbox bank	ACCP for fixture file
NACHA validator	unit	NACHA generator	AC-19.8
Run idempotency	E2E (Temporal test server with activity failure injection)	PaymentRun	AC-19.4
Aging ties	E2E	aging job	AC-19.5
Status ingest	unit	pain.002 parser	all codes map; unknown → DLQ
Proposal throughput	performance	10k items	< 5 min run, p95 settle activity < 50 ms

Reconciliation checks: Σ VendorTransaction.open_amount_acct per control account = ledger balance; Σ payments POSTED per bank clearing account = ledger clearing balance; Σ file control sums = Σ payments SENT; settlement discount Σ = discount account movement for the period.

3.19.10 Deployment and operations

Helm chart `passage-payables` extended: payment-run Temporal worker ×2, file generator worker ×2, object store bucket `passage-payment-files` (S3-compatible, server-side encryption, 7-year retention, write-once). Config: `AP_WRITE_OFF_LIMIT=1.00`, `AP_DISCOUNT_LOOKAHEAD_DAYS=7`, `AP_COST_OF_CAPITAL_PCT=8`, `AP_MIN_PAYMENT=1.00`, `AP_FILE_RETENTION_DAYS=2555`. Migrations `payables/v19.*`. Flags: `ap.nacha`, `ap.checks`, `ap.positive_pay`, `ap.auto_settle_credit_notes`, `ap.structured_remittance`. Jobs: aging reconciliation daily 03:00; discount-expiry digest daily 07:00; pain.002 poller (wave 36 replaces with bank connectivity). SLOs: settlement preview p95 < 300 ms; proposal selection of 10k items < 10 s; file generation < 30 s for 2,000 payments. Alerts: aging diff ≠ 0 (page); payment run failed activity > 3 retries (page); files generated but not downloaded/transmitted within 4 h (ticket); rejected payments > 1 % of a run (ticket). Runbook: resume stuck run (Temporal), regenerate file, reverse payment, correct vendor bank account and re-propose. Rollback: additive migrations; payment files already transmitted are not affected; disable `ap.*` format flags to stop generation.

3.19.11 Migration from AX / SAP

Source	Passage entity	Notes
AX VendTrans + VendTransOpen (open items)	VendorTransaction OPEN/PARTIALLY_SETTLED	AmountCur/AmountMST → amount_txn/acct; VendTransOpen.AmountCur → open; CashDiscDate, DueDate; vendor balance Σ must equal migrated AP control
AX VendSettlement history	not migrated	closed history in lakehouse
AX VendPaymModeTable, VendPaymModeSpec	PaymentMethod	ER format name → format enum
AX BankAccountTable (vendor bank accounts, VendBankAccount)	vendor bank accounts (wave 7 role data)	IBAN/BIC/ABA validated on load
AX CashDisc, PaymTerm	PaymentTerms discount tiers	
AX LedgerJournalTrans open payment journals	not migrated	post or delete before cutover
SAP BSIK (open vendor items)	VendorTransaction	DMBTR/WRBTR, ZFBDT+ZBD1T → due/discount dates, ZLSPR → hold; UMSKZ A → PREPAYMENT

Source	Passage entity	Notes
SAP T042Z/T042E (payment methods), FBZP house banks	PaymentMethod, bank accounts	
SAP LFBK (vendor bank details)	vendor bank accounts	
SAP REGUH/REGUP of unexecuted F110 proposals	not migrated	complete or delete before cutover
SAP T052 payment terms	PaymentTerms	

Validation: Σ open items per vendor and per control account equals the source trial balance at cutover (0.00 difference); count of open items equals source; 100 random vendors' bank details re-validated. Not migrated: cleared items (BSAK, settled VendTrans), check registers (void history), positive pay history, payment files.

3.19.12 Dependencies, risks, open questions

Depends on: wave 18 (VendorTransaction creation), wave 12 (rates, realized gain/loss accounts, rounding), wave 13 (withholding), wave 14 (AP period control), wave 7 (vendor bank accounts, terms, holds), wave 4 (Temporal, approvals), wave 36 for bank transport (forward dependency; this wave uses file download).

Risk	Likelihood	Impact	Mitigation
Bank-specific pain.001 variants exceed the 20-key profile model	Medium	Medium	Profile model reviewed against 4 banks' implementation guides; escape hatch: XSLT post-processor per profile
Accountant rejects discount-on-partial default	Low	Low	Policy flag; fixture covers both
Payment file leakage (contains bank details)	Low	High	Object store with per-tenant prefix, OPA-gated download, audit on every download, no email attachment of files

Open questions:

1. pain.001 version: .09 (2019) as default or .03 for banks still on the older schema? Default: .09 with profile override to .03. Decide by wave 19 mid-point.
2. Should the proposal auto-net credit notes across currencies? Default: same currency only. Decide by wave 19 close.
3. Card payments (virtual cards) in v1? Default: method type exists, no provider adapter until v1.x. Decide by wave 35.

3.19.13 Parameters and setup

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
`write_off_limit` / `auto_write_off`	legal entity (per currency)	numeric / bool	1.00 / true	≥ 0	FR-19.2 step 5	Accounts payable parameters → Settlement → "Maximum penny difference" / over-under payment	OBA3 / OBXT tolerance groups for vendors and payment differences (T043G)
`discount_on_partial`	legal entity	bool	true	true/false	BR-19.3	Settlement → "Calculate cash discount for partial payments"	OBA3 cash discount adjustment for partial payments
`use_cash_discount`	vendor	enum	NORMAL	NORMAL, ALWAYS, NEVER	FR-19.3	Vendor → "Use cash discount"	n/a (always per terms; ZTERM override)
`discount_lookahead_days` / `cost_of_capital_pct` / `optimize`	legal entity	int / numeric / bool	7 / 8 / false		FR-19.4	Payment proposal → "Cash discount" selection	F110 parameter "next payment run date" logic
`min_payment` / `max_payment`	payment method	numeric	1.00 / none	≥ 0	BR-19.10	Method of payment → minimum/maximum	FBZP payment method per company code: minimum/maximum amount
`payment_methods`	legal entity	table	TRANSFER (pain.001), ACH (NACHA), CHECK, WIRE	type, format, bank account, clearing account, check lot, grace days, cutoff time	FR-19.5	Methods of payment (VendPaymModeTable), payment specifications, payment fees	T042Z payment methods per country, T042E per company code, FBZP
`bank_profiles`	bank account	record	SEPA / US / UK / CH variants	≤ 20 override keys	FR-19.6	ER format configurations per bank	DMEE tree / PMW format (OBPM1–OBPM4)
`pain001_version`	bank profile	enum	001.001.09	.03, .09	open question 1	ER format version	DMEE format version
`check_lots` / `check_layout`	bank account	table / template	none / default MICR layout	lot ranges, layout fields	FR-19.7	Check layout (per bank account), check number sequences	FCHI check lots, FBZ5 print program RFFOUS_C
`positive_pay_format`	bank account	enum	CSV	CSV, BAI-like fixed, bank XML	FR-19.7	Positive pay formats	FCHX check extract
`proposal_approval_bands`	legal entity	table	> 100,000 USD two approvers	bands	FR-19.4	Payment journal approval workflow	F110 release via BCM approval (FBPM rules)
`aging_buckets` / `aging_basis`	legal entity, user override	list / enum	0–30, 31–60, 61–90, 91–180, >180 / DUE_DATE	DUE_DATE, DOCUMENT_DATE, POSTING_DATE	FR-19.11	Aging period definitions	S_ALR_87012078 variant (days in arrears)
`prenote_required` / `prenote_wait_days`	payment method / legal entity	bool / int	true for ACH / 6	3–10 banking days	FR-19.15	Bank account → Prenote setup; Method of payment "Prenote required"	n/a
`payment_calendar_rules`	legal entity × method × bank account	table	NEXT, bank calendar from wave 6	NEXT, PREVIOUS, NEXT_UNLESS_MONTH_CHANGE; payment days	FR-19.16	Payment calendar (D365), Payment days, Bank holidays	House bank calendar, FBZP "bank calendar", T052 "next business day"

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
`shift_discount_dates`	legal entity	bool	false	true/false	BR-19.14	Payment calendar "Cash discount date" shift option	n/a
`correspondence_types`	legal entity	table	VENDOR_STATEMENT, PAYMENT_NOTICE, OPEN_ITEMS_LIST, BALANCE_CONFIRMATION, PAYMENT_ADVICE	template, channel, trigger	FR-19.18	Print management for vendor documents	OB77 / OB78 / OB79 correspondence types and print programs (T048, T048B)
`balance_confirmation_reply_days`	legal entity	int	21	7–90	FR-19.17	n/a	F.18 reply deadline (letter text)
`special_gl_types`	legal entity	table	NOTED_ITEM, GUARANTEE with accounts		FR-19.19	Prepayment posting profiles	OBYR special G/L indicators (T074)
`bank_change_cooling_days` / `bank_change_dual_approval`	legal entity	int / bool	3 / true	0–15	FR-19.22	Vendor bank account change workflow (D365)	Sensitive fields for dual control (V_T055F), FK08
`auto_settle_credit_notes`	legal entity	bool	false	true/false	FR-19.14	Settlement → "Automatic settlement"	F.13 automatic clearing
`withholding_at_payment`	legal entity	bool	per wave 13 country pack		FR-19.2 step 7	Withholding tax parameters	Extended withholding at payment (T059P)

3.19.14 Inquiries and reports

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
Vendor transactions (open / all)	list inquiry	vendor, status, type, date range, currency	voucher, document, dates, amount, open, discount available, hold	`VendorTransaction`	Vendor transactions (VendTrans), Open transactions	FBL1N / FBL1H vendor line items
Vendor balance	list inquiry	vendor group, currency, as-of	balance txn/acct, last payment	`VendorTransaction` aggregate	Vendor balance list	FK10N / S_ALR_87012082 vendor balances
Vendor aging	operational report	as-of, basis, buckets, group	buckets, total, control balance, diff	FR-19.11 projection	Vendor aging report (VendAgingReport)	S_ALR_87012078 due date analysis, RFKOPR00 aging
Cash requirements / due forecast	operational report	due date range, method, bank account	amount due by day and currency, discounts available	`VendorTransaction` open	Cash flow forecast (AP part)	S_ALR_87012083 open items for printing; FF7A cash position
Settlement history	drill-down	vendor, date, kind	settlement, items, discount, FX, write-off	`Settlement`	Closed transaction editing / Settlement history	FBL1N cleared items, FB03 clearing document
Cash discount inquiry	list inquiry	date range, taken/lost	invoice, discount available, taken, lost	`SettlementLine`	Cash discount inquiry	S_ALR_87012085 payment history with discount
Payment proposal log	drill-down	proposal	included/excluded items with reasons	`PaymentProposal`	Payment proposal (VendPaymProposal)	SAPF110V proposal log, FBZ0
Payment history / payment list	list inquiry	method, status, date, bank account	payment number, vendor, amount, file, status, reason code	`Payment`	Payment history	S_P99_41000099 payment list, FBL1N payments
Payment files	list inquiry	format, bank, status	file number, count, control sum, sha256, downloaded by	`PaymentFile`	Generated payment files	FDTA DME administration
Positive pay inquiry	list inquiry	bank account, date	check number, amount, payee, void	`Payment` CHECK	Positive pay inquiry	FCHN check register
Check register	operational report	check lot, date	check number, payee, amount, status (issued/void/cleared)	`Payment` CHECK	Check journal (BankChequeTable)	FCHN, FCH6
Prenote status	list inquiry	status, vendor	bank account (masked), status, sent at, return code	vendor bank accounts	Prenote inquiry	n/a
Down payments / prepayments open at key date	list inquiry	as-of, vendor	prepayment, applied, open	`VendorTransaction` PREPAYMENT	Prepayment inquiry	S_ALR_87012105 down payments at key date

Vendor bank account changes (sensitive fields)	operational report (audit)	period, vendor	field, old/new (masked), requested by, approved by, cooling until	audit log	Vendor bank account change tracking (D365)	S_ALR_87010039 sensitive field changes, FK08
AP control reconciliation	operational report	entity, account, date	open items total, ledger balance, diff	aging job output	Ledger reconciliation (AP)	FAGLF03 / F.03 comparative analysis

3.19.15 Printed and electronic documents

Document	Trigger	Layout elements (header / line / footer)	Formats	Numbering sequence	Legal / retention requirement
ISO 20022 credit transfer	payment run	per FR-19.6 mapping	XML pain.001.001.09 (or .03)	file number `PF–`	Bank instruction; retain 7–10 years (write-once bucket, 2,555 days default)
NACHA file	payment run (ACH) / prenote run	records 1/5/6/7/8/9 per FR-19.7	fixed-width 94-char ASCII	file id modifier A–Z/0–9 per day	NACHA Operating Rules record retention (2 years min); retained 7 years
Check with remittance stub	payment run (CHECK)	check face: date, payee, amount in words and digits, MICR (E-13B) line with check number, routing, account; stub: invoices settled, discounts	PDF on check stock (MICR toner)	check lot number	Escheat/unclaimed property follow-up records; 7 years
Positive pay file	after check run / void	bank account, check number, amount, payee, issue date, void flag	CSV / bank format	per file	Bank agreement

Document	Trigger	Layout elements (header / line / footer)	Formats	Numbering sequence	Legal / retention requirement
Payment advice / remittance advice	payment posted / sent	header: payer, payee, payment number, date, method, amount; lines: invoice number, date, gross, discount, withholding, paid	PDF, email, portal (wave 20), EDI 820/REMADV (wave 35)	payment number	none beyond accounting retention
Vendor account statement	on demand / scheduled	header: vendor, period; lines: opening, documents, payments, closing balance	PDF, email, portal	n/a	none
Balance confirmation letter	confirmation run	header: key date, vendor, our balance; lines: open items; reply slip	PDF, email, portal	run number BC–	Audit evidence (ISA 505 external confirmations); retain with audit file 10 years
Withholding certificate	payment with withholding	payer, payee tax ids, gross, withheld, rate, period	PDF (country form in wave 48)	per country	Country tax law (e.g., IN Form 16A, MX constancia)
Prenote notification	prenote sent	vendor, account (masked), expected confirmation date	email	n/a	none

3.19.16 Periodic and batch jobs

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
Aging reconciliation to AP control	daily 03:00	legal entity × control account	run id (entity, date)	< 2 min per 1M open items	retry 3×	diff ≠ 0 pages AP lead
Discount-expiry digest	daily 07:00	legal entity	key = (entity, date)	< 30 s	retry	none
Scheduled payment proposal (opt-in, SAP F110S)	per schedule (e.g., Tue/Thu 06:00)	legal entity × method	key = (schedule, run date); creates proposal in SELECTED only	< 10 s per 10k items	alert treasurer	proposal not created → ticket
pain.002 / NACHA return poller	every 15 min (until wave 36)	bank account	key = message id / return trace number	< 30 s	DLQ unknown ids	DLQ depth > 0 → ticket
Prenote status update (FR-19.15)	daily 05:00	legal entity	key = (bank account, date)	< 1 min	retry	PENDING > 10 banking days → ticket
Automatic settlement of credit notes (FR-19.14)	every 30 min	vendor	key = credit note id	< 1 min	item-level error	errors > 0 → ticket
Recalculate cash discount and due dates after calendar change (FR-19.16)	on calendar change + nightly 01:30	legal entity	key = (calendar version, item)	< 2 min per 100k items	retry	changed items reported
Balance confirmation run (FR-19.17)	annually / on demand	vendor range	key = run id; letters generated once	< 5 min per 5k vendors	vendor-level errors	NO_REPLY after deadline → list to auditor
Correspondence scheduled sends (statements)	monthly day 3	vendor	key = (vendor, period, type)	< 10 min per 10k vendors	retry 3×	bounce rate > 5 % → ticket
Guarantee expiry alert (FR-19.19)	daily 06:00	legal entity	key = (guarantee, date)	< 10 s	retry	guarantees expiring < 30 days → notification
Payment file retention sweep	monthly	bucket prefix	object lock ensures no early delete	< 5 min	none	n/a

3.19.17 Security duties and privileges

Duty	Privileges (entry points: API paths / screens / jobs)	Segregation-of-duties conflicts	Default roles that include it	AX duty / SAP authorization reference
APInquire	vendor transactions, balance, aging, settlement history, payment history	none	AP clerk, Controller, Auditor	AX "Inquire into vendor transactions"; SAP F_LFA1_BUK display, FBL1N
APSettle	settlements preview/commit/reverse; payments :reverse, :void; holds	with PaymentRunExecute when four-eyes; with VendorMaintain (w7)	AP supervisor	AX "Settle vendor transactions" (VendSettle); SAP F_BKPF_KOA K clearing F-44

3.19.19 Performance budgets and capacity

Operation	Volume assumption (per tenant per day / peak per minute)	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
Settlement preview	5,000 / 100 per min	60 ms / 300 ms / 600 ms	100 rps	none	VendorTransaction (tenant, vendor_id, status, due_date)	p95 ≤ 1 s; preview limited to 500 items per request
Settlement commit	20,000 (incl. runs) / 2,000 per min in runs	30 ms / 50 ms / 120 ms per item activity	200 items/s per worker	Settlement ≈ 500 B + lines 300 B	lock order by id (BR-19.7)	Run extends; deadline-based alert if ETA past cutoff
Proposal selection (10k open items)	20 runs	3 s / 10 s / 20 s	n/a	proposal lines ≈ 200 B	partial index on status = OPEN	Selection paginated by vendor range
Payment run (2,000 payments, 10k items)	5 runs / day	2 min / 5 min / 8 min	40 items/s end-to-end	Payment ≈ 600 B; files 1–5 MB	payments (proposal_id), (end_to_end_id) unique	Worker HPA 2→6; cutoff-time ETA alert
File generation (2,000 payments)	5 / day	8 s / 30 s / 60 s	n/a	object store 7-year retention ≈ 20 GB/year	per-tenant prefix	Streaming writer; memory bounded at 256 MiB
Status ingest (pain.002)	50 files / day	1 s / 5 s / 10 s per file	10k transactions per file	raw messages retained 7 years	(end_to_end_id) lookup	Queue; status lag ≤ 15 min
Aging (5k vendors, 1M items)	200 queries	300 ms / 2 s / 4 s	n/a	daily snapshot ≈ 50 MB	snapshot table by (as_of, vendor_group)	Served from snapshot + intraday delta; exact recompute async
Vendor balance	50k / 500 per min	10 ms / 50 ms / 100 ms	500 rps	n/a	running balance table per vendor × currency	Read replica

3.19.20 Localization and compliance hooks

Concern	Varies by	Country packs touching it (wave 48)	Extension point used
Payment formats beyond the canonical pain.001/NACHA (UK BACS Standard 18, CH pain.001 SPS, DE DTAZV, JP Zengin, MX SPEI, BR CNAB 240, AU ABA, CA CPA 005)	Local clearing systems	UK, CH, DE, JP, MX, BR, AU, CA	`PaymentFile` generator plug-in interface (format enum + bank profile); XSLT post-processor escape hatch
Payment purpose codes and regulatory reporting codes (e.g., CN, IN, AE purpose codes, CBR reporting)	Central bank rules	CN, IN, AE, RU	`Purp/Cd` and `RgltryRptg` from vendor/payment purpose code table (AX "Payment purpose codes")
Bills of exchange, promissory notes, postdated checks	IT, ES, FR, TR, JP, BR, APAC practice	IT, ES, FR, TR, JP, BR, MY, SG	Wave 36 instrument model on top of `VendorTransaction` type extension; DEFERRED (see 3.19.21)

Concern	Varies by	Country packs touching it (wave 48)	Extension point used
Withholding at payment and certificates (US 1099/backup withholding, IN TDS, MX ISR, BR IRRF)	Country tax law	US, IN, MX, BR, PH	Wave 13 withholding engine called in settlement step 7; certificate templates per pack; 1099 reporting in wave 48
Cash discount VAT adjustment (discount reduces taxable base in some countries)	VAT regimes	DE, AT, NL, BE	Settlement journal hook `tax.adjust_on_discount` invoking wave 13
Payment calendars and bank holidays	Clearing system calendars (TARGET2, Fedwire, BACS)	all	Wave 6 calendars referenced by FR-19.16
Unclaimed property / escheatment of uncashed checks	US state law	US	Check register aging report + `escheat_due_date` on CHECK payments (wave 48 report)
Strong customer authentication / payment approval evidence	PSD2 (bank side), SOX controls	EU, US	Proposal approval workflow evidence, file hash, download audit
Vendor bank detail change fraud controls	Internal control frameworks	all	FR-19.22 dual approval and cooling-off
Data protection of bank data in files and advices	GDPR, PCI (card)	EU	Masked display, OPA-gated download, encryption at rest
Language and format of advices, statements and confirmation letters	Vendor language	all	Wave 15 templates

3.19.21 Coverage closure

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
AX 12.2.1 — Payments → Prenotes (ACH) [#10]	PARTIAL	ADDED as FR-19.15	Zero-dollar NACHA entries with status lifecycle
AX 12.2.3 — Vendor → Update vendor bank accounts status (prenote results) [#13]	PARTIAL	ADDED as FR-19.15	Job in 3.19.16
AX 12.2.4 — Payment → Payment calendar (D365) [#15]	PARTIAL	ADDED as FR-19.16	Due-date and execution-date shifting
AX 12.3.4 — Payment → Payment calendar (AR) [#26]	PARTIAL	ADDED as FR-19.16	Same rule set reused by wave 30 for customer due dates
AX 12.5.4 — Bank account → Prenote setup [#38]	PARTIAL	ADDED as FR-19.15	`prenote_required`, `prenote_wait_days` (3.19.13)
AX 12.5.4 — Bank → Bank holidays / Payment calendar [#39]	PARTIAL	ADDED as FR-19.16	Bank calendars from wave 6
SAP 13.1 — F.97 / F.98 / F.99 balance confirmations (G/L, AP, AR) [#11]	GAP (propose 19)	ADDED as FR-19.17	Vendor side here; customer side reuses the framework in wave 30; G/L confirmations (F.97) SUPERSEDED by wave 15 audit trail exports
SAP 13.1 — OBXR / OBYR special G/L indicators (customers / vendors) [#16]	PARTIAL-19	ADDED as FR-19.19	Noted items and guarantees added; bills of exchange DEFERRED to wave 36; customer side wave 30
SAP 13.2 — F.98 vendor balance confirmation [#31]	GAP (propose 19)	ADDED as FR-19.17	
SAP 13.2 — F.64 AP correspondence maintain / print [#33]	PARTIAL-19	ADDED as FR-19.18	Correspondence types with log; conditional routing in wave 46
SAP 13.2 — OBYR special G/L indicators vendors (down payments, guarantees, BoE) [#34]	PARTIAL-19	ADDED as FR-19.19	Down payments already FR-19.10; guarantees added; BoE DEFERRED to wave 36
SAP 13.2 — Define correspondence types / forms OB77, OB78, OB79 [#36]	PARTIAL-19	ADDED as FR-19.18	`correspondence_types` (3.19.13)
SAP 13.20 — Supplier condition contracts (purchasing rebates, chargebacks) [#229]	PARTIAL-19	DEFERRED to wave 26	Rebate accrual and claim engine belongs with the wave 26 condition engine; AP settlement of the resulting vendor credit notes already uses FR-18.12 and FR-19.2
AX 12.2.1 / 12.2.2 / 12.2.3 / 12.2.4 — Promissory note journals, documents, draw/remit/settle batches, setup [#1, #3, #4, #6; register wave 36]	GAP	DEFERRED to wave 36	Register assigns treasury instruments to wave 36; noted here because the instrument settles vendor open items; `VendorTransaction.type` is extensible for it
AX 12.5.1 / 12.5.4 — Bills of exchange / promissory notes and postdated checks (bank side) [#16, #17, #18, #19; register wave 36]	GAP	DEFERRED to wave 36	Same
SAP 13.2 — F-40 / F-36 / FBW6 bill of exchange payment (AP) [#24; register wave 36]	GAP	DEFERRED to wave 36	Same
SAP 13.1 / 13.2 — OBB8 / OBB9 installment terms [#17, #35; register wave 7]	PARTIAL-7	ADDED as FR-19.20 (open-item split)	Terms definition stays in wave 7; splitting vendor open items into installments is closed here
AX 12.3.1 — Direct debit mandates (SEPA) [#18; register wave 30] / SAP 13.3 SEPA mandate management [#44; register wave 30]	PARTIAL-30	ADDED as FR-19.21 (vendor-initiated debits only)	Customer-side creditor mandates (pain.008) remain wave 30
SAP 13.2 — One-time vendor (CPD) payment [#23; register wave 7]	PARTIAL-7	ADDED as FR-19.23	Invoice capture in FR-18.19

3.20 Wave 20: Inventory Costing & Supplier Collaboration

3.20.1 Scope and business context

Wave 20 makes inventory value correct. Waves 16–18 wrote `cost_amount_physical` and `cost_amount_posted` on every inventory transaction at the running estimate (receipt price, running average on issues). This wave adds the costing engine that settles issues against receipts under the item model group's method — FIFO, LIFO, weighted average (running or periodic) or standard cost — and the inventory close/recalculation job (AX InventClosing with InventSettlement and InventCostTrans; SAP material ledger period-end closing CKMLCP with CKMLPP/CKMLCR and MBEW price control S/V, MR21 price change, MR22 debit/credit) that posts `cost_amount_adjustment` rows and GL adjustments so that the inventory value report ties to the GL inventory accounts by site, warehouse, item group and financial dimension. Standard cost captures purchase price variance (PPV) on receipt and invoice. Costing versions (AX CostingVersion/InventItemPrice; SAP CK11N/CK24 marking and release for material-level prices) hold planned and standard costs by product × site with activation and revaluation of on-hand.

The supplier portal (D365 vendor collaboration; SAP Ariba Supplier Network / SNC) at `supplier.<env>.passage.dev` lets vendor users acknowledge POs (accept/reject/propose changes), send ASNs, reply to RFQs (wave 17 hook), submit invoices against POs (wave 18 `:capture` source PORTAL), view payment status and advices (wave 19), and exchange documents.

Out of scope: BOM cost roll-up, costing sheets and production variance decomposition (wave 39), production order WIP settlement (wave 21 uses this engine for its receipts/issues), landed cost (wave 34), cost accounting ledger (wave 38), portal e-invoicing via Peppol (wave 35), supplier onboarding/qualification workflow (v1.x).

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
AX inventory close (InventClosing) takes 4–12 h for large companies, blocks posting in the period, fails on unsettled negative issues with cryptic "cannot settle" messages, and must be cancelled and re-run end to end	Single-threaded settlement per item in X++ with helper threads; whole-period scope; no incremental	Close runs as a Temporal workflow with per-product child workflows (parallelism 32), incremental from the last closed date, resumable, with a pre-check report listing items that cannot settle and why	Close duration on 1M transactions: 4–12 h → < 20 min; re-run after failure: full → incremental from checkpoint
Inventory value does not tie to the GL: AX "Inventory value report" (InventValueReport) requires report configuration (InventValueReportSetup) and still differs from the GL because of manual journals and timing; SAP MB5L vs FAGLB03 differences investigated monthly	Value report computed from InventTrans; GL has postings from other sources; no per-dimension open-item relationship	Value report is a projection from `CostTransaction` rows with the GL voucher on each; daily reconciliation per inventory account × dimension; every difference row drills to the causing voucher	Monthly inventory-to-GL reconciliation: 1–3 days → < 1 h; unexplained differences: non-zero → 0
Weighted average in AX during the period uses running average per receipt, then close recalculates to periodic average, changing COGS retroactively with surprises at close; SAP MAP (VERPR) can go negative or spike on small stock with large invoice differences	Two-phase (running vs periodic) design; MAP recalculated on invoice with stock near zero	Method choice `WEIGHTED_AVG_RUNNING` (what you see during the period is final) or `WEIGHTED_AVG_PERIODIC` (explicit), with a preview of close adjustments by product before posting; guard that invoice differences on zero stock post to price difference, not to a residual unit	Unexpected COGS adjustments at close: typical 1–3 % of COGS → < 0.1 %; MAP spike incidents: tracked, target 0
Standard cost activation in AX requires costing version setup, pending prices, "Activate pending prices", then a revaluation posting that is hard to reconcile; SAP CK24 marking/release with CKM3 analysis is a multi-transaction month-end routine	Multi-step manual procedure	`CostingVersion` with pending/active state; `:activate` posts the revaluation of on-hand in one voucher and shows the per-site delta before activation	Steps to activate standard costs for a plant: 6–9 transactions → 2 (review, activate); activation latency: hours → < 2 min for 10k products
Vendors call or email for PO status, ASN entry is EDI-only or re-keyed by the warehouse, invoices arrive by email PDF; D365 vendor collaboration needs Azure AD B2B guest setup per vendor user; Ariba requires a separate subscription	Portal is an add-on with separate identity	Portal built on the same APIs/events with its own Keycloak realm; vendor admin invites users self-service; ASN pre-fills receiving (wave 18)	Vendor onboarding to portal: days → < 15 min; PO acknowledgement latency: 2–5 days → < 1 day median; receipts pre-filled from ASN: 0 % → > 80 % of portal vendors' receipts

3.20.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity level
Costing method per item	InventModelGroup.InventModel (FIFO, LIFO, LIFO date, Weighted avg, Weighted avg date, Standard cost, Moving average)	MBEW VPRSV (S standard / V moving average), material ledger actual costing for periodic	`ItemModelGroup.costing_method` (FIFO, LIFO, LIFO_DATE, WEIGHTED_AVG_RUNNING, WEIGHTED_AVG_PERIODIC, STANDARD, MOVING_AVG)	full
Inventory close	InventClosing, InventSettlement, InventCostTrans, InventClosingRecalculation; Close and adjustment form	CKMLCP (material ledger cockpit: selection, determine sequence, single/multi-level price determination, post closing), CKMLPP/CKMLCR	`InventoryClose` workflow, `CostSettlement`, `CostTransaction`	full
Recalculation	Recalculation (without closing), cancel recalculation	Material ledger price determination preview; CKM3 analysis	`:recalculate` (preview/post without closing period)	full
Adjustment	Adjustment of on-hand / transactions (InventAdjOnhand, InventAdjTrans)	MR22 debit/credit material, MR21 price change	`CostAdjustment` (on-hand or transaction level)	full
Standard cost / costing versions	CostingVersion, InventItemPrice (pending/active), activation, revaluation posting	Standard price STPRS, CK11N estimate, CK24 mark/release, price change document MR21, revaluation	`CostingVersion`, `ItemCost` (PENDING/ACTIVE), `:activate` with revaluation voucher	full (roll-up in w39)
Purchase price variance	Standard cost variance posting types PurchPriceVariance at receipt/invoice	PRD price difference account (OBYC PRD) on GR/IR	PPV posting at receipt and invoice (wave 18 hooks) with `CostTransaction` kind PPV	full
Inventory value report	InventValueReport, InventValueReportSetup, Inventory aging	MB5L (stock value), MC.9 / MB52, CKM3	`GET /costing/value-report` with dimension grouping and GL tie-out column	improved
Marking	InventTrans marking (MarkingRefInventTransOrigin)	Not standard (batch-specific valuation partial)	`marked_transaction_id` on transactions (wave 16 field) honored by settlement	full
Moving average	Moving average (InventModel MovingAverage) with product cost adjustment at invoice	MAP VERPR update on GR/IR	`MOVING_AVG` with invoice-difference settlement to stock proportionally	full
Vendor collaboration	D365 Vendor collaboration workspace (PO confirmation, consignment, invoices, RFQ replies)	Ariba Supplier Network, SNC/Supplier Portal	Supplier portal (PO ack, ASN, invoice, RFQ reply, payments, documents)	full
ASN	D365 vendor collaboration ASN; AIF ASN inbound	ASN via EDI DESADV, SNC	`AdvanceShipNotice` → receiving expected lines	full
Parallel inventory valuation	D365 Global inventory accounting add-in (multiple cost ledgers, accounting conventions, accounting policies per ledger)	Material ledger with multiple currencies/valuations (group valuation, profit-center valuation, parallel currencies in CKMLCR), transfer prices	`ValuationLedger` per wave 12 ledger group with its own costing method and currency (FR-20.15)	full
Split valuation / batch valuation	Inventory by dimension cost price (site/warehouse/batch "Financial inventory" flag on dimension group)	Split valuation OMWC/OMWD (valuation categories and types, e.g., domestic/import, new/refurbished), batch valuation (valuation type = batch), T149	`valuation_type` dimension with `ValuationCategory` (FR-20.16)	full
Inventory aging	Inventory aging report (D365, InventAgingReport) with aging period definitions, inventory aging report storage	MC.A / MC50 dead stock / MC46 slow-moving, inventory turnover MC.9	Inventory aging report by receipt-date layers (FR-20.17)	full
Vendor requests and onboarding	Vendor requests (R3: VendRequest*), vendor request types, D365 prospective vendor registration wizard and questionnaires	Ariba SLP registration and qualification; MDG-S supplier requests	`VendorRequest` workflow and portal self-registration with questionnaires (FR-20.18)	full
Vendor catalog upload	Vendor collaboration → vendor catalogs (CMR upload)	Ariba catalog (CIF) upload	Portal catalog upload into wave 17 staging (FR-20.19)	full
Supplier service entry	n/a	SAP Business Network / Fieldglass supplier SES and timesheets	Portal service entry sheet and timesheet entry (FR-20.20)	full
Document distribution to suppliers	Document handling + vendor collaboration documents	DMS document distribution CVI1/CVI2/CVI8, recipient lists, distribution log	`DocumentDistribution` with recipient lists, acknowledgement and log (FR-20.21)	full
Portal consignment view	Vendor collaboration consignment inventory (on-hand, replenishment orders, product receipts)	SNC consignment monitor	Portal consignment pages (FR-20.22)	full

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity level
Alternative valuation / usage variance distribution / WIP at actual / CO-PA revaluation	n/a	CKMLCPAVR, CKMDUVACT/CKMDUVMAT, WIP at actual, KE27	Not in this wave; production actual costing in waves 21/39	dropped-with-reason (3.20.21)

3.20.3 Functional requirements

- **FR-20.1 Costing methods** — Must. The system shall value issues against receipts by the item model group's method:
  - **FIFO**: issues settle against the oldest unsettled receipts by `financial_date`, then `physical_date`, then id. Example: receipts 100 @ 10.00 (Jan 5), 100 @ 12.00 (Jan 20); issue 150 on Jan 25 → cost = 100 × 10.00 + 50 × 12.00 = 1,600.00; remaining on-hand 50 @ 12.00 = 600.00.
  - **LIFO**: issues settle against the newest receipts preceding the issue date (LIFO_DATE) or the newest in the period (LIFO). Same data, LIFO_DATE: 150 issue = 100 × 12.00 + 50 × 10.00 = 1,700.00; remaining 50 @ 10.00 = 500.00.
  - **WEIGHTED_AVG_PERIODIC**: all issues in the period settle at `(opening value + Σ receipts value) / (opening qty + Σ receipts qty)`. Same data: average = 2,200 / 200 = 11.00; issue cost 1,650.00; remaining 550.00.
  - **WEIGHTED_AVG_RUNNING**: each issue uses the average at its moment (in date order): issue on Jan 25 after both receipts = 11.00 → 1,650.00; an issue of 50 on Jan 10 would be at 10.00.
  - **MOVING_AVG**: like running average, but invoice-price differences on already-issued quantity post to price difference (not to stock); differences on remaining stock adjust its value.
  - **STANDARD**: all transactions at the active `ItemCost` for product × site; receipt at PO price 10.50 against standard 10.00 for 100 units posts PPV 50.00 Dr; invoice at 10.80 posts additional PPV 30.00; inventory stays 1,000.00.
  - Settlement rows (`CostSettlement`) link issue to receipt with qty and value; `cost_amount_adjustment` on the issue = settled value – previously posted value.
- **FR-20.2 Inventory close** — Must. The system shall run `InventoryClose` for a legal entity up to a close date as a Temporal workflow: pre-check (unsettled negative on-hand, missing invoices for RECEIVED-not-PURCHASED when `close_requires_invoice=true`, open count sheets), settlement per product (child workflows, parallelism configurable, default 32), adjustment postings to the ledger (one voucher per product group × account, idempotent on close id), and lock of transactions with `financial_date ≤ close_date` against cost changes.
  - Performance: 1M transactions, 2,000 products in < 20 min on the stage sizing.
  - Cancel close reverses adjustment vouchers and unlocks; a close cannot be cancelled if a later close exists.
  - Close requires the INVENTORY period for the close date to be OPEN; after close completes it may be set CLOSED (wave 14).
- **FR-20.3 Recalculation** — Must. The system shall run the same settlement as close without locking, posting adjustments with `kind=RECALC` reversible by the next recalculation or close; preview mode returns per-product adjustment totals without posting.
- **FR-20.4 Cost transactions and value report** — Must. The system shall write a `CostTransaction` for every value-affecting event (physical posting, financial posting, invoice difference, settlement adjustment, PPV, revaluation, manual adjustment) with the ledger voucher, and serve the inventory value report (quantity and value by product, site, warehouse, item group, dimension; posted vs physical value; opening, receipts, issues, adjustments, closing) whose totals equal the ledger inventory account balances per dimension on the report date.
  - Daily reconciliation job `costing.reconcile` emits `reconciliation.diff` on any difference.
  - Value report for 10k products p95 < 5 s.
- **FR-20.5 Costing versions and standard cost activation** — Must. The system shall maintain `CostingVersion` (type STANDARD, PLANNED; blocking flags; fallback version) with `ItemCost` rows (product, site, unit cost, cost breakdown placeholder for wave 39, effective_from, status PENDING/ACTIVE/SUPERSEDED). Activation sets ACTIVE, supersedes the previous, posts revaluation of on-hand `(new − old) × physical qty` per product × site to inventory / revaluation account, and emits `cost.changed`.
  - Pending prices can be imported (CSV/API) and copied from the previous version with a percent change.
  - Activation is atomic per product and idempotent per version id.
- **FR-20.6 Cost adjustments** — Must. The system shall allow manual adjustments of on-hand value (per product × dimension: new unit cost or amount) and of specific receipt transactions (amount), posting to inventory / adjustment account and flowing to issues on next close.
- **FR-20.7 Purchase price variance** — Must. The system shall, for STANDARD items, post PPV at receipt `(PO price − standard) × qty` and at invoice `(invoice price − PO price) × qty` (wave 18 hook), to the PPV account from the posting profile; for actual-cost methods the invoice difference adjusts the receipt's cost (`cost_amount_posted`) and flows to issues through settlement.
- **FR-20.8 Marking** — Should. The system shall honor explicit marking between an issue and a receipt (set by users or by wave 21/27 processes) so settlement pairs marked transactions first regardless of method.
- **FR-20.9 Supplier portal: PO acknowledgement** — Must. The portal shall show confirmed POs and versions to the vendor's users; they shall accept, reject (reason) or propose changes (date, qty, price per line) which create a `PurchaseOrderAcknowledgement`; proposed changes become a pending change on the PO for the buyer to accept (creating a new version via wave 17) or decline.
  - SLA tracking: acknowledgement due within `ack_due_days` (default 2); overdue listed on the buyer workspace.
- **FR-20.10 Supplier portal: ASN** — Must. The portal shall create an `AdvanceShipNotice` (carrier, tracking, ship date, expected arrival, packages with SSCC optional, lines with PO line, qty, batch, serials, expiry) that pre-creates ARRIVED expected lines in receiving; receipt registration from an ASN pre-fills quantities and tracking dimensions.
- **FR-20.11 Supplier portal: invoices and payments** — Must. The portal shall let vendors submit invoices against received PO lines (source PORTAL into wave 18 `:capture`, structured, no OCR), view invoice match/approval status (without internal variance amounts), and see payment status, advices and remittance details from wave 19.
- **FR-20.12 Supplier portal: identity and authorization** — Must. The portal shall use a separate Keycloak realm `suppliers` with vendor organizations as groups, vendor-admin self-service invitation of users (email verification, MFA optional per vendor), OPA policies scoping every query to the vendor ids the user belongs to, and rate limits (60 requests/min per user, 1,000/min per vendor).

- **FR-20.13 Supplier portal: RFQ replies and documents** — Should. The portal shall accept RFQ replies (wave 17 FR-17.4) and exchange documents (certificates, contracts) with virus scanning and 25 MB size limit.
- **FR-20.14 Phase-exit walkthrough** — Must. The system shall support the recorded end-to-end demo: requisition → PO → portal acknowledgement → ASN → receipt → invoice (portal) → match → payment run → close → value report tie-out, on the stage environment with the demo plant.
- **FR-20.15 Parallel inventory valuation ledgers** — Should. The system shall allow a legal entity to define additional `ValuationLedger` rows bound to wave 12 ledger groups (e.g., IFRS primary in EUR with WEIGHTED_AVG_PERIODIC, US GAAP group ledger in USD with FIFO, tax ledger with LIFO_DATE), each with `costing_method_override` per item model group, `currency`, and `exchange_rate_type`; every value-bearing inventory event writes one `CostTransaction` per valuation ledger (column `valuation_ledger_id`, default ledger = existing behavior), close and recalculation run per valuation ledger (child workflows keyed by ledger × product), and adjustments post only to the ledgers of that ledger group via `Post(JournalEntry)` with ledger-group scope; the value report takes a `valuationLedger` parameter. Cost lookup for waves 21/27 returns the primary ledger unless asked otherwise.
- **FR-20.16 Split valuation and batch valuation** — Should. The system shall support a `valuation_type` storage/tracking dimension governed by a `ValuationCategory` on the product (e.g., ORIGIN with types DOMESTIC/IMPORT; CONDITION with NEW/REFURBISHED; BATCH where each batch is its own valuation type), so that cost layers, running/periodic averages, standard costs and the value report are kept per product × site × valuation type (SAP OMWC/OMWD split valuation, valuation type = batch); the item posting profile can resolve accounts per valuation type (valuation class equivalent); a transfer between valuation types is a TRANSFER journal posting the value difference to revaluation; the category is set at product creation and cannot change while stock exists (`CST-VAL-002`).
- **FR-20.17 Inventory aging report** — Must. The system shall produce an inventory aging report as of a date by product, site, warehouse, item group and valuation type with configurable buckets (default 0–30, 31–90, 91–180, 181–365, > 365 days) based on the receipt date of the remaining cost layers (FIFO layers after settlement; for average methods, oldest-unconsumed approximation using FIFO layer order), showing quantity and value per bucket and totals that tie to the value report; report setups (bucket sets, grouping) are saved per user or legal entity (AX Inventory aging report setup) and the report can be stored as a snapshot for month-end evidence.
- **FR-20.18 Vendor requests and prospective vendor onboarding** — Should. The system shall support `VendorRequest` (types ADD_VENDOR, ADD_TO_CATEGORY, CHANGE_STATUS, per AX vendor request types) raised internally or via a public portal registration page (D365 prospective vendor registration): the prospect enters company data, contacts, bank details (not activated), tax ids and answers to the `OnboardingQuestionnaire` assigned by category or request type (file uploads for certificates); the request runs a wave 4 approval workflow (category manager, compliance, AP master data) with duplicate check against wave 7 parties (tax id, name similarity ≥ 0.9), sanctions screening hook, and on approval creates the wave 7 vendor role (status ON_HOLD until bank account approval per FR-19.22) and invites the contact as VENDOR_ADMIN; rejected requests keep data 90 days then purge.
- **FR-20.19 Vendor catalog upload via the portal** — Should. The portal shall let vendor users upload catalog files (CSV/JSON per FR-17.18, max 50,000 rows, images ≤ 2 MB each, 25 MB total) into the wave 17 staging area for a catalog the buyer has opened to that vendor, show row-level validation results, and notify the buyer for review; vendors see only their own staged and published rows.
- **FR-20.20 Supplier service entry and timesheets** — Should. The portal shall let vendor users create service entry sheets (wave 18 FR-18.14) against their open SERVICE PO lines, including timesheet-style entry (worker name or contractor id, date, hours, service item) aggregated into sheet lines, submit them for acceptance, and view acceptance status and rejection reasons; internal limits and expected values are not displayed, only remaining limit percentage when `portal_show_limit=true`.
- **FR-20.21 Controlled document distribution to suppliers** — Could. The system shall provide `DocumentDistribution` (SAP CVI1/CVI2): a document (drawing, specification, quality agreement, policy) from the wave 5 attachment store is distributed to a `RecipientList` (vendors, vendor users, categories) via the portal, each recipient must acknowledge (read and accept) the specific version by a due date, reminders follow wave 4 timers, and the distribution log (SAP CVI8) shows sent/viewed/acknowledged per recipient; a new document version supersedes open distributions and re-requests acknowledgement.
- **FR-20.22 Portal consignment view** — Should. The portal shall show vendor users their vendor-owned stock (wave 16 FR-16.17) by warehouse and product with age, open consignment replenishment orders, receipts against them, ownership changes (consumption) and consignment settlement invoices (wave 18 FR-18.16), with export.

3.20.4 Data model

CostTransaction

Field	Type	Required	Notes
id	uuid	yes	
inventory_transaction_id	uuid	yes	FK
product_id, site_id, dimension_set_id	uuid/bytea	yes	denormalized for the report
kind	enum	yes	PHYSICAL, FINANCIAL, INVOICE_DIFF, SETTLEMENT_ADJ, PPV, REVALUATION, MANUAL_ADJ, RECALC
qty	numeric(28,6)	yes	0 for value-only
amount_acct	numeric(19,4)	yes	signed
close_id / recalc_id	uuid	no	
ledger_entry_id	uuid	yes	voucher
financial_date	date	yes	
created_at	timestamptz	yes	append-only

CostSettlement

Field	Type	Required	Notes
id	uuid	yes	
close_id	uuid	yes	or recalc id
issue_transaction_id, receipt_transaction_id	uuid	yes	
qty_settled	numeric(28,6)	yes	> 0
value_settled_acct	numeric(19,4)	yes	
method	enum	yes	method used

Field	Type	Required	Notes
sequence	int	yes	order of settlement for determinism
cancelled (bool), cancelled_by_close_id		no	

InventoryClose

Field	Type	Required	Notes
id, close_number	uuid, text	yes	
legal_entity_id, close_date	uuid, date	yes	
kind	enum	yes	CLOSE, RECALC, PREVIEW
status	enum	yes	PRECHECK, PRECHECK_FAILED, SETTLING, POSTING, COMPLETED, CANCELLING, CANCELLED, FAILED
parallelism	int	yes	default 32
products_total, products_done, settlements_count, adjustment_total_acct	int/numeric	yes	progress
started_at, completed_at, duration_s	timestamptz/int		
temporal_workflow_id	text	yes	

CostingVersion / ItemCost: version (id, code, type STANDARD/PLANNED, status DRAFT/ACTIVE/ARCHIVED, fallback_version_id, block_activation (bool), site_scope[]); item cost (version_id, product_id, site_id, unit, unit_cost_acct, effective_from, status PENDING/ACTIVE/SUPERSEDED, activated_at, revaluation_ledger_entry_id, source MANUAL/IMPORT/COPY/ROLLUP (w39)).

PurchaseOrderAcknowledgement / AdvanceShipNotice / SupplierUser: ack (id, po_id, version_no, vendor_user_id, response ACCEPT/REJECT/PROPOSE, reason, proposed_lines jsonb, status PENDING_BUYER/ACCEPTED/DECLINED, created_at); asn (id, asn_number, vendor_id, po_id, carrier, tracking_number, ship_date, expected_arrival, packages jsonb (sscc, weight), lines (po_line_id, qty, batch, serials[], expiry), status SUBMITTED/ARRIVED/RECEIVED/CANCELLED); supplier user (keycloak_subject, vendor_ids[], role VENDOR_ADMIN/VENDOR_USER, invited_by, mfa_enabled, last_login).

Invariants: for each issue transaction Σ qty_settled over non-cancelled settlements ≤ |qty|; after a COMPLETED close every issue with `financial_date ≤ close_date` is fully settled or listed in the close exception report; Σ CostTransaction.amount_acct per inventory account = ledger balance; exactly one ACTIVE ItemCost per (STANDARD version chain, product, site); a vendor user can read only rows where vendor_id ∈ their vendor_ids (OPA + RLS policy on the `supplier` database). Indexes: CostTransaction (tenant, product_id, financial_date), (ledger_entry_id); CostSettlement (issue_transaction_id), (receipt_transaction_id); ItemCost (product_id, site_id, status).

3.20.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
POST	/api/v1/costing/closes	Start close (kind CLOSE/RECALC/PREVIEW)	entity+close_date+kind	InventoryCloseRun
GET	/api/v1/costing/closes/{id}	Progress and exceptions	n/a	CostingInquire
POST	/api/v1/costing/closes/{id}:cancel	Cancel/reverse	close id	InventoryCloseRun
GET	/api/v1/costing/value-report?asOf=&groupBy=&site=	Inventory value with GL tie-out	n/a	CostingInquire
POST	/api/v1/costing/adjustments	On-hand or transaction adjustment	client key	CostAdjust
POST	/api/v1/costing/versions	Create costing version	client key	CostingVersionMaintain
POST	/api/v1/costing/versions/{id}/item-costs:import	Import pending costs (CSV/JSON)	file hash	CostingVersionMaintain
POST	/api/v1/costing/versions/{id}:activate	Activate pending costs with revaluation	version id	CostingVersionActivate
GET	/api/v1/costing/products/{id}/cost?site=&date=	Current cost (used by waves 21, 27)	n/a	CostingInquire
POST	/internal/v1/costing/ppv	Hook from receiving/payables for STANDARD items	source doc id	service account
GET	/portal/v1/purchase-orders	Vendor's POs	n/a	portal: VendorUser
POST	/portal/v1/purchase-orders/{id}:acknowledge	Accept/reject/propose	po+version	portal: VendorUser
POST	/portal/v1/asns	Submit ASN	client key	portal: VendorUser
POST	/portal/v1/invoices	Submit invoice (→ payables capture)	vendor invoice number	portal: VendorUser
GET	/portal/v1/payments	Payment status and advices	n/a	portal: VendorUser
POST	/portal/v1/users:invite	Vendor admin invites user	email	portal: VendorAdmin

Commands: `StartClose` (period open, no running close for entity, close_date ≥ last close), `ActivateVersion` (no block flag, all pending costs > 0 unless `allow_zero_cost`, site in scope), `Acknowledge` (latest version only; proposals require at least one changed line), `SubmitASN` (PO confirmed, qty ≤ remaining × (1 + over_delivery_pct), serial count = qty for serial items).

Event	Trigger	Payload fields	Consumers
`dev.passage.costing.close.completed.v1` / `.cancelled.v1` / `.failed.v1`	close lifecycle	close_id, entity, close_date, kind, products, settlements, adjustment_total, duration_s, exceptions_count	ledger reconciliation, notifications, analytics
`dev.passage.costing.cost.changed.v1`	activation, manual adjustment affecting unit cost	product_id, site_id, version, old_cost, new_cost, effective_from, revaluation_amount	inventory (cost price cache), planning (w22), product costing (w39)
`dev.passage.costing.reconciliation.diff.v1`	daily tie-out diff ≠ 0	account, dimension, inventory_value, ledger_balance, diff, sample vouchers	alerting
`dev.passage.supplier.po.acknowledged.v1`	portal ack	po_id, version, response, proposed changes	procurement (pending change), notifications
`dev.passage.supplier.asn.submitted.v1`	ASN submit	asn_id, po_id, lines, expected_arrival, tracking	receiving (expected lines), warehouse (w31), notifications
`dev.passage.supplier.invoice.submitted.v1`	portal invoice	invoice_id (payables), vendor_id, po_id, total	payables (already captured), notifications
`dev.passage.supplier.vendor-request.submitted.v1` / `.approved.v1` / `.rejected.v1`	vendor request lifecycle	request_id, type, prospect (name, country, tax id masked), category, questionnaire score	party master (w7 vendor creation), notifications, compliance screening

Event	Trigger	Payload fields	Consumers
`dev.passage.supplier.document.acknowledged.v1`	recipient acknowledges distributed document	distribution_id, document_id, version, vendor_id, user_id, acknowledged_at	quality (w33), notifications
`dev.passage.costing.aging.snapshot.created.v1`	aging snapshot stored	snapshot_id, entity, as_of, valuation_ledger, totals per bucket	analytics, close checklist (w14)

3.20.6 User experience

Screen	Primary actions	Key fields/columns	Duty required
Costing workspace	Last close status, reconciliation diffs, pending costing versions, products with negative value or unsettled issues	counts, amounts, durations	CostingInquire
Inventory close	Pre-check, start, monitor (progress bar per product), exceptions list, cancel	close date, kind, parallelism, exceptions (product, reason, qty)	InventoryCloseRun
Inventory value report	Group by, as-of date, GL tie-out column, drill to cost transactions and vouchers, export	product, site, qty, physical value, financial value, GL balance, diff	CostingInquire
Costing version / item costs	Create, import, copy with %, compare to active, activate with revaluation preview	product, site, pending cost, active cost, delta, on-hand qty, revaluation amount	CostingVersionMaintain
Cost adjustment	Adjust on-hand or receipt, preview voucher, post	product, dims, qty, current value, new unit cost, delta	CostAdjust
Supplier portal: home	Open POs needing ack, ASNs, invoices in progress, payments	counts, due dates	portal VendorUser
Supplier portal: PO	View versions, accept/reject/propose per line, print	lines, dates, prices, version diff	portal VendorUser
Supplier portal: ASN	Create from PO lines, add packages, batches/serials, submit	PO lines, qty, batch, expiry, serials, tracking	portal VendorUser
Supplier portal: invoices / payments	Submit invoice from receipts, status timeline, payment advices	invoice no, amount, status, payment date, reference	portal VendorUser
Supplier portal: users	Invite, deactivate, MFA	email, role, status	portal VendorAdmin

Interaction rules: the close screen refreshes progress via server-sent events every 2 s; value report defaults to the last close date; activation shows a mandatory revaluation preview with total and top-20 deltas; portal is WCAG 2.1 AA, mobile-friendly, English + German + French + Spanish strings in v1, no internal data (variance amounts, standard costs, approvals) exposed; portal file uploads scanned before storage.

3.20.7 Business rules and edge cases

- **BR-20.1** Close state machine: `PRECHECK → SETTLING → POSTING → COMPLETED`; `PRECHECK → PRECHECK_FAILED`; `SETTLING|POSTING → FAILED` (resumable); `COMPLETED → CANCELLING → CANCELLED` only when it is the latest close for the entity.
- **BR-20.2** Settlement determinism: receipts are ordered by (financial_date, physical_date, id) and issues by (financial_date, physical_date, id); the same inputs always produce the same `CostSettlement` sequence (property-tested), so re-runs after crashes are idempotent.
- **BR-20.3** Unsettled issues (negative on-hand at settlement time) are valued at the running average of the product × site (fallback: active standard, then last receipt cost) and listed as exceptions; a later receipt settles them at the next close with an adjustment.
- **BR-20.4** Rounding: settlement values are computed in full precision and rounded half-even to the minor unit per settlement row; the last settlement row of a receipt absorbs the rounding residual so Σ settled value = receipt value exactly.
- **BR-20.5** Periodic weighted average with transfers between sites: the average is per product × site (`costing_level=SITE`, default) or per product (`costing_level=ENTITY`) as configured on the item model group; transfers at site level settle like issues/receipts.
- **BR-20.6** Invoice difference after close: an invoice posted after the receipt's period was closed posts the difference to the invoice's period as `INVOICE_DIFF` and flows to issues in the next close (never reopens a closed period).
- **BR-20.7** Standard cost revaluation uses the physical on-hand quantity at activation time; transactions already financially posted are not restated; activation during an in-flight close is rejected (`CST-ACT-004`).
- **BR-20.8** Close date must be ≤ today and ≥ the last completed close; transactions with `financial_date ≤ close_date` are locked against new cost adjustments except through `:cancel`.
- **BR-20.9** Portal acknowledgement applies to the latest PO version only; a new version invalidates pending acknowledgements (status SUPERSEDED) and re-requests one.
- **BR-20.10** ASN quantity may exceed PO remaining only within the over-delivery tolerance (wave 18); duplicate tracking number per vendor is rejected; an ASN can be cancelled until any of its lines is RECEIVED.
- **BR-20.11** Portal invoice submission is limited to lines with received, uninvoiced quantity; the vendor cannot submit a price different from the PO price unless the buyer enabled `portal_price_override` for the vendor (creating a price-variance exception in wave 18).
- **BR-20.12** Concurrency: close child workflows take an advisory lock per product; wave 16 journal posting for a product whose close child is settling waits up to 5 s then fails with `CST-LOCK-001` (retry); costs read by waves 21/27 are the last committed values.
- **BR-20.13** Valuation ledgers share quantities and settlement order inputs but not values: each ledger's settlement is computed independently from the same transaction sequence using its own method and currency; the primary ledger's results drive `cost_amount_adjustment` on the inventory transaction, the others are stored only in `CostTransaction`; a close is COMPLETED for the entity only when all valuation ledgers completed.
- **BR-20.14** Split valuation: issues must name a valuation type when more than one has stock (`CST-VAL-001`) unless the product's default valuation type is set; batch valuation creates the valuation type automatically at batch receipt with the receipt cost.
- **BR-20.15** Aging buckets use calendar days between layer receipt `financial_date` (physical date when not yet invoiced) and the as-of date; layers from migration opening balances carry the source receipt date when available, else the cutover date (flagged).
- **BR-20.16** A vendor request cannot create a vendor when a duplicate party match ≥ 0.9 exists unless a master data steward links or overrides with reason; bank details captured in onboarding are always subject to FR-19.22 dual approval.
- **BR-20.17** Portal-entered service entry sheets enter status SUBMITTED directly; vendors may withdraw only while not ACCEPTED; timesheet hours per worker per day are capped at 24 and per sheet at the period length.

3.20.8 Acceptance criteria

- **AC-20.1** (FR-20.1) Given the 100 receipt/issue sequences per method fixture, when settled by close, then every issue cost, remaining on-hand value and adjustment equals the reference workbook to the cent for FIFO, LIFO, LIFO_DATE, WEIGHTED_AVG_PERIODIC, WEIGHTED_AVG_RUNNING, MOVING_AVG and STANDARD.
- **AC-20.2** (FR-20.1) Given the FR-20.1 example data, when closed under FIFO, LIFO_DATE and WEIGHTED_AVG_PERIODIC, then issue cost is 1,600.00, 1,700.00 and 1,650.00 and remaining value 600.00, 500.00 and 550.00.

- **AC-20.3** (FR-20.2) Given the 1M-transaction fixture, when a close runs on stage, then it completes in < 20 min, and the value report at close date equals the GL inventory balances per site and item group with diff 0.00.
- **AC-20.4** (FR-20.7) Given a STANDARD item at 10.00 with a PO at 10.50 and invoice at 10.80 for 100 units, when received and invoiced, then PPV postings are 50.00 and 30.00 Dr, inventory value is 1,000.00, GR/IR nets to zero.
- **AC-20.5** (FR-20.5) Given 10,000 pending item costs, when the version is activated, then all are ACTIVE within 2 min, one revaluation voucher per site balances to `Σ (new − old) × on-hand`, and `cost.changed` is emitted per product.
- **AC-20.6** (FR-20.2) Given a close killed during SETTLING at 40 %, when resumed, then it completes with the same settlement rows as an uninterrupted run (byte-equal export).
- **AC-20.7** (FR-20.9) Given a confirmed PO visible in the portal, when the vendor proposes a delivery date change, then a pending change appears on the buyer's PO and accepting it creates version 2 and emits `po.version.created`.
- **AC-20.8** (FR-20.10) Given an ASN for 2 batch-tracked lines, when the goods arrive and the receiver opens the receipt from the ASN, then quantities, batches and expiry dates are pre-filled and registration takes one confirmation.
- **AC-20.9** (FR-20.12) Given a user of vendor A, when they request vendor B's PO by id, then the portal returns 404 and the OPA decision log records the denial.
- **AC-20.10** (FR-20.14) Given the demo plant, when the phase-exit walkthrough is executed, then every step completes on stage and the final value report, GR/IR report and AP aging each reconcile to the GL with 0.00 difference.
- **AC-20.11** (FR-20.15) Given the FR-20.1 example data, a primary ledger (EUR, WEIGHTED_AVG_PERIODIC) and a group ledger (USD at 1.10, FIFO), when the close runs, then the primary issue cost is 1,650.00 EUR and the group ledger issue cost is 1,760.00 USD (1,600.00 × 1.10), each ledger's value report ties to its own ledger balances, and the group ledger adjustment voucher posts only to the group ledger.
- **AC-20.12** (FR-20.16) Given a product with valuation category ORIGIN and receipts 100 DOMESTIC @ 10.00 and 100 IMPORT @ 14.00 under WEIGHTED_AVG_RUNNING, when 50 IMPORT are issued, then issue cost is 700.00 (not 600.00) and the value report shows DOMESTIC 1,000.00 and IMPORT 700.00.
- **AC-20.13** (FR-20.17) Given FIFO layers received 400, 100 and 20 days before the as-of date with remaining 10, 50 and 100 units at 5.00, when the aging report runs with default buckets, then buckets 0–30 = 500.00, 91–180 = 250.00, 181–365 = 50.00 and the total equals the value report for the product.
- **AC-20.14** (FR-20.18) Given a prospect registering with a tax id equal to an existing vendor's, when the request is submitted, then it is flagged as duplicate and cannot create a vendor until a steward links it; a non-duplicate approved request creates a vendor ON_HOLD and emails a VENDOR_ADMIN invitation.
- **AC-20.15** (FR-20.21) Given a specification distributed to 10 vendors with due date 5 days, when 7 acknowledge and a new version is released on day 3, then the 7 acknowledgements are marked SUPERSEDED, all 10 receive the new version, and the log shows per-recipient status for both versions.

3.20.9 Test plan and fixtures

Fixtures: `cost-methods-700` (100 sequences × 7 methods with reference workbook `cost_reference.xlsx` maintained by the accountant; includes negative on-hand, transfers, invoice differences, returns); `cost-1m` (reuses `inv-1m-txn` with receipts/invoices from waves 17–18 generators); `cost-std-activation-10k`; `portal-demo-vendor` (vendor with 3 users, 20 POs, 5 ASNs); `cost-ax-extract` (InventClosing, InventSettlement, InventItemPrice from USMF); `cost-sap-extract` (MBEW, CKMLHD/CKMLPP/CKMLCR samples).

Test	Type	Target	Pass criterion
Method correctness	unit (table-driven)	settlement engine	AC-20.1
Determinism/idempotency	property	engine	identical inputs → identical settlements; resume = uninterrupted
Close performance	performance (stage)	InventoryClose	< 20 min on cost-1m
Value report tie-out	E2E	value-report vs ledger	diff 0.00 after close
PPV	contract	receiving/payables → costing/ppv	AC-20.4
Activation	E2E	versions:activate	AC-20.5
Portal authz	security (OPA unit + E2E)	portal APIs	AC-20.9; no cross-vendor leakage across 1,000 random requests
Portal accessibility	E2E (axe)	portal screens	0 serious/critical violations
Phase-exit walkthrough	E2E (Playwright, recorded)	full flow	AC-20.10

Reconciliation checks: Σ CostTransaction per inventory account = ledger balance; Σ settlement value per receipt = receipt value; Σ PPV cost transactions = PPV account movement; revaluation voucher = Σ item deltas × on-hand; portal invoice totals = payables captured totals.

3.20.10 Deployment and operations

Helm charts: `passage-costing` (API ×2, Temporal close workers ×4 with CPU 2 each, schema `costing` in `inventory-db`), `passage-supplier-portal` (React app served by the shell at `supplier.<env>.passage.dev`, BFF ×2 in TypeScript, CloudNativePG `supplier-db`, Keycloak realm `suppliers` provisioned by Helm hook, Envoy Gateway route with rate limiting and WAF rules). Config: `CST_CLOSE_PARALLELISM=32`, `CST_LOCK_WAIT_S=5`, `CST_LEVEL_DEFAULT=SITE`, `CST_ALLOW_ZERO_COST=false`, `PORTAL_RATE_LIMIT_USER=60`, `PORTAL_UPLOAD_MAX_MB=25`, `PORTAL_ACK_DUE_DAYS=2`. Migrations `inventory/v20.*` (costing schema), `supplier/v20.*`. Flags: `cst.moving_avg`, `cst.marking`, `portal.rfq_replies`, `portal.invoice_submit`, `portal.mfa_required`. Jobs: reconciliation daily 02:15; ack-overdue scan daily 08:00; portal inactive-user cleanup weekly. SLOs: value report p95 < 5 s; cost lookup p95 < 20 ms; close < 20 min per 1M txns; portal page load p95 < 1.5 s; portal availability 99.9 %. Alerts: reconciliation diff ≠ 0 (page); close FAILED (page); close running > 60 min (ticket); portal auth failures > 100/min from one IP (security ticket, auto-block). Runbook: resume close, cancel close, re-run reconciliation, rotate portal realm client secret, revoke vendor user. Rollback: additive migrations; costing schema can be disabled (flag `cst.enabled=false` reverts to wave 16 running estimate without data loss); portal can be taken down independently (DNS) without affecting internal flows.

3.20.11 Migration from AX / SAP

Source	Passage entity	Notes
AX InventModelGroup.InventModel	ItemModelGroup.costing_method	FIFO→FIFO, LIFO→LIFO, LIFODate→LIFO_DATE, WeightedAvg→WEIGHTED_AVG_PERIODIC, WeightedAvgDate→WEIGHTED_AVG_RUNNING, StdCost→STANDARD, MovingAverage→MOVING_AVG
AX InventItemPrice (active, PriceType Cost) per CostingVersion	ItemCost ACTIVE in version `MIG-STD`	per site; pending prices migrated as PENDING
AX InventSum PostedValue / wave 16 opening	opening cost layers: one receipt layer per product × dimension at average cost	FIFO/LIFO layer detail from last InventClosing unsettled receipts (InventTrans with open qty) when available, else collapsed to one layer
AX InventClosing history	not migrated	reporting only

Source	Passage entity	Notes
SAP MBEW (VPRSV, STPRS, VERPR, LBKUM, SALK3, PEINH)	costing_method (S→STANDARD, V→WEIGHTED_AVG_RUNNING or MOVING_AVG per decision), ItemCost (STPRS/PEINH), opening layer value SALK3	per plant (BWKEY) → site
SAP CKMLPP/CKMLCR (material ledger period values)	opening layer value when ML active	actual price of last closed period
SAP MLCD / CKMLHD history	not migrated	
D365 vendor collaboration users / Ariba supplier accounts	SupplierUser invitations (not credentials)	vendors re-register via invitation email

Validation: Σ opening layer value per product × site equals source value (0.01 tolerance per product, 0.00 total per account); standard costs for 200 random products equal source; costing method distribution equals source counts. Not migrated: settled cost history, SAP ML price analysis, AX recalculation logs, portal documents.

3.20.12 Dependencies, risks, open questions

Depends on: wave 16 (transactions, cost fields, marking field), wave 17 (PO prices, versions, pending changes), wave 18 (receipts, invoice differences, capture), wave 19 (payment status), wave 11–14 (posting, period control, vouchers), wave 4 (Temporal), wave 2–3 (Keycloak realms, OPA, metadata), wave 7 (vendor contacts).

Risk	Likelihood	Impact	Mitigation
Opening cost layers from AX/SAP are collapsed, so first FIFO/LIFO close differs from legacy	High	Medium	Document in cutover; parallel-run compare in wave 49; collapsed layer flagged in value report
Close parallelism contends with daytime posting	Medium	Low	Run off-hours by default; lock wait 5 s with retry; advisory locks per product only
Portal security incident	Low	High	Separate realm/DB, OPA deny-by-default, pen-test before phase exit, WAF, rate limits, audit
Accountant requires LIFO by period layers (US tax) beyond LIFO_DATE	Medium	Low	Periodic LIFO pools deferred; documented as v1.x

Open questions:

1. SAP MAP (V) maps to WEIGHTED_AVG_RUNNING or MOVING_AVG by default? Default: MOVING_AVG (closest to VERPR behavior on invoice differences). Decide by wave 20 mid-point.
2. Should the portal expose expected payment dates (from proposals) or only executed payments? Default: executed only. Decide by wave 20 close.
3. Costing level ENTITY vs SITE default for weighted average? Default: SITE. Decide by wave 20 mid-point with the accountant.
4. Dollar-value LIFO pools for US tax reporting: v1.x or wave 39? Default: v1.x. Decide by wave 39 planning.

3.20.13 Parameters and setup

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
`costing_method`	item model group	enum	WEIGHTED_AVG_RUNNING	FIFO, LIFO, LIFO_DATE, WEIGHTED_AVG_RUNNING, WEIGHTED_AVG_PERIODIC, STANDARD, MOVING_AVG	FR-20.1	InventModelGroup.InventModel	MBEW-VPRSV price control S/V (OMW0/OMW1)
`include_physical_value`	item model group	bool	true	true/false	physically posted (un-invoiced) receipts participate in running average	Item model group → "Include physical value"	n/a (MAP updated at GR)
`costing_level`	item model group	enum	SITE	SITE, ENTITY	BR-20.5	Dimension-based cost price (financial inventory flag on site/warehouse)	Valuation level plant vs company code (OX14)
`close_parallelism`	legal entity	int	32	1–128	FR-20.2	Inventory close helper threads	CKMLCP parallel processing settings
`close_requires_invoice`	legal entity	bool	false	true/false	FR-20.2 pre-check	n/a	CKMLCP "materials not invoiced" check
`lock_wait_s`	tenant	int	5	1–30	BR-20.12	n/a	n/a
`unsettled_issue_fallback`	legal entity	enum	RUNNING_AVG	RUNNING_AVG, STANDARD, LAST_RECEIPT	BR-20.3	Inventory parameters → "Use latest cost price" / break-even	ML price determination fallback (CKMLCP single-level)
`costing_versions`	legal entity	table	`STD-{year}`	type STANDARD/PLANNED, block activation, fallback version, site scope	FR-20.5	Costing versions	CK11N costing variant, CK24 marking allowance (CK24 "allow marking")
`allow_zero_cost`	legal entity	bool	false	true/false	FR-20.5 activation check	n/a	n/a
`posting_profile.revaluation_account` / `ppv_account` / `cost_adjustment_account`	posting profile	account	seeded	ledger accounts	FR-20.5–20.7	Posting profiles: Standard cost revaluation, Price variance, Inventory adjustment	OBYC UMB (revaluation), PRD (price difference), BSX

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
`valuation_ledgers`	legal entity	table	primary only	ledger group (w12), currency, rate type, method override per item model group	FR-20.15	Global inventory accounting: ledgers, accounting policies, conventions	ML currency types (OMX2/OMX3), group/profit-center valuation (8KEM)
`valuation_categories`	tenant	table	none	category code, types, account mapping per type, BATCH flag	FR-20.16	Financial inventory dimension (batch/warehouse)	OMWC split valuation (T149C/T149D), OMWD valuation grouping code
`aging_bucket_sets`	legal entity, user	table	0–30, 31–90, 91–180, 181–365, > 365	bucket boundaries	FR-20.17	Inventory aging report setup	MC50 / MC46 day thresholds
`value_report_setup`	legal entity	table	default columns	columns, dimensions, resource type, GL tie-out	FR-20.4	Inventory value report configuration	MB5L variant
`portal_rate_limit_user` / `portal_rate_limit_vendor`	tenant	int	60 / 1,000 per min		FR-20.12	n/a	n/a
`portal_mfa_required`	vendor	bool	false	true/false	FR-20.12	Vendor collaboration security (Azure AD B2B)	Ariba MFA setting
`ack_due_days`	legal entity, vendor	int	2	0–30	FR-20.9	Vendor collaboration → confirmation response time	Confirmation control keys (T163D)
`portal_price_override`	vendor	bool	false	true/false	BR-20.11	Vendor collaboration "Allow price change on invoice"	n/a
`portal_upload_max_mb` / `portal_allowed_file_types`	tenant	int / list	25 / pdf, png, jpg, csv, xlsx, xml		FR-20.13	Document management file types	DMS document type file extensions
`vendor_request_types` / `onboarding_questionnaires`	legal entity	table	ADD_VENDOR with default questionnaire	type, workflow id, questionnaire per category	FR-20.18	Vendor request types; Vendor onboarding questionnaires; Registration wizard configuration	Ariba SLP registration questionnaires
`prospect_data_retention_days`	tenant	int	90	30–365	FR-20.18 purge	n/a	n/a
`portal_show_limit`	vendor	bool	false	true/false	FR-20.20	n/a	n/a
`document_recipient_lists` / `distribution_types`	legal entity	table	none	recipients, acknowledgement required, due days	FR-20.21	n/a	DMS distribution types and recipient lists (CVI customizing)

3.20.14 Inquiries and reports

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
Inventory value report	statutory / operational report	as-of, group by, site, valuation ledger, valuation type, segment	qty, physical value, financial value, GL balance, diff	`CostTransaction`	Inventory value report (InventValueReport)	MB5L, MB5W, MC.9
Inventory close list and exceptions	list inquiry	entity, close date, kind	status, duration, products, settlements, exceptions	`InventoryClose`	Closing and adjustment list	CKMLCP cockpit status, CKMLPP log
Settlement trace (cost explorer)	drill-down	issue or receipt transaction	settled pairs, qty, value, method, sequence	`CostSettlement`	Inventory value / Cost explorer, Settlements	CKM3N material price analysis
Adjustment history	list inquiry	product, period	adjustment kind, amount, voucher	`CostTransaction` kinds SETTLEMENT_ADJ/RECALC/MANUAL_ADJ	Adjustment history	MR22 documents, ML price change documents
Costing version comparison	operational report	version A vs B, site	product, cost A, cost B, delta, on-hand, revaluation	`ItemCost`	Costing version comparison	CK13N / CK40N comparison, MR21 preview
Price change history	list inquiry	product, site	effective date, old/new cost, source, voucher	`cost.changed` projection	Item price history (InventItemPrice)	MR21 price change documents, S_P99_41000062 price history
PPV analysis	operational report	vendor, product, period	PO price, standard, invoice price, PPV at receipt, PPV at invoice	`CostTransaction` PPV	Standard cost variance report	PRD account analysis, CKM3
Inventory-to-GL reconciliation	operational report (daily)	account, dimension	inventory value, ledger, diff, sample vouchers	`costing.reconcile`	Ledger reconciliation inquiry	MB5L vs FAGLB03
Inventory aging	operational report	as-of, bucket set, grouping, valuation ledger	qty and value per bucket, total, % > 180 days	cost layers after settlement	Inventory aging report (D365)	MC50 dead stock, MC46 slow-moving, MC.A
Inventory turnover / days on hand	KPI	period, item group, site	COGS, average inventory, turns, days on hand	`CostTransaction`	Inventory turnover (D365 PBI)	MC.9 / MC44 inventory turnover
Portal acknowledgement monitor	list inquiry	vendor, due, status	PO, version, sent, due, response	`PurchaseOrderAcknowledgement`	Vendor collaboration → PO confirmation requests	ME92F/ME92K monitor order acknowledgment, ME2A
ASN list	list inquiry	vendor, expected arrival, status	ASN, PO, lines, tracking	`AdvanceShipNotice`	Vendor collaboration ASN	VL06I inbound delivery monitor
Portal user activity and provisioning	operational report	vendor, last login, status	user, role, MFA, invited by, last login	`SupplierUser`	Portal user activity / provisioning status	Ariba user report

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
Vendor requests pipeline	list inquiry	type, status, category, age	request, prospect, step, assignee, duplicate flag	`VendorRequest`	Vendor requests list	MDG-S change requests (USMD)
Document distribution log	list inquiry	document, recipient list, status	recipient, version, sent, viewed, acknowledged	`DocumentDistribution`	n/a	CVI8 distribution log
Consignment portal activity	list inquiry	vendor	replenishment orders, receipts, ownership changes, settlements	waves 16/18 projections	Vendor collaboration consignment	SNC consignment monitor

3.20.15 Printed and electronic documents

Document	Trigger	Layout elements (header / line / footer)	Formats	Numbering sequence	Legal / retention requirement
Inventory value report (period-end)	close COMPLETED / on demand	header: entity, as-of, valuation ledger, method; lines: grouping, qty, value, GL balance, diff; footer: totals per account	PDF/A, XLSX	close number `CLS–`	Year-end inventory valuation evidence (IAS 2, HGB §253, US ASC 330); retain 10 years
Inventory aging snapshot	month end	buckets per grouping, totals	PDF, XLSX	snapshot id	Audit workpaper (obsolescence reserve support)
Standard cost revaluation voucher report	version activation	per site: products, old/new cost, on-hand, revaluation amount	PDF, XLSX	version code	Audit evidence for cost changes
Cost adjustment voucher report	manual adjustment	product, dims, old/new value, reason, approver	PDF	adjustment number `CAD–`	Audit evidence
PO acknowledgement confirmation	vendor acknowledges	PO, version, response, proposed changes	email to buyer and vendor	n/a	Commercial correspondence
ASN / delivery note (vendor-generated)	ASN submitted	ASN number, PO, packages with SSCC, lines, batches	PDF (vendor print), SSCC label ZPL	vendor ASN number	GS1 logistics label where required
Vendor onboarding confirmation	request approved / rejected	prospect, decision, next steps	email	request number `VR–`	Privacy notice reference (GDPR Art. 13)
Distributed document acknowledgement receipt	acknowledgement	document, version, user, timestamp	PDF in log, email	n/a	Quality agreement evidence (ISO 9001 §7.5, IATF 16949)

3.20.16 Periodic and batch jobs

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
Inventory close / recalculation (FR-20.2, FR-20.3)	monthly after period end (manual start or schedule day 2 22:00)	legal entity × valuation ledger × product	close id; settlement deterministic; child checkpoints	< 20 min per 1M transactions per ledger	FAILED resumable; cancel reverses	close FAILED page; > 60 min ticket
Inventory-to-GL reconciliation (`costing.reconcile`)	daily 02:15	legal entity × account	run id	< 5 min	retry 3×	diff ≠ 0 page
Running average / on-hand cost refresh	every 10 min	product	idempotent recompute from cost layers	< 1 min	retry	lag > 30 min ticket
Pending cost activation (scheduled versions)	daily 00:30	version × site	version id idempotent	< 2 min per 10k products	per-product failure listed	failures > 0 ticket
Moving-average revaluation (invoice differences on remaining stock)	hourly	product	key = invoice diff cost transaction	< 1 min	retry	none
Inventory value report and aging snapshots	month end day 1 03:00	legal entity × valuation ledger	key = (entity, ledger, as-of)	< 5 min per 10k products	retry	missing snapshot → close checklist blocker
PO acknowledgement overdue scan	daily 08:00	vendor	key = (ack, date)	< 30 s	retry	overdue list on buyer workspace
Portal inactive-user cleanup	weekly Sunday 04:00	vendor	deactivates users with no login > 180 days	< 1 min	retry	deactivations reported to vendor admin
Vendor request SLA and prospect data purge	daily 01:00	legal entity	purge key = request id after retention	< 1 min	retry	none
Document distribution reminders	daily 07:30	distribution	timer per recipient	< 1 min	retry	overdue acknowledgements → owner notification

3.20.17 Security duties and privileges

Duty	Privileges (entry points: API paths / screens / jobs)	Segregation-of-duties conflicts	Default roles that include it	AX duty / SAP authorization reference
CostingInquire	closes GET, value report, aging, cost lookup, settlement trace	none	Cost accountant, Controller, Auditor	AX "Inquire into inventory value"; SAP CKM3 (K_ML_VA display)
InventoryCloseRun	closes POST (CLOSE/RECALC/PREVIEW), :cancel	with CostAdjust, CostingVersionActivate	Cost accountant	AX "Close inventory" (InventClosing); SAP CKMLCP (K_ML_VA activity 'post closing')
CostAdjust	adjustments POST	with InventoryCloseRun, InventoryJournalPost (w16)	Senior cost accountant	AX "Adjust inventory" (InventAdjustment); SAP MR22 (M_MSEG_WMB / K_ML_VA)
CostingVersionMaintain	versions create, item-costs:import, copy	with CostingVersionActivate	Cost accountant	AX "Maintain costing versions"; SAP CK11N / CK24 mark (K_KEKO)
CostingVersionActivate	versions :activate (revaluation)	with CostingVersionMaintain, CostAdjust	Controller	AX "Activate pending prices"; SAP CK24 release, MR21 (M_MATE_WRK + F_BKPF_BUK)
ValuationSetupMaintain	valuation ledgers, valuation categories, item model group costing fields, posting profile accounts	with InventoryCloseRun	Finance system administrator	AX "Maintain cost management setup"; SAP OMWC/OMX2 (S_TABU_DIS)

Duty	Privileges (entry points: API paths / screens / jobs)	Segregation-of-duties conflicts	Default roles that include it	AX duty / SAP authorization reference
SupplierPortalAdmin (internal)	invite vendor admins, deactivate users, vendor request approval queue, distribution lists	with VendorBankAccountApprove (w19)	Supplier relationship manager	D365 "Provision vendor collaboration users"; Ariba administrator
VendorRequestApprove	approve/reject vendor requests, duplicate override	with VendorMaintain (w7) when the same person entered prospect data	Category manager, Compliance officer, Vendor master steward	AX "Approve vendor requests"; SAP MDG-S approval
DocumentDistributionMaintain	distributions create, recipient lists	none	Quality engineer, Buyer	SAP CVI1/CVI2 (C_DRAD_OBJ)
portal: VendorUser	/portal/v1 purchase orders, ASNs, invoices, payments, SES/timesheets, catalog upload (when granted), consignment view, documents	scoped by OPA to own vendor ids	external vendor staff	D365 "Vendor collaboration user" role; Ariba supplier user
portal: VendorAdmin	users:invite, deactivate, MFA settings, contact data	none (external)	external vendor administrator	D365 "Vendor admin (external)"; Ariba supplier administrator
portal: ProspectiveVendor	public registration endpoint, own request status	rate limited, CAPTCHA	anonymous prospect	D365 "Prospective vendor" role

3.20.18 Message catalog

Code	Severity	User text	Cause	Remediation	Raised by
CST-CLS-001	error	A close is already running for {entity} ({close})	StartClose	Wait for completion	FR-20.2

3.20.19 Performance budgets and capacity

Operation	Volume assumption (per tenant per day / peak per minute)	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
Inventory close (1M transactions, 2,000 products, per valuation ledger)	monthly	12 min / 20 min / 30 min	1,000 settlements/s across 32 children	CostSettlement ≈ 200 B/row (~1.2M rows per close ≈ 240 MB) ; CostTransaction ≈ 250 B/row	CostTransaction (tenant, product_id, financial_date), (ledger_entry_id), (valuation_ledger_id); monthly partitions	Parallelism capped by DB CPU; additional ledgers run sequentially if CPU > 80 %
Value report (10k products)	200 runs	1 s / 5 s / 10 s	n/a	n/a	materialized balance per (product, site, account, valuation ledger) refreshed on each cost transaction	Served from last snapshot with "as of HH:MM" banner
Cost lookup (waves 21/27)	500k / 5,000 per min	3 ms / 20 ms / 40 ms	2,000 rps	n/a	in-pod cache keyed (product, site, valuation type) invalidated by `cost.changed`	Cache-only reads, stale ≤ 60 s
Standard cost activation (10k products)	12 / year	40 s / 2 min / 4 min	n/a	ItemCost ≈ 200 B/row	(product_id, site_id, status)	Chunked by 500 products
Aging report (10k products, 200k layers)	50 runs	2 s / 8 s / 15 s	n/a	snapshots ≈ 20 MB/month	layers (product, site, receipt_date)	Snapshot fallback

Operation	Volume assumption (per tenant per day / peak per minute)	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
Portal page load / API	2,000 vendor users, 50k requests / 500 per min	300 ms / 1.5 s / 3 s (page) ; 50 ms / 200 ms / 400 ms (API)	200 rps	supplier-db ≈ 5 GB/year + documents 50 GB/year	RLS by vendor_id; indexes (vendor_id, status)	Rate limits per user/vendor; WAF; static assets cached at edge
ASN submit / receipt pre-fill	1,500 / 50 per min	150 ms / 500 ms / 1 s	50 rps	ASN ≈ 2 KB + lines	(vendor_id, tracking_number) unique	Queue to receiving consumer

3.20.20 Localization and compliance hooks

Concern	Varies by	Country packs touching it (wave 48)	Extension point used
Permitted costing methods (LIFO prohibited under IFRS/IAS 2; allowed under US GAAP and US tax with LIFO conformity)	Accounting framework, tax	US (LIFO, dollar-value LIFO in v1.x), IFRS countries	Item model group validation per ledger framework; FR-20.15 lets a tax/US GAAP ledger use LIFO while IFRS uses FIFO/average
Lower of cost and net realizable value / write-downs	IAS 2, ASC 330, HGB §253	all	Manual cost adjustment (FR-20.6) + aging report (FR-20.17) as evidence; NRV calculation hook for wave 39
Statutory inventory valuation reports (e.g., FR état des stocks, IT LIFO a scatti, BR Bloco K / SPED, MX inventory reports)	Country	FR, IT, BR, MX, IN	Value report projection exposed to wave 15 report definitions; SPED Bloco K mapping in wave 48
Currency of valuation ledgers and hyperinflation (IAS 29 restatement)	Functional currency	AR, TR, VE	Valuation ledger with index-adjusted revaluation hook (wave 12 revaluation)
Transfer pricing for intercompany stock (group valuation)	OECD guidelines	all multi-entity	Group valuation ledger in FR-20.15; intercompany profit elimination in wave 40
Supplier portal accessibility and language	WCAG 2.1 AA, EU EAA 2025	EU	Shell i18n (en, de, fr, es); axe tests
Supplier data privacy (prospect and user personal data, retention, consent)	GDPR, CCPA, LGPD	EU, US-CA, BR	Privacy notice at registration; purge job; DSAR export of SupplierUser data
Supplier due diligence and sanctions screening (EU CSDDD, German LkSG supply-chain act, UFLPA)	Country law	DE, EU, US	FR-20.18 questionnaire + screening hook; questionnaire answers stored as evidence
E-invoice submission from portal must respect clearance mandates	IT SDI, MX CFDI, IN IRN	IT, MX, IN, PL (KSeF)	Portal invoice converted via wave 35 country adapter before posting
Document distribution evidence for quality agreements	ISO 9001, IATF 16949, GMP	all (regulated industries)	FR-20.21 acknowledgement log retained 10 years

3.20.21 Coverage closure

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
AX 12.8.1 — Global inventory accounting (multiple cost ledgers / accounting conventions) [#20]	GAP	ADDED as FR-20.15	Valuation ledgers bound to wave 12 ledger groups
AX 12.8.4 — Global inventory accounting setup (ledgers, accounting policies, conventions) [#21]	GAP	ADDED as FR-20.15	`valuation_ledgers` in 3.20.13
AX 12.2.1 — Vendor requests (R3) [#9]	PARTIAL	ADDED as FR-20.18	Internal and prospect-initiated requests
AX 12.2.4 — Vendors → Vendor request types [#14]	PARTIAL	ADDED as FR-20.18	`vendor_request_types`
AX 12.8.2 — Inventory aging report (D365) [#48]	PARTIAL	ADDED as FR-20.17	Layer-based buckets tying to value report
AX 12.8.4 — Inventory aging report setup [#52]	PARTIAL	ADDED as FR-20.17	`aging_bucket_sets`
AX 12.14.2 — SSRS: Inventory aging (link) [#128]	PARTIAL	ADDED as FR-20.17	3.20.14 and snapshot document (3.20.15)
AX 12.16.1 — Vendor catalogs (vendor catalog import, CMR files) [#154]	PARTIAL	ADDED as FR-20.19	Portal upload into FR-17.18 staging
AX 12.16.1 — Vendor requests (link) [#155]	PARTIAL	ADDED as FR-20.18	
AX 12.16.1 — Procurement → Vendor onboarding (prospective vendor registration) [#157]	PARTIAL	ADDED as FR-20.18	Public registration with questionnaires
AX 12.16.4 — Vendors → Vendor request types / Vendor onboarding questionnaires [#164]	PARTIAL	ADDED as FR-20.18	`onboarding_questionnaires`
AX 12.39.1 — Vendor → Prospective vendor registration (wizard, questionnaires) [#316]	PARTIAL	ADDED as FR-20.18	
AX 12.39.4 — Vendor collaboration → Onboarding: registration wizard configuration, questionnaires [#317]	PARTIAL	ADDED as FR-20.18	
AX 12.39.1 — Vendor → Consignment inventory view [#108, deferred from wave 16]	GAP	ADDED as FR-20.22	Data from FR-16.17 and FR-18.16
SAP 13.8 — CKMLCPAVR alternative valuation run (cumulative periods) [#93]	PARTIAL-20	DEFERRED to wave 39	Multi-period cumulative actual costing belongs with product costing and multi-level actual cost roll-up; the wave 20 engine provides per-period settlement only
SAP 13.8 — CKMDUVACT / CKMDUVMAT distribution of usage variances [#94]	PARTIAL-20	DEFERRED to wave 39	Requires production consumption variances (waves 21/39)
SAP 13.8 — WIP at actual cost (ML) [#95]	PARTIAL-20	DEFERRED to wave 39	WIP valuation from wave 21 production orders; revaluation at actual in wave 39
SAP 13.9 — KE27 periodic valuation (revaluate profitability with actual costs) [#104]	PARTIAL-20	DEFERRED to wave 39	COGS revaluation to profitability segments uses `close.completed` adjustments; profitability analysis lands with wave 38/39 cost accounting
SAP 13.12 — SAP Ariba Buying / Sourcing / Contracts / SLP [#130]	PARTIAL-20	ADDED as FR-20.18 (supplier onboarding/qualification), FR-17.19 (weighted RFP scoring)	Reverse auctions and contract authoring OUT-OF-SCOPE for v1

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
SAP 13.13 — OMWD / OMWC / OMSK split valuation, valuation types, valuation classes [#152]	PARTIAL-20	ADDED as FR-20.16	`valuation_type` dimension and per-type account mapping
SAP 13.15 — Supplier self-service SES (Business Network / Fieldglass) [#174]	PARTIAL-20	ADDED as FR-20.20	Portal sheets and timesheets; contingent-labor management (Fieldglass worker onboarding) OUT-OF-SCOPE
SAP 13.33 — Batch valuation (split valuation per batch) [#366]	PARTIAL-20	ADDED as FR-20.16	Valuation category BATCH
SAP 13.33 — Batch valuation activation (T001K, T149) [#372]	PARTIAL-20	ADDED as FR-20.16	`valuation_categories` with BATCH flag
SAP 13.35 — CV01N document distribution (recipients, CVI1/CVI2/CVI8) [#380]	PARTIAL-20	ADDED as FR-20.21	
SAP 13.35 — CVI8 distribution log [#387]	PARTIAL-20	ADDED as FR-20.21	3.20.14
SAP 13.35 — Document distribution runs (CVI) [#390]	PARTIAL-20	ADDED as FR-20.21	Reminder job (3.20.16)
SAP 13.35 — Document distribution customizing (recipient lists, distribution types) [#395]	PARTIAL-20	ADDED as FR-20.21	`document_recipient_lists`

Part 4 — Phase 4: Manufacturing & Planning (waves 21–25)

4.0 Phase overview

Business outcome at phase exit. A discrete or process manufacturer can run its plant on Passage: master planning nets demand against supply across a multi-level BOM and generates planned purchase, production and transfer orders; planners firm those into production or batch orders, schedule them against finite resource capacity on a Gantt, release them to the floor, and operators execute them from a kiosk while machines report counts over OPC-UA/MQTT. Every material issue, route consumption and report-as-finished posts WIP through the universal journal (wave 11) and the inventory ledger (wave 16); order end settles actual against planned cost and posts variances. Lean plants run kanban replenishment and production flows with periodic backflush costing. The phase-exit demo (wave 25 proof) manufactures a configured product from planned order to finished goods with full costing, and the WIP, inventory and variance accounts reconcile to the journal.

Phase-exit sign-off criteria

- 100% of production order status transitions in the wave-21 state machine are covered by a property test; every illegal transition is rejected and every legal one posts the fixture-defined inventory and GL entries.
- WIP control account balance = Σ(open production orders' posted consumption – posted RAF value) to the cent, verified by the nightly subledger reconciliation job for 30 consecutive days in `stage`.
- The 40 APICS-style MRP fixtures (wave 22) pass; a 50k-item × 12-period × 5-level plan completes in < 10 min on the 3-node reference cluster and produces byte-identical planned orders on re-run.
- Scheduler produces feasible, non-overlapping schedules on all 30 OR-Library job-shop instances; 5k operations scheduled in < 60 s; CP-SAT mode within 5% of known optimum on instances ≤ 10×10.
- Process fixtures: potency consumption, co/by-product allocation (sum equals batch cost exactly), catch-weight dual quantities, and the event-kanban simulation pass.
- Kiosk E2E: an 8-hour shift of 6 operators clocks jobs offline for 30 min, syncs without duplicates, and the production order's labor cost equals Σ(hours × pay rate) from the approved registrations.
- IoT: a simulated machine publishes 10,000 events/min for 60 min with a broker restart at minute 30; zero events lost (sequence check); OEE tile lag p95 < 5 s.
- A practicing cost accountant signs off the WIP/variance fixture set (50 orders) against a reference workbook.

Cross-wave data model summary

Entity	Owning service (Postgres DB)	Key relationships
ProductionOrder	`production` (production_db)	→ ReleasedProduct (w8), BomVersion/RouteVersion (w9), Site/Warehouse (w6), PlannedOrder (w22), SalesOrderLine (w27, pegged)
ProductionBomLine, ProductionOperation, ProductionJob	`production`	child of ProductionOrder; ProductionJob → Resource (w9)
ProductionJournal (+ lines)	`production`	→ ProductionOrder; posts to InventoryTransaction (w16) and JournalEntry (w11)
CostEstimate, WipPosting, Variance	`production`	→ ProductionOrder; → JournalEntry
BatchOrder, Formula, CoProductLine, BatchAttribute, CatchWeightQty	`production` (process extension)	BatchOrder is a ProductionOrder subtype; → InventoryBatch (w16)
PlanVersion, Requirement, PlannedOrder, Pegging, ActionMessage, CoverageGroup, ForecastLine	`planning` (planning_db)	Requirement ↔ Pegging ↔ Requirement; PlannedOrder → ProductionOrder/PurchaseOrder/TransferOrder on firming
ResourceCapacity, ScheduledJob, ScheduleRun	`scheduling` (scheduling_db)	ScheduledJob → ProductionJob; ResourceCapacity → Resource + WorkCalendar (w9)
ValueStream, ProductionFlow, FlowActivity, KanbanRule, Kanban, KanbanCard	`lean` (lean_db)	Kanban → ProductionOrder (manufacturing kanban) or TransferOrder (withdrawal)
Worker, TimeRegistration, PayLine, ProfileDay	`shopfloor` (shopfloor_db)	TimeRegistration → ProductionJob; PayLine → payroll export (w43)
MachineEvent, OeeBucket, DowntimeRecord	`shopfloor`	MachineEvent → Resource; OeeBucket aggregated per resource × 15 min

Cross-wave event catalog

Event (CloudEvents type)	Producer	Consumers	Payload summary
`passage.production.order.status-changed.v1`	production	planning, scheduling, shopfloor, lean, analytics	orderId, from, to, qty, dates, actor
`dev.passage.production.journal.posted.v1`	production	inventory (w16), ledger (w11), planning	journalId, type, lines[item, qty, cost], journalEntryId
`dev.passage.production.order.settled.v1`	production	ledger, costing (w20), analytics	orderId, actualCost, plannedCost, variances[]
`dev.passage.planning.plan.completed.v1`	planning	production, purchasing (w17), scheduling	planVersionId, counts, duration, messages
`passage.planning.planned-order.firmed.v1`	planning	production, purchasing, inventory	plannedOrderId, targetType, targetId
`dev.passage.scheduling.job.scheduled.v1`	scheduling	production, shopfloor, planning	jobId, resourceId, start, end, runId
`passage.lean.kanban.state-changed.v1`	lean	production, inventory, shopfloor	kanbanId, from, to, handlingUnits
`dev.passage.shopfloor.registration.posted.v1`	shopfloor	production, payroll (w43)	registrationId, workerId, jobId, hours, payType
`dev.passage.shopfloor.machine.event.v1`	iot-edge → shopfloor	shopfloor (OEE), production, analytics	machineId, resourceId, kind, counts, state, ts

Phase-level risks

Risk	Likelihood	Impact	Mitigation	Owner
WIP postings drift from the journal under concurrent journal posting on one order	Medium	High	Per-order advisory lock; idempotency key per journal; nightly WIP reconciliation job with alert at any non-zero delta	Engineering
MRP non-determinism from map iteration / parallelism	Medium	High	Deterministic sort keys (item, date, source id) at every stage; plan hash in `plan.completed` event; CI compares hashes across 3 runs	Engineering
Scheduling heuristic produces infeasible schedules on calendar edge cases (DST, zero-capacity days)	Medium	Medium	Calendar materialized in UTC minutes per resource; property test "no job outside open capacity" over 10k jobs	Engineering
Process-industry semantics (potency, co-products) misunderstood	Medium	High	Fixtures reviewed by a process-industry consultant before wave 24 close	Product

Risk	Likelihood	Impact	Mitigation	Owner
IoT connector drops events on broker restart	Low	High	Edge buffer (SQLite ring, 24 h) + Kafka idempotent producer + per-machine sequence numbers	Engineering
Two-person team on five engine-heavy waves	High	High	Reuse OR-Tools, statsforecast, frePPLe comparison harness; cut scope per the open questions rather than slip proofs	Product

4.21 Wave 21: Production Orders, WIP & Order-Based Costing

4.21.1 Scope and business context

Wave 21 is where Passage first consumes components and produces finished goods. Before it, the demo plant buys, receives, pays and values inventory (phase 3) but cannot transform it. After it, a production supervisor can create a production order for a BOM/route item, estimate its planned cost, release it, start it (auto-consuming materials by backflush or manually via a picking list), report route time on route and job cards, report quantities as finished including by-/co-products and scrap, and end the order so that actual cost settles against planned cost with material, labor and overhead variances posted to the GL. Subcontracted operations create a linked purchase order to the vendor.

Out of scope: scheduling against capacity (wave 23; wave 21 schedules with infinite capacity only), MRP-generated orders (wave 22), formula/batch orders, co-product allocation methods beyond the basic by-quantity method (wave 24), operator kiosk and time registration (wave 25), standard-cost roll-up and activation (wave 39; wave 21 reads an active standard or weighted-average cost from wave 20).

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
AX ProdTable status update dialogs (Estimate → Schedule → Release → Start) each open a modal with 8–15 parameters (ProdParmStartUp, ProdParmRelease); a supervisor clicks ~40 times to take one order to Started; SAP CO02 needs CO01 → release → CO11N → MIGO 261 across four transactions	Each status is a separate parameter table and batch class (ProdMultiStartUp); no sensible defaults persisted per site	One `:start` command with site-level defaults; parameter overrides only in an "advanced" drawer; bulk start on the list page	Clicks per order to Started 40 → 3; bulk 500 orders in < 5 min
WIP vs GL drift is found at month-end: AX ProdCalcTrans and the ledger disagree after a failed ProdUpd posting left half a journal; SAP KKAX WIP calculation runs as a batch (CO88 settlement) hours before close	Non-atomic multi-table posting (ProdJournal → InventTrans → LedgerTrans) without idempotency; WIP computed periodically rather than per posting	Journal post is one transaction with idempotency key; WipPosting rows per journal; nightly reconciliation job, delta alerts	WIP reconciliation effort 2 days/month → 0; drift detected < 24 h instead of at close
Backflush quantities silently rounded: AX BOM lines with `Round-up` = No and InventTable unit precision truncate 0.3333 to 0.33, accumulating variance; SAP RESB rounding profile (MARC.RDPRF) applied inconsistently to backflush	Rounding applied at explosion, not at posting; precision taken from the unit not the line	BR-21.2 rounds at posting with 6-decimal internal precision and explicit per-line round-up flag; variance of rounding reported	Rounding-induced variance < 0.01% of material cost (today 0.3–1%)
Cost analysis requires re-keying into Excel: AX "Price calculation" form (ProdCalcTrans) and SAP CO03 cost itemization have no drill to the GL line; auditors re-key order costs into spreadsheets	Cost itemization stored separately from the ledger posting; no shared trace id	Costs tab drills from variance → WipPosting → JournalEntry (w15 drill) with one trace id; `/costs` API for BI	Time to explain one order's variance 30 min → < 1 min; 100% of cost lines link to a journal entry
Epicor Kinetic and Infor LN require a separate MES (Plex, Infor MES) to see live order progress; AX users run the ProdTable list with manual refresh	Status and quantities updated only by batch posting classes	`order.status-changed` and `journal.posted` CloudEvents on Kafka within 1 s; any MES/BI consumes them without middleware	Order-status latency to external systems 15 min polling → < 2 s event

4.21.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Production order header	ProdTable, ProdStatus enum, form ProdTable, menu item ProdTable	AUFK/AFKO/AFPO, CO01/CO02/CO03	`production` service, entity ProductionOrder, screen Production orders	full
Order BOM and route snapshot	ProdBOM, ProdRoute, ProdRouteJob (ProdUpdCreate explosion)	RESB (components), AFVC/AFVV (operations), order read of BOM/routing	ProductionBomLine, ProductionOperation, ProductionJob	full
Estimation (planned cost)	ProdParmCostEstimation, ProdCalcTrans, status Estimated	Preliminary costing (CO01 → cost), KKF6N	CostEstimate entity, `:estimate` action	full
Picking list	ProdJournalTable (JournalType=Bom), ProdJournalBOM, backflush via BOM line flushing principle	Goods issue MIGO 261, backflush at CO11N	ProductionJournal type `picking-list`	full
Route card / job card	ProdJournalRoute (route card), ProdJournalRoute by job (job card), ProdParmReportFinished	CO11N confirmation (AFRU), CO15 order confirmation	ProductionJournal types `route-card`, `job-card`	full
Report as finished	ProdJournalProd, ProdParmReportFinished, accept error quantity	Goods receipt MIGO 101 for order, CO15 final confirmation	ProductionJournal type `report-as-finished`	full
WIP posting	Production posting profiles (ProdPosting), ledger accounts WIP issue/receipt, Picking list issue/offset	WIP calculation KKAX/KKAO, results analysis (RA key)	WipPosting rows, posting profile per item group × site	full
Order end and settlement	ProdParmCostUpdate (End), ProdCalcTrans actual, variance accounts	Settlement KO88/CO88, variance calculation KKS2	`:end` action, Variance entity, settlement to journal	full
Subcontracting	Vendor resource type, BOM line type Vendor, auto PO	External processing operation (PP02 control key), PO item category L	ProductionOperation.subcontract → PurchaseOrderLine (w17)	full
Production order inquiry	ProdTable listpage, ProdCalcTrans inquiry, ProdJournal inquiries	COOIS, CO03 cost analysis	Production order detail, Cost tab, Status log	improved (single trace id per transaction)
Scrap and error quantity	ProdJournalProd.QtyError, BOM line scrap %, route scrap %	Assembly scrap (MARC), component scrap (STPO), operation scrap	Scrap fields on BOM line, operation and RAF line	full
Reset status	ProdTable reset status (ProdUpdStatusDown)	Not native (reversal via CO13 cancel confirmation)	`:reset-status` with reversal journals	full
Production pools / groups	ProdPool, ProdGroup	Production scheduler profile, order type	OrderGroup (posting profile key)	partial — pools dropped; replaced by saved views
Order split / group	ProdSplit (Split production order), ProdGroup	CO02 → Functions → Split order (AFKO.SPLIT), order group	`:split` and `:merge` commands (FR-21.15)	full

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Order change management	ECO re-explosion on ProdTable before Started (BOMCalc), no change-cost tracking	OCM (COCM / COCM1), change profiles, change costs (COCM*)	OrderChangeRecord, `:apply-change` with cost preview (FR-21.16)	full
Trigger points / rework operation insertion	n/a (manual route edit)	Trigger points (CO31/CO33, OPMP/OPM, TTRIG), rework order CO07	TriggerPoint rules on operation feedback (FR-21.17); rework order (FR-21.20)	full
Order-specific BOM / route (ETO)	ProdBOM / ProdRoute line edits on the order (ProdBOM form)	Order BOM CU51/CU52/CU55/CU56, order routing	Order BOM editor with audit (FR-21.18)	full
As-built genealogy (serial → component serial)	InventTrans tracing by serial (InventDim), no as-built record	Serial numbers at component level (IQ09, as-built configuration)	AsBuiltRecord captured at picking/RAF (FR-21.19)	full

4.21.3 Functional requirements

- **FR-21.1 Create production order** — Must. The system shall create a ProductionOrder for a released product with a BOM version and route version resolved as of the order's delivery date and site, and explode them into ProductionBomLine, ProductionOperation and ProductionJob rows at creation.
  - Notes: Order number from the `production-order` number sequence (continuous not required). Default quantity from released-product default order settings; multiple/min/max enforced. Manual BOM/route version override allowed only before Estimated. Phantom BOM lines are exploded in place; line numbering keeps the parent's line number with a suffix (`30.1`, `30.2`). Explosion of a 7-level, 2,000-component product completes in < 1 s (wave 9 explosion API).
- **FR-21.2 Status lifecycle** — Must. The system shall enforce the state machine in BR-21.1 with statuses Created, Estimated, Scheduled, Released, Started, ReportedAsFinished, Ended and Cancelled.
  - Notes: Transitions are commands (`:estimate`, `:schedule`, `:release`, `:start`, `:report-finished`, `:end`, `:cancel`, `:reset-status`); each is idempotent by `Idempotency-Key`. Each transition writes a StatusLog row with actor, timestamp, trace id. SAP mapping on export: CRTD→Created, REL→Released, PCNF→Started, CNF/DLV→ReportedAsFinished, TECO/CLSD→Ended.
- **FR-21.3 Estimation** — Must. The system shall compute planned cost per order: material (Σ BOM line qty × (1 + scrap%) × unit cost from the active costing version), labor (Σ operation setup + run time × resource cost category rate), overhead (costing-sheet surcharges from wave 20; full costing sheets in wave 39), and subcontract (PO price).
  - Notes: Creates inventory transactions: receipt `ordered` for the finished item, issues `on-order` for BOM lines (w16 statuses). Re-estimate is allowed until Started and replaces the estimate atomically. Rounding: cost amounts to 4 decimals internally, 2 on posting.
- **FR-21.4 Release and printing** — Must. The system shall release an order, generate the picking list and job card documents (PDF), and set BOM-line reservations according to the order's reservation policy (none, estimated, released, started).
  - Notes: Release is blocked if any BOM line has an unreleased product in this legal entity. Release with shortages raises a warning listing short lines; a `strict` flag turns it into an error.
- **FR-21.5 Picking list journal** — Must. The system shall post picking-list journals that issue BOM-line quantities from inventory to WIP, with proposal modes: remaining quantity, consumption proportional to RAF quantity, or manual.
  - Notes: Flushing principle per BOM line: `manual`, `start` (consumed at Start), `finish` (consumed at RAF), `available-at-location` (consumed when job reports). Over-consumption beyond 100% + line tolerance (default 10%) requires duty *Post production over-consumption*. Posting creates one InventoryTransaction per line with status `deducted` and the GL entry Dr WIP / Cr Inventory.
- **FR-21.6 Route card and job card journals** — Must. The system shall post route consumption (setup hours, run hours, quantity good, quantity error) per operation (route card) or per job (job card), valued at the resource's cost category rate, posting Dr WIP / Cr Labor absorption (and Cr Overhead absorption for indirect costs).
  - Notes: Hours in decimals to 2 places; minimum postable 0.01 h. Reporting on an operation of a non-Started order auto-starts the order if the order's parameter `autoStartOnFeedback` is true (default true, AX parity). Operation `finished` flag closes it to further feedback unless reopened.
- **FR-21.7 Report as finished** — Must. The system shall post RAF journals that receive the finished item (and by-/co-product lines) into inventory at the estimated unit cost (standard cost if the item's costing method is standard), consume `finish`-flushed BOM lines, and post Dr Finished goods / Cr WIP.
  - Notes: `acceptError` flag posts error quantity as scrap without inventory receipt. RAF quantity > remaining + tolerance (default 0%) is rejected. The last RAF sets `endJob = true` on all jobs when the `endJobs` parameter is set. Tracking dimensions (batch/serial) required per the item's tracking dimension group; serials must be unique across the tenant (w16).
- **FR-21.8 End and settle** — Must. The system shall end an order by computing actual cost from posted journals, reversing WIP, posting actual cost to the consumption and inventory accounts, and posting variances per BR-21.6.
  - Notes: End date must be ≥ last journal date and in an open inventory and GL period (w14 period control). Remaining `on-order` and `ordered` inventory transactions are cancelled. Orders with RAF quantity 0 and posted consumption are ended with 100% of cost to variance (AX "end with zero quantity" behavior) and require duty *End production order with zero output*.
- **FR-21.9 Reset status** — Should. The system shall reset an order to an earlier status, reversing postings made by later statuses (reversal journals with negative quantities, linked to originals).
  - Notes: Reset from Ended is not allowed (AX parity); reset from ReportedAsFinished to Started reverses all RAF journals. Reset is blocked if any reversed inventory transaction has been consumed by a later issue (on-hand would go negative).
- **FR-21.10 Subcontracting** — Should. The system shall create a purchase order line (w17) for an operation whose resource is of type Vendor, linked to the operation, and shall post the vendor invoice amount as the operation's actual cost on product receipt.
  - Notes: PO line quantity = operation quantity in the service item's UoM; delivery date = operation end. Changes to order quantity after PO confirmation raise a PO change (w17 versioning).
- **FR-21.11 Order inquiry and cost view** — Must. The system shall show, per order, planned vs actual cost by cost group (material, labor, overhead, subcontract), the journal list, inventory transactions, GL entries with drill-down to the journal entry (w15 drill-down) and the status log.
- **FR-21.12 Bulk status update** — Should. The system shall apply a status transition to up to 500 selected orders in one batch job (Temporal), reporting per-order success/failure.
- **FR-21.13 Posting profiles** — Must. The system shall resolve ledger accounts for each posting type (picking list issue, picking list offset, WIP issue, WIP account, RAF receipt, RAF offset, variance accounts per variance type) by item group × site, falling back to All.
- **FR-21.14 Co-product RAF (basic)** — Could. The system shall accept RAF lines for co-/by-products declared on the BOM (w9), allocating cost by quantity only; allocation methods arrive in wave 24.
- **FR-21.15 Order split and merge** — Should. The system shall split a production order in status Created…Started into two orders (original keeps the remaining quantity; the new order receives `splitQty`), carrying BOM lines, operations and jobs proportionally, and shall merge orders of the same product, BOM/route version and site that are in status ≤ Released into one.
  - Notes: Split of a Started order distributes posted consumption and route hours proportionally to the split ratio unless `allocation=keep-on-original`; WIP postings move via an internal transfer journal (Dr WIP new / Cr WIP original) so each order's WIP stays reconcilable. Split quantity must be ≥ the item's minimum order quantity and a multiple of the item's multiple. Scheduled jobs of the new order are rescheduled (w23) with the original's dates as the preferred window. Merge is refused if either order has posted journals. AX ProdSplit and SAP CO02 split both stop at Released; Passage allows Started with the allocation rules above.

- **FR-21.16 Order change management** — Should. The system shall detect, for open orders (status < Started, or Started with `ocm.allowStarted`), that the BOM or route version they snapshot has been superseded by an ECO (w9 `bom.version.activated` / `route.version.activated` events) and shall offer `:apply-change` that re-explodes the order and reports the delta (added/removed/changed lines and operations) with a change cost = Σ (new planned cost – old planned cost) plus a configurable change-cost surcharge per OCM profile.
    - Notes: OCM profile per item group × site: `automatic` (apply at next status transition), `manual` (planner confirms), `none` (ignore). Lines already consumed are never removed; they become `substituted` and feed the production substitution variance (BR-21.6). Each application writes an OrderChangeRecord (ECO id, before/after snapshot hash, change cost, actor). Configured products (w8) re-explode through the configurator with the stored configuration; a changed model that no longer yields the same configuration raises `OCM_CONFIG_DRIFT` and requires manual review.
- **FR-21.17 Trigger points** — Should. The system shall evaluate TriggerPoint rules on operation feedback events (route card / job card post, operation status change, qty_error > 0, quality check fail from w25) and perform the configured function: insert a rework operation sequence after the current operation (standard operation set from w9), create a rework order (FR-21.20) for the error quantity, release the next operation, start a Temporal workflow, or raise a notification.
    - Notes: Trigger points are defined on route operations (w9 route version) and copied to ProductionOperation at explosion; conditions use the same expression language as alert rules (w5) over the feedback payload. Inserted operations get oper_number = current + 5 (renumbered if collision) and are scheduled forward (w23). One trigger point fires at most once per operation unless `repeatable`.
- **FR-21.18 Order-specific BOM and route** — Should. The system shall allow editing BOM lines and operations on an order after explosion and before Started (add, remove, change quantity/item/resource requirement), marking the order `orderBomModified = true`, keeping an audit diff against the source versions, and optionally saving the result as a new BOM/route version for the product (ETO reuse).
    - Notes: Edits after Released require duty *Maintain order BOM after release* and re-run the reservation policy. Planned cost is re-estimated after each edit. Edited orders are excluded from automatic OCM `automatic` profile and flagged for manual review instead.
- **FR-21.19 As-built genealogy** — Should. For serial- or batch-tracked finished items the system shall record, per finished serial/batch, which component serials/batches were consumed (AsBuiltRecord), captured on picking-list posting (component serials against the order) and resolved per finished serial at RAF (operator assignment on the kiosk in w25, or automatic when the order quantity is 1).
    - Notes: Genealogy is queryable in both directions (where-used of a component serial; as-built of a finished serial) and feeds the w16 trace inquiry and w33 nonconformance. Unresolved component serials at End raise a warning, not an error, unless the item's tracking policy sets `asBuiltRequired`.
- **FR-21.20 Rework production orders** — Should. The system shall create a rework order for a finished item quantity (optionally referencing the original order, batch or serial): no BOM explosion by default (components added manually), a route of rework operations, and a `reworkReference` so that the rework cost is posted to the item's rework cost group and reported against the original order.
    - Notes: Rework output is received at the original item's current cost; rework cost is posted as a variance of type `rework` (added to the Variance enum) and not capitalized into inventory unless the parameter `rework.capitalize` is set. SAP CO07 (order without material) semantics; AX equivalent is a production order with an empty BOM and the "rework" posting profile.

4.21.4 Data model

ProductionOrder

Field	Type	Required	Notes
id	uuid	yes	PK
tenant_id, legal_entity_id	uuid	yes	RLS
order_number	text	yes	unique per legal entity; number sequence
product_id, variant_id	uuid	yes/no	FK ReleasedProduct (w8)
site_id, warehouse_id	uuid	yes	FK (w6)
quantity	numeric(18,6)	yes	> 0, in inventory UoM
qty_started, qty_raf, qty_error	numeric(18,6)	yes	default 0
bom_version_id, route_version_id	uuid	yes	FK (w9), snapshot taken at creation
status	enum	yes	Created…Cancelled
delivery_date, start_date, end_date	date	yes/no/no	start/end set by scheduling
scheduling_method	enum	yes	`operations` or `jobs`
reservation_policy	enum	yes	none/estimated/released/started
posting_profile_key	text	yes	item group × site resolved key
origin_type, origin_id	enum, uuid	no	PlannedOrder, SalesOrderLine, Manual, Kanban
version	int	yes	optimistic concurrency

ProductionBomLine: id, order_id (FK), line_number (text), item_id, variant_id, bom_qty_per (numeric 18,6), bom_series_size (numeric), scrap_pct (numeric 7,4, 0–100), qty_required (numeric 18,6, computed), qty_consumed (numeric 18,6), flushing_principle (enum), line_type (enum: item, phantom, pegged-supply, vendor), warehouse_id, location_id, reservation_status (enum), unit_cost_est (numeric 18,6).

ProductionOperation: id, order_id, oper_number (int), next_oper_number (int, 0 = last), priority (enum: primary, secondary1–4), resource_group_id, resource_id (nullable until scheduled), setup_time_h, run_time_h_per (numeric 10,4), process_qty (numeric), queue_before_h, queue_after_h, transit_h, scrap_pct, cost_category_setup_id, cost_category_run_id, subcontract (bool), purchase_line_id (nullable), status (enum: open, started, finished), scheduled_start, scheduled_end (timestamptz).

ProductionJob: id, operation_id, job_type (enum: queue-before, setup, process, overlap, transport, queue-after), resource_id, planned_start, planned_end, planned_hours, reported_hours, qty_good, qty_error, status.

ProductionJournal: id, order_id, journal_type (enum: picking-list, route-card, job-card, report-as-finished), journal_number, posting_date, posted (bool), posted_at, posted_by, journal_entry_id (w11 FK), reversal_of (nullable self FK), idempotency_key (unique).

CostEstimate / WipPosting / Variance: CostEstimate(order_id, cost_group, planned_qty, planned_unit_cost, planned_amount, costing_version_id); WipPosting(order_id, journal_id, posting_type, amount_dr, amount_cr, ledger_account, journal_entry_id); Variance(order_id, variance_type enum {lot-size, production-quantity, production-price, production-substitution}, cost_group, amount, journal_entry_id).

Invariants:

- Σ WipPosting.amount_dr – Σ amount_cr for an order = 0 once status = Ended.
- qty_raf + qty_error ≤ quantity × (1 + raf_tolerance_pct/100).
- Every posted ProductionJournal has exactly one journal_entry_id and its inventory transactions sum to the journal's quantities.

- A ProductionOperation with subcontract = true has exactly one purchase_line_id once the order is Released.

Indexing: ProductionOrder (tenant_id, legal_entity_id, status, delivery_date); (tenant_id, product_id, status); ProductionJournal unique (tenant_id, idempotency_key); WipPosting (order_id); partition ProductionJournal and WipPosting by legal_entity_id hash (16) once rows > 50M.

OrderChangeRecord (FR-21.16): id, order_id (FK), eco_id (w9 FK), source_version_old_id, source_version_new_id, delta (jsonb: added/removed/changed lines and operations), change_cost (numeric 18,4), surcharge (numeric 18,4), profile (enum automatic/manual/none), status (enum detected/previewed/applied/dismissed), applied_by, applied_at, snapshot_hash_before, snapshot_hash_after (bytea).

TriggerPoint (FR-21.17): id, order_id, oper_number, sequence (int), condition (text, w5 expression), function (enum: insert-operations, create-rework-order, release-next, start-workflow, notify), standard_operation_set_id (nullable, w9), workflow_key (nullable), repeatable (bool), fired_count (int), last_fired_at.

AsBuiltRecord (FR-21.19): id, order_id, finished_item_id, finished_serial_or_batch (text), component_item_id, component_serial_or_batch (text), qty (numeric 18,6), journal_id (picking list), raf_journal_id, assigned_by, assigned_at; unique (tenant_id, component_item_id, component_serial_or_batch) for serialized components.

ProductionOrder additions: split_from_order_id (nullable self FK), merged_into_order_id (nullable), order_bom_modified (bool, default false), rework_reference_type (enum: order/batch/serial, nullable), rework_reference_id; ProductionOrder.origin_type gains `Split` and `Rework`; Variance.variance_type gains `rework`.

Invariants (additions): Σ quantity of an original order and orders split from it = original quantity at split time; an order with merged_into_order_id set has status Cancelled and no posted journals; each serialized component serial appears in at most one AsBuiltRecord. Indexing: AsBuiltRecord (finished_serial_or_batch), (component_serial_or_batch); OrderChangeRecord (status, order_id).

4.21.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
POST	/api/v1/production/orders	Create order (explodes BOM/route)	Idempotency-Key header	Maintain production orders
GET	/api/v1/production/orders/{id}	Read order with lines, ops, jobs, cost summary	n/a	View production orders
PATCH	/api/v1/production/orders/{id}	Edit header fields allowed for current status	ETag/version	Maintain production orders
POST	/api/v1/production/orders/{id}:estimate	Estimate	Idempotency-Key	Maintain production orders
POST	/api/v1/production/orders/{id}:release	Release (and :schedule, :start, :end, :cancel, :reset-status)	Idempotency-Key	Release production orders / End production orders
POST	/api/v1/production/orders/{id}/journals	Create journal with proposal (`proposal=remaining	proportional	none`)
POST	/api/v1/production/journals/{id}:post	Post journal	Idempotency-Key	Post production journals
GET	/api/v1/production/orders/{id}/costs	Planned vs actual by cost group	n/a	View production costs
POST	/api/v1/production/orders:bulk-status	Batch transition up to 500 ids	Idempotency-Key	Release production orders
GET	/api/v1/production/posting-profiles	Resolve accounts for item group × site	n/a	View production setup

Commands: `CreateOrder` (validates product released, BOM/route active as of delivery date, qty multiples); `PostJournal` (validates order status allows journal type, period open, quantities within tolerance, tracking dims present); `EndOrder` (validates no unposted journals, all subcontract POs invoiced or explicitly accrued).

Event	Trigger	Payload fields	Consumers
`dev.passage.production.order.created.v1`	order committed	orderId, orderNumber, productId, qty, siteId, deliveryDate, originType, originId	planning, analytics
`passage.production.order.status-changed.v1`	any transition	orderId, from, to, qty, startDate, endDate, actor, occurredAt	planning, scheduling, shopfloor, lean
`dev.passage.production.journal.posted.v1`	journal posted	journalId, orderId, type, postingDate, lines[{itemId, qty, unitCost, operNumber, hours}], journalEntryId	inventory, ledger, planning
`dev.passage.production.order.settled.v1`	End posted	orderId, plannedCost{material,labor,overhead,subcontract}, actualCost{…}, variances[{type,costGroup,amount}]	ledger, costing, analytics
`passage.production.subcontract.po-requested.v1`	release of subcontract op	orderId, operNumber, vendorId, serviceItemId, qty, dueDate	purchasing

4.21.6 User experience

Screen	Primary actions	Key fields/columns	Duty required
Production orders (list)	Create, Estimate, Release, Start, RAF, End, bulk status, saved views by status/site	Order, Item, Qty, Remaining, Status, Delivery date, Site, Planned cost, Actual cost	View production orders
Production order detail	Tabs: Lines (BOM), Route, Jobs, Journals, Costs, Inventory transactions, Status log	Header fields; per-tab grids	Maintain production orders
Journal editor	Add lines, proposal, validate, post, print	Item/operation, qty, hours, error qty, reason, batch/serial	Post production journals
Cost analysis	Compare planned vs actual, drill to journal entry	Cost group, planned, actual, variance, variance %	View production costs
Posting profile setup	Maintain accounts by item group × site	Posting type, item group, site, account, dimensions	Maintain production setup

Interaction rules: `Ctrl+Shift+S` opens the status action menu; list page supports multi-select with inline status badge; validation runs on blur per field and fully on post; journal editor keeps unsaved lines in `localStorage` and warns on navigation; the Costs tab is read-only and recomputes on each journal post event (live update via SSE from the BFF).

4.21.7 Business rules and edge cases

- **BR-21.1 State machine.** Allowed transitions and their posting effects:

From → To	Preconditions	Posting
Created → Estimated	BOM/route exploded	Inventory transactions `ordered` / `on-order`; CostEstimate rows
Estimated → Scheduled	estimate exists	Operation/job dates (infinite capacity in w21)
Scheduled → Released	no unreleased components	Reservations per policy; documents
Released → Started	period open	Auto-post picking list for `start`-flushed lines; route card for ops with `autoStart`; Dr WIP / Cr Inventory

From → To	Preconditions	Posting
Started → ReportedAsFinished	qty_raf > 0	Dr FG inventory (est. cost) / Cr WIP; consume `finish`-flushed lines
ReportedAsFinished → Ended	no open journals; period open	Reverse WIP; post actual; post variances
Started → Ended	qty_raf = 0 and duty held	Same as above with 100% variance
Created/Estimated/Scheduled/Released → Cancelled	no posted journals	Cancel `ordered`/`on-order` transactions
Any non-Ended → earlier status (`:reset-status`)	reversal possible (BR-21.5)	Reversal journals

Any other transition returns HTTP 409 `PRODUCTION_ILLEGAL_TRANSITION`.

- **BR-21.2 Quantity rounding.** Required quantity = ceil-to-UoM-precision(qty_per × order_qty / series_size × (1 + scrap/100)); UoM precision from the unit definition (w6), default 6 decimals; "round up to whole unit" flag on the BOM line forces integer.
- **BR-21.3 Posting date.** A journal's posting date must be ≥ order creation date and within an open inventory period and GL period for the Production module; otherwise 422 `PERIOD_CLOSED`.
- **BR-21.4 Concurrency.** Journal posting takes `pg_advisory_xact_lock(hash(order_id))`; concurrent posts serialize; a stale `version` on PATCH returns 412.
- **BR-21.5 Reversal safety.** Reset status is refused when any inventory transaction created by a to-be-reversed journal has a downstream issue with status `deducted` or `picked`.
- **BR-21.6 Variance decomposition at End** (standard-cost items; weighted-average items post only a total variance to the item's inventory adjustment account):
  - Production quantity variance = Σ (actual qty – planned qty for actual output) × standard price.
  - Production price variance = Σ actual qty × (actual price – standard price).
  - Lot-size variance = planned fixed cost (setup, constant overhead) × (1 – actual output / planned output).
  - Production substitution variance = cost of consumed items/operations not on the estimate minus estimate of items not consumed.
  - Sum of the four equals actual cost – (qty_raf × standard unit cost); property-tested.
- **BR-21.7 Worked settlement example.** Item FG-100, standard cost USD 50.00/unit = material 30.00 + labor 15.00 + overhead 5.00. Order 100 units. Estimate: 300 kg RM @ 10.00 = 3,000.00; 50 h @ 30.00 = 1,500.00; overhead 10.00/h × 50 = 500.00; total 5,000.00. Actual: picking list 305 kg at weighted-average 10.20 = 3,111.00; route cards 46 h = 1,380.00; overhead 46 × 10.00 = 460.00; actual total 4,951.00. RAF 100 units posts Dr Finished goods 5,000.00 / Cr WIP 5,000.00. WIP before End: Dr 4,951.00, Cr 5,000.00, balance Cr 49.00. End posts: material quantity variance Dr 50.00 ((305 – 300) × 10.00), material price variance Dr 61.00 (305 × 0.20), labor quantity variance Cr 120.00 ((46 – 50) × 30.00), overhead quantity variance Cr 40.00; WIP cleared to 0.00; net variance Cr 49.00 (favorable). EUR equivalents are carried on each line at the posting-date rate (w12).
- **BR-21.8 Scrap.** Operation scrap compounds backward along the route: quantity to start at operation n = order qty / Π(1 – scrap_k) for k ≥ n, rounded up at each operation.
- **BR-21.9 Negative inventory.** Picking list posting that would drive on-hand negative is rejected unless the item model group allows physical negative inventory (w16 policy).
- **BR-21.10 Serial/batch at RAF.** A RAF line for a serial-tracked item must carry exactly qty_good serial numbers; duplicates across the tenant are rejected at 422 `SERIAL_DUPLICATE`.
- **BR-21.11 Split allocation.** With split ratio r = splitQty / order qty: posted consumption qty, route hours and WIP amounts move to the new order at round(x × r, 6) (quantities) and round(x × r, 2) (amounts); the rounding residual stays on the original. Each order's Σ WipPosting must equal its moved consumption after the transfer journal; property-tested.
- **BR-21.12 OCM change cost.** change_cost = Σ_new planned – Σ_old planned + surcharge(profile), where surcharge is a fixed amount or % of the delta; a negative delta still carries the fixed surcharge. Applying a change to an order whose scheduled jobs are firmed (w23) requires un-firming or the `ocm.forceReschedule` option.
- **BR-21.13 Trigger point evaluation order.** Trigger points on one operation evaluate in ascending sequence number; a trigger that inserts operations re-evaluates nothing on the inserted operations in the same feedback transaction (prevents loops). A trigger's function failing (e.g., no standard operation set) raises `TRIGGER_FUNCTION_FAILED` and does not block the journal post.
- **BR-21.14 As-built resolution.** Σ component serials assigned across finished serials ≤ component serials consumed on the order; one component serial belongs to exactly one finished serial; reversal of a RAF journal detaches the finished serial's record.

4.21.8 Acceptance criteria

- **AC-21.1** (FR-21.1) Given a released product with a 3-level BOM and a 4-operation route, when I create an order for 100 units, then the order has the exploded lines with phantoms flattened and quantities per BR-21.2.
- **AC-21.2** (FR-21.2) Given an order in Created, when I call `:start`, then I get 409 `PRODUCTION_ILLEGAL_TRANSITION`.
- **AC-21.3** (FR-21.3) Given an estimated order, when I read `/costs`, then planned material equals Σ line qty × unit cost from the active costing version to 4 decimals.
- **AC-21.4** (FR-21.5) Given a Started order with `start`-flushed lines, when I RAF 100 units with proportional consumption, then consumed quantities equal BOM qty × 100 × (1 + scrap%) exactly (wave proof).
- **AC-21.5** (FR-21.7) Given a batch-tracked finished item, when I post RAF without a batch, then the post fails with 422 and no inventory transaction is created.
- **AC-21.6** (FR-21.8) Given the BR-21.7 fixture, when I end the order, then the four variance rows total –49.00 and the WIP account balance for the order is 0.00.
- **AC-21.7** (FR-21.8) Given a partially RAF'd order (60 of 100) ended with duty, then remaining WIP equals posted consumption – 60 × standard cost and reconciles to the GL WIP account.
- **AC-21.8** (FR-21.9) Given an order in ReportedAsFinished whose finished goods were already shipped, when I reset to Started, then the reset is refused with `REVERSAL_BLOCKED_DOWNSTREAM`.
- **AC-21.9** (FR-21.10) Given an operation on a Vendor resource, when I release the order, then a PO line exists for the vendor with the operation quantity and due date.
- **AC-21.10** (FR-21.12) Given 500 Released orders, when I bulk-start them, then the batch completes in < 5 min and the report lists per-order results.
- **AC-21.11** (FR-21.15, BR-21.11) Given a Started order of 100 with 305 kg consumed and 20.00 h posted, when I split 40 units with proportional allocation, then the new order shows 122.000000 kg and 8.00 h, the original 183.000000 kg and 12.00 h, and both WIP balances reconcile to the GL.
- **AC-21.12** (FR-21.16, BR-21.12) Given a Released order whose BOM version was superseded by an ECO adding one line, when I preview `:apply-change`, then the delta lists the added line and a change cost equal to the line's planned cost plus the profile surcharge; applying it re-explodes without touching consumed lines.
- **AC-21.13** (FR-21.17) Given a trigger point "qty_error > 0 → insert rework operations R10, R20", when a job card posts 3 error units, then operations 25 and 26 (renumbered) exist after the current operation and are scheduled forward.
- **AC-21.14** (FR-21.19, BR-21.14) Given an order for 2 serialized units consuming 2 serialized motors, when RAF assigns motor M-1 to unit S-1 and M-2 to S-2, then the as-built inquiry for S-2 returns M-2 and the where-used of M-1 returns S-1.
- **AC-21.15** (FR-21.20) Given a rework order for 5 units of FG-100 with 2.00 h of rework at 30.00/h, when ended, then a variance of type `rework` of 60.00 is posted and the 5 units are received at their existing unit cost.

4.21.9 Test plan and fixtures

Fixtures: `prod-orders-50` (50 orders with known consumptions, standard and weighted-average items, generated from the demo plant BOMs; expected WIP and variance postings in a reviewed XLSX); `prod-bom-7level` (from wave 9); `prod-state-machine` (table of all 9×9 transition pairs with expected result); `prod-subcontract-5`.

Test	Type	Target	Pass criterion
State machine	property (Go rapid)	transitions	every illegal transition rejected, every legal one posts expected entries
Settlement fixtures	unit	`settle()`	50/50 orders match workbook to the cent
Backflush	unit	RAF proportional	consumed = BOM × qty × (1+scrap)
Posting contract	contract	ledger/inventory APIs	journals produce balanced entries, idempotent on replay
Period control	contract	journal post	closed period rejected on every journal type
Order E2E	Playwright	create→end	demo order ends with 0 WIP
Journal post latency	performance	200-line picking list	p95 < 2 s

Reconciliation: Σ open-order WIP = GL WIP control account; Σ RAF value = inventory receipts from production (w16) for the period; Σ variances = GL variance accounts.

4.21.10 Deployment and operations

Helm chart `production` (Go service, 3 replicas, HPA on CPU 70%), `production-db` (CloudNativePG, 2 instances, 100 GB). Config: `PRODUCTION_RAF_TOLERANCE_PCT` (0), `PRODUCTION_OVERCONSUMPTION_PCT` (10), `PRODUCTION_AUTOSTART_ON_FEEDBACK` (true). Migrations via Atlas from entity metadata. Feature flags: `prod.subcontracting`, `prod.coproduct-basic`. Scheduled jobs: nightly `wip-reconcile` (Temporal, 02:00 tenant local), `cancel-stale-created-orders` (weekly). SLOs: create p95 < 300 ms; transition p95 < 500 ms; journal post p95 < 2 s; availability 99.9%. Alerts: WIP reconciliation delta ≠ 0 (page); journal post error rate > 1% 5 min (warn). Runbook: "WIP delta" — list orders with unbalanced WipPosting, check outbox lag, replay. Rollback: Argo CD to prior digest; migrations are additive within the wave.

4.21.11 Migration from AX / SAP

Source	Passage entity	Notes
ProdTable (AX) / AUFK+AFKO+AFPO (SAP)	ProductionOrder	status map per FR-21.2; only open orders (status < Ended / not TECO)
ProdBOM / RESB	ProductionBomLine	qty_required recomputed; consumed qty from InventTrans / MSEG 261
ProdRoute, ProdRouteJob / AFVC, AFVV	ProductionOperation, ProductionJob	reported hours from ProdRouteTrans / AFRU
ProdJournalTable+Bom/Route/Prod / AFRU, MSEG	ProductionJournal (history)	posted journals loaded read-only, no re-posting
ProdCalcTrans / CO cost itemization	CostEstimate (planned), WipPosting (actual, as opening balance)	WIP opening = Σ actual − Σ RAF value, posted as one opening journal per order

Validation: per-order WIP opening = legacy WIP report (AX ProdCalcTrans actual, SAP KKAX) within 0.01; counts of open orders by status match. Not migrated: ended/TECO orders (go to the lakehouse via w46 history load), production pools, legacy posting-profile accounts (re-mapped to the new chart). Recommended cutover: end all orders in legacy that are ≥ 95% complete.

4.21.12 Dependencies, risks, open questions

Depends on: w9 BOM/route explosion and resources; w16 inventory transactions and statuses; w11 posting API; w14 period control; w17 PO creation; w20 costing versions and standard cost.

Risk	Likelihood	Impact	Mitigation
Variance semantics differ between AX (4 types) and SAP (price/quantity/resource-usage/lot-size/…)	High	Medium	Ship AX's four; document SAP mapping; w39 adds decomposition
Backflush under weighted-average produces cost at post time not at End	Medium	Low	Revalue at End using inventory close (w20) settlement

Open questions: (1) Should Cancelled be exposed for Released orders with reservations? Default yes with automatic un-reserve; decide by wave 21 mid-point. (2) Co-product basic allocation in w21 or defer entirely to w24? Default defer; decide at w21 kickoff.

4.21.13 Parameters and setup

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
Production order number sequence	legal entity	sequence ref	`production-order`	any w5 sequence	Numbers new orders	Production control parameters → Number sequences	CORU/OPJH number ranges per order type (CO82)
Default reservation policy	site	enum	`released`	none / estimated / released / started	When BOM-line reservations are created	Production control parameters → General → Reservation	Order type-dependent parameters OPL8 (reservation/purchase req. creation)
RAF tolerance %	site	numeric(5,2)	0	0–100	Max over-delivery on RAF	Production parameters → Report as finished → Accept error / over-delivery	Overdelivery tolerance in material master (MARC.UEETO) / order
Over-consumption tolerance %	site	numeric(5,2)	10	0–1000	Picking beyond required qty before duty is needed	Production parameters → Journals → Over-consumption	None native (user status / exit)
Auto-start on feedback	site	bool	true	true/false	Route card on a non-Started order starts it	Production parameters → Status update → Auto-start	Confirmation parameters OPK4 → "Set order status PCNF/CNF automatically"
End jobs on last RAF	site	bool	true	true/false	Sets endJob on all jobs at final RAF	ProdParmReportFinished.EndJob	Final confirmation flag (AFRU.AUERU)
Estimate on create	site	bool	false	true/false	Runs `:estimate` immediately after creation	Production parameters → Estimation on creation	Preliminary costing at order creation (OPL8 costing variant)

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
Picking-list proposal default	site	enum	`remaining`	remaining / proportional / none	Default journal proposal mode	ProdParmBOMConsumption → Quantity	Backflush indicator (MARC.RGEKZ / work center)
Route-card proposal basis	site	enum	`remaining`	remaining / proportional	Default hours proposal	ProdParmRouteConsumption	Confirmation proposal (OPK4 → propose quantities/activities)
Posting profile	legal entity	table	per item group × site	item group, site, All	Ledger accounts per posting type	Production posting profiles (ProdPosting)	OBYC keys GBB-VBR/AUF, WIP via results analysis OKG1–OKG4
Variance accounts per type	legal entity	table	per posting profile	account per variance type	GL account for lot-size/qty/price/substitution/rework	ProdPosting variance accounts	Variance categories OKV1, settlement profile
Period control for Production module	legal entity	ref	w14 module `PROD`	open/closed per period	Blocks journal posting in closed periods	Ledger calendar module access	Posting period OB52 (MM/CO)
OCM profile	item group × site	enum	`manual`	automatic / manual / none	FR-21.16 behavior	n/a	OCM change profile (COCM profiles)
OCM change-cost surcharge	tenant	amount or %	0	≥ 0	Added to change cost	n/a	Change cost in OCM profile
Trigger points enabled	site	bool	false	true/false	FR-21.17 evaluation	n/a	OPMP standard trigger points
Split allocation default	site	enum	`proportional`	proportional / keep-on-original	FR-21.15 allocation	ProdSplit dialog	CO02 split dialog
Rework capitalize	legal entity	bool	false	true/false	FR-21.20 cost treatment	n/a	Settlement rule of rework order (CO07)
As-built required	item tracking policy	bool	false	true/false	FR-21.19 End enforcement	n/a	Serial number profile (OIS2) procedure PPAU/PPRL
Status transition duties	tenant	duty map	per 4.21.17	duties	Which duty each `:command` needs	Security roles on ProdTable menu items	Authorization object C_AFKO_AWK per status/activity

4.21.14 Inquiries and reports

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
Production orders list	list inquiry	status, site, product, delivery date range, origin, saved view	order, item, qty, remaining, status, dates, planned/actual cost	`production.order_summary`	ProdTable list page	COOIS (order headers)
Production order detail / status log	drill-down	order id	header, lines, operations, jobs, journals, status log with actor/trace id	order aggregate	ProdTable form, ProdTable status log	CO03, order status log (AFKO status, JEST)
Cost analysis per order	drill-down	order, cost group	planned, actual, variance, variance %, drill to journal entry	`production.cost_view`	ProdCalcTrans "Price calculation" inquiry	CO03 → Cost analysis (KKBC_ORD)
Production journals	list inquiry	journal type, date range, posted/unposted, order	journal number, type, posting date, lines, journal entry id	ProductionJournal	ProdJournalTable inquiries (Picking list, Route card, Job card, RAF)	CO14 confirmation display, MB51 (movement types 261/101)
Operations overview	list inquiry	site, resource, status, date range	order, oper, resource, planned/reported hours, qty good/error, status	ProductionOperation	ProdRoute inquiry "Operations"	COOIS (operations), CO26
WIP balance by order	operational report	site, as-of date, status	order, posted consumption, posted RAF value, WIP balance, GL WIP account delta	WipPosting	SSRS ProdCalcTrans (WIP), "Production orders in process"	KKAO/KKAX WIP calculation list, S_ALR_87013127
Variance report	operational report	period, site, item group, variance type	order, variance type, cost group, amount, % of planned	Variance	SSRS "Production variance" (ProdVariance)	KKS1/KKS2 variance report, S_ALR_87013139
Material shortage / release check	list inquiry	order selection	line, item, required, available, short qty	ProductionBomLine × on-hand (w16)	Release warning list, "Missing materials"	CO24 missing parts list, CO09 availability
Subcontract operations	list inquiry	vendor, status, due date	order, oper, vendor, PO line, qty, price, receipt status	ProductionOperation.subcontract	Vendor resource operations (ProdRoute)	ME2O subcontracting stock monitor, COOIS (external ops)
Order change management worklist	list inquiry	site, OCM status	order, ECO, delta count, change cost, profile	OrderChangeRecord	n/a	COCM / COCM1 worklist
As-built / where-used by serial	drill-down	finished serial or component serial	serial tree, order, posting date	AsBuiltRecord	InventTrans serial trace	IQ09 / serial number history
Production order throughput KPI	KPI	site, period	orders ended, on-time %, average cycle days, scrap %	`production.order_kpi` (w46)	n/a (BI)	SAP MC.* PP information system (MCP1/MCP3)

4.21.15 Printed and electronic documents

Document	Trigger	Layout elements	Formats	Numbering sequence	Legal / retention requirement
Picking list	Release, journal create, manual print	Header: order, item, qty, site/warehouse, dates; line: line no., item, variant, qty required/issued, location, batch/serial, barcode; footer: signatures, page x/y	PDF (w5 document service), email, print queue	`prod-doc` per legal entity	None statutory; keep with order 7 years where production records are GxP (w24 EBR)
Job card	Release, re-print	Header: order, operation, resource, scheduled start/end; line: job type, planned hours, qty; barcode (GS1 `(90)jobId`) for kiosk scan	PDF, print queue	`prod-doc`	None
Route card	Release	Header: order, route version; line per operation: resource, setup/run time, scrap %, instructions	PDF	`prod-doc`	None

Document	Trigger	Layout elements	Formats	Numbering sequence	Legal / retention requirement
Production order summary (shop packet)	On demand	Header, BOM lines, operations, documents (w5 attachments list), QR code to order	PDF	`prod-doc`	None
Rework instruction	Rework order release (FR-21.20)	Reference order/batch/serial, defect reason, rework operations	PDF	`prod-doc`	Kept with original order record
Order change notice	OCM apply (FR-21.16)	ECO id, before/after lines and operations, change cost, approver	PDF, email to planner	`prod-doc`	None
Subcontract dispatch note	Release of subcontract operation	Vendor, PO line, components shipped, qty, due date	PDF, email, EDI DESADV via w35	`prod-doc`	Customs / transit documents in w34 where goods cross borders
Electronic order events	Each status change / journal post	CloudEvents on Kafka (4.21.5)	JSON	n/a	Retained 7 years in Iceberg (w46)

4.21.16 Periodic and batch jobs

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
`wip-reconcile`	daily 02:00 tenant local	legal entity	Compares Σ WipPosting per order vs GL WIP account; writes ReconcileRun row; re-runnable	< 5 min per 50k open orders	Per-entity failure isolates; retries 3×	Delta ≠ 0 pages on-call
`bulk-status-update` (Temporal)	on demand	order id batches of 50	Idempotency-Key per batch; per-order result rows	500 orders < 5 min	Continue-on-error, per-order status	Error rate > 5% warns
`cancel-stale-created-orders`	weekly Sunday 03:00	site	Orders Created > N days (param, 90) without estimate → Cancelled; checkpoint per 1,000	< 2 min	Skip orders with origin PlannedOrder	Count cancelled reported
`ocm-detect`	on ECO event + daily 04:00	site	Marks orders whose snapshot version is superseded; idempotent by (order, ECO)	< 1 min per 10k orders	Logs and continues	Worklist size > 500 warns
`subcontract-accrual`	month-end (w14 close task)	legal entity	Accrues received-not-invoiced subcontract ops; reversal next period	< 3 min	Blocks close task on failure	Close checklist
`order-cost-snapshot`	daily 23:30	legal entity	Snapshots planned vs actual per open order for trend KPI; upsert by (order, date)	< 5 min	Non-blocking	Missing snapshot warns
`auto-end-fully-reported`	daily 22:00 (opt-in)	site	Ends orders with qty_raf = qty and no open journals; param `autoEnd.enabled`	< 5 min	Per-order errors listed	Report emailed to supervisor

4.21.17 Security duties and privileges

Duty	Privileges (entry points)	Segregation-of-duties conflicts	Default roles
View production orders	GET /production/orders*, order list and detail screens, status log	none	Production supervisor, Planner, Cost accountant, Shop floor supervisor
Maintain production orders	POST/PATCH /production/orders, `:estimate`, `:schedule`, order BOM editor (FR-21.18 pre-release)	with *Post production journals* when the same user also approves cost (w39 cost approval)	Production supervisor, Planner
Release production orders	`:release`, `:start`, `:cancel`, `:reset-status`, `:bulk-status`, `:split`, `:merge`	with *End production orders* for the same order (release and settle) — flagged, not blocked	Production supervisor
Post production journals	POST /production/orders/{id}/journals, `:post`, journal editor	with *Maintain production setup* (posting profiles)	Production supervisor, Shop floor supervisor, Kiosk service account (w25)
Post production over-consumption	journal post beyond tolerance	—	Production supervisor
End production orders	`:end`, `end with zero output` (separate privilege), settlement	with *Maintain production setup*; with *Post production journals* flagged	Production supervisor, Cost accountant
End production order with zero output	`:end` when qty_raf = 0	—	Cost accountant
View production costs	GET /production/orders/{id}/costs, cost analysis, variance report	none	Cost accountant, Controller, Production supervisor
Maintain production setup	posting profiles, parameters (4.21.13), OCM profiles, trigger points	with *Post production journals*, *End production orders*	ERP administrator, Cost accountant (posting profiles only)
Maintain order BOM after release	FR-21.18 edits on Released orders	with *Release production orders* flagged	Production engineer
Apply order change	`:apply-change` (FR-21.16)	none	Planner, Production engineer
Create rework orders	FR-21.20 create/release	none	Production supervisor, Quality engineer (w33)

4.21.18 Message catalog

Code	Severity	User text	Cause	Remediation	Raised by
PROD-0001	error	Transition {from} → {to} is not allowed for order {order}.	Illegal state-machine transition	Use an allowed command; see status log	BR-21.1 (`PRODUCTION_ILLEGAL_TRANSITION`)
PROD-0002	error	Posting date {date} is in a closed period for Production.	Period closed in w14 period control	Change posting date or reopen period	BR-21.3 (`PERIOD_CLOSED`)
PROD-0003	error	Order {order} was changed by another user. Reload and retry.	Stale version on PATCH	Reload	BR-21.4
PROD-0004	error	Reset is blocked: inventory from journal {journal} has been consumed downstream.	Reversal would drive on-hand negative	Reverse the downstream issue first	BR-21.5 (`REVERSAL_BLOCKED_DOWNSTREAM`)
PROD-0005	warning	Release with shortages: {n} lines short (first: {item} short {qty}).	On-hand < required at release	Release anyway, or wait/expedite supply	FR-21.4
PROD-0006	error	Release blocked: line {line} item {item} is not released in {legalEntity}.	Unreleased product	Release the product (w8)	FR-21.4
PROD-0007	error	Consumption {qty} exceeds required {required} plus tolerance {pct}%.	Over-consumption without duty	Reduce qty or obtain duty	FR-21.5

Code	Severity	User text	Cause	Remediation	Raised by
PROD-0008	error	RAF quantity {qty} exceeds remaining {remaining} plus tolerance.	Over-delivery	Reduce qty or raise tolerance	FR-21.7
PROD-0009	error	Serial {serial} already exists in this tenant.	Duplicate serial at RAF	Use a unique serial	BR-21.10 (`SERIAL_DUPLICATE`)
PROD-0010	error	Tracking dimension {dim} is required for item {item}.	Missing batch/serial	Enter batch/serial	FR-21.7
PROD-0011	error	Picking would drive on-hand of {item} at {location} negative ({qty}).	Negative inventory not allowed	Receive stock or change location	BR-21.9
PROD-0012	error	Cannot end: {n} journals are unposted.	Open journals at End	Post or delete the journals	FR-21.8
PROD-0013	error	Cannot end with zero output without the duty "End production order with zero output".	qty_raf = 0	Obtain duty or RAF	FR-21.8
PROD-0014	warning	{n} subcontract operations have no vendor invoice; cost will be accrued at PO price.	Uninvoiced subcontract ops at End	Accept accrual or wait for invoice	FR-21.10
PROD-0015	error	Split quantity {qty} is below the minimum order quantity {min} or not a multiple of {multiple}.	Invalid split	Adjust split quantity	FR-21.15
PROD-0016	error	Merge refused: order {order} has posted journals.	Merge precondition	Only merge unposted orders	FR-21.15
PROD-0017	info	A newer BOM/route version exists (ECO {eco}); change cost {amount}.	OCM detection	Preview and apply the change	FR-21.16
PROD-0018	error	Configuration drift: the model change no longer yields this order's configuration.	OCM on configured product	Review configuration manually	FR-21.16 (`OCM_CONFIG_DRIFT`)
PROD-0019	warning	Trigger point {tp} on operation {oper} failed: {reason}. Journal was posted.	Trigger function failure	Fix the trigger setup and re-run	BR-21.13 (`TRIGGER_FUNCTION_FAILED`)
PROD-0020	warning	{n} component serials are not assigned to a finished serial.	Unresolved as-built at End	Assign on the order's as-built tab	FR-21.19
PROD-0021	error	As-built assignment is required for item {item} before End.	`asBuiltRequired` policy	Assign component serials	FR-21.19
PROD-0022	error	Bulk status update: {succeeded} succeeded, {failed} failed; see result list.	Partial batch failure	Open result list and retry failed orders	FR-21.12

4.21.19 Performance budgets and capacity

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation under 3× load
Create order (explode 7-level, 2,000 components)	2,000 orders/tenant/day; peak 50/min	150 / 300 / 800 ms	100 creates/s per 3 replicas	2,000 × 365 × ~40 rows × 0.5 KB ≈ 15 GB	ProductionOrder (tenant, legal_entity, status, delivery_date); lines by order_id	Queue creates behind HPA scale-out; p95 ≤ 2 s
Status transition	10,000/day; peak 500/min (bulk)	100 / 500 / 1,000 ms	200/s	StatusLog 10k × 365 × 0.3 KB ≈ 1 GB	advisory lock per order	Bulk batches throttle to 50 concurrent
Journal post (200 lines)	5,000 journals/day; peak 100/min	600 ms / 2 s / 4 s	50 posts/s	ProductionJournal + lines + WipPosting ≈ 20 GB	unique (tenant, idempotency_key); hash partition by legal entity at > 50M rows	Serialize per order; shed with 429 above 3× for > 60 s
Cost view read	20,000/day	80 / 300 / 600 ms	300/s	n/a (projection)	materialized `cost_view` refreshed on journal.posted	Serve last snapshot with staleness header
Order list (saved view, 50 rows)	100,000/day	100 / 300 / 600 ms	500/s	n/a	covering index + keyset pagination	Reduce page size to 25
wip-reconcile	nightly over 50k open orders	n/a	50k orders in < 5 min	ReconcileRun 365 rows/entity	batch by legal entity	Runs serially per entity; alerts if > 15 min
Event publishing (outbox)	50,000 events/day	lag p95 < 1 s	1,000 events/s	Kafka retention 7 days; Iceberg forever	Debezium outbox per DB	Lag alert at 30 s; consumers idempotent

4.21.20 Localization and compliance hooks

- **Period control and fiscal calendars**: journal posting dates obey the legal entity's fiscal calendar (w14) including 4-4-5 and non-January year starts; no production-specific statutory calendars.
- **Currency rounding**: WIP and variance amounts post in the legal entity's accounting currency with the w12 rounding rule (0.01 USD/EUR; 1 JPY; 0.05 CHF cash rounding does not apply to GL postings); EUR reporting-currency amounts carried per line.
- **Statutory production reporting**: none in v1. Country packs (wave 48) may add production statistics extracts (e.g., EU PRODCOM, Brazil Bloco K of SPED Fiscal, which needs consumption per order by NCM code) through the `production.statutory-extract` extension point on the `journal.posted` projection; Bloco K is registered as a wave 48 BR country-pack item.
- **Retention**: production journals and WIP postings are financial records — 7 years (configurable per legal entity, w48 retention policy); GxP plants extend to batch expiry + 1 year via the w24 EBR profile.
- **Language**: document templates (4.21.15) are per-language in the w5 document service; item descriptions print in the site's language with fallback to the tenant default.
- **Units**: metric/imperial dual display from w6 unit conversions; quantities stored in inventory UoM.
- **Privacy**: actor ids on StatusLog are Keycloak subject ids; worker names resolve at read time so GDPR erasure (w48) pseudonymizes without rewriting history.
- **Extension points**: `production.posting-profile.resolve` (OPA policy hook for country-specific account derivation), `production.document.render` (template override per country), `production.statutory-extract`.

4.21.21 Coverage closure

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
AX 12.22.1 Production control — Production order → Split / Group (ProdSplit) [AX #195]	PARTIAL-21	ADDED as FR-21.15	Split and merge with proportional WIP allocation (BR-21.11); AX stops at Released, Passage allows Started
SAP 13.21 PP — Rework (CO07 / trigger points CO31 / CO33) [SAP #245]	PARTIAL-21	ADDED as FR-21.17, FR-21.20	Trigger points insert rework operations or create rework orders; rework order semantics of CO07

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
SAP 13.21 PP — Order split (CO02 → split), order change management (OCM: COCM / COCM1) [#246]	PARTIAL-21	ADDED as FR-21.15, FR-21.16	Split per FR-21.15; OCM detection, delta preview and change cost per FR-21.16 / BR-21.12
SAP 13.21 PP Customizing — OPMP / OPM trigger points (TTRIG) [#249]	PARTIAL-21	ADDED as FR-21.17	Trigger point definitions on w9 route operations; parameter "Trigger points enabled" in 4.21.13
SAP 13.21 PP Customizing — OCM profiles (change profiles, change cost) [#252]	PARTIAL-21	ADDED as FR-21.16	OCM profile and surcharge parameters in 4.21.13; worklist in 4.21.14
SAP 13.32 LO-VC — CU51 / CU52 / CU55 / CU56 order BOM [#357]	PARTIAL-21	ADDED as FR-21.18	Order-specific BOM/route edits with audit diff and save-as-version; sales-order-level order BOM before order creation stays with wave 27
SAP 13.32 LO-VC Periodic — Re-explosion of configured orders after model change (OCM) [#363]	PARTIAL-21	ADDED as FR-21.16	Re-explosion through the configurator with `OCM_CONFIG_DRIFT` guard; `ocm-detect` job in 4.21.16
SAP 13.32 LO-VC Customizing — Order BOM settings (CU51 processing) [#364]	PARTIAL-21	ADDED as FR-21.18	Duty *Maintain order BOM after release* and OCM exclusion flag replace CU51 processing settings
SAP 13.33 Batch/Serial — Serial numbers at component level (as-built genealogy) [#368]	PARTIAL-21	ADDED as FR-21.19	AsBuiltRecord captured at picking/RAF; kiosk assignment in w25; inquiry in 4.21.14

4.22 Wave 22: Master Planning: MRP, MPS & Forecasting

4.22.1 Scope and business context

Wave 22 gives planners the engine that decides what to make, buy and move. Before it, orders are created by hand. After it, a nightly (or on-demand) plan nets all demand (sales orders, forecasts, safety stock, dependent demand, transfer demand) against all supply (on-hand, purchase orders, production orders, transfers, planned orders) level by level through the BOM, applying coverage groups and lead times, and produces planned purchase, production and transfer orders with action and futures/delay messages, each fully pegged to the demand it serves. Planners firm planned orders into real orders, and a statistical forecast (ETS/Croston) seeds demand with manual override and a consensus workflow. Out of scope: finite capacity (wave 23; wave 22 plans infinite), DDMRP buffers, multi-site network optimization, and ATP (wave 27 reuses the engine's supply picture).

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
Nightly MRP regeneration takes hours: AX ReqCalcTask on 50k items runs 3–6 h with helper threads contending on ReqTrans; SAP MD01 NEUPL regenerative run 2–4 h; Epicor Kinetic "MRP Full Regen" and Infor LN "Order Planning" routinely 4+ h, so planners work on yesterday's plan	Row-at-a-time netting with database round trips per item; planned orders deleted and recreated in place	In-memory level-by-level engine with sparse buckets, snapshot per PlanVersion, pointer swap; dynamic net-change within 60 s of an order event	50k items 4 h → < 10 min; net change 4 h → 60 s
No live pegging: AX ReqTransCov is only populated during the run and lost on re-run; SAP MD04 pegged requirements (MD09) require multi-level order report and are unavailable for planned orders mid-run; Plex "Where Used/Demand" pegging is single-level	Pegging stored as a transient by-product of the run	Pegging rows persisted per version; `/pegging` explain tree to any depth; "Explain this plan" in the UI	Time to answer "why is this planned order here" 20 min → < 5 s; 100% of qty explained
Exception noise: SAP MD06 exception groups and AX action messages generate tens of thousands of rows planners ignore; Infor LN exception messages cannot be filtered by cause	Messages generated for every supply without fences or root-cause grouping; no deduplication	Action/futures fences per coverage group; messages grouped by root cause (one delayed PO → one message with propagated effects)	Messages per planner per run 5,000 → < 300; 90% of messages actionable (survey)
Non-deterministic results: AX plans differ run to run under helper threads; SAP parallel MRP (OMIQ) ordering varies, so planners cannot diff two runs	Parallel processing without stable ordering	Deterministic sort keys and plan hash; version-to-version diff API	Identical input → identical hash 100% of runs; diff of two versions in < 2 s
Forecast re-keying: AX ForecastSales grid vs D365 demand forecasting Excel round-trips; SAP MD61 PIR upload by LSMW; Epicor forecast import by CSV	Forecasting done outside the ERP and pasted back	Statistical baseline in the `forecast` service, in-grid override, consensus workflow, published as a version	Forecast cycle 2 days → 2 h; zero CSV round-trips

4.22.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Plan definition	ReqPlan (static/dynamic), ReqPlanVersion	MRP area, planning run parameters (MD01/MD02 processing keys NETCH/NEUPL)	Plan, PlanVersion	full
Coverage group	ReqGroup (ReqPOType: Requirement/Period/MinMax/Manual)	MRP type (PD/VB/ND), lot-sizing procedure (T438A: EX, TB, FX, WB), MRP group	CoverageGroup	full
Item coverage overrides	ReqItemTable	MARC MRP views 1–4 (DISMM, DISLS, EISBE)	ItemCoverage	full
Requirement transactions	ReqTrans (ReqRefType), ReqPO (planned orders)	MDTB (MRP list), PLAF (planned orders), MD04 stock/requirements list	Requirement, PlannedOrder	full
Pegging	ReqTransCov	Pegged requirements (MD09), order report	Pegging	improved (explain tree API)
Action messages	ReqTrans action (Advance/Postpone/Decrease/Increase/Derived)	Exception messages (MD06, groups 1–8)	ActionMessage	full
Futures/delay messages	ReqTrans futures date	Exception 10/15 (reschedule in/out), 30 (plan process according to schedule)	DelayMessage	full
Low-level codes	BOMCalcLevel / ReqCalcTask level loop	Low-level code (MARA.DISST)	Item.low_level_code	full
Forecast	ForecastSales, ForecastPurch, reduction keys, D365 demand forecasting (Azure ML)	PIR (MD61), consumption mode (MARC.VRMOD), flexible planning/SOP	ForecastLine, forecast service	full
MPS	Master scheduling via item coverage + planning time fence	MPS (MD40), MPS items (MRP type M0–M4)	plan scope `mps` with time fence	full
Firming	ReqTransPO firming to ProdTable/PurchTable	MD14/MD15 convert planned order	`:firm`	full
Intercompany planned orders	Intercompany master planning	Special procurement key 40/70	planned transfer orders only; intercompany in w40	partial

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Simulation / long-term planning	ReqPlan static plans as copies (ReqPlanVersion), forecast plan, D365 planning optimization "simulation"	LTP MS01–MS08, MS31–MS70 planning scenarios, simulative MRP, PURCHIS transfer; S/4 pMRP; APO /SAPAPO/MC01 planning versions	Plan kind `simulation` with ScenarioOverride (FR-22.15)	full
DDMRP buffers / priority-based planning	D365 priority-based planning (planning priority on coverage, ReqPlanningPriority)	S/4 DDMRP: buffer positioning, buffer profiles (PPH_DD_*), buffer level calculation, replenishment planning Fiori apps	Coverage code `ddmrp`, DdmrpBuffer, BufferProfile (FR-22.16)	full
Quota arrangements	Item coverage vendor + "intercompany/transfer" source; no percentage split	MEQ1/MEQ3/MEQ4/MEQ6/MEQ8, quota arrangement (EQUK/EQUP), source list rules (TMQ1)	QuotaArrangement (FR-22.17)	full
MRP areas (sub-site planning)	Warehouse-level coverage (ReqItemTable by InventDim warehouse)	MRP areas OMIZ (MDLV, MDLG, MDLW), storage location and subcontractor MRP areas	Planning scope `warehouse` and `subcontractor` (FR-22.18)	full
Planning strategies	Coverage code + forecast reduction keys (ReqReduceKey) + pegged supply BOM lines	Strategy groups OPPS/OPPT (T461S, T461P), requirements types/classes (OVZG/OVZH), consumption mode MARC.VRMOD	PlanningStrategy (FR-22.19)	full
Shelf-life planning	Shelf-life on InventBatch, master planning "Use shelf life" (PdsShelfLife on coverage)	PP/DS shelf-life planning (SAP_PP_SL001)	Shelf-life aware pegging (FR-22.20)	full
Supply schedule workbench	ReqSupplySchedule (Supply schedule form, R3), SSRS supply schedule report	MD04 period totals, MD07 collective list	Supply schedule screen (FR-22.21)	full
Inventory forecast	ForecastInvent (Inventory forecast inquiry)	MD04 projected available stock, MS04 simulation	InventoryForecast projection (FR-22.22)	full

4.22.3 Functional requirements

- **FR-22.1 Plan versions** — Must. The system shall run a plan as a batch job (Temporal) that snapshots inputs into a PlanVersion and writes outputs there, swapping the "current" pointer atomically on success.
  - Notes: Two plan kinds, `static` (nightly, full regeneration) and `dynamic` (net-change, triggered by order events within 60 s, limited to affected items). Regeneration deletes unfirmed planned orders of the version; firmed ones are supply. Max 20 retained versions per plan; older ones purged by nightly job.
- **FR-22.2 Coverage groups** — Must. The system shall support coverage codes Requirement (lot-for-lot), Period (coverage time fence in days, orders grouped per period), Min/Max (reorder to max when PAB < min) and Manual (no planned orders, only messages), with safety stock, positive/negative days, coverage time fence, firming time fence, freeze time fence, action and futures message settings.
  - Notes: Defaults: coverage time fence 100 days, negative days 1, positive days 0 (ignore existing supply earlier than requirement when 0 means unlimited; AX semantics documented in BR-22.4), firming fence 0, freeze fence 0. SAP mapping: PD→Requirement/Period; VB→Min/Max with reorder point = min; ND→Manual.
- **FR-22.3 Netting algorithm** — Must. The system shall compute net requirements per BR-22.1 and produce planned orders with order type by the item's default order settings (purchase, production, transfer, kanban).
- **FR-22.4 Lot sizing** — Must. The system shall apply minimum, maximum, multiple and standard order quantities from default order settings per site, and period grouping.
  - Notes: After rounding up to multiple, if the result exceeds maximum, split into ⌈qty/max⌉ orders. Max 1,000 splits per requirement.
- **FR-22.5 Lead time and calendars** — Must. The system shall offset dates by purchase lead time (vendor-specific from trade agreements, else item), production lead time (route-based: Σ operation times at infinite capacity, else item lead time), transfer lead time, plus safety margins (receipt, issue, reorder margins) using the site's working calendar.
- **FR-22.6 Pegging** — Must. The system shall record Pegging rows linking each unit of supply to the demand it covers, FIFO by requirement date then by priority (sales order > forecast > safety stock), and expose an explain tree.
- **FR-22.7 Action and delay messages** — Must. The system shall generate Advance, Postpone, Decrease, Increase, Cancel and Derived actions for existing supply, and Futures/Delay messages when a planned date falls before today (plus the delay propagates upward to the demand).
- **FR-22.8 Forecast and reduction** — Must. The system shall accept forecast lines by item/site/period (and allocation keys) and reduce them by sales orders using reduction principles: none, percent per period, transactions (forecast minus open orders in the period), transactions-dynamic period.
- **FR-22.9 Statistical forecast** — Should. The system shall generate a baseline forecast per item/site from 24+ months of history using ETS (seasonal/non-seasonal selected by AICc) or Croston/TSB for intermittent items (ADI > 1.32), via the Python `forecast` service, with MAPE/wMAPE reported per item.
  - Notes: Batch for 50k items < 15 min. Manual override per cell; consensus workflow (Temporal approval) locks the forecast version.
- **FR-22.10 Firming** — Must. The system shall firm a planned order into a ProductionOrder (`:estimate` optional), PurchaseOrder line (grouped by vendor/date per setting) or TransferOrder, preserving pegging to the firmed supply.
- **FR-22.11 Planned order maintenance** — Must. The system shall allow planners to change quantity/date/vendor on a planned order, approve it (becomes firmed on next run), or delete it.
- **FR-22.12 Net requirements view** — Must. The system shall show per item/site the MD04-style time-phased list: period, gross requirements, scheduled receipts, planned receipts, PAB, net requirement, with drill to pegging.
- **FR-22.13 Plan scope** — Should. The system shall support plan filters by site, item group, planner, low-level-code range, and `mps` scope (MPS items only; MRP uses MPS output as fixed supply).
- **FR-22.14 Determinism** — Must. The system shall produce byte-identical outputs for identical inputs; the plan hash is emitted in `plan.completed`.
- **FR-22.15 Simulation plans and planning scenarios** — Should. The system shall run plans of kind `simulation` that read the same snapshot inputs as an operational plan but apply a ScenarioOverride (demand source = a named forecast version or demand program, demand multipliers by item group, added/removed sales demand, BOM/route version effective date, lead-time and capacity overrides, starting inventory as of a date), write to their own PlanVersion, never firm or emit action messages to operational consumers, and offer evaluations: rough-cut capacity load per resource group and period (using route-based times, or w23 finite load with flag), purchase volume by vendor × period (value at trade-agreement price), and inventory value projection.
  - Notes: Up to 10 active scenarios per plan; each scenario may run as many times as needed (versions retained per FR-22.1). Simulation results can be copied into a forecast version (LTP "transfer to PURCHIS"/vendor information) and published to suppliers via the w20 supplier portal as a non-binding forecast. pMRP-style rough simulation is the scenario run with `bucket=week` and `bomDepth=1..n` limit for speed (≤ 2 min for 50k items at depth 2). Planned orders in a simulation version carry `simulation = true` and are rejected by `:firm` with 409 `PLAN_SIMULATION_NOT_FIRMABLE`. Version-to-version diff (FR-22.14 hash, diff API) works across a scenario and the current operational version.
- **FR-22.16 DDMRP buffers and priority-based planning** — Should. The system shall support coverage code `ddmrp` for items marked as decoupling points (strategic buffers), computing per item/site: average daily usage (ADU, rolling past and/or forward window), decoupled lead time (DLT), buffer zones per BufferProfile (lead-time factor, variability factor, minimum order cycle, minimum order qty) — red base = ADU × DLT × LTF, red safety = red base × VF, yellow = ADU × DLT, green = max(ADU × DLT × LTF, MOQ, ADU × order cycle) — and planned orders by the net-flow equation (BR-22.11), with planning priority = net-flow position / top of green (TOG) used to sort planned orders and the planner worklist.

    - Notes: Buffer positioning is set per item coverage (`decouplingPoint = true`); DLT is the longest unprotected lead-time path through the BOM to the next decoupling point or purchase (computed from w9 BOM and lead times). Order-spike threshold (default 50% of red zone) and horizon (default DLT) qualify spikes into qualified demand. Dynamic adjustment factors (planned adjustment factor per period, e.g., seasonal ramp) multiply ADU. Non-buffered items below a decoupling point are planned by standard MRP. Buffer recalculation runs nightly (4.22.16). Priority-based planning (D365) uses the same priority field: coverage groups with `priorityBased = true` replace date-ordering with priority ordering for planned-order generation within the horizon.
- **FR-22.17 Quota arrangements** — Should. The system shall split net requirements of an item/site across sources defined in a QuotaArrangement (valid from/to; sources: vendor, own production with production version, transfer from site/warehouse; quota per source; quota base qty; maximum quantity per period; minimum lot per source) by quota rating = (allocated qty + base qty) / quota, assigning each planned order to the source with the lowest rating, optionally splitting a single requirement across sources (`split = true`, SAP quota "splitting quota").
    - Notes: Allocated qty accumulates from firmed and open orders created against the arrangement (purchase orders, production orders, transfer orders carry `quota_arrangement_id`). Sources with quota 0 are used only when all others are blocked (e.g., trade agreement expired). Quota arrangement analysis shows planned vs actual split by source for the validity period. Takes precedence over the item coverage default vendor; trade-agreement lead times apply per chosen source.
- **FR-22.18 Planning scope by warehouse and subcontractor (MRP areas)** — Should. The system shall plan items at site level (default) or at warehouse level when item coverage exists for that warehouse (MRP area), with warehouse-level demand and supply netted separately and replenished from the site by planned transfers or by direct purchase/production per the warehouse's coverage; and shall plan components provided to a subcontractor (w21 FR-21.10 vendor operations) in a subcontractor planning scope per vendor, creating planned transfer (provision) orders to the vendor location.
    - Notes: A warehouse in its own planning scope is excluded from site-level netting. Subcontractor scope requires the vendor to have a w16 vendor-location warehouse (consignment-out type). Planning scope is a field on ItemCoverage (`site`, `warehouse`, `subcontractor`).
- **FR-22.19 Planning strategies** — Should. The system shall assign a PlanningStrategy to item coverage that controls how forecasts and sales demand interact: `mts-net` (SAP 10: forecast is demand, sales orders reduce forecast per reduction principle), `mts-gross` (SAP 11: forecast planned regardless of on-hand), `mto` (SAP 20: no forecast; supply created per sales line and marked/pegged 1:1, segregated as order-specific stock when w16 sales-order stock dimension is active), `assemble-to-order-final` (SAP 40: forecast at the finished item consumed by sales orders with consumption mode backward/forward/backward-then-forward and consumption periods in days), `plan-without-final-assembly` (SAP 50/52: forecast plans components; finished item supply created only on sales demand), `subassembly` (SAP 70: forecast on the subassembly consumed by dependent demand).
    - Notes: Consumption window: backward days (default 30) and forward days (default 0); unconsumed sales demand beyond the window is added on top of forecast. `mto` and `plan-without-final-assembly` set `is_marking = true` on Pegging so the supply cannot be re-pegged by later runs. Strategies map from SAP strategy groups (T461P) on migration; AX customers map ReqReduceKey + coverage code combinations to the nearest strategy (mapping table in 4.22.11 addendum below).
- **FR-22.20 Shelf-life aware pegging** — Should. For items with shelf-life tracking (w24 FR-24.6) the planning engine shall treat batch on-hand and supply as usable for a demand only if expiry (or best-before, per item setting) – demand date ≥ the demand's required remaining shelf life (customer sellable days from w24 FR-24.19, else item default), creating planned supply for the shortfall and a `Expiring supply` message for batches that will expire unpegged.
- **FR-22.21 Supply schedule workbench** — Should. The system shall provide a period-bucketed (day/week/month) grid per item × site for a selection of items showing demand, supply, planned supply, PAB and safety stock per period, with inline creation of planned orders in a period cell, quantity edits, firming, and a printable supply schedule report.
- **FR-22.22 Inventory forecast** — Could. The system shall expose an InventoryForecast projection per item/site/period: projected on-hand = PAB at period end of the current plan version (or a chosen scenario), with value at current cost, and days-of-supply = projected on-hand / average daily demand of the next 30 days.

4.22.4 Data model

CoverageGroup: id, tenant_id, code (text, unique), coverage_code (enum), coverage_time_fence_days (int, default 100), negative_days, positive_days (int), safety_stock_policy (enum: today, first-issue), firming_fence_days, freeze_fence_days, action_fence_days, futures_fence_days, period_days (int, Period only), rescheduling_margin_days, generate_actions (bool), generate_futures (bool).

ItemCoverage: id, item_id, site_id, warehouse_id (nullable), coverage_group_id, min_qty, max_qty, safety_margin_receipt_days, lead_time_days (override), vendor_id (default), planned_order_type (enum).

PlanVersion: id, plan_id, number (int), kind (static/dynamic), snapshot_at (timestamptz), status (running/complete/failed/current), items_planned, planned_orders_count, messages_count, duration_ms, plan_hash (bytea, sha256).

Requirement (ReqTrans): id, plan_version_id, item_id, variant_id, site_id, warehouse_id, ref_type (enum: sales-line, forecast, safety-stock, bom-line, transfer-issue, on-hand, purchase-line, production-order, transfer-receipt, planned-order), ref_id, direction (demand/supply), qty (numeric 18,6, +supply/–demand), requirement_date (date), futures_date (date, nullable), low_level_code (int), priority (int).

PlannedOrder (ReqPO): id, plan_version_id, number, item_id, site_id, warehouse_id, order_type (purchase/production/transfer/kanban), qty, order_date, delivery_date, vendor_id, from_warehouse_id, status (enum: unprocessed, approved, firmed), firmed_target_type, firmed_target_id, bom_version_id, route_version_id, lot_rule_applied (text).

Pegging (ReqTransCov): id, supply_requirement_id, demand_requirement_id, qty, is_marking (bool).

ActionMessage: id, requirement_id, action (enum), suggested_qty, suggested_date, reason, delay_days.

ForecastLine: id, model_id, item_id, site_id, period_start, period_end, qty, source (statistical/manual/consensus), reduced_qty, version.

Invariants: Σ Pegging.qty per supply ≤ supply qty; Σ Pegging.qty per demand = demand qty when fully covered (else a `Cancel`-free shortage message exists); PAB(t) = PAB(t–1) + Σ supply(t) – Σ demand(t) for every period; only one PlanVersion per plan has status `current`.

Indexing: Requirement (plan_version_id, item_id, site_id, requirement_date); Pegging (demand_requirement_id), (supply_requirement_id); PlanVersion rows partitioned by plan_version_id (one partition per version, dropped on purge — avoids 50M-row deletes).

ScenarioOverride (FR-22.15): id, plan_id, name, demand_source (enum: operational, forecast-version, demand-program), forecast_version_id, demand_multipliers (jsonb: [{itemGroupId, factor}]), added_demand (jsonb lines), bom_effective_date (date), lead_time_overrides (jsonb), capacity_mode (enum: none, rough-cut, finite), start_inventory_as_of (date), bucket (enum day/week/month), bom_depth_limit (int, nullable), active (bool).

BufferProfile / DdmrpBuffer (FR-22.16): BufferProfile(id, code, item_type (manufactured/purchased/distributed), lead_time_factor numeric(5,3), variability_factor numeric(5,3), order_cycle_days int, spike_threshold_pct numeric(5,2) default 50, spike_horizon_days int nullable = DLT); DdmrpBuffer(id, item_id, site_id, warehouse_id, profile_id, adu numeric(18,6), adu_window_past_days int default 90, adu_window_future_days int default 0, dlt_days numeric(8,2), daf numeric(6,3) default 1, red_base, red_safety, yellow, green, top_of_red, top_of_yellow, top_of_green (numeric 18,6), calculated_at, manual_override (bool)).

QuotaArrangement / QuotaSource (FR-22.17): QuotaArrangement(id, item_id, site_id, valid_from, valid_to, split (bool), min_split_qty); QuotaSource(id, arrangement_id, source_type (vendor/production/transfer), vendor_id, production_version (bom_version_id, route_version_id), from_warehouse_id, quota numeric(9,4), base_qty numeric(18,6), allocated_qty numeric(18,6), max_qty_per_period, period_days, priority int).

PlanningStrategy (FR-22.19): code (enum per FR-22.19), consumption_mode (backward/forward/backward-forward), backward_days int default 30, forward_days int default 0, uses_marking (bool), segregated_stock (bool); ItemCoverage gains planning_strategy_code, planning_scope (site/warehouse/subcontractor), decoupling_point (bool), buffer_profile_id, required_shelf_life_days, priority_based (bool). PlannedOrder gains simulation (bool), planning_priority numeric(7,4), quota_source_id.

Invariants (additions): for a DdmrpBuffer, top_of_red = red_base + red_safety < top_of_yellow < top_of_green; for an active QuotaArrangement Σ quota of non-zero sources > 0 and validity periods of arrangements for the same item/site do not overlap; no PlannedOrder with simulation = true has status firmed.

4.22.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
POST	/api/v1/planning/plans/{planId}:run	Start plan (static/dynamic, scope filter)	Idempotency-Key; one running version per plan	Run master planning
GET	/api/v1/planning/plans/{planId}/versions/{v}	Version status, counts, hash	n/a	View planning
GET	/api/v1/planning/planned-orders?planId&status&site&itemGroup	List/filter planned orders	n/a	View planning
PATCH	/api/v1/planning/planned-orders/{id}	Change qty/date/vendor; approve	ETag	Maintain planned orders
POST	/api/v1/planning/planned-orders:firm	Firm up to 1,000 ids with grouping options	Idempotency-Key	Firm planned orders
GET	/api/v1/planning/net-requirements?itemId&siteId&planId	MD04-style time-phased view	n/a	View planning
GET	/api/v1/planning/planned-orders/{id}/pegging	Explain tree (depth ≤ 20)	n/a	View planning
GET	/api/v1/planning/messages?planId&type	Action/delay messages	n/a	View planning
POST	/api/v1/planning/forecasts/{modelId}:generate	Statistical forecast batch	Idempotency-Key	Maintain forecasts
PUT	/api/v1/planning/forecasts/{modelId}/lines	Bulk upsert manual lines	full replace per item/site/period	Maintain forecasts
GET	/api/v1/planning/coverage-groups	Setup	n/a	View planning setup

Event	Trigger	Payload fields	Consumers
`dev.passage.planning.plan.started.v1`	run begins	planId, versionId, kind, scope	analytics
`dev.passage.planning.plan.completed.v1`	version becomes current	planId, versionId, itemsPlanned, plannedOrders{purchase,production,transfer}, messages, durationMs, planHash	production, purchasing, scheduling
`passage.planning.planned-order.firmed.v1`	firm	plannedOrderId, orderType, targetId, qty, dates	production, purchasing, inventory
`dev.passage.planning.message.raised.v1`	message created	requirementId, refType, refId, action, delayDays	purchasing, sales (w27), notifications
`dev.passage.planning.forecast.published.v1`	consensus approved	modelId, version, items, horizonPeriods	planning run

4.22.6 User experience

Screen	Primary actions	Key fields/columns	Duty required
Master planning workspace	Run plan, view last run, tiles: delayed orders, actions, planned orders by type	Plan, version, status, duration, counts	View planning
Planned orders	Filter, approve, firm (grouped), change, delete, bulk	Number, item, site, type, qty, order/delivery date, vendor, status, delay	Maintain planned orders
Net requirements (MD04)	Time-phased grid, pegging drill, simulate (what-if qty change)	Period, GR, SR, PR, PAB, net req, messages	View planning
Action messages	Apply action to the source order (advance/postpone PO date), dismiss	Action, order, qty, date, suggested date, delay	Maintain planned orders
Forecast grid	Edit cells, generate statistical, submit consensus	Item, site, period columns, source badge, MAPE	Maintain forecasts
Coverage groups / item coverage	Setup	per data model	Maintain planning setup

Interaction rules: planned-orders grid supports keyboard range selection and `F` to firm; cell edits in the forecast grid validate ≥ 0 immediately; the net-requirements grid is virtualized to 365 periods × 20 columns; pegging tree lazy-loads children.

4.22.7 Business rules and edge cases

- **BR-22.1 Netting algorithm.** Per plan run:
  1. Snapshot inputs (on-hand by dimension at physical-available, open orders, forecasts after reduction, safety stock, item coverage, BOM/route versions as of each requirement date, calendars) into the PlanVersion.
  2. Assign low-level codes: LLC(item) = max over all active BOMs of the depth at which the item appears (finished items 0). Recomputed when any BOM changes (w9 event). Cycles are rejected at BOM activation.
  3. For LLC = 0 … max: for each item/site in that level, sort requirements by date then priority then ref id (determinism).
  4. Build time buckets by day; PAB_0 = on-hand – safety stock (policy `today`) or on-hand (policy `first-issue`, safety stock added as a demand on the first issue date).
  5. For each day t: PAB_t = PAB_{t–1} + SR_t + PR_t – GR_t. If PAB_t < 0 (Requirement/Period) or PAB_t < min (Min/Max), net requirement N = –PAB_t (or max – PAB_t).
  6. Lot-size N: Requirement → N; Period → aggregate N over the next `period_days`; Min/Max → max – PAB; then apply min/multiple/max/standard qty.
  7. Create planned order with delivery date t – receipt margin; order date = delivery date – lead time (working days); if order date < today → futures_date = today + lead time; raise Delay message with delay_days and propagate the futures date to pegged demand.
  8. Peg the planned order to the demand(s) that caused it, FIFO.
  9. Explode planned production orders: for each BOM line, create dependent demand Requirement (ref_type bom-line) on the item at date = order start (or operation start when route-based), qty per BR-21.2; these appear at a higher LLC and are processed in step 3 of that level.
  10. For existing supply earlier than its earliest pegged demand by more than positive_days (0 = unlimited) raise Postpone; later than demand by more than negative_days raise Advance; unpegged supply beyond the fence raises Cancel/Decrease.

11. Write outputs, compute plan hash over (planned orders, pegging, messages) sorted, mark version current.

- **BR-22.2 Worked example (3-level BOM, weekly buckets, today = Monday of week 1).** FG-100 (LLC 0) uses 2 × SA-200 (LLC 1) and 1 × RM-300; SA-200 uses 3 × RM-300, so RM-300 has LLC 2. Coverage: all Requirement; FG-100 lead time 1 wk, safety stock 10, on-hand 20; SA-200 lead time 1 wk, multiple 100, on-hand 50; RM-300 purchase lead time 2 wk, minimum 500, on-hand 200, open PO 300 due week 2. Demand: sales order 120 FG week 4; forecast 80 FG week 5.
  - FG-100: PAB_0 = 20 − 10 = 10. Week 4: 10 − 120 = −110 → planned production PP-1 110, due wk 4, start wk 3. Week 5: 0 − 80 = −80 → PP-2 80, due wk 5, start wk 4. Dependent demand: SA-200 220 wk 3, 160 wk 4; RM-300 110 wk 3, 80 wk 4.
  - SA-200: PAB_0 = 50. Week 3: 50 − 220 = −170 → multiple 100 → PP-3 200, due wk 3, start wk 2; PAB 30. Week 4: 30 − 160 = −130 → PP-4 200, due wk 4, start wk 3; PAB 70. Dependent RM-300: 600 wk 2, 600 wk 3.
  - RM-300: PAB_0 = 200. Week 2: 200 + 300 (PO) − 600 = −100 → min 500 → planned purchase PO-1 500 due wk 2, order date wk 0 < today → futures date wk 3, Delay message 7 days; PAB 400. Week 3: 400 − 600 − 110 = −310 → PO-2 500 due wk 3, order date wk 1 = today (no delay); PAB 190. Week 4: 190 − 80 = 110.
  - Propagation: PP-3 pegged to PO-1 inherits futures wk 3 → PP-3 cannot finish before wk 4 → PP-1 futures wk 5 → Delay message on sales order line (requested wk 4, expected wk 5, delay 7 days). Pegging explains 100% of each planned order: PP-1 → SO 110 of 120 (10 from on-hand after safety), PO-1 → PP-3 (100 of 500; 400 surplus unpegged, no Cancel because within coverage time fence).
- **BR-22.3 Forecast reduction.** `transactions` principle: reduced forecast for a period = max(0, forecast − Σ sales order qty in the period); periods are forecast-line periods, not calendar months.
- **BR-22.4 Fences.** Requirements inside the freeze fence generate no planned orders; inside the firming fence, planned orders are auto-firmed; action messages are generated only inside the action fence; futures messages only inside the futures fence.
- **BR-22.5 Safety stock replenishment date.** With policy `today`, the safety-stock planned order is dated today + lead time; with `first-issue`, the first demand date.
- **BR-22.6 Dynamic plan scope.** A dynamic run replans the changed item and all items whose LLC is greater and that are reachable through its BOM; it never changes planned orders outside that set.
- **BR-22.7 Transfer planning.** Warehouse-level coverage with `transfer` order type creates demand at the from-warehouse at delivery date − transfer lead time.
- **BR-22.8 Calendar edge cases.** Lead-time offsets skip closed days; if a date falls on a closed day it moves backward (supply) or forward (demand) to the nearest open day.
- **BR-22.9 Firming concurrency.** Firming is a saga: create target order → mark planned order firmed → on failure compensate by deleting the target; a planned order already firmed returns 409.
- **BR-22.10 Quantity precision.** Requirements carry the item's inventory UoM to 6 decimals; forecast lines in forecast UoM converted at load.
- **BR-22.11 DDMRP net-flow equation.** Net-flow position NFP = on-hand + open supply (inside DLT) − qualified demand, where qualified demand = past-due demand + demand due today + spikes (single-day demand > spike threshold × red zone inside the spike horizon). If NFP ≤ top of yellow, a planned order is created for TOG − NFP (rounded up to MOQ/multiple), dated today + DLT. Planning priority = NFP / TOG; zone shown red ≤ TOR, yellow ≤ TOY, else green. Worked example: ADU 10, DLT 10 days, LTF 0.5, VF 0.5, MOQ 0, order cycle 7 days → red base 50, red safety 25, TOR 75; yellow 100, TOY 175; green max(50, 0, 70) = 70, TOG 245. On-hand 90, open supply 60, qualified demand 20 → NFP 130 ≤ 175 → order 115, priority 53.06% (yellow).
- **BR-22.12 Quota rating.** rating_s = (allocated_s + base_s) / quota_s; ties broken by priority then source id. Example: vendor A quota 60, allocated 300; vendor B quota 40, allocated 100; requirement 100 → ratings A 5.00, B 2.50 → B is chosen; after allocation B = 200 → 5.00. With split on, the requirement is divided so that post-allocation ratings are as equal as possible, subject to min_split_qty.
- **BR-22.13 Strategy consumption.** For `assemble-to-order-final`, a sales line on date d consumes forecast in [d − backward_days, d] (latest first), then in (d, d + forward_days] (earliest first); unconsumed sales qty adds to gross requirements; forecast never goes negative.
- **BR-22.14 Simulation isolation.** A simulation version reads the operational snapshot by reference (copy-on-write) and writes only its own partitions; operational `plan.completed` consumers ignore events with `simulation = true`; firming, action messages to purchasing and delay messages to sales are suppressed.
- **BR-22.15 Shelf-life usability.** A batch with expiry e is usable for demand on date d only if e − d ≥ required remaining shelf life r; planned production supply is assumed to have expiry = delivery date + shelf_life_days.

4.22.8 Acceptance criteria

- **AC-22.1** (FR-22.3, 22.4, 22.5) Given the BR-22.2 fixture, when the static plan runs, then the planned orders PP-1…PP-4, PO-1, PO-2 exist with the stated quantities and dates and a 7-day delay message on the sales line.
- **AC-22.2** (FR-22.6) Given any planned order in the 40-fixture set, when I read its pegging, then Σ pegged qty = planned qty.
- **AC-22.3** (FR-22.14) Given the 50k-item dataset, when the plan runs three times, then all three plan hashes are equal and each run completes in < 10 min.
- **AC-22.4** (FR-22.2) Given a Min/Max item with min 100, max 400 and PAB 90, when planned, then one planned order of 310 is created.
- **AC-22.5** (FR-22.7) Given a PO due 10 working days before its earliest pegged demand and positive_days = 5, when planned, then a Postpone message suggests the demand date − receipt margin.
- **AC-22.6** (FR-22.8) Given forecast 100 and sales orders 30 in a period with `transactions` reduction, then gross requirement from forecast is 70.
- **AC-22.7** (FR-22.9) Given 24 months of intermittent history (ADI 2.1), when the statistical forecast runs, then the Croston/TSB model is chosen and MAPE is reported.
- **AC-22.8** (FR-22.10) Given 3 approved planned purchase orders for one vendor on one date with grouping on, when firmed, then one PO with 3 lines is created and the planned orders show status firmed with target id.
- **AC-22.9** (FR-22.1) Given a running static version, when a second run is requested, then 409 `PLAN_ALREADY_RUNNING`.
- **AC-22.10** (FR-22.12) Given item RM-300 in the example, when I open net requirements, then the PAB column shows 400, 190, 110 for weeks 2–4.
- **AC-22.11** (FR-22.15, BR-22.14) Given scenario "Demand +20% on group FG", when the simulation runs, then its planned production quantities for FG items are ≥ the operational plan's, no ActionMessage reaches purchasing, and `:firm` on any of its planned orders returns 409 `PLAN_SIMULATION_NOT_FIRMABLE`.
- **AC-22.12** (FR-22.16, BR-22.11) Given the BR-22.11 buffer, when planned, then one planned order of 115 is created with priority 0.5306 and zone yellow.
- **AC-22.13** (FR-22.17, BR-22.12) Given the BR-22.12 quota arrangement, when a requirement of 100 is planned, then the planned purchase order is for vendor B and B's allocated qty becomes 200 after firming.
- **AC-22.14** (FR-22.19, BR-22.13) Given strategy `assemble-to-order-final` with backward 30 days, forecast 100 on 2026-11-30 and a sales line of 40 on 2026-11-20, when planned, then gross requirement is 100 (forecast 60 + sales 40), not 140.
- **AC-22.15** (FR-22.20, BR-22.15) Given a batch expiring in 20 days and a demand 5 days out requiring 30 days remaining shelf life, when planned, then the batch is not pegged and a planned order covers the demand.
- **AC-22.16** (FR-22.18) Given item coverage at warehouse WH-2 in its own scope, when the plan runs, then WH-2 demand is covered by a planned transfer from the site warehouse and WH-2 on-hand is not netted against site demand.

4.22.9 Test plan and fixtures

Fixtures: `mrp-textbook-40` (APICS CPIM-style scenarios: lot-for-lot, FOQ, POQ, safety stock, scrap, phantom, multi-source, delays; expected planned orders as JSON); `mrp-3level` (BR-22.2); `mrp-50k` (generated: 50k items, 5-level BOMs, 12 monthly periods, 200k sales lines); `forecast-history-2k` (24 months, mix of

smooth/intermittent); `frepple-compare` (shared dataset exported to frePPLe, expected within ±1 day and ±1% qty).

Test	Type	Target	Pass criterion
Textbook scenarios	unit	engine	40/40 match
PAB identity	property	engine	PAB recurrence holds for every item/day
Pegging completeness	property	pegging	Σ peg = planned qty for all planned orders
Determinism	integration	plan run	3 identical hashes
Scale	performance	50k plan	< 10 min, memory < 8 GB
Firming saga	contract	planning ↔ production/purchasing	compensations on injected failure
Forecast models	unit (Python)	statsforecast wrapper	model selection matches fixture
frePPLe comparison	integration (optional)	shared dataset	within tolerance

Reconciliation: Σ supply – Σ demand per item/site over the horizon = closing PAB; planned production orders firmed = ProductionOrders with origin PlannedOrder.

4.22.10 Deployment and operations

Helm charts `planning` (Go, 2 replicas API + 1 planner worker pool with 8 CPU / 16 GB request, Temporal worker), `planning-db` (CloudNativePG, 200 GB), `forecast` (Python, 2 replicas). Config: `PLANNING_MAX_VERSIONS` (20), `PLANNING_DYNAMIC_DEBOUNCE_SECONDS` (60), `PLANNING_HORIZON_DAYS` (365). Flags: `planning.dynamic`, `planning.statistical-forecast`, `planning.mps-scope`. Scheduled: nightly static plan 01:00 site-local; weekly forecast generation Sunday 22:00; version purge daily. SLOs: 50k-item plan < 10 min; planned-order list p95 < 300 ms; pegging read p95 < 500 ms. Alerts: plan failed or > 20 min (page); dynamic-plan lag > 5 min (warn). Runbook: "plan stuck" — inspect Temporal workflow, cancel, re-run; "hash mismatch" — compare sorted outputs between versions. Rollback: prior digest; versions are immutable so rollback never corrupts plans.

4.22.11 Migration from AX / SAP

Source	Passage entity	Notes
ReqGroup (AX) / T438A + MRP type config (SAP)	CoverageGroup	ReqPOType→coverage_code; SAP lot-size EX→Requirement, TB→Period, FX→fixed qty via ItemCoverage standard qty, WB→Period(7)
ReqItemTable / MARC MRP views	ItemCoverage	DISMM PD/VB/ND; EISBE→safety; DISLS; PLIFZ→lead time
ForecastSales / PIR (PBIM/PBED)	ForecastLine	periods normalized to weeks or months
ReqPO (firmed only) / PLAF (firmed, PLAF-AUFFX = X)	PlannedOrder status firmed	unfirmed planned orders are not migrated — regenerated by the first run
ReqTrans, ReqTransCov / MDTB	not migrated	regenerated

Validation: first Passage plan vs last legacy plan on identical snapshot: planned order count within ±5% and 95% of planned orders match item/date ±1 day. Not migrated: planning history, AX ReqCalcTask logs, SAP MRP lists.

Migration addendum (FR-22.16–22.19). SAP T461P strategy groups map to PlanningStrategy (10 → mts-net, 11 → mts-gross, 20 → mto, 40 → assemble-to-order-final, 50/52 → plan-without-final-assembly, 70 → subassembly; 25/26/30/59/60/63/74/81/82 → nearest strategy with a migration warning). SAP EQUK/EQUP → QuotaArrangement/QuotaSource with allocated qty carried over. SAP MDLV/MDLG/MDLW → ItemCoverage planning_scope. S/4 DDMRP buffer data (PPH_DD_*) → BufferProfile/DdmrpBuffer with recalculation on first run. AX ReqPlan static plans used as simulations → ScenarioOverride with demand_source = forecast-version. AX ReqReduceKey + ReqPOType combinations → strategy per mapping table delivered with the w10 migration templates.

4.22.12 Dependencies, risks, open questions

Depends on: w21 production orders (firming target, route-based lead times); w17 PO creation; w16 on-hand and inventory transactions; w9 BOM/LLC; w6 calendars; w27 sales orders (demand arrives later — until then sales demand is loaded via fixtures and the `sales-line` ref type).

Risk	Likelihood	Impact	Mitigation
Without sales orders until w27 the plan is demo-only	Certain	Low	Forecast + fixture demand; re-proof at w27
Memory blow-up on 50k × 365 daily buckets	Medium	Medium	Sparse buckets (only dates with movement); weekly buckets beyond 90 days

Open questions: (1) Daily vs weekly buckets beyond 90 days — default weekly; decide at w22 kickoff. (2) Whether to expose `positive_days = 0` as "unlimited" (AX) or 0 — default AX semantics; decide by w22 mid-point.

4.22.13 Parameters and setup

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
Current static plan	legal entity	plan ref	`MAIN`	any static plan	Plan whose current version drives firming and messages	Master planning parameters → General → Current static master plan	Planning file / MRP run scope per plant (OMDU, MD01 plant)
Current dynamic plan	legal entity	plan ref	`DYN`	any dynamic plan	Net-change plan for order events	Master planning parameters → Current dynamic master plan	Net change planning NETCH (MD02 processing key)
Planning horizon days	plan	int	365	30–1,095	Requirements beyond are ignored	ReqPlan coverage time fence / Master plans → time fences	Planning horizon OMDV/OPPQ (MRP planning horizon in workdays)
Daily-bucket window days	plan	int	90	0–365	Daily buckets inside, weekly beyond	n/a	Period split in MD04 (period totals)
Dynamic debounce seconds	tenant	int	60	10–3,600	Coalesces order events before net change	n/a (D365 auto-planning)	Planning file entry processing (MDAB/MDRE)
Max retained versions	plan	int	20	2–100	Purge threshold	ReqPlanVersion cleanup	n/a (single MRP list per run)
Default coverage group	legal entity	ref	`REQ`	any CoverageGroup	Used when item has none	Master planning parameters → Standard coverage → Coverage group	MRP type default per plant (OPPQ), MRP group OPPR
Planning priority on forecast vs sales	tenant	enum	sales > forecast > safety	permutations	Pegging priority	Master plans → Sequence of requirements	Requirements class priority (OVZG)

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
Reduction principle default	legal entity	enum	`transactions`	none / percent / transactions / transactions-dynamic	Forecast reduction	Reduction keys (ReqReduceKey) on coverage groups	Consumption mode MARC.VRMOD, OMPA
Statistical forecast model selection	tenant	enum	`auto`	auto / ets / croston / tsb / naive	Model per item	Demand forecasting parameters → Forecast algorithm	MP30/MP31 forecast models (MPOP)
Forecast history months	tenant	int	36	12–120	History window	Demand forecasting parameters → Historical horizon	Forecast profile periods (MP38)
Firming grouping	legal entity	enum	`vendor-date`	none / vendor / vendor-date / vendor-week	PO grouping on firm	Master planning parameters → Planned orders → Firming → Grouping	MD14/MD15 collective conversion, ME59N grouping
Auto-firm in firming fence	coverage group	bool	false	true/false	Firm planned orders automatically	Coverage group → Firming time fence	Firming type in MRP type (T438A.FXHOR)
Simulation scenarios per plan	tenant	int	10	0–50	FR-22.15 limit	Static plan copies	LTP planning scenarios (MS31)
DDMRP enabled	legal entity	bool	false	true/false	FR-22.16	Priority-based planning feature	DDMRP activation (PPH_DD settings)
ADU window past/future days	buffer profile	int/int	90 / 0	7–365	ADU computation	n/a	DDMRP buffer level calculation app parameters
Spike threshold %	buffer profile	numeric	50	1–500	Qualified demand	n/a	DDMRP spike horizon/threshold
Quota arrangements enabled	legal entity	bool	false	true/false	FR-22.17	n/a	Quota usage indicator MARC.USEQU
Default planning strategy	item group	enum	`mts-net`	FR-22.19 codes	Strategy when coverage has none	Coverage group + reduction key	Strategy group OPPS / MRP group OPPR
Consumption backward/forward days	strategy	int/int	30 / 0	0–365	BR-22.13	Reduction key periods	MARC.VINT1/VINT2, OPPR
Shelf-life aware planning	item	bool	false	true/false	FR-22.20	Coverage group "Use shelf life" (PdsShelfLife)	PP/DS shelf-life planning
Planning scope per item coverage	item coverage	enum	`site`	site / warehouse / subcontractor	FR-22.18	Coverage by warehouse dimension	MRP area type 01/02/03 (OMIZ)

4.22.14 Inquiries and reports

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
Net requirements (stock/requirements list)	drill-down	item, site/warehouse, plan/version or scenario	date, ref type, qty, PAB, futures date, messages	Requirement	Net requirements form (ReqTransDisplay)	MD04 / MD05 (MRP list)
Collective net requirements	list inquiry	planner, item group, exception group, site	item, shortage date, messages count, coverage days	Requirement × ActionMessage	Net requirements list page	MD06 / MD07 collective display
Planned orders	list inquiry	plan, type, status, vendor, date range	number, item, qty, dates, status, priority, quota source	PlannedOrder	Planned orders (ReqPO) list page	MD16 / MD13 planned order list
Action messages	list inquiry	plan, action type, buyer/planner	action, ref order, qty, date, suggested date	ActionMessage	Actions (ReqTransAction) form	MD06 exception groups 1–8
Delay (futures) messages	list inquiry	plan, delay days ≥ n	demand ref, requested, expected date, delay	ActionMessage (delay)	Futures messages form	MD06 exception 10/15/30
Pegging / explain tree	drill-down	planned order id, depth	tree of supply → demand with qty	Pegging	Explosion form (ReqTransExplosion)	MD09 pegged requirements, MD4C order report
Supply schedule	operational report	items, site, bucket	per period demand, supply, PAB, safety	Requirement buckets	Supply schedule (ReqSupplySchedule), SSRS supply schedule report	MD04 period totals, MS04
Scenario comparison	operational report	scenario vs current version	planned qty/value deltas by item group, capacity load, purchase volume by vendor	PlanVersion diff	Static plan comparison (manual)	MS70 / MCEC (LTP purchasing evaluation), MS44 capacity
DDMRP buffer status	list inquiry	site, zone, priority ≤ x	item, NFP, TOR/TOY/TOG, priority %, zone	DdmrpBuffer	Priority-based planning workspace (D365)	DDMRP Replenishment planning Fiori app
Quota arrangement analysis	list inquiry	item, period	source, quota %, planned qty, actual qty, deviation	QuotaSource × orders	n/a	MEQ6/MEQ8
Forecast accuracy	KPI	item group, horizon lag	MAPE, wMAPE, bias, forecast vs actual	ForecastLine × sales history	Demand forecast accuracy (D365 Power BI)	MP33/MP32 forecast analysis
Inventory forecast	operational report	items, horizon	projected on-hand, value, days of supply	InventoryForecast	Inventory forecast (ForecastInvent)	MD04 projected stock
Plan run history	list inquiry	plan, date range	version, kind, duration, counts, hash, status	PlanVersion	Master planning log (ReqLog)	MRP run log (MDKP), MD01 list

4.22.15 Printed and electronic documents

Document	Trigger	Layout elements	Formats	Numbering sequence	Legal / retention requirement
Supply schedule report	On demand	Header: item selection, site, bucket; per item: periods × demand/supply/PAB; footer: plan version and hash	PDF, XLSX	none	None
Supplier forecast (non-binding)	Scenario or plan publish to w20 portal	Header: vendor, horizon, version; lines: item, period, qty, unit	PDF, portal view, EDI DELFOR via w35	`supplier-forecast`	Non-binding disclaimer text per legal entity
Plan run summary	`plan.completed`	Version, duration, counts by type, top delays, hash	email, in-app	none	None
Firming result report	Firming batch	Planned orders → created POs/production/transfer orders	PDF, email	none	None
Electronic plan events	Run lifecycle	CloudEvents (4.22.5)	JSON	n/a	1 year in Iceberg

4.22.16 Periodic and batch jobs

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
Static plan run	daily 01:00 site-local	plan × LLC level	New PlanVersion per run; pointer swap only on success	50k items < 10 min	Version marked failed; previous stays current	Failed or > 20 min pages
Dynamic net change	event-driven, 60 s debounce	item reach set	Version per batch; dedupe by event id	< 60 s after event	Retry 3× then fall back to next static run	Lag > 5 min warns
Statistical forecast generation	weekly Sunday 22:00	item batches of 1,000	Forecast version per run; resumable per batch	50k items < 15 min	Failed batches retried; partial version not published	Failure warns
DDMRP buffer recalculation	daily 00:15	site	Upsert per (item, site) with calculated_at	20k buffers < 2 min	Keep previous zones	Zone change > 30% reported
Quota allocation recompute	daily 00:45	legal entity	Recomputes allocated_qty from orders; idempotent	< 1 min	Non-blocking	Drift vs incremental > 0 warns
Version purge	daily 03:00	plan	Drops partitions beyond max versions	< 1 min	Retry next day	n/a
Simulation runs	on demand	scenario	Version per run	50k items < 10 min (< 2 min rough-cut)	Version failed	none
Forecast consumption snapshot	daily 23:00	legal entity	Snapshot of reduced forecast for accuracy KPI	< 2 min	Non-blocking	Missing warns

4.22.17 Security duties and privileges

Duty	Privileges (entry points)	Segregation-of-duties conflicts	Default roles
View planning	GET /planning/*, master planning workspace, net requirements, pegging, reports	none	Planner, Buyer, Production supervisor, Sales (read delays)
Run master planning	POST /plans/{id}:run (static/dynamic)	none	Planner (lead), Batch service account
Maintain planned orders	PATCH planned orders, approve, delete, supply schedule edits	none	Planner
Firm planned orders	POST planned-orders:firm	with *Approve purchase orders* (w17) for purchase-type firming above approval limit	Planner, Buyer
Maintain forecasts	forecasts generate/lines, consensus submit	with *Approve forecast consensus*	Demand planner
Approve forecast consensus	Temporal approval step	with *Maintain forecasts* (same version)	Supply chain manager
Maintain planning setup	coverage groups, item coverage, strategies, buffer profiles, quota arrangements, parameters	with *Firm planned orders* flagged	Planning administrator
Run simulations	scenario create/run/compare, publish supplier forecast	none	Planner, S&OP manager

4.22.18 Message catalog

Code	Severity	User text	Cause	Remediation	Raised by
PLAN-0001	error	A run of plan {plan} is already in progress.	Concurrent run	Wait or cancel the running version	FR-22.1 (`PLAN_ALREADY_RUNNING`)
PLAN-0002	error	Planned order {po} is already firmed.	Duplicate firm	Refresh	BR-22.9
PLAN-0003	error	Planned orders of a simulation cannot be firmed.	Firm on simulation	Copy quantities to the operational plan	FR-22.15 (`PLAN_SIMULATION_NOT_FIRMABLE`)
PLAN-0004	warning	BOM cycle detected for {item}; low-level codes not updated.	Cyclic BOM	Fix BOM (w9)	BR-22.1 step 2
PLAN-0005	warning	Requirement for {item} splits into {n} orders (max {max}).	Lot size max	Review maximum qty	FR-22.4
PLAN-0006	info	Supply {ref} can be postponed to {date}.	Early supply	Apply action	FR-22.7
PLAN-0007	warning	Demand {ref} will be delayed {days} days (expected {date}).	Futures date propagation	Expedite supply or accept delay	FR-22.7
PLAN-0008	warning	No vendor for planned purchase of {item}; using none.	Missing default vendor / trade agreement	Set vendor on item coverage or quota	FR-22.3
PLAN-0009	error	Quota arrangement {qa} has no usable source in {period}.	All quotas 0 or blocked	Maintain sources	FR-22.17
PLAN-0010	warning	Buffer for {item} is in red zone (priority {pct}%).	NFP ≤ TOR	Expedite replenishment	FR-22.16
PLAN-0011	warning	Batch {batch} of {item} expires unpegged on {date}.	Shelf-life aware planning	Use in other demand or scrap	FR-22.20
PLAN-0012	error	Forecast history for {item} is shorter than {months} months; naive model used.	Short history	Accept or set manual forecast	FR-22.9
PLAN-0013	error	Plan hash mismatch with previous identical-input run.	Non-determinism	Open incident; compare sorted outputs	FR-22.14
PLAN-0014	warning	Subcontractor scope for vendor {vendor} has no vendor-location warehouse.	FR-22.18 precondition	Create vendor location (w16)	FR-22.18
PLAN-0015	info	Sales demand {ref} exceeds consumable forecast by {qty}; added on top.	BR-22.13	none	FR-22.19

4.22.19 Performance budgets and capacity

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation under 3× load
Static plan run	50k items × 5 levels, 200k sales lines; 1 run/day + 5 scenarios	run < 6 / 10 / 15 min	50k items per run	20 versions × ~15M rows ≈ 30 GB steady (dropped partitions)	partition per PlanVersion	Scenarios queue behind operational run; operational < 20 min
Dynamic net change	5,000 events/day, peak 200/min	20 / 60 / 120 s after event	200 events/min coalesced	included above	reach-set computation in memory	Debounce extends to 300 s
Net requirements read	30,000/day	100 / 300 / 800 ms	200/s	n/a	(plan_version, item, site, date)	Serve from previous version
Pegging explain (depth 20)	10,000/day	150 / 500 / 1,200 ms	100/s	n/a	(demand), (supply) indexes	Lazy depth beyond 5
Firm 1,000 planned orders	50 batches/day	batch < 2 / 5 / 8 min	10 orders/s	n/a	saga per order	Batches serialized per plan
Forecast generation	50k items weekly	< 15 min	60 items/s per worker	ForecastLine 50k × 104 periods ≈ 5M rows/yr ≈ 1 GB	(model, item, site, period)	Additional Python replicas via HPA
DDMRP recalculation	20k buffers daily	< 2 min	200 buffers/s	20k × 365 history ≈ 7M rows ≈ 1 GB	(item, site, calculated_at)	Runs after plan; skip on overload with alert

4.22.20 Localization and compliance hooks

- **Calendars**: lead-time offsets use the site work calendar (w6) including country public holidays imported per country pack (wave 48 supplies holiday calendars for the 20 launch countries).
- **Units and decimals**: quantities in inventory UoM to 6 decimals; no currency rounding in planning except value projections (supplier forecast value, inventory forecast) which use w12 rounding.
- **Supplier forecasts**: EDI DELFOR (EDIFACT) / 830 (X12) formats via w35; German VDA 4905/4984 delivery schedules for automotive suppliers are a wave 48 DE pack item through the `planning.supplier-forecast.format` extension point.
- **Export control / restricted parties**: planned purchase orders to vendors flagged by w48 sanctions screening are created but blocked from firming with the w48 screening message.
- **Privacy**: none (no personal data in planning entities except planner ids).
- **Retention**: plan versions are operational data, not records; only the last 20 versions are kept; plan run summaries retained 1 year.
- **Extension points**: `planning.demand-source` (country- or industry-specific demand feeds such as call-off schedules), `planning.supplier-forecast.format`, `planning.lead-time.adjust` (OPA hook, e.g., customs lead time per country of origin from w34).

4.22.21 Coverage closure

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
AX 12.21.1 Master planning — Supply schedule (ReqSupplySchedule) [AX #188]	PARTIAL-22	ADDED as FR-22.21	Period-bucketed workbench with inline planned-order creation
AX 12.21.1 Master planning — Inventory forecast (ForecastInvent) [AX #189]	PARTIAL-22	ADDED as FR-22.22	Projected on-hand, value and days of supply per period
AX 12.21.2 Master planning — SSRS: Supply schedule report [AX #191]	PARTIAL-22	ADDED as FR-22.21	Report listed in 4.22.14/4.22.15
AX 12.21.4 Master planning — Priority-based planning (D365 planning priority) [AX #194]	PARTIAL-22	ADDED as FR-22.16	Planning priority = NFP / TOG; `priorityBased` coverage groups
SAP 13.12 MM-PUR — MEQ1 / MEQ3 / MEQ4 / MEQ6 / MEQ8 quota arrangement [SAP #125]	PARTIAL-22	ADDED as FR-22.17	Quota rating BR-22.12; analysis report in 4.22.14
SAP 13.12 MM-PUR Customizing — Source determination, quota arrangement rules (T001W, TMQ1) [#137]	PARTIAL-22	ADDED as FR-22.17	Quota usage parameter in 4.22.13; source-list requirement stays with w17
SAP 13.21 PP — MM02 MRP areas (MD61 per MRP area) [#237]	PARTIAL-22	ADDED as FR-22.18	Planning scope site / warehouse / subcontractor
SAP 13.21 PP — MS01–MS08 long-term planning, simulative MRP [#239]	PARTIAL-22	ADDED as FR-22.15	Plan kind `simulation` with ScenarioOverride
SAP 13.21 PP — MS31/MS32/MS33/MS44/MS47/MS64/MS65/MS70 LTP scenarios and evaluations [#240]	PARTIAL-22	ADDED as FR-22.15	Capacity and purchase-volume evaluations; supplier forecast transfer
SAP 13.21 PP — DDMRP (buffer positioning, levels, replenishment planning) [#241]	GAP (propose 22)	ADDED as FR-22.16	Coverage code `ddmrp`, BR-22.11 net-flow equation
SAP 13.21 PP — Predictive MRP (pMRP) [#242]	PARTIAL-22	ADDED as FR-22.15	Rough-cut scenario with weekly buckets and BOM depth limit
SAP 13.21 PP — Planning strategies 20/40/50/70 [#244]	PARTIAL-22	ADDED as FR-22.19	Sales-order stock segregation depends on the w16 inventory dimension (register row #145, wave 16)
SAP 13.21 PP Customizing — OPPS / OPPT strategy groups (T461S, T461P) [#247]	PARTIAL-22	ADDED as FR-22.19	Strategy mapping in migration addendum
SAP 13.21 PP Customizing — OMIZ MRP areas (MDLV, MDLG, MDLW) [#248]	PARTIAL-22	ADDED as FR-22.18	ItemCoverage.planning_scope
SAP 13.21 PP Customizing — DDMRP buffer profiles, classification runs (PPH_DD_*) [#251]	GAP (propose 22)	ADDED as FR-22.16	BufferProfile entity; ABC/XYZ classification for buffer positioning uses w16 ABC classification
SAP 13.23 PP/DS — Shelf-life planning (SAP_PP_SL001) [#278]	PARTIAL-22	ADDED as FR-22.20	BR-22.15 usability rule
SAP 13.23 PP/DS — /SAPAPO/MC01, /SAPAPO/MVM planning versions [#279]	PARTIAL-22	ADDED as FR-22.15	Scenario versions isolated per BR-22.14
SAP 13.23 PP/DS — /SAPAPO/SDP94 (DP), /SAPAPO/SNP94 (SNP), GATP [#280]	PARTIAL-22	SUPERSEDED by FR-22.9 (DP) and FR-22.17 + BR-22.7 (cross-site sourcing); GATP DEFERRED to wave 27; SNP optimizer OUT-OF-SCOPE	SNP-style network optimization (transport-lane capacity LP) is not in v1: quota and transfer planning cover sourcing across sites, and the w23 CP-SAT service is the extension path if demand justifies it

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
SAP 13.26 CS — Service parts planning (SPP) [#306]	PARTIAL-22	DEFERRED to wave 45	Single-echelon MRP with warehouse scopes (FR-22.18) plans field stock; installed-base demand and multi-echelon service parts logic arrive with service management

4.23 Wave 23: Capacity Planning & Finite Scheduling

4.23.1 Scope and business context

Wave 23 replaces the infinite-capacity dating of waves 21–22 with a scheduler that places operations and jobs on resources with calendars and finite capacity, forward or backward, honoring precedence, setup, queue and transit times, primary/secondary resources and capabilities. Planners see a resource × time Gantt, drag jobs, see capacity load and bottlenecks, and optionally run a CP-SAT optimization that minimizes weighted lateness and makespan. Schedule dates flow back to production orders (start/end, job dates) and to master planning (planned production orders use scheduled lead times). Out of scope: shop-floor dispatch lists on the kiosk (wave 25 reads this wave's jobs), tool/fixture management, multi-plant capacity.

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
AX job scheduling on a 2,000-job plant takes 20–40 min (WrkCtrCapRes rebuilt per order in X++); SAP CM21 capacity leveling is manual dispatch per work center and PP/DS needs a separate APO/embedded install with CIF integration	Scheduling runs per order inside the status-update dialog; capacity reservations stored row-by-row; finite scheduling is an add-on product	Scheduler service with materialized UTC capacity intervals, GiST exclusion constraint, site-level run with checkpoints	5,000 operations 30 min → < 60 s; no separate product
Gantt is read-mostly: D365 Gantt drag does not validate secondary resources or calendars until save; SAP CM21 planning board shows overloads but cannot propagate to dependent orders; Epicor Kinetic Multi-Resource Scheduling requires the APS module and locks the board during save	Validation happens server-side after commit; no dependency graph in the board	`:move` with `dryRun` preview showing violations and dependent impact before commit; canvas Gantt	Reschedule-and-verify 15 min → < 30 s; zero committed double-bookings
Load reports lag reality: AX "Capacity load" form (WrkCtrCapRes) and SAP CM01 are as-of the last scheduling run; Infor LN "Capacity Utilization" is a batch report	Load is not maintained incrementally	CapacityLoad recomputed per run and per move; bottleneck events	Load view staleness hours → < 5 s after any move
Optimization is unavailable or opaque: no optimizer in AX; SAP PP/DS optimizer configuration is a consulting project; Plex scheduling is rule-based only	Optimization tied to proprietary engines	CP-SAT via OR-Tools with a stated objective, time limit and reported solver status; heuristic kept if no improvement	Known-optimum gap ≤ 5% on small instances; optimization run self-service in 1 click
Scheduled dates do not reach planning: AX master planning re-derives lead times from the route rather than from the schedule; SAP MRP ignores PP/DS results unless CIF is configured	Planning and scheduling keep separate date models	`order.dates-changed` events feed planning; `planning.finite-capacity` flag uses scheduled dates	Date mismatch between plan and schedule 100% of orders → 0

4.23.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Operations scheduling	ProdTable scheduling (operations), WrkCtrCapRes (capacity reservations), scheduling direction	Lead-time scheduling (CA97), capacity requirements KBED/KBEZ	ScheduleRun mode `operations`, ResourceCapacity	full
Job scheduling	Job scheduling (ProdRouteJob), WrkCtrCapRes by job	Detailed scheduling (PP/DS), SAP APO	mode `jobs` (minute level)	full
Finite/infinite capacity	ReqGroup/parameters finite capacity, finite capacity on resource	Capacity leveling CM21/CM22, finite scheduling flag	per-resource `finite` flag; run option	full
Capacity load view	WrkCtrCapRes load inquiry, Capacity load graph	CM01 (load), CM05, CM07	Capacity load screen	full
Gantt	Gantt chart (D365)	Planning board CM21, PP/DS detailed scheduling board	Scheduling workspace Gantt	improved (drag with constraint check)
Calendars/efficiency	WorkCalendar, efficiency % on resource, capacity per calendar day	Factory calendar, capacity header (CR02), utilization %	WorkCalendar (w9), ResourceCapacity.efficiency_pct	full
Primary/secondary resources	Route operation resource requirements (capability/group/resource/type), priority	Alternative sequences, work center hierarchy, split (AFVV)	ProductionOperation.priority; capability matching	full
Optimization	none native	PP/DS optimizer (genetic), S/4 pMRP	CP-SAT mode	improved
Reschedule dependents	Reschedule with reference orders	Rescheduling from MRP, CM21 dispatch	`:reschedule` with dependency propagation	full
Bottleneck resource	Bottleneck resource flag (D365 scheduling)	Bottleneck work center (CM21)	utilization > threshold detection	full
Resource networks	n/a (route operation resource requirements only)	Resource network CRC5/CRC1–3 (allowed resource sequences in PP-PI)	ResourceNetwork with allowed transitions (FR-23.13)	full
Campaign planning	D365 batch order sequencing by "batch order sequence" / planning priority; no campaign object	PP-PI campaigns (COCP, CMP process order campaigns), PP/DS campaign planning	Campaign entity and campaign scheduling (FR-23.14)	full
Changeover / cleanout	Route setup time only; D365 sequencing value	Setup matrix (/SAPAPO/CDPS setup groups), cleanout orders, recipe-dependent cleaning	SetupMatrix, changeover jobs, cleanout orders (FR-23.15)	full
Campaign cost settlement	n/a	Campaign settlement / cleanout cost allocation to campaign orders	Cleanout cost allocation (FR-23.16)	full
Block planning	n/a	PP/DS block planning (/SAPAPO/CDPSC12, characteristic blocks on resources)	CapacityBlock with attribute constraints (FR-23.17)	full

4.23.3 Functional requirements

- **FR-23.1 Capacity model** — Must. The system shall materialize ResourceCapacity as open intervals (UTC minutes) per resource per day from its WorkCalendar (shifts), efficiency % and capacity-per-day override, for a rolling horizon of 365 days.
  - Notes: Rebuilt incrementally when a calendar changes (w9 event). Finite resources cannot be loaded beyond open interval minutes; infinite resources ignore the limit but still only schedule in open intervals.
- **FR-23.2 Operations scheduling** — Must. The system shall schedule operations in daily buckets, forward from a start date or backward from a delivery date, selecting a resource per operation by priority (named resource > resource group > capability) and finite availability.

- **FR-23.3 Job scheduling** — Must. The system shall schedule jobs (queue-before, setup, process, overlap, transport, queue-after) at minute granularity with the same direction and resource choice rules, splitting process jobs across shifts but not across resources.
- **FR-23.4 Constraints** — Must. The scheduler shall honor: precedence (next_oper_number), max one process job per finite resource at any minute, secondary resources booked concurrently with the primary, setup before process, overlap transfer batch (operation n+1 may start after `overlap_qty` units), transit time between resources, calendar open intervals, order start ≥ today (forward) and end ≤ delivery date (backward, else convert to forward and flag late), operation `finished` jobs frozen, firmed jobs frozen.
- **FR-23.5 Dispatch heuristic** — Must. The default algorithm is priority-list scheduling: orders sorted by (delivery date, priority, order number); each operation placed at the earliest feasible interval on the best resource (least finish time, tie → least load); complexity O(n log n) per resource.
- **FR-23.6 CP-SAT optimization** — Should. The system shall offer an optimization run via OR-Tools CP-SAT (Python `scheduler-opt` service) with objective minimize Σ weight × lateness + λ × makespan, time limit configurable (default 60 s), horizon ≤ 2,000 operations per run (larger sets are windowed).
- **FR-23.7 Gantt** — Must. The system shall render resources × time with jobs as bars colored by order, allow drag to move/reassign a job within its capability set, and show constraint violations (red outline + tooltip) before commit.
- **FR-23.8 Reschedule with propagation** — Must. Moving a job shall reschedule all successors of the same order forward and, optionally, the dependents (orders pegged to the moved order's output) with a preview of affected orders before commit.
- **FR-23.9 Capacity load** — Must. The system shall show load % = Σ booked minutes / Σ open minutes per resource/group/period (day/week), with bottleneck flag when load > 90% in ≥ 3 consecutive weeks (threshold configurable).
- **FR-23.10 Feedback to planning** — Must. The system shall publish scheduled dates so that production orders update start/end, and master planning uses scheduled lead times for firmed orders and route-based estimates for planned orders (optionally finite in the plan run via flag `planning.finite-capacity`).
- **FR-23.11 Schedule runs** — Must. Scheduling can run per order (on `:schedule`), per selection, or for the whole site nightly, as Temporal jobs with checkpoints every 500 operations.
- **FR-23.12 Capability matching** — Should. Resource selection shall honor capability requirements with minimum level and expiry dates (w9 capabilities).
- **FR-23.13 Resource networks** — Should. The system shall define a ResourceNetwork per site as a directed graph of resources (nodes) with allowed transitions (edges, with optional transfer time and maximum wait minutes), assign a network to a route operation chain, and constrain the scheduler (heuristic and CP-SAT) so that when operation n runs on resource r, operation n+1 is scheduled only on a resource r' with an edge r → r'.
    - Notes: Typical use: mixing vessel V1 feeds fillers F1/F2 only; V2 feeds F3 only. Maximum wait (e.g., product holds 120 min in the vessel) becomes a hard constraint end_n + wait_max ≥ start_{n+1}; violation in heuristic mode moves the predecessor later. A network edge may require a secondary resource (e.g., transfer line). CP-SAT encodes allowed pairs as `AddAllowedAssignments` on the resource choice variables of consecutive operations.
- **FR-23.14 Campaign planning** — Should. The system shall group production/batch orders into a Campaign (resource or resource group, campaign key such as formula family or setup group, planned start, maximum size in orders/quantity/duration, sequence rule) and schedule them contiguously on the campaign resource, inserting a leading setup and a trailing cleanout, with orders inside the campaign sequenced by the setup matrix to minimize Σ changeover minutes.
    - Notes: Campaigns are created manually from a selection, or proposed by the `campaign-proposal` job from planned/firmed orders sharing a campaign key within a horizon window (default 14 days). Orders join or leave a campaign until the first order is Started. A campaign is frozen once Started; added orders go to the next campaign. Sequence rule: setup-matrix nearest neighbor (heuristic) or CP-SAT circuit (`AddCircuit`) with time limit 30 s for ≤ 50 orders.
- **FR-23.15 Setup matrix and changeover/cleanout operations** — Should. The system shall maintain a SetupMatrix per resource or resource group with changeover minutes and cost per (from setup group → to setup group) and a cleanout definition per setup group (cleaning standard operation set, duration, mandatory after N batches or M hours), and shall generate changeover jobs between consecutive jobs with different setup groups and cleanout orders (lightweight production orders of type `cleanout`, no BOM output) at campaign end or when the mandatory condition is reached.
    - Notes: Setup group comes from the product (w8) or formula (w24) and may be overridden on the order. Changeover jobs replace the route's static setup time when a matrix entry exists. Recipe-dependent cleaning: a matrix entry may require a specific cleaning standard operation set (e.g., allergen cleanout from "contains peanut" to "peanut-free" = wet clean 240 min). Cleanout orders consume cleaning materials and labor through w21 journals.
- **FR-23.16 Campaign cost settlement** — Should. The system shall allocate the actual cost of a campaign's cleanout and leading-setup orders to the campaign's production orders by RAF quantity (default), equally, or by run minutes, posting the allocation as an overhead cost line of type `campaign-changeover` before those orders are ended.
    - Notes: Orders cannot be ended while the campaign's cleanout order is unended unless `campaign.allowEarlyEnd` is set, in which case the allocation estimates from the cleanout's planned cost and the difference posts to the last order ended.
- **FR-23.17 Block planning** — Could. The system shall define CapacityBlocks on a resource (recurring or dated time windows, e.g., Monday 06:00–14:00) each restricted to an attribute condition over product or order attributes (variant dimension values such as color = white, or batch attribute targets such as grade ≥ 2), and the scheduler shall place a job inside a block only if the job's attributes satisfy the block condition; jobs outside any matching block are placed in unblocked capacity or flagged late.

4.23.4 Data model

ResourceCapacity: id, tenant_id, resource_id, day (date), interval_start (timestamptz), interval_end, open_minutes (int), efficiency_pct (numeric 5,2), finite (bool), source (calendar/override).

ScheduledJob: id, job_id (FK ProductionJob), order_id, oper_number, resource_id, start (timestamptz), end, minutes, run_id, firmed (bool), late_minutes (int), overlap_qty (numeric), secondary_resource_ids (uuid[]).

ScheduleRun: id, scope (order/selection/site), mode (operations/jobs), direction (forward/backward), finite (bool), algorithm (heuristic/cp-sat), time_limit_s, status, started_at, finished_at, operations_count, makespan_minutes, total_lateness_minutes, objective_value, solver_status (OPTIMAL/FEASIBLE/UNKNOWN).

CapacityLoad (materialized): resource_id, period_start, period_type, open_minutes, booked_minutes, load_pct, bottleneck (bool).

Invariants: no two ScheduledJob rows on the same finite resource overlap in [start, end); every ScheduledJob lies within ResourceCapacity open intervals of its resource; for jobs j, k in the same operation chain with k successor of j: k.start ≥ j.end + transit; a ScheduledJob with firmed = true is unchanged by any run without `force`.

Indexing: ScheduledJob GiST exclusion constraint `EXCLUDE USING gist (resource_id WITH =, tstzrange(start,end) WITH &&) WHERE (finite)`; ResourceCapacity (resource_id, day); CapacityLoad refreshed per run.

ResourceNetwork / NetworkEdge (FR-23.13): ResourceNetwork(id, site_id, code, name, active_from, active_to); NetworkEdge(id, network_id, from_resource_id, to_resource_id, transfer_minutes int, max_wait_minutes int nullable, secondary_resource_id nullable).

Campaign / CampaignOrder (FR-23.14): Campaign(id, site_id, resource_id or resource_group_id, campaign_key text, status (proposed/planned/started/completed/cancelled), planned_start, planned_end, max_orders int, max_qty numeric, max_minutes int, sequence_rule (enum nearest-neighbor/cp-sat/manual), cleanout_order_id, setup_order_id, total_changeover_minutes); CampaignOrder(campaign_id, order_id, sequence int).

SetupMatrix / SetupMatrixEntry / CleanoutRule (FR-23.15): SetupMatrix(id, resource_id or resource_group_id, version, active_from); SetupMatrixEntry(matrix_id, from_setup_group, to_setup_group, changeover_minutes int, changeover_cost numeric(18,4), cleaning_operation_set_id nullable); CleanoutRule(setup_group, duration_minutes, operation_set_id, after_batches int nullable, after_hours int nullable, at_campaign_end bool).

CapacityBlock (FR-23.17): id, resource_id, recurrence (RRULE text) or start/end, condition (jsonb attribute predicate), priority int, active.

Invariants (additions): consecutive scheduled jobs of an order chain using a network have an edge between their resources; jobs of one campaign on the campaign resource are contiguous except for changeover and cleanout jobs; Σ allocated campaign changeover cost = Σ actual cost of the campaign's setup and cleanout orders.

4.23.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
POST	/api/v1/scheduling/runs	Start run (scope, mode, direction, finite, algorithm)	Idempotency-Key	Run scheduling
GET	/api/v1/scheduling/runs/{id}	Run status/metrics	n/a	View scheduling
GET	/api/v1/scheduling/gantt?siteId&from&to&resourceIds	Jobs for Gantt window (≤ 5,000 bars)	n/a	View scheduling
POST	/api/v1/scheduling/jobs/{id}:move	Move/reassign with `dryRun` preview	Idempotency-Key	Maintain schedule
POST	/api/v1/scheduling/jobs/{id}:firm	Firm/unfirm	Idempotency-Key	Maintain schedule
GET	/api/v1/scheduling/capacity-load?resourceIds&period=week	Load and bottlenecks	n/a	View scheduling
GET	/api/v1/scheduling/resources/{id}/capacity?from&to	Open intervals	n/a	View scheduling
POST	/api/v1/scheduling/resources/{id}/capacity-overrides	Add downtime/extra shift	Idempotency-Key	Maintain capacity

Event	Trigger	Payload fields	Consumers
`dev.passage.scheduling.run.completed.v1`	run done	runId, scope, operations, makespanMinutes, totalLatenessMinutes, solverStatus	production, planning
`dev.passage.scheduling.job.scheduled.v1`	job placed/moved	jobId, orderId, operNumber, resourceId, start, end, runId, firmed	production, shopfloor
`passage.scheduling.order.dates-changed.v1`	order start/end changed	orderId, start, end, lateMinutes	production, planning, sales (w27)
`dev.passage.scheduling.bottleneck.detected.v1`	load > threshold	resourceId, periods[], loadPct	notifications

4.23.6 User experience

Screen	Primary actions	Key fields/columns	Duty required
Scheduling workspace (Gantt)	Zoom day/week, drag job, reassign, firm, run heuristic/optimize, preview propagation	Resource rows, job bars (order, item, qty, start/end), late markers, open-interval shading	Maintain schedule
Capacity load	Filter resource/group/period, open bottleneck, drill to jobs	Resource, period, open h, booked h, load %, bottleneck	View scheduling
Schedule runs	Start, monitor, compare runs	Scope, mode, algorithm, status, makespan, lateness, duration	Run scheduling
Resource capacity	Overrides, view calendar materialization	Day, intervals, efficiency, finite	Maintain capacity

Interaction rules: drag snaps to 5-minute grid; `Shift+drag` moves the whole order; violations block commit unless the user holds *Override scheduling constraints*; Gantt virtualizes rows and uses canvas rendering for > 1,000 bars; undo stack of 20 moves per session.

4.23.7 Business rules and edge cases

- **BR-23.1 Duration.** Process minutes = (run_time_h_per × qty / process_qty) × 60 / (efficiency_pct/100); setup minutes = setup_time_h × 60 / efficiency; both rounded up to whole minutes.
- **BR-23.2 Backward fallback.** If backward scheduling places any job before now + 1 h, the run re-schedules the order forward from now and sets late_minutes = end – delivery date end-of-day.
- **BR-23.3 Shift splitting.** A process job crossing a closed interval is split into segments on the same resource; setup is never split (if it does not fit before close, it moves to the next open interval).
- **BR-23.4 Secondary resources.** Booked for the same interval as the primary; if no secondary is free, the primary slot is skipped.
- **BR-23.5 Overlap.** With overlap_qty q > 0, operation n+1 earliest start = start_n + setup_n + process minutes for q units + transit.
- **BR-23.6 Firmed and reported jobs.** Jobs with reported hours or `finished` status keep their actual start; remaining minutes = planned – reported, floor 0.
- **BR-23.7 DST and time zones.** All intervals stored in UTC; calendars defined in site time zone; a 23-hour DST day yields fewer open minutes — property test covers 2026-03-29 (EU) and 2026-11-01 (US).
- **BR-23.8 Resource selection tie-break.** Equal finish time → lower load % → lower resource code (deterministic).
- **BR-23.9 CP-SAT model.** Interval variables per job, `NoOverlap` per finite resource, `AddNoOverlap2D` not used; precedence as start ≥ end + transit; objective Σ w_i × max(0, end_i – due_i) + λ × makespan with λ = 0.1 default; `num_workers` = 8; result accepted if FEASIBLE; heuristic result kept if solver returns UNKNOWN.
- **BR-23.10 Propagation limit.** Dependent rescheduling stops after 500 orders or 5 pegging levels and reports the truncation.
- **BR-23.11 Network wait limit.** For edge r → r' with max wait w: start_{n+1} – end_n ≤ w; the heuristic first tries r' candidates in transfer-time order; if none satisfies w, it delays operation n (and its predecessors) forward until a feasible pair exists, up to 7 days, then flags `NETWORK_INFEASIBLE`.
- **BR-23.12 Changeover sequencing.** Nearest-neighbor: start from the setup group with the lowest changeover from the resource's current state; repeatedly pick the unscheduled order with minimal changeover (tie → earliest due date → order number). Example: groups A→B 30, A→C 90, B→C 20, C→B 60; current A; orders B, C → sequence A→B→C = 50 min vs A→C→B = 150 min.
- **BR-23.13 Mandatory cleanout.** A cleanout is inserted when batches since last cleanout ≥ after_batches or run hours ≥ after_hours, whichever first, and always at campaign end if at_campaign_end; a cleanout is never split across shifts (moves to next open interval like setup, BR-23.3).
- **BR-23.14 Campaign allocation rounding.** Allocation by quantity: share_i = raf_i / Σ raf; amount_i = round(cost × share_i, 2); residual to the largest order.
- **BR-23.15 Block matching.** A job matches a block if every predicate in the block condition is true for the job's product variant dimensions and order attributes; overlapping blocks resolve by block priority; an unmatched job may use unblocked capacity only.

4.23.8 Acceptance criteria

- **AC-23.1** (FR-23.2, 23.4) Given OR-Library instance `ft06`, when scheduled with the heuristic, then the schedule is feasible (no overlap, precedence held); when optimized with CP-SAT 60 s, makespan = 55 (known optimum).

- **AC-23.2** (FR-23.4) Given 10k random jobs across 50 finite resources, then the exclusion constraint never fires and the property test "every job inside open intervals" passes.
- **AC-23.3** (FR-23.8) Given an order whose output is pegged to a sales line, when I move its last job 2 days later, then the preview lists the sales line delay and after commit the order's end date and `order.dates-changed` event carry the new date.
- **AC-23.4** (FR-23.11) Given 5,000 operations on the demo plant, when the site run executes, then it completes in < 60 s.
- **AC-23.5** (FR-23.3) Given a 300-minute process job on a resource with a shift ending in 120 minutes, then two ScheduledJob segments of 120 and 180 minutes exist on the same resource.
- **AC-23.6** (FR-23.9) Given booked 150 h against 160 h open for 3 consecutive weeks, then the resource is flagged bottleneck and an event is emitted once (not per run).
- **AC-23.7** (FR-23.1) Given a calendar change closing next Friday, then the ResourceCapacity rows for that day are removed within 30 s and affected jobs show violations.
- **AC-23.8** (FR-23.10) Given a scheduled order, when planning runs with `planning.finite-capacity` on, then its supply date equals the scheduled end date.
- **AC-23.9** (FR-23.6) Given an optimization run that times out with UNKNOWN, then the heuristic schedule remains and the run reports solver_status UNKNOWN.
- **AC-23.10** (FR-23.13, BR-23.11) Given network V1 → {F1, F2} with max wait 120 min and F1, F2 busy for the next 4 hours, when an order with mixing on V1 is scheduled, then mixing is delayed so that filling starts ≤ 120 min after mixing ends, and no filling job is placed on F3.
- **AC-23.11** (FR-23.14, FR-23.15, BR-23.12) Given the BR-23.12 matrix and two orders B and C in one campaign, when the campaign is scheduled, then the sequence is B then C with 50 changeover minutes and a cleanout job after C.
- **AC-23.12** (FR-23.16, BR-23.14) Given a cleanout costing USD 900.00 and campaign orders with RAF 100, 200 and 300 units, when allocated, then the orders receive 150.00, 300.00 and 450.00.
- **AC-23.13** (FR-23.17, BR-23.15) Given a Monday block restricted to color = white, when a red-variant job is scheduled for Monday, then it is placed outside the block or flagged late; a white job is placed inside it.

4.23.9 Test plan and fixtures

Fixtures: `orlib-jobshop-30` (ft06, ft10, ft20, la01–la20, abz5–abz9 with known optima); `sched-calendar-edge` (DST days, 24/7, zero-capacity holidays); `sched-5k-ops` (demo plant scaled); `sched-propagation` (pegged chains 5 deep).

Test	Type	Target	Pass criterion
Job-shop feasibility	unit	heuristic	30/30 feasible
CP-SAT optimality	integration	optimizer	within 5% on instances ≤ 10×10
No double-booking	property	ScheduledJob	0 violations over 10k jobs
Calendar edges	unit	capacity materialization	open minutes match fixture
Gantt move	Playwright	move + propagate	persisted and dependents updated
Scale	performance	5k ops	< 60 s, p95 Gantt load < 1 s

Reconciliation: Σ booked minutes per resource (CapacityLoad) = Σ ScheduledJob minutes; production order start/end = min/max of its scheduled jobs.

4.23.10 Deployment and operations

Helm: `scheduling` (Go, 2 API replicas + 2 worker replicas, 4 CPU / 8 GB), `scheduler-opt` (Python OR-Tools, 1 replica, 8 CPU / 16 GB, scale-to-zero via KEDA on queue depth), `scheduling-db` (CloudNativePG 50 GB). Config: `SCHED_BOTTLENECK_PCT` (90), `SCHED_OPT_TIME_LIMIT_S` (60), `SCHED_HORIZON_DAYS` (365). Flags: `scheduling.cp-sat`, `scheduling.propagate-dependents`, `planning.finite-capacity`. Jobs: nightly site run 00:30 (before planning); capacity materialization daily. SLOs: 5k-op run < 60 s; Gantt window p95 < 1 s; move p95 < 400 ms. Alerts: run failure (page), optimizer OOM (warn). Rollback: prior digest; ScheduledJob rows versioned by run_id so a bad run is reverted by re-pointing to the previous run.

4.23.11 Migration from AX / SAP

Source	Passage entity	Notes
WrkCtrCapRes (AX) / KBED+KBEZ (SAP)	ScheduledJob	only for open orders; re-scheduled on first run, legacy dates kept as `firmed` if the order is Started
WrkCtrTable capacity/efficiency, WorkCalendar / CR02 capacity header, factory calendar	ResourceCapacity (materialized)	from w9 resources and calendars
ProdRouteJob dates / AFVV dates	ProductionJob planned dates	preserved for reference

Not migrated: historical capacity reservations, PP/DS optimizer profiles, AX scheduling parameters (re-set in Passage).

4.23.12 Dependencies, risks, open questions

Depends on: w21 jobs/operations; w22 planned orders and pegging; w9 resources, capabilities, calendars.

Risk	Likelihood	Impact	Mitigation
Heuristic quality far from optimum on large instances	High	Low	CP-SAT windowing; planners can firm; measure lateness trend
Gantt performance in the browser	Medium	Medium	Canvas rendering, windowed fetch ≤ 5,000 bars

Open questions: (1) Should optimization run automatically nightly or only on demand? Default on demand; decide by w23 mid-point. (2) Tool/fixture resources as secondary resources in w23 or w44 (EAM)? Default w44.

4.23.13 Parameters and setup

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
Default scheduling method	site	enum	`jobs`	operations / jobs	Mode on `:schedule`	Production control parameters → General → Scheduling method	Scheduling type in order type-dependent params (OPU3: forward/backward)
Default scheduling direction	site	enum	`backward`	forward / backward	Direction	Scheduling parameters → Direction	OPU3 scheduling type, adjust dates (OPJH)

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
Finite capacity default	site	bool	false	true/false	Run option default	Production control parameters → Scheduling → Finite capacity	Finite scheduling in capacity planning profile (OPD0 / CM21 profile)
Capacity horizon days	site	int	365	30–730	ResourceCapacity materialization	Capacity time fence (ReqGroup / scheduling parameters)	Capacity planning horizon (OPA6 / OPDB profiles)
Bottleneck threshold %	site	numeric	90	50–200	FR-23.9 flag	Bottleneck resource (D365 scheduling)	Overload % in capacity profile (CM01 evaluation profile OPA2)
Bottleneck consecutive weeks	site	int	3	1–12	FR-23.9	n/a	n/a
Optimization time limit s	tenant	int	60	5–1,800	CP-SAT stop	n/a	PP/DS optimization profile (/SAPAPO/CDPSC11) runtime
Lateness weight λ	tenant	numeric	0.1	0–100	CP-SAT objective	n/a	PP/DS optimizer weighting (makespan/lateness/setup)
Drag snap minutes	user	int	5	1–60	Gantt grid	Gantt chart setup	Planning board profile (CM21 OPD0) time scale
Propagation limit	tenant	int pair	500 orders / 5 levels	1–5,000 / 1–20	BR-23.10	Reschedule references	Rescheduling options
Primary resource selection rule	site	enum	`least-finish`	least-finish / least-load / priority	FR-23.5	Resource selection (ProdParmSchedule)	Work center selection (alternate sequences)
Schedule run nightly time	site	time	00:30	any	Site run	Batch job ProdMultiSchedule	Collective rescheduling CO05N / CM40 background leveling
Safety time / queue defaults	resource group	minutes	0	0–10,080	Added to queue before	Resource group queue time	Queue time in work center (CR02), float before/after production (OPU3 sched margin key OPJN)

4.23.14 Inquiries and reports

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
Capacity load by resource	list inquiry	resource/group, period type, date range	open h, booked h, load %, bottleneck	CapacityLoad	Capacity load (WrkCtrCapRes) form, Capacity load graphically	CM01 / CM02 / CM07
Capacity load detail	drill-down	resource, period	jobs, orders, minutes	ScheduledJob	Capacity reservations (WrkCtrCapRes)	CM03 / CM05 pegged requirements
Gantt	operational view	site, resources, window	job bars, late markers, violations	ScheduledJob	Gantt chart	CM21 / PP/DS detailed scheduling board
Late orders	list inquiry	site, lateness ≥ n min	order, delivery date, scheduled end, late minutes, pegged demand	ScheduledJob × order	Production orders "delayed" filter	COOIS with late date filter, CM25
Schedule run comparison	operational report	two runs	makespan, total lateness, changeover minutes, utilization	ScheduleRun	n/a	PP/DS optimization log
Resource utilization KPI	KPI	site, period	utilization %, idle %, setup %	CapacityLoad + ScheduledJob	SSRS "Resource utilization" (WrkCtrCapResUtil)	MCP7 / work center analysis (PP information system)
Campaign overview	list inquiry	site, resource, status	campaign, key, orders, planned start/end, changeover min, cleanout	Campaign	n/a	COCP campaign worklist
Changeover analysis	operational report	resource, period	changeovers count, minutes, cost by from/to group	ScheduledJob (changeover)	n/a	PP/DS setup analysis
Network feasibility	list inquiry	network, date range	orders flagged NETWORK_INFEASIBLE, wait-time violations	ScheduleRun messages	n/a	n/a (PP-PI scheduling log)
Block utilization	list inquiry	resource, period	block, matched minutes, unused block minutes	CapacityBlock × ScheduledJob	n/a	Block planning evaluation

4.23.15 Printed and electronic documents

Document	Trigger	Layout elements	Formats	Numbering sequence	Legal / retention requirement
Dispatch list (per resource / shift)	On demand, shift start	Header: resource, shift, date; lines: sequence, order, operation, item, qty, start/end, setup group	PDF, kiosk view (w25)	none	None
Gantt print	On demand	Resource rows, time scale, bars, legend	PDF (landscape A3/Tabloid)	none	None
Campaign sheet	Campaign planned	Campaign key, sequence of orders, changeovers, cleanout instructions	PDF	`campaign`	Allergen cleanout sheets kept 2 years where food safety plans (FSMA/HACCP) require
Cleanout record	Cleanout order completed	Cleaning steps, materials, verifier, time	PDF; signature via FR-24.22 where GxP	`prod-doc`	Kept with batch records (w24 EBR)
Electronic schedule events	Job placed/moved	CloudEvents (4.23.5)	JSON	n/a	1 year

4.23.16 Periodic and batch jobs

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
Site schedule run	daily 00:30 site-local	site	New run_id; checkpoint every 500 operations; pointer to current run	5k operations < 60 s	Previous run stays current	Failure pages

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
Capacity materialization	daily 00:05 + on calendar event	resource	Upsert per (resource, day)	1,000 resources × 365 days < 2 min	Retry; stale capacity flagged	Lag > 30 min warns
CapacityLoad refresh	after each run/move	resource × period	Recompute deltas	< 5 s per move	Full refresh nightly	Staleness > 60 s warns
Campaign proposal	daily 23:00	site × campaign key	Proposed campaigns replaced per key	< 1 min	Non-blocking	Count reported
Bottleneck detection	after nightly run	resource	One event per bottleneck episode	< 30 s	Non-blocking	Event to notifications
Optimization (on demand)	user	selection ≤ 2,000 ops (windowed)	Solver result stored; heuristic kept on UNKNOWN	≤ time limit	OOM → heuristic retained	OOM warns

4.23.17 Security duties and privileges

Duty	Privileges (entry points)	Segregation-of-duties conflicts	Default roles
View scheduling	GET /scheduling/*, Gantt (read), capacity load, reports	none	Planner, Production supervisor, Shop floor supervisor
Run scheduling	POST /scheduling/runs (heuristic, optimization)	none	Scheduler, Planner
Maintain schedule	`:move`, `:firm`, Gantt drag, campaign sequencing	none	Scheduler
Override scheduling constraints	commit moves with violations	with *Maintain capacity* flagged	Scheduling lead
Maintain capacity	capacity overrides, calendars on resources, capacity blocks	none	Production engineer
Maintain scheduling setup	parameters, setup matrices, resource networks, cleanout rules	none	Production engineer, ERP administrator
Maintain campaigns	create/modify/release campaigns, allocate campaign cost	with *End production orders* (w21) flagged for allocation	Scheduler, Cost accountant (allocation)

4.23.18 Message catalog

Code	Severity	User text	Cause	Remediation	Raised by
SCHED-0001	error	Job {job} overlaps {other} on finite resource {resource}.	Double booking on move	Choose another slot	FR-23.4
SCHED-0002	warning	Job {job} falls outside open capacity on {date}.	Calendar change	Reschedule or add capacity override	FR-23.1
SCHED-0003	warning	Order {order} is late by {minutes} min (backward scheduling fell back to forward).	BR-23.2	Expedite or accept	BR-23.2
SCHED-0004	error	No resource with capability {cap} level ≥ {level} is available.	Capability matching	Add resource or capability	FR-23.12
SCHED-0005	error	Secondary resource {resource} is not free for the selected slot.	BR-23.4	Pick another slot	BR-23.4
SCHED-0006	info	Optimization ended with status {status}; {kept} schedule kept.	Solver result	none	BR-23.9
SCHED-0007	warning	Propagation truncated after {n} orders / {levels} levels.	BR-23.10	Run site schedule	BR-23.10
SCHED-0008	error	Firmed job {job} cannot be moved without force.	Firmed	Unfirm first	FR-23.4
SCHED-0009	error	No allowed successor resource in network {network} for operation {oper} within {days} days.	Network infeasible	Add network edge or capacity	BR-23.11 (`NETWORK_INFEASIBLE`)
SCHED-0010	warning	Wait time {minutes} min exceeds network maximum {max} min.	Max wait	Move predecessor later	BR-23.11
SCHED-0011	error	Order {order} cannot join campaign {campaign}: campaign already started.	Frozen campaign	Use next campaign	FR-23.14
SCHED-0012	warning	Setup matrix has no entry {from} → {to}; route setup time used.	Missing matrix entry	Maintain matrix	FR-23.15
SCHED-0013	error	Cannot end order {order}: campaign cleanout {cleanout} is not ended.	FR-23.16	End the cleanout or allow early end	FR-23.16
SCHED-0014	warning	Job {job} does not match any block on {resource}; placed in unblocked capacity.	Block planning	Review blocks	BR-23.15
SCHED-0015	warning	Resource {resource} is a bottleneck: load {pct}% for {weeks} weeks.	FR-23.9	Add capacity or offload	FR-23.9

4.23.19 Performance budgets and capacity

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation under 3× load
Site schedule run (heuristic)	5,000 operations, 200 resources, 1 nightly + 20 ad hoc/day	25 / 60 / 90 s	100 ops/s	ScheduledJob ~ 5k × 6 jobs × 365 runs retained 30 days ≈ 1M rows	GiST exclusion; (run_id)	Ad hoc runs queued; nightly priority
Gantt window load	5,000 bars; 2,000 loads/day	300 ms / 1 s / 2 s	50/s	n/a	(resource_id, start)	Window narrowed to 2,000 bars
Move with dryRun	3,000/day; peak 30/min	120 / 400 / 800 ms	20/s	ScheduleRun move log 1M rows ≈ 0.5 GB	exclusion constraint check	Propagation preview limited to 100 orders
Capacity materialization	1,000 resources × 365 days	< 2 min full; < 30 s per calendar change	n/a	365k rows/yr	(resource_id, day)	Horizon reduced to 90 days for incremental
CP-SAT optimization	≤ 2,000 ops per window, 5 runs/day	≤ time limit (60 s)	n/a	negligible	n/a	KEDA scale-out; queued beyond 3 concurrent
Campaign sequencing	≤ 50 orders per campaign	1 / 5 / 30 s (CP-SAT circuit)	n/a	negligible	n/a	Fall back to nearest neighbor

4.23.20 Localization and compliance hooks

- **Calendars and time zones**: capacity is materialized from site time zone calendars into UTC (BR-23.7); country holiday calendars come from wave 48 packs; working-time regulations (e.g., EU Working Time Directive 11-hour rest) are not enforced on resources but on workers in w25/w42.
- **Food safety**: allergen changeover rules (FR-23.15) support FSMA (US 21 CFR 117) and EU Regulation 852/2004 HACCP plans by forcing cleanout entries; cleanout records retained 2 years (configurable).
- **GxP**: for regulated plants, cleanout records require e-signature (w24 FR-24.22) and become part of the EBR.
- **Formats**: Gantt time labels follow the user locale (24h/12h), ISO week numbers in load views (configurable to US week numbering).
- **Privacy**: none (no personal data in scheduling entities).
- **Extension points**: `scheduling.constraint` (pluggable constraint provider evaluated in heuristic and CP-SAT, e.g., country-specific noise-curfew windows for resources), `scheduling.objective` (custom weights).

4.23.21 Coverage closure

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
SAP 13.22 PP-PI — CRC5 / CRC resource network [SAP #253]	PARTIAL-23	ADDED as FR-23.13	Allowed transitions and max wait; CP-SAT allowed assignments
SAP 13.22 PP-PI — Campaign planning (COCP / CMP) [#259]	PARTIAL-23	ADDED as FR-23.14	Campaign entity, proposal job, setup-matrix sequencing
SAP 13.22 PP-PI — Cleanout / changeover orders, recipe-dependent cleaning [#260]	PARTIAL-23	ADDED as FR-23.15	SetupMatrix, CleanoutRule, cleanout orders
SAP 13.22 PP-PI Periodic — Campaign settlement / cleanout cost allocation [#270]	PARTIAL-23	ADDED as FR-23.16	BR-23.14 allocation by quantity/equal/run minutes
SAP 13.22 PP-PI Customizing — Resource networks [#272]	PARTIAL-23	ADDED as FR-23.13	Network setup under *Maintain scheduling setup*
SAP 13.22 PP-PI Customizing — Campaign planning settings [#273]	PARTIAL-23	ADDED as FR-23.14	Parameters in 4.23.13
SAP 13.23 PP/DS — Block planning (/SAPAPO/CDPSC12) [#276]	GAP (propose 23)	ADDED as FR-23.17	CapacityBlock with attribute predicate
SAP 13.23 PP/DS Customizing — Block planning settings, CDP settings [#281]	GAP (propose 23)	ADDED as FR-23.17 (block planning); CDP settings ADDED as FR-24.23	CDP is planning against batch characteristics and lives with batch attributes in wave 24

4.24 Wave 24: Process Manufacturing & Lean (Formulas, Batches, Kanban)

4.24.1 Scope and business context

Wave 24 extends production to two further modes. Process manufacturers (food, chemicals, pharma) create batch orders from formulas whose lines scale with batch size, consume ingredients by potency, produce co- and by-products with cost allocation, track batch attributes, shelf life and disposition, and handle catch-weight items with a dual quantity. Lean plants define value streams and production flows with activities, replenish through kanban rules (manufacturing and withdrawal; fixed, scheduled and event replenishment), work kanban cards on a board, and cost production flows by periodic backflush. Formulas and recipes are version-controlled through engineering change (w9). After this wave a second demo plant (food/chem line) runs a batch order and a kanban-driven cell. Out of scope: PI sheets with electronic signatures (w33 quality covers signatures), process control system integration beyond the IoT connector of w25, recipe scale-up optimization.

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
Rescaling a batch order in AX (PmfProdTable "Rescale batch") recomputes lines but silently rounds to the inventory unit precision and does not preserve percent totals; SAP COR2 quantity change re-reads the recipe and drops manual line edits	Scaling implemented as re-explosion; rounding residual not tracked	BR-24.1 scaling with residual assigned to the largest scalable line, side-by-side preview, manual edits preserved	Percent-controlled Σ = 100.0000 on 100% of batches; rescale 12 clicks → 2
Potency adjustment is manual: AX requires the batch potency on InventBatch to be keyed before picking and the picking list does not recompute compensating lines automatically; SAP active-ingredient management needs batch characteristics plus custom proportion units	Potency not part of the consumption proposal	BR-24.2 proposal computes active and compensating quantities from recorded batch attributes	Potency re-keying 0 (attributes recorded once); consumption error < 0.1%
Co-product costing errors at End: AX TCA allocation misallocates when a co-product has zero standard cost; SAP apportionment structures (TKKAA) must be maintained per material and settlement KO88 fails silently with status messages	Allocation data in separate setup objects, no invariant check	Allocation normalized with residual rule and property test Σ = batch cost; preview before End	Allocation mismatches 0; End failures surfaced synchronously with reason
Kanban cards and boards are disconnected: AX kanban board (KanbanBoardScheduleView) refreshes manually and cannot be used on a tablet; SAP PK13N is a GUI-only status screen; Plex and Epicor Kinetic kanban rely on printed cards and scanner re-keying	Board is a list page over KanbanJob with no push updates	Touch board with SSE refresh, GS1 DataMatrix cards, event kanbans within 5 s	Card-to-board latency 5 min refresh → < 2 s; re-keying 0
Shelf-life and disposition rules are enforced only at picking in AX (PdsShelfLife) and by batch status in SAP (MSC2N), so expired or on-hold batches appear in proposals	Rules applied post hoc rather than in the proposal query	Proposals exclude expired/on-hold batches; override requires duty + reason	Expired-batch consumption incidents → 0; audit reason on 100% of overrides

4.24.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Formula	PmfFormula, BOMVersion with PmfFormulaSize, PmfFormulaLine (scalable, percent-controlled)	Master recipe (C201), material list in recipe, base quantity	Formula (BomVersion subtype), FormulaLine	full
Batch order	ProdTable with ProdType=Batch (PmfProdTable), batch order status = ProdStatus	Process order (COR1/COR2), AUFK with order category 40	BatchOrder (ProductionOrder subtype)	full
Co-/by-products	PmfCoByProd, cost allocation (TCA, manual, none), by-product cost type	Co-product settlement rule (apportionment structure), by-product with negative qty	CoProductLine, allocation_method	full
Potency	PdsBatchAttrib, PdsBatchAttribItem, base attribute, potency unit, active-ingredient line type	Active ingredient management (batch characteristic, proportion unit)	BatchAttribute with `potency` role; consumption rule	full
Batch attributes / disposition	PdsBatchAttrib, PdsBatchAttributes on InventBatch, PdsDispositionCode	Batch classification (MSC1N characteristics), batch status, usage decision	BatchAttribute, InventoryBatch.disposition (w16 batch)	full
Shelf life	InventBatch expiry, best-before, shelf-advice, PdsShelfLife	Shelf-life expiration date (SLED), minimum remaining shelf life	shelf_life_days, best_before, expiry on batch	full
Catch weight	PdsCW, CW unit, nominal/min/max qty	Catch-weight management (S/4 CWM, parallel UoM)	CatchWeightQty on product and transactions	full

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
PI sheet / process instructions	n/a (route card notes)	PI sheets (CORA/CO60), control recipes, process messages	operation instructions on kiosk (w25); messages via events	partial — no XSteps
Production flow / value stream	LeanProductionFlow, LeanProductionFlowActivity, ValueStream (OMOperatingUnit)	PP-REM production version, product cost collector, MF50 planning table	ProductionFlow, FlowActivity, ValueStream (w6 OperatingUnit)	full
Kanban rules and kanbans	KanbanRule (fixed/scheduled/event), Kanban, KanbanJob, KanbanJobSchedule, kanban board	Control cycle PK01, kanban board PK13N, PK05 demand source, PK17	KanbanRule, Kanban, KanbanJob	full
Backflush costing	Lean backflush costing, production flow costing (periodic)	Product cost collector (KKF6N), REM backflush MFBF, periodic settlement	FlowCostingPeriod	full
Repetitive planning table	n/a	MF50	kanban board takt view	partial
Batch attribute / shelf-life inheritance (batch derivation)	PdsInheritance (Lot inheritance setup), PdsBatchAttribInherit on formula lines, end-item / co-product inheritance	Batch derivation DVMO / DVSP / DVMAN (sender/receiver rules)	InheritanceRule, derivation on RAF and manual (FR-24.15)	full
Batch merge	PdsBatchMerge (Batch merge form)	Transfer posting batch to batch (MIGO 309/311) with manual characteristic update	`:merge` batches with attribute recomputation (FR-24.16)	improved
Consolidated batch orders (bulk → packed)	PdsConsolidatedOrder, bulk/pack relations (PdsBulkItemConv)	Process order with co-ordinated packaging orders (manual)	BulkPackRelation, consolidation job (FR-24.17)	full
Rework batch orders	PdsRework (Rework batch order), rework parameters	Rework process order (COR1 order without material), trigger points	Rework BatchOrder keeping batch identity (FR-24.18)	full
Same-batch reservation; customer sellable days; customer batch attribute requirements	PdsSameBatch, PdsCustSellableDays, PdsCustBatchAttrib	Batch search strategy for sales (VCH1, SD batch determination), minimum remaining shelf life on customer-material info	Same-batch flag, CustomerBatchRequirement (FR-24.19)	full
Lean subcontracting	LeanSubcontracting: service activity, vendor work cell, purchase agreement for service	Subcontracting in REM / kanban with external procurement (PK01 replenishment strategy external)	Service FlowActivity with vendor work cell (FR-24.20)	full
Electronic batch record	n/a (D365 batch order documents only)	COEBR batch record (creation, approval, archive)	ElectronicBatchRecord with review by exception (FR-24.21)	improved
Electronic signatures (21 CFR Part 11)	D365 electronic signature (SIGSignatureLog) on configured events	Digital signature DSIG, signature strategies (O2, DMS signature strategies)	Signature service with step-up re-authentication (FR-24.22)	full
Characteristic-dependent planning	n/a (batch attributes on sales only)	PP/DS characteristic-dependent planning (CDP)	Attribute-constrained pegging (FR-24.23)	full
Documentary batches	Tracking dimension group with batch active but not physical inventory	S/4 documentary batches	Tracking policy `batch-record-only` (FR-24.24)	full

4.24.3 Functional requirements

- **FR-24.1 Formulas** — Must. The system shall define a Formula as a BomVersion with formula_size and FormulaLine fields: scalable (bool), percent_controlled (bool, lines sum to 100%), line_type (ingredient, active-ingredient, phantom, co-product, by-product), per_series/quantity.
  - Notes: Percent-controlled formulas validate Σ scalable line % = 100.00 ± 0.01. Formula version changes go through ECO (w9); a batch order snapshots the formula at creation.
- **FR-24.2 Batch orders** — Must. The system shall create BatchOrder from a formula, scaling scalable lines proportionally to batch size (non-scalable lines fixed), with the same state machine and journals as w21 plus co-/by-product RAF lines.
- **FR-24.3 Potency** — Must. The system shall consume active-ingredient lines by potency: consumed qty = planned qty × (standard potency / actual batch potency), with compensating lines (fillers) adjusted so the batch size is kept.
  - Notes: Potency attribute defined per item (base attribute, target value, min/max); batch potency recorded at receipt or by quality (w33) on the InventoryBatch. Batches outside min/max are not pickable for the line.
- **FR-24.4 Co-/by-product costing** — Must. The system shall allocate batch cost to co-products by method: none (all cost to main item), manual (fixed %), total cost allocation (TCA: Σ co-product standard cost shares), by quantity; by-products reduce cost by burden: per series, per quantity, percent, or recycled (negative issue).
  - Notes: Allocation percentages are normalized to sum 100.0000; rounding residual goes to the main product; property test Σ allocated = batch cost.
- **FR-24.5 Batch attributes and disposition** — Must. The system shall record BatchAttribute values per inventory batch (numeric/text/enum/date with min/max/target), block batches by disposition code (available, on-hold, rejected, quarantine) and restrict picking by customer-specific attribute ranges (sales linkage in w27).
- **FR-24.6 Shelf life** — Must. The system shall compute best_before = manufacturing date + best_before_days and expiry = manufacturing date + shelf_life_days at RAF, support shelf-advice (advice days before expiry) and FEFO picking on batch orders, and block consumption of expired batches unless duty *Consume expired batch* is held.
- **FR-24.7 Catch weight** — Must. The system shall support catch-weight items with inventory quantity in the CW unit (e.g. cases) and a nominal weight with min/max, carrying both quantities on every inventory and production transaction; cost is per inventory (weight) quantity.
  - Notes: RAF requires actual weight per CW unit; variance outside min/max rejected; sales/purchase price is per weight (w26 pricing uses nominal until actual known).
- **FR-24.8 Production flows** — Must. The system shall model ValueStream → ProductionFlow (versioned, with takt time, activation dates) → FlowActivity (process or transfer; cycle time, resource/work cell, input/output locations, picking activities) and validate connectivity (every process activity has an output).
- **FR-24.9 Kanban rules** — Must. The system shall define KanbanRule with type (manufacturing/withdrawal), replenishment strategy (fixed: number of kanbans and product quantity; scheduled: via planning as planned kanbans; event: generated from sales line, BOM line, kanban line, minimum stock), lead time, fixed quantity, activity sequence, and automatic planning/firming.
- **FR-24.10 Kanbans and board** — Must. The system shall create Kanban (card) with KanbanJobs per activity, states Not planned → Planned → Prepared → In progress → Completed → Emptied (card returns), print cards with barcodes (GS1 DataMatrix), and provide a board per work cell (columns by job status) with drag completion and quantity/scrap entry.
- **FR-24.11 Kanban events** — Must. Event kanbans shall be generated within 5 s of a triggering sales line (w27 or fixture) or BOM line of a production order, and withdrawal kanbans create transfer jobs that post inventory transfers on completion.
- **FR-24.12 Lean backflush costing** — Should. The system shall cost production flows periodically: per costing period, issue materials at standard/weighted-average on kanban completion, accumulate conversion cost by activity (cycle time × cost rate), and settle at period end with variances to the flow's posting profile.
- **FR-24.13 Kanban manufacturing orders** — Must. Manufacturing kanbans shall create a lightweight ProductionOrder of type `kanban` (no routing jobs; single process activity) that reports as finished on kanban completion.
- **FR-24.14 Takt and board metrics** — Could. The board shall show takt vs cycle, WIP count per column and kanbans overdue (planned < now).

- **FR-24.15 Batch attribute and shelf-life inheritance (batch derivation)** — Must. The system shall apply InheritanceRules at RAF of batch orders (and on manual derivation) that copy or compute attribute values and shelf-life dates from sender batches (consumed ingredient batches flagged `inherit` on the formula line, or the main product batch for co-products) to receiver batches (product, co-products), with aggregation per attribute: `copy` (single sender), `min`, `max`, `weighted-average` (by consumed quantity), `earliest-date`, `latest-date`, or `fixed`.
  - Notes: Rules are defined per receiving item (AX "Lot inheritance setup") with sender item(s) or formula line; `inherit-shortest-shelf-life` (BR-24.4) is the built-in shelf-life rule. If a sender attribute is missing, the receiver attribute is left empty and the derivation log records `missing-sender-value`. Manual derivation (SAP DVMAN) re-runs rules for a batch after attribute changes upstream and propagates forward to batches already derived from it (max depth 10). Each derivation writes a DerivationLog row (sender batches, rule, values before/after) viewable in the derivation monitor (SAP DVMO).
- **FR-24.16 Batch merge** — Should. The system shall merge two or more batches of the same item and warehouse into a target batch (new or one of the sources) by posting a transfer from each source batch to the target, recomputing target attributes (numeric → weighted average by quantity; text/enum → must be equal or merge is refused unless the attribute is `merge-override`; dates → earliest expiry/best-before) and recording genealogy (all sources as parents).
  - Notes: Sources must have disposition `available` (or the same disposition) and the same catch-weight unit; merge of batches with different potency recomputes potency as weighted average; merge cost per unit = weighted average of source costs (standard-cost items unaffected). Merge requires duty *Merge batches*.
- **FR-24.17 Consolidated batch orders (bulk and packed items)** — Should. The system shall maintain BulkPackRelations (bulk item → packed item, packing quantity per packed unit in bulk UoM, pack formula/BOM) and a consolidation function that groups planned or firmed packed-item orders (planned production orders from w22 or firmed orders) within a date window into one bulk BatchOrder sized to Σ packed demand in bulk UoM (rounded up to formula multiples), creating packing orders that consume the bulk batch and are pegged to it.
  - Notes: Consolidation runs on demand or as a batch job (4.24.16); the bulk order's RAF batch is reserved for its packing orders (same-batch); packing orders inherit bulk batch attributes (FR-24.15) by default. Window default 7 days; maximum bulk batch size = formula maximum.
- **FR-24.18 Rework batch orders** — Should. The system shall create a rework BatchOrder for an existing batch: the batch (or part of it) is the first ingredient line, additional ingredients and rework operations come from a rework formula/route or are entered manually, and the output is received to the same batch number (default) or a new batch per rework parameters, with attributes re-recorded and the original batch genealogy preserved.
  - Notes: Rework parameters (AX "Rework" parameters): `keep-batch-number` (default true), `require-quality-order` (w33, default true), disposition of output (default `quarantine` until quality release). Cost: rework cost posts as variance type `rework` (w21 FR-21.20) unless `rework.capitalize`.
- **FR-24.19 Same-batch reservation and customer batch requirements** — Should. The system shall support (a) a same-batch flag on item (and overridable on sales lines) requiring a reservation or pick of the full line quantity from one batch, (b) customer sellable days (minimum remaining shelf life in days at shipment) per customer × item or item group, and (c) customer batch attribute requirements (attribute ranges per customer × item), enforced in batch reservation proposals, picking (w28) and shelf-life aware planning (w22 FR-22.20).
  - Notes: Batches not meeting the customer's requirements are excluded from proposals; override requires duty *Override customer batch requirements* with reason. Same-batch on a line with quantity larger than any single batch returns 409 `SAME_BATCH_UNAVAILABLE` with the largest available batch quantity. Sales lines arrive in w27; until then the rules apply to transfer and production picking and to fixtures.
- **FR-24.20 Lean subcontracting** — Should. The system shall model a FlowActivity of kind `service` on a vendor work cell (a Vendor resource from w9 linked to a vendor account), priced by a purchase agreement for a service item (w17), and on kanban job completion (or per period, configurable) generate or update purchase order lines for the service quantity, receive them automatically at completion, and post the service cost as conversion cost of the production flow.
  - Notes: Modes: `po-per-kanban` (one PO line per kanban job), `periodic-po` (one PO per vendor per period with released quantities accumulated, receipts per job). Material sent to the vendor moves to the vendor work cell's location via withdrawal kanbans. Vendor invoice matching uses the w18 three-way match against auto-receipts.
- **FR-24.21 Electronic batch record (EBR)** — Should. The system shall compile, for each batch order of an item whose BatchRecordProfile is active, an ElectronicBatchRecord containing: header (product, batch, formula/route version with ECO ids, batch size, dates), every posted journal line with batch/serial, attribute values with recorded-by, executed PI sheet steps and process data (w25 FR-25.16), process messages (w25 FR-25.17), equipment and cleanout records (w23), deviations (w33 nonconformances linked to the order), exceptions (any value outside limits, any override, any signature-required step), and signatures (FR-24.22); and shall route it through review (production review, QA review) with review by exception — reviewers must disposition every exception — before QA approval, after which the record is sealed (hash) and archived as PDF/A-2b plus JSON.
  - Notes: BatchRecordProfile: required sections, reviewer roles, number of signatures per stage, whether batch disposition `available` requires EBR approval (default true for GxP items). A sealed record is immutable; corrections create an addendum record linked to the original. EBR generation is incremental (sections update on events) so the review screen is current while the batch runs.
- **FR-24.22 Electronic signature service** — Must. The system shall provide a signature service usable by any service through `POST /api/v1/signatures` that records a signature only after re-authentication of the signer (Keycloak step-up: password plus a second factor; first signing in a session requires both components, subsequent signings in the same continuous session require at least one per 21 CFR 11.200(a)(1)), binds it to the signed record by a SHA-256 hash of the record's canonical JSON, and stores signer id, printed name, date/time (UTC and signer's local time zone), meaning (authored, reviewed, approved, verified, released, rejected) and reason/comment.
  - Notes: Signature strategies define for an object type and event: number of signers, sequence (parallel/serial), distinct-user rule (signers ≠ record author), required roles/duties, and the meaning per signer. Signature manifestation (11.50) is rendered on every printed or exported signed record. Signatures cannot be copied or transferred (11.70): any change to the record after signing invalidates the hash and the record shows `signature-invalidated` until re-signed. Signature log is append-only (outbox to Iceberg, 15-year retention). Three consecutive failed re-authentications lock signing for the user for 15 minutes and raise a security event (w2). Wave 48 extends this service to configured tables/fields across all modules.
- **FR-24.23 Characteristic-dependent planning** — Could. The planning engine (w22) shall carry required attribute ranges on demand (from customer batch requirements FR-24.19 or entered on the demand line) and target attribute values on supply (batch attribute values for on-hand, formula target values for planned production), and peg supply to demand only when supply attributes satisfy the demand's ranges; unmatched demand yields planned orders with the demand's attribute targets.
- **FR-24.24 Documentary batches** — Could. The system shall support a tracking policy `batch-record-only` for items that are not batch-managed in inventory: batch numbers are captured on receipts, issues and RAF and stored on InventoryTransaction for traceability and genealogy, but on-hand is not split by batch and FEFO/disposition rules do not apply.

4.24.4 Data model

FormulaLine: id, bom_version_id, line_number, item_id, line_type (enum), qty (numeric 18,6), percent (numeric 9,4), scalable (bool), percent_controlled (bool), potency_base_item (bool), unit_id, scrap_pct, is_co_product (bool), allocation_pct (numeric 7,4), by_product_cost_type (enum: per-series, per-quantity, percent, recycled).

BatchOrder (extends ProductionOrder): formula_size (numeric), batch_size (numeric), scale_factor (numeric 18,9, computed), planning_item_id (for co-product planning), potency_mode (enum), manufacturing_date, batch_number (text, generated at RAF via `batch` sequence).

CoProductLine: id, order_id, item_id, planned_qty, raf_qty, allocation_method (enum: none, manual, tca, quantity), allocation_pct, allocated_cost (numeric 18,4), is_by_product (bool), by_product_cost_type.

BatchAttribute: id, item_id, attribute_id, data_type (numeric/text/enum/date), target, min, max, role (enum: potency, generic), unit_id; **BatchAttributeValue**: batch_id (w16 InventoryBatch), attribute_id, value_numeric, value_text, value_date, recorded_at, recorded_by.

CatchWeightQty (on product): cw_unit_id, nominal_qty (numeric 18,6), min_qty, max_qty; on InventoryTransaction and journal lines: cw_qty (numeric 18,6) alongside qty.

ProductionFlow: id, value_stream_id (OperatingUnit), version, name, site_id, takt_time_s (int), status (draft/active/expired), active_from, active_to; **FlowActivity**: id, flow_id, name, kind (process/transfer), cycle_time_s, work_cell_resource_id, input_location_id, output_location_id, predecessor_ids (uuid[]), picking_required (bool).

KanbanRule: id, item_id, site_id, warehouse_id, location_id, rule_type (manufacturing/withdrawal), replenishment (fixed/scheduled/event), fixed_qty, number_of_kanbans (int), min_kanbans, max_kanbans, lead_time_h, event_source (sales/bom/kanban/min-stock), auto_plan (bool), auto_firm (bool), flow_activity_sequence (uuid[]), effective_from, effective_to.

Kanban: id, rule_id, card_number, qty, cw_qty, state (enum), handling_units (int), planned_start, due, production_order_id / transfer_id, event_ref_type, event_ref_id, printed_at; **KanbanJob**: id, kanban_id, activity_id, sequence, state (not-planned/planned/prepared/in-progress/completed), start, end, reported_qty, scrap_qty.

FlowCostingPeriod: id, flow_id, period_start, period_end, status (open/settled), material_cost, conversion_cost, output_value, variance, journal_entry_id.

Invariants: Σ FormulaLine.percent for percent-controlled scalable lines = 100.0000; Σ CoProductLine.allocated_cost + main-item cost = batch actual cost (after by-product burden); Kanban state transitions only forward except `Emptied → Not planned` on card reuse; fixed-rule active kanbans count ≤ number_of_kanbans; cw_qty present iff the item is catch-weight.

Indexing: Kanban (rule_id, state); KanbanJob (activity_id, state, planned_start) for the board; BatchAttributeValue (batch_id); FormulaLine (bom_version_id, line_number).

InheritanceRule / DerivationLog (FR-24.15): InheritanceRule(id, receiver_item_id, sender_item_id or formula_line_ref, attribute_id or `shelf-life`, aggregation (enum copy/min/max/weighted-average/earliest-date/latest-date/fixed), fixed_value, applies_to (enum product/co-product/all), active); DerivationLog(id, receiver_batch_id, sender_batch_ids uuid[], rule_id, attribute_id, value_before, value_after, trigger (raf/manual/merge), derived_at, derived_by).

BulkPackRelation (FR-24.17): id, bulk_item_id, packed_item_id, pack_qty_per_unit numeric(18,6) (bulk UoM per packed unit), pack_bom_version_id, consolidation_window_days int default 7, active.

CustomerBatchRequirement (FR-24.19): id, customer_id or customer_group_id, item_id or item_group_id, sellable_days int, attribute_id nullable, min, max, same_batch (bool), valid_from, valid_to.

ElectronicBatchRecord / EbrException / BatchRecordProfile (FR-24.21): ElectronicBatchRecord(id, order_id, batch_id, profile_id, status (compiling/in-review/approved/sealed/addendum), content_hash bytea, pdf_document_id (w5), json_document_id, sealed_at, parent_record_id (addendum)); EbrException(id, record_id, source_type, source_id, description, severity, disposition (accepted/deviation-raised/rejected), dispositioned_by, signature_id); BatchRecordProfile(id, code, item_group_id, required_sections text[], review_stages jsonb, approval_required_for_release bool).

Signature / SignatureStrategy (FR-24.22): Signature(id, tenant_id, object_type, object_id, record_hash bytea, signer_subject_id, printed_name, meaning (enum), reason text, signed_at_utc timestamptz, signer_time_zone text, auth_method (enum password+otp/otp/webauthn), session_id, strategy_id, sequence int, valid (bool)); SignatureStrategy(id, object_type, event, signers int, order (parallel/serial), distinct_from_author bool, required_duties text[], meanings text[]).

Invariants (additions): a sealed ElectronicBatchRecord's content_hash equals SHA-256 of its JSON document; every EbrException of an approved record has a disposition and a signature; a Signature with valid = true has record_hash equal to the current hash of the object; DerivationLog rows are append-only.

4.24.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
POST	/api/v1/production/batch-orders	Create batch order from formula with batch_size	Idempotency-Key	Maintain batch orders
POST	/api/v1/production/batch-orders/{id}:rescale	Change batch size before Started	Idempotency-Key	Maintain batch orders
POST	/api/v1/production/batch-orders/{id}/co-products:allocate	Preview/apply allocation	Idempotency-Key	Post production journals
PUT	/api/v1/inventory/batches/{id}/attributes	Record attribute values	full replace	Maintain batch attributes
POST	/api/v1/inventory/batches/{id}:disposition	Change disposition	Idempotency-Key	Maintain batch disposition
POST	/api/v1/lean/flows	Create/version production flow	Idempotency-Key	Maintain production flows
POST	/api/v1/lean/flows/{id}:activate	Validate and activate	Idempotency-Key	Maintain production flows
POST	/api/v1/lean/kanban-rules	Create rule	Idempotency-Key	Maintain kanban rules
POST	/api/v1/lean/kanbans:generate	Generate kanbans for a rule (fixed/event)	Idempotency-Key	Maintain kanbans
POST	/api/v1/lean/kanban-jobs/{id}:complete	Complete job with qty/scrap/handling units	Idempotency-Key	Work kanban board
GET	/api/v1/lean/board?workCellId	Board view (jobs by column)	n/a	Work kanban board
POST	/api/v1/lean/flows/{id}/costing-periods/{p}:settle	Settle period	Idempotency-Key	Settle production flows

Event	Trigger	Payload fields	Consumers
`passage.production.batch-order.created.v1`	batch order created	orderId, formulaVersionId, batchSize, scaleFactor, coProducts[]	planning, analytics
`passage.production.batch.attributes-recorded.v1`	attribute values saved	batchId, itemId, values[{attributeId, value}], potency	quality (w33), sales (w27)
`passage.production.co-product.allocated.v1`	End of batch order	orderId, lines[{itemId, method, pct, amount}], byProductBurden	ledger, costing
`dev.passage.lean.kanban.created.v1`	kanban generated	kanbanId, ruleId, qty, eventRefType, eventRefId, due	production, shopfloor
`passage.lean.kanban.state-changed.v1`	job/kanban transition	kanbanId, jobId, from, to, qty, scrap, handlingUnits	production, inventory, shopfloor
`passage.lean.flow-period.settled.v1`	period settled	flowId, period, materialCost, conversionCost, outputValue, variance, journalEntryId	ledger, analytics

4.24.6 User experience

Screen	Primary actions	Key fields/columns	Duty required
Formula designer	Add lines, toggle scalable/percent, define co/by-products, validate 100%, submit ECO	Line, item, type, qty/%, scalable, potency base, allocation %	Maintain formulas
Batch order detail	Rescale, estimate, release, RAF with co-products, attributes tab	Batch size, scale factor, co-product lines, batch number, dates, attributes	Maintain batch orders
Batch attributes / disposition	Record values, change disposition, view history	Attribute, value, target/min/max, pass flag, disposition	Maintain batch attributes
Production flow designer	Canvas of activities, connect, set cycle times, activate	Activity, kind, cycle time, work cell, locations	Maintain production flows
Kanban rules	Create fixed/scheduled/event rules, compute number of kanbans	Item, type, replenishment, qty, kanbans, lead time	Maintain kanban rules
Kanban board (work cell)	Drag job between columns, complete with qty, print cards, filter	Columns Not planned/Planned/Prepared/In progress/Completed; card: item, qty, due, order	Work kanban board
Flow costing	Open/settle period, variance drill	Period, material, conversion, output, variance	Settle production flows

Interaction rules: formula percent cells show a running total with red when ≠ 100; board is touch-friendly (min 44 px targets) and refreshes via SSE; card print uses the w5 document service with GS1 DataMatrix encoding `(240)kanbanId`; rescale shows before/after line quantities side-by-side.

4.24.7 Business rules and edge cases

- **BR-24.1 Scaling.** scale_factor = batch_size / formula_size; scalable line qty = formula qty × scale_factor; non-scalable lines unchanged; percent-controlled lines qty = batch_size × percent/100; rounding to UoM precision with residual added to the largest scalable line so Σ = batch_size.
- **BR-24.2 Potency consumption.** For an active-ingredient line with standard potency P_s and picked batch potency P_a: qty = planned × P_s / P_a; the compensating line qty = planned_comp – (qty – planned); negative compensating qty is rejected with 422 `POTENCY_COMPENSATION_NEGATIVE`. Example: 100 kg at 50% standard, batch at 40% → 125 kg; filler reduced by 25 kg.
- **BR-24.3 Co-product allocation (TCA).** share_i = std_cost_i × raf_qty_i / Σ_j std_cost_j × raf_qty_j; allocated_i = round(batch_cost_after_by_products × share_i, 4); residual to the main product. Example: batch cost USD 10,000.00; main A (std 40, 200 units = 8,000), co-product B (std 20, 100 = 2,000): A gets 8,000.00, B 2,000.00. By-product C per-quantity burden 1.50 × 50 = 75.00 reduces batch cost first (9,925.00 allocated 7,940.00 / 1,985.00; C received at 75.00).
- **BR-24.4 Shelf life.** best_before/expiry computed at RAF from manufacturing_date (defaults to RAF date); if the formula has `inherit-shortest-shelf-life`, the output expiry = min(ingredient batch expiries) when earlier.
- **BR-24.5 Catch-weight RAF.** cw_qty integer ≥ 1; qty (weight) must satisfy min_qty × cw_qty ≤ qty ≤ max_qty × cw_qty; cost per weight unit.
- **BR-24.6 Kanban state machine.** Not planned → Planned (date set) → Prepared (picking complete) → In progress (first job started) → Completed (last job completed; manufacturing: RAF posted; withdrawal: transfer posted) → Emptied (consumed; card returns to Not planned for fixed rules, or is deleted for event rules). Backward moves only Planned → Not planned. Illegal moves return 409.
- **BR-24.7 Fixed rule kanban count.** number_of_kanbans = ⌈(daily demand × lead_time_days × (1 + safety%)) / fixed_qty⌉ as a suggestion; rule cannot have more active (non-Emptied) kanbans than number_of_kanbans.
- **BR-24.8 Event kanban quantity.** Event kanbans for demand D create ⌈D / fixed_qty⌉ kanbans; last kanban is full-size (overproduction allowed) unless `exact_qty` flag.
- **BR-24.9 Flow period settlement.** variance = material_cost + conversion_cost – output_value; settled at period end only if all kanbans with jobs in the period are Completed or Emptied, else 409 `FLOW_PERIOD_OPEN_KANBANS` listing them.
- **BR-24.10 Expired batch.** A picking line selecting a batch with expiry < posting date fails unless duty held, in which case the audit log records the override reason (required, ≥ 10 chars).
- **BR-24.11 Weighted-average inheritance and merge.** value = Σ (v_i × q_i) / Σ q_i over senders with a value, rounded to the attribute's decimals (default 4); example: batches 200 kg at 40.0% and 300 kg at 45.0% potency → 43.0000%. Earliest-date aggregation for expiry: min(e_i).
- **BR-24.12 Consolidation sizing.** Bulk batch qty = ⌈Σ_j packed_qty_j × pack_qty_per_unit / formula_multiple⌉ × formula_multiple; if it exceeds formula maximum, split into ⌈qty / max⌉ bulk orders, allocating packing orders by due date.
- **BR-24.13 Customer sellable days.** A batch qualifies for a customer line shipping on date d if expiry – d ≥ sellable_days; if both item default and customer value exist, the customer value wins; if both customer-group and customer exist, the customer wins.
- **BR-24.14 Signature re-authentication.** A continuous session is one without idle > 10 minutes or logout; the first signature in a session requires password + second factor; subsequent signatures require password; the signer must match the session subject; a signing attempt with a mismatched subject is rejected and logged.
- **BR-24.15 EBR review by exception.** An exception is created for: a value outside limits, any override of a block (expired batch, disposition, constraint), an unsigned required step, a deviation linked to the order, a manual journal edit after posting, or a missed process message; approval is refused while any exception is undispositioned.
- **BR-24.16 Lean subcontract receipt.** Service receipt qty = completed kanban job qty; periodic POs close at period end with quantity = Σ receipts; price from the purchase agreement valid on the job completion date.

4.24.8 Acceptance criteria

- **AC-24.1** (FR-24.2, BR-24.1) Given a 1,000 kg formula with a 50 kg non-scalable line, when I create a 2,500 kg batch, then scalable lines are ×2.5 and the non-scalable line stays 50 kg.
- **AC-24.2** (FR-24.3) Given the BR-24.2 example, when the picking list proposes consumption, then the active line is 125 kg and the filler is reduced by 25 kg.
- **AC-24.3** (FR-24.4) Given the BR-24.3 fixture for each allocation method, when the order ends, then Σ allocated cost + by-product burden = batch actual cost exactly.
- **AC-24.4** (FR-24.6) Given an expired ingredient batch, when picked without the duty, then 422 `BATCH_EXPIRED`.
- **AC-24.5** (FR-24.7) Given a catch-weight item (nominal 10 kg, min 9, max 11), when I RAF 10 cases at 95 kg, then the post fails; at 102 kg it succeeds with qty 102 and cw_qty 10.
- **AC-24.6** (FR-24.11) Given an event rule with fixed_qty 20, when a sales line for 50 arrives, then 3 kanbans exist within 5 s and completing them through the board posts RAF of 60.
- **AC-24.7** (FR-24.10) Given a kanban in Planned, when I drag it to Completed, then 409 and the board reverts.
- **AC-24.8** (FR-24.12) Given a flow period with 10 completed kanbans, when settled, then the journal entry balances and the variance equals material + conversion – output.
- **AC-24.9** (FR-24.1) Given a percent-controlled formula summing to 99.5%, when I activate it, then validation fails.
- **AC-24.10** (FR-24.5) Given a batch with disposition on-hold, when a batch order picks it, then the batch is excluded from proposals.
- **AC-24.11** (FR-24.15, BR-24.11) Given an inheritance rule `weighted-average` on potency and two ingredient batches (200 kg at 40%, 300 kg at 45%), when the batch order reports as finished, then the product batch potency is 43.0000% and the derivation monitor shows both senders.

- **AC-24.12** (FR-24.16) Given two available batches of 100 kg (expiry 2027-03-01) and 50 kg (expiry 2027-02-01), when merged into a new batch, then the target holds 150 kg with expiry 2027-02-01 and genealogy lists both sources.
- **AC-24.13** (FR-24.17, BR-24.12) Given packed orders for 400 and 600 bottles at 0.5 kg each and formula multiple 100 kg, when consolidated, then one bulk batch order of 500 kg exists and both packing orders are pegged to it.
- **AC-24.14** (FR-24.19, BR-24.13) Given customer sellable days 60 and batches expiring in 45 and 90 days, when proposing reservation for that customer, then only the 90-day batch is proposed.
- **AC-24.15** (FR-24.22, BR-24.14) Given a QA approver signing an EBR, when the second factor is wrong, then no signature is stored; after three failures signing is locked for 15 minutes and a security event exists.
- **AC-24.16** (FR-24.21, BR-24.15) Given a batch with one expired-batch override, when QA attempts approval without dispositioning the exception, then approval is refused; after disposition and signatures the record is sealed and its PDF shows signer name, meaning and UTC time.
- **AC-24.17** (FR-24.20, BR-24.16) Given a service activity on vendor V with mode `po-per-kanban`, when a kanban job of 20 completes, then a PO line for 20 service units at the agreement price is created and received.
- **AC-24.18** (FR-24.18) Given rework of batch B-77 with `keep-batch-number`, when the rework order reports as finished, then batch B-77 has the new quantity, disposition `quarantine`, and the genealogy shows the rework order.

4.24.9 Test plan and fixtures

Fixtures: `pmf-potency-20` (standard/actual potency pairs with expected consumption); `pmf-coby-12` (allocation methods × by-product cost types); `pmf-catchweight-10`; `lean-flow-demo` (3-activity flow, 2 fixed rules, 1 event rule); `lean-kanban-sim` (sales lines → event kanbans → board completion).

Test	Type	Target	Pass criterion
Potency	unit	consumption proposal	20/20
Allocation sums	property	allocation	Σ = cost for random costs/quantities
Catch weight	unit	RAF validation	min/max enforced
Kanban state machine	property	transitions	illegal rejected
Event kanban latency	integration	event→kanban	p95 < 5 s
Board E2E	Playwright	board	kanbans complete, RAF posted
Flow settlement	contract	ledger	balanced entry

Reconciliation: Σ co-product allocated cost = batch cost; Σ kanban RAF = inventory receipts from kanban orders; flow period variance = GL flow variance account.

4.24.10 Deployment and operations

Helm: `production` extended (flag `prod.process`), `lean` (Go, 2 replicas), `lean-db` (CloudNativePG 50 GB). Config: `LEAN_EVENT_KANBAN_SLA_S` (5), `PMF_POTENCY_TOLERANCE_PCT` (0.5). Flags: `prod.process`, `prod.catch-weight`, `lean.kanban`, `lean.flow-costing`. Jobs: shelf-advice notification daily 06:00; flow period auto-settle (optional) monthly. SLOs: board load p95 < 500 ms; kanban generation p95 < 5 s. Alerts: event-kanban backlog > 100 (warn); flow settlement failure (page). Rollback: prior digest; flags off disables the second plant's workspaces without data loss.

4.24.11 Migration from AX / SAP

Source	Passage entity	Notes
PmfFormula/BOMVersion+BOM lines (AX) / PLKO+PLPO+STPO recipe (SAP)	Formula, FormulaLine	formula size → base quantity; percent lines derived from quantities when SAP recipe is in base units
PmfCoByProd / co-product apportionment (TKKAA)	CoProductLine on formula	TCA percentages from apportionment structure
PdsBatchAttrib, PdsBatchAttribItem, PdsBatchAttributes / batch classification (AUSP, CABN)	BatchAttribute, BatchAttributeValue	characteristic → attribute; numeric/char/date types
InventBatch expiry/best-before / MCH1 VFDAT, HSDAT	InventoryBatch (w16) fields	already migrated in w16; this wave adds attributes
PdsCW / CWM units	CatchWeightQty	nominal/min/max
LeanProductionFlow, LeanProductionFlowActivity / production versions, REM profiles	ProductionFlow, FlowActivity	active versions only
KanbanRule, Kanban, KanbanJob / PKHD, PKPS	KanbanRule, Kanban (active cards)	completed/emptied cards not migrated

Validation: formula explosion of 100 sampled batches matches legacy consumption to 0.01%; active kanban count per rule equals legacy. Not migrated: process-order history, PI sheet archives, SAP XSteps.

Migration addendum (FR-24.15–24.24). AX PdsInheritance setup → InheritanceRule; AX PdsCustSellableDays/PdsCustBatchAttrib → CustomerBatchRequirement; AX PdsBulkItemConv → BulkPackRelation; AX LeanSubcontracting service activities → FlowActivity kind `service`; SAP DVSP derivation strategies → InheritanceRule (sender/receiver fields → attributes); SAP customer-material minimum remaining shelf life (KNMT) → sellable_days; SAP signature strategies (DSIG / O2) → SignatureStrategy. Historical EBRs and signature logs are not re-signed: legacy COEBR archives and AX SIGSignatureLog are loaded as read-only archived documents (w5) with their legacy hashes, linked to the batch.

4.24.12 Dependencies, risks, open questions

Depends on: w21 order engine; w16 batches and FEFO; w9 ECO; w6 operating units (value streams); w22 scheduled kanbans via planning.

Risk	Likelihood	Impact	Mitigation
Potency/attribute semantics vary by industry	High	Medium	Configurable role model; consultant review
Lean costing conflicts with order-based WIP reconciliation	Medium	High	Kanban orders are ProductionOrders — same WIP accounts; flow periods settle through the same End logic

Open questions: (1) Should by-product `recycled` (negative issue) be supported in v1? Default yes. (2) Board per work cell vs per flow? Default work cell; decide by w24 kickoff.

4.24.13 Parameters and setup

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
Batch order number sequence	legal entity	sequence ref	`batch-order`	any	Batch order numbers	Production control parameters → Number sequences (batch order)	Order type PI01 number range (CO82/OPJH)
Batch number sequence	item group	sequence ref	`batch`	any	Batch numbers at RAF	Batch number groups (InventNumGroup)	Batch number assignment (OMCZ / internal number range BATCH_CLT)
Potency tolerance %	legal entity	numeric	0.5	0–10	Accepted potency deviation	Process manufacturing parameters → Potency	Active ingredient tolerance (proportion unit settings)
Default co-product allocation	item group	enum	`tca`	none/manual/tca/quantity	FR-24.4 default	Formula → Cost allocation	Apportionment structure default (OKG8 / TKKAA)
Shelf-advice days default	item group	int	30	0–3,650	Shelf-advice notification	Item → Shelf advice period	Minimum remaining shelf life (MARA.MHDRZ)
Expired batch consumption allowed	site	bool	false	true/false (duty still required)	FR-24.6	Batch disposition / expiry blocking	Batch status management (OMCT)
Catch-weight variance handling	legal entity	enum	`reject`	reject / warn	BR-24.5	CW min/max validation	CWM tolerance group
Inheritance active	legal entity	bool	true	true/false	FR-24.15	Lot inheritance (PdsInheritance)	Batch derivation activation (DVMO customizing)
Merge override attributes	attribute	bool	false	true/false	FR-24.16	Batch merge setup	n/a
Consolidation window days	bulk/pack relation	int	7	1–60	FR-24.17	Consolidated batch orders setup	n/a
Rework keep batch number	legal entity	bool	true	true/false	FR-24.18	Rework parameters	Rework order settings
Rework requires quality order	legal entity	bool	true	true/false	FR-24.18	Rework parameters	QM inspection type 04 on rework
Customer sellable days default	item group	int	0	0–3,650	BR-24.13	Customer sellable days	KNMT minimum remaining shelf life
Lean subcontract PO mode	vendor work cell	enum	`po-per-kanban`	po-per-kanban / periodic-po	FR-24.20	Lean subcontracting purchase settings	Kanban control cycle external procurement (PK01)
Batch record profile	item group	ref	none	any BatchRecordProfile	FR-24.21	n/a	EBR batch record settings (COEBR customizing)
EBR approval required for release	profile	bool	true	true/false	Disposition `available` gated	n/a	Batch record approval before usage decision
Signature strategy per event	object type × event	ref	none	any SignatureStrategy	FR-24.22	Electronic signature setup (SIGSetup)	Signature strategies (DSIG / O2)
Signing lockout attempts / minutes	tenant	int / int	3 / 15	1–10 / 1–1,440	FR-24.22	Security parameters	DSIG settings
Kanban card barcode symbology	site	enum	`gs1-datamatrix`	gs1-datamatrix / code128 / qr	Card print	Kanban card setup	PK card print (PK17)
Flow costing period length	production flow	enum	`month`	week / month	FR-24.12	Lean costing periods	Product cost collector period (KKF6N)

4.24.14 Inquiries and reports

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
Batch orders	list inquiry	status, formula, site, dates	order, formula version, batch size, scale factor, status, batch number	BatchOrder	Batch orders list page (PmfProdTable)	COOISPI process order info system
Batch attribute values	drill-down	item, batch, attribute	value, target, min, max, pass, recorded by	BatchAttributeValue	Batch attributes form (PdsBatchAttributes)	MSC3N batch classification
Batch genealogy (top-down / bottom-up)	drill-down	batch	tree of parent/child batches, orders, qty	InventoryTransaction genealogy + DerivationLog	Batch tracing (InventTrackingRegisterTrans), Item tracing	MB56 batch where-used list
Derivation monitor	list inquiry	receiver batch, date, status	rule, senders, values before/after, missing values	DerivationLog	Lot inheritance inquiry	DVMO
Co-product allocation	operational report	order, period	method, %, allocated cost by item	CoProductLine	Co-product cost allocation inquiry	KKF6N / CO88 settlement log
Shelf-life / expiry report	operational report	site, expiry within n days	batch, item, qty, expiry, best before, shelf advice	InventoryBatch	SSRS "Batch expiry" / shelf-life inquiry	MB5M BBD/SLED list
Kanban board / kanban overview	list inquiry	work cell, rule, state	card, item, qty, due, state, order	Kanban, KanbanJob	Kanban board (KanbanBoardScheduleView), Kanbans list	PK13N, PK18
Kanban rule analysis	KPI	rule, period	cycles, average lead time, overdue %, kanbans active vs max	Kanban	Kanban rule inquiry	PK13N control cycle evaluation
Flow costing period	operational report	flow, period	material, conversion, output, variance	FlowCostingPeriod	Lean costing (backflush costing) inquiry	KKF6N, MF41
Electronic batch record list	list inquiry	status, product, date, reviewer	record, batch, open exceptions, stage, sealed at	ElectronicBatchRecord	n/a	COEBR batch record list
Signature log	list inquiry	object type, signer, date	object, meaning, signer, UTC time, reason, valid	Signature	Electronic signature log inquiry (SIGSignatureLog)	DSIG signature log (DSAL)
Customer batch requirement check	list inquiry	customer, item	requirement, qualifying batches, qty available	CustomerBatchRequirement × InventoryBatch	Customer sellable days inquiry	Batch determination log (VCH1/VB(J))

4.24.15 Printed and electronic documents

Document	Trigger	Layout elements	Formats	Numbering sequence	Legal / retention requirement
Batch ticket (picking list for batch order)	Release	Header: batch order, formula version, batch size, scale factor; lines: ingredient, qty, potency-adjusted qty, batch, weigh station; signatures block (weighed by / verified by)	PDF, kiosk (w25)	`prod-doc`	Part of EBR for GxP items
Kanban card	Kanban creation, reprint	Item, qty, CW qty, source/destination location, rule, GS1 DataMatrix `(240)kanbanId`, due	PDF (card stock 4×6 in / A6)	Kanban card number per rule	None
Batch label	RAF	Item, batch, manufacturing date, expiry/best-before, catch weight, GS1-128 `(01)(10)(17)(310n)`	ZPL via w32 printers, PDF	batch sequence	Food/pharma labeling rules per country (w48)
Certificate of analysis (batch attributes)	Batch release, on demand	Batch, attribute, specification, result, release signature	PDF, email, EDI (w35)	`coa`	Customer contract; signature manifestation if signed (FR-24.22)
Electronic batch record	QA approval (sealed)	Full EBR sections, exceptions with dispositions, signature manifestation (printed name, meaning, date/time)	PDF/A-2b + JSON, SHA-256 hash	`ebr` per legal entity	21 CFR 211.180: at least 1 year after batch expiry (default expiry + 1 year, min 5 years); EU GMP Annex 11 / EudraLex Vol 4 Ch 4: 1 year after expiry or 5 years after certification, whichever longer
Signature manifestation	Any signed record print/export	Signer printed name, date/time, meaning	Embedded in PDF	n/a	21 CFR 11.50
Lean service purchase order	FR-24.20	Vendor, service item, qty, agreement reference	PDF, EDI ORDERS (w35)	PO sequence (w17)	Purchasing retention (w17)

4.24.16 Periodic and batch jobs

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
Shelf-advice notification	daily 06:00 site-local	site	One notification per batch per advice date	< 1 min	Retry next run	Delivery failures warn
Consolidate batch orders	daily 21:00 (opt-in) + on demand	site × bulk item	Proposal per window replaced; firm on confirm	< 2 min	Per-bulk errors listed	Result report
Inheritance re-derivation	on attribute change event + nightly 02:30	receiver item	DerivationLog per (batch, rule, trigger id)	< 5 min for 10k batches	Max depth 10; cycles stop	Missing-sender count reported
Flow period settlement	monthly (optional auto)	production flow	One settlement per (flow, period); blocked with open kanbans	< 5 min	409 with open kanbans list	Failure pages
EBR compilation	event-driven + hourly sweep	batch order	Section upserts by source event id	< 10 s per event	Sweep repairs missed events	Missed events > 0 warns
EBR archive and seal	on approval	record	Seal once; hash stored; archive retry	< 30 s	Retry 5×; record stays approved-unsealed	Unsealed > 1 h pages
Lean periodic PO close	period end	vendor	Close once per (vendor, period)	< 1 min	Retry	Failure warns
Fixed-kanban count suggestion	weekly Monday 05:00	rule	Suggestion per rule; not applied automatically	< 1 min	Non-blocking	Deviations > 25% reported

4.24.17 Security duties and privileges

Duty	Privileges (entry points)	Segregation-of-duties conflicts	Default roles
Maintain formulas	Formula designer, formula ECO submit	with *Approve engineering change* (w9)	Formulator, Production engineer
Maintain batch orders	batch-orders create, `:rescale`, consolidation, rework orders	none	Production supervisor, Planner
Maintain batch attributes	PUT batch attributes, manual derivation	with *Maintain batch disposition* for the same batch flagged	Quality technician
Maintain batch disposition	`:disposition`	with *Maintain batch attributes* (same batch)	QA manager
Merge batches	batch `:merge`	none	Inventory supervisor
Consume expired batch	picking override with reason	with *Maintain batch disposition* flagged	Production supervisor
Override customer batch requirements	FR-24.19 override	none	Sales supervisor (w27)
Maintain production flows / kanban rules	flows, activities, rules, service activities	none	Lean engineer
Work kanban board	board, job complete, card print	none	Operator, Shop floor supervisor
Settle production flows	flow period settle	with *Maintain production flows*	Cost accountant
Review batch records	EBR review stage, exception disposition	with *Approve batch records* (same record)	Production reviewer
Approve batch records	EBR QA approval, seal	with *Review batch records* and with *Maintain batch orders* (same order)	QA manager
Maintain signature strategies	SignatureStrategy setup	with *Approve batch records*	Compliance administrator

4.24.18 Message catalog

Code	Severity	User text	Cause	Remediation	Raised by
PMF-0001	error	Percent-controlled lines sum to {sum}%, not 100%.	Formula validation	Adjust line percentages	FR-24.1
PMF-0002	error	Compensating line {line} would become negative ({qty}).	Potency adjustment	Choose another batch or change formula	BR-24.2 (`POTENCY_COMPENSATION_NEGATIVE`)
PMF-0003	error	Batch {batch} expired on {date}.	Expired batch picked	Pick another batch or use override duty	BR-24.10 (`BATCH_EXPIRED`)
PMF-0004	error	Catch weight {qty} is outside {min}–{max} for {cw} units.	BR-24.5	Re-weigh	BR-24.5
PMF-0005	warning	Batch {batch} potency {p}% is outside {min}–{max}%; not pickable.	FR-24.3	Choose batch in range	FR-24.3
PMF-0006	error	Merge refused: attribute {attr} differs ({a} vs {b}).	FR-24.16	Align values or mark merge-override	FR-24.16

Code	Severity	User text	Cause	Remediation	Raised by
PMF-0007	warning	Inheritance rule {rule}: sender value missing for {attr}.	FR-24.15	Record sender attribute and re-derive	FR-24.15
PMF-0008	error	No single batch can supply {qty} (largest {max}).	Same-batch requirement	Split line or wait for supply	FR-24.19 (`SAME_BATCH_UNAVAILABLE`)
PMF-0009	warning	Batch {batch} does not meet customer {customer} requirements ({rule}).	FR-24.19	Choose qualifying batch or override	FR-24.19
PMF-0010	error	Signature rejected: re-authentication failed.	BR-24.14	Retry with correct credentials	FR-24.22
PMF-0011	error	Signing locked for {minutes} minutes after {n} failed attempts.	Lockout	Wait or contact security	FR-24.22
PMF-0012	error	Signer must differ from the record author.	Distinct-user rule	Another user signs	FR-24.22
PMF-0013	warning	Record changed after signing; signature invalidated.	Hash mismatch	Re-sign	FR-24.22
PMF-0014	error	Batch record cannot be approved: {n} exceptions without disposition.	BR-24.15	Disposition exceptions	FR-24.21
PMF-0015	error	Batch {batch} cannot be released: batch record not approved.	Profile gating	Complete EBR approval	FR-24.21
LEAN-0001	error	Kanban move {from} → {to} is not allowed.	BR-24.6	Use allowed move	BR-24.6
LEAN-0002	error	Rule {rule} already has {n} active kanbans (max {max}).	BR-24.7	Empty a kanban or raise count	BR-24.7
LEAN-0003	error	Period cannot be settled: {n} kanbans open.	BR-24.9	Complete kanbans	BR-24.9 (`FLOW_PERIOD_OPEN_KANBANS`)
LEAN-0004	error	Flow activity {activity} has no output location.	FR-24.8 connectivity	Set output	FR-24.8
LEAN-0005	error	No valid purchase agreement for service {item} on {date}.	FR-24.20	Create or extend agreement	FR-24.20

4.24.19 Performance budgets and capacity

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation under 3× load
Batch order create + scale	500/day; peak 20/min	150 / 400 / 900 ms	50/s	~5 GB (orders + lines)	as w21	Queue behind HPA
Potency proposal	2,000/day	100 / 300 / 700 ms	50/s	n/a	BatchAttributeValue (batch_id)	Proposal without potency sort (warning)
Event kanban generation	10,000/day; peak 200/min	1 / 5 / 8 s	50 kanbans/s	Kanban + jobs ~ 10M rows ≈ 4 GB	Kanban (rule_id, state); KanbanJob (activity, state, planned_start)	SLA alert; backlog processed FIFO
Board load	20,000 loads/day	150 / 500 / 1,000 ms	200/s	n/a	as above	SSE falls back to 30 s polling
Inheritance at RAF	500 RAFs/day × 20 attributes	50 / 200 / 500 ms added to RAF	n/a	DerivationLog ~ 4M rows ≈ 1 GB	(receiver_batch_id)	Deferred to async with flag `pending-derivation`
EBR compile + seal	500 batches/day, 2,000 events each	event apply p95 < 2 s; seal p95 < 30 s	1M events/day	EBR JSON+PDF ~ 5 MB each → 0.9 TB/yr in object storage	record by order; documents in object storage	Compilation lag allowed to 5 min; review screen shows lag
Signature	5,000/day	300 ms / 1 s / 2 s (excl. user input)	20/s	Signature 2M rows ≈ 1 GB/yr	(object_type, object_id)	Step-up auth latency dominated by Keycloak; no degradation of hash check

4.24.20 Localization and compliance hooks

- **21 CFR Part 11 (US) and EU GMP Annex 11**: FR-24.22 implements 11.10(e) audit trail via the signature log and w5 audit, 11.50 manifestation, 11.70 record linkage, 11.100 uniqueness (Keycloak subject), 11.200 two-component re-authentication, 11.300 controls (password policy and lockout from w2). Validation package (IQ/OQ scripts, traceability matrix to these clauses) is a wave 48 deliverable; this wave provides the OQ test cases from 4.24.9 and AC-24.15/AC-24.16.
- **Retention**: EBR retention per country/regime (US 21 CFR 211.180: expiry + 1 year; EU: max(expiry + 1 year, 5 years after certification); some countries require 10 years for blood/plasma products) set by the w48 retention policy; legal hold blocks purge.
- **Food labeling**: batch label content (allergen declaration, lot code formats, best-before vs use-by wording, e.g., EU Regulation 1169/2011) is rendered by country-specific templates in wave 48 packs via the `production.label.render` extension point.
- **Catch weight**: legal-for-trade weighing (OIML R76 / NIST Handbook 44) is a device concern; Passage stores the scale id and certification reference on catch-weight RAF lines when provided.
- **Excise / alcohol**: bonded-production reporting (US TTB Form 5110.40, EU EMCS) is a wave 48 country-pack item fed from batch order consumption and RAF events through `production.statutory-extract`.
- **Language**: batch tickets, CoA and EBR render in the site language; signature meanings are stored as codes and rendered per locale.
- **Extension points**: `production.label.render`, `production.statutory-extract`, `signature.strategy.resolve` (OPA), `ebr.section.provider` (additional EBR sections such as environmental monitoring).

4.24.21 Coverage closure

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
AX 12.14.1 Inventory — Batch merge (PI) (PdsBatchMerge) [AX #122]	PARTIAL-24	ADDED as FR-24.16	Attribute recomputation BR-24.11
AX 12.23.1 PI — Consolidated batch orders (PdsConsolidatedOrder) [AX #196]	PARTIAL-24	ADDED as FR-24.17	Bulk → packed with pegged packing orders
AX 12.23.1 PI — Rework batch order (PdsRework) [AX #197]	PARTIAL-24	ADDED as FR-24.18	Keeps batch identity by default
AX 12.23.1 PI — Batch attribute inheritance (PdsInheritance) [AX #198]	PARTIAL-24	ADDED as FR-24.15	Product-to-product and co-product inheritance
AX 12.23.1 PI — Batch merge (PdsBatchMerge) [AX #201]	PARTIAL-24	ADDED as FR-24.16	Same capability as #122
AX 12.23.1 PI — Same-batch reservation (PdsSameBatch) [AX #202]	PARTIAL-24	ADDED as FR-24.19	Sales-line enforcement active from wave 27
AX 12.23.1 PI — Customer-specific batch attribute requirements (PdsCustSellableDays, PdsCustBatchAttrib) [AX #203]	PARTIAL-24	ADDED as FR-24.19	BR-24.13

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
AX 12.23.3 PI Periodic — Consolidate batch orders (batch) [AX #205]	PARTIAL-24	ADDED as FR-24.17	Job in 4.24.16
AX 12.23.3 PI Periodic — Attribute inheritance processing on RAF [AX #206]	PARTIAL-24	ADDED as FR-24.15	Re-derivation job in 4.24.16
AX 12.23.4 PI Setup — Lot inheritance setup [AX #208]	PARTIAL-24	ADDED as FR-24.15	InheritanceRule entity
AX 12.23.4 PI Setup — Customer sellable days / customer batch attribute requirements [AX #211]	PARTIAL-24	ADDED as FR-24.19	CustomerBatchRequirement entity
AX 12.23.4 PI Setup — Rework parameters [AX #212]	PARTIAL-24	ADDED as FR-24.18	Parameters in 4.24.13
AX 12.23.4 PI Setup — Bulk/pack item relations [AX #213]	PARTIAL-24	ADDED as FR-24.17	BulkPackRelation entity
AX 12.24.1 Lean — Subcontracting in lean (LeanSubcontracting) [AX #214]	PARTIAL-24	ADDED as FR-24.20	Service activity on vendor work cell
AX 12.24.3 Lean Periodic — Generate purchase orders for service activities [AX #215]	PARTIAL-24	ADDED as FR-24.20	Lean periodic PO close job
AX 12.24.4 Lean Setup — Subcontracting setup (service items, purchase agreements) [AX #216]	PARTIAL-24	ADDED as FR-24.20	Agreement pricing per BR-24.16
SAP 13.22 PP-PI — COEBR electronic batch record [SAP #257]	GAP (propose 24)	ADDED as FR-24.21	Review by exception, sealed PDF/A + JSON
SAP 13.22 PP-PI — Digital signature in PI sheets / batch records (DSIG) [#261]	GAP (propose 24)	ADDED as FR-24.22	Signature service reused by w25 PI sheets and generalized in w48
SAP 13.22 PP-PI — Batch derivation (DVMO / DVMAN) [#262]	PARTIAL-24	ADDED as FR-24.15	Manual derivation included
SAP 13.22 PP-PI Reports — COEBR batch record list [#264]	GAP (propose 24)	ADDED as FR-24.21	Report in 4.24.14
SAP 13.22 PP-PI Periodic — COEBR batch record generation/archive [#269]	GAP (propose 24)	ADDED as FR-24.21	EBR compilation and seal jobs in 4.24.16
SAP 13.22 PP-PI Customizing — EBR batch record profiles, archiving, approval workflow [#274]	GAP (propose 24)	ADDED as FR-24.21	BatchRecordProfile
SAP 13.22 PP-PI Customizing — Batch management in PP-PI (COB1 batch determination, class 023, derivation) [#275]	PARTIAL-24	ADDED as FR-24.15 (derivation); batch determination SUPERSEDED by w16 FEFO batch selection + FR-24.19	Class 023 characteristics = BatchAttribute (FR-24.5)
SAP 13.23 PP/DS — Characteristic-dependent planning (CDP) [#277]	PARTIAL-24	ADDED as FR-24.23	Engine change lives in the w22 planning service
SAP 13.33 Batch/Serial — DVMO / DVSP / DVMAN derivation [#365]	PARTIAL-24	ADDED as FR-24.15	—
SAP 13.33 Batch/Serial — Documentary batches (S/4) [#367]	PARTIAL-24	ADDED as FR-24.24	Tracking policy `batch-record-only` (w16 tracking dimension group)
SAP 13.33 Batch/Serial Reports — DVMO derivation monitor [#369]	PARTIAL-24	ADDED as FR-24.15	Derivation monitor in 4.24.14
SAP 13.33 Batch/Serial Periodic — Batch derivation runs (DVMO) [#370]	PARTIAL-24	ADDED as FR-24.15	Re-derivation job
SAP 13.33 Batch/Serial Customizing — Batch derivation activation, sender/receiver fields, rules [#371]	PARTIAL-24	ADDED as FR-24.15	Parameter "Inheritance active"
SAP 13.33 Batch/Serial Customizing — Documentary batch activation (S/4) [#373]	PARTIAL-24	ADDED as FR-24.24	Activation via tracking policy
SAP 13.35 DMS Customizing — Digital signature for documents (signature strategies) [#397]	GAP (propose 24)	ADDED as FR-24.22	SignatureStrategy covers any object type, including w5 documents

Scope note: the 4.24.1 out-of-scope line "PI sheets with electronic signatures (w33 quality covers signatures)" is narrowed by this closure. Electronic signatures are delivered here (FR-24.22) and PI sheets in wave 25 (FR-25.16). Wave 33 uses the same signature service for quality orders, and wave 48 extends it to configured tables and fields (AX register rows #22–#25, wave 48).

4.25 Wave 25: Shop Floor Execution, Time Registration & IoT

4.25.1 Scope and business context

Wave 25 puts production on the floor. Operators use a touch kiosk (PWA) to clock in and out, start and stop jobs (including bundling several jobs), report good and scrap quantities with reason codes, run quality checks and view instructions and drawings, and keep working for up to 30 minutes offline. Registrations are turned into pay lines (overtime, shift premiums, flex) through profiles, approved by supervisors and exported to payroll (w43). Machines publish counts, states and downtime over OPC-UA/MQTT through an edge connector into Kafka; the shopfloor service computes OEE per resource in 15-minute buckets and drives andon alerts. Labor and machine time flows into the production order's route-card postings. This is the phase-exit wave: the demo plant manufactures a configured product from planned order to finished goods with full costing. Out of scope: payroll calculation itself (w43), quality orders and usage decisions (w33; kiosk checks are simple pass/fail capture), maintenance work orders from machine events (w44 consumes the events), label printing beyond kanban cards (w32).

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
Job-card re-keying: AX JmgTermReg registrations are "calculated" and "transferred" by a supervisor before ProdJournalRoute lines exist, so route cards are re-keyed or posted a day late; SAP CO11N confirmations are typed by a clerk from paper tickets; Infor LN and Epicor Kinetic MES data collection posts labor in a nightly batch	Registration and production posting are separate modules joined by a transfer job	Registration stop generates and posts the job-card journal (option immediate); reversal on edit	Labor posting latency 24 h → < 5 s; re-keyed tickets 0
Kiosk needs the AOS: AX terminal registration (JmgTermReg form) is a thick client; D365 production floor execution requires connectivity; Plex is cloud-only with no offline mode	No client-side queue or idempotent replay	PWA with IndexedDB queue, client UUIDs, conflict flags	Lost registrations during outages → 0 over a 30-min disconnect
Machine data lives outside the ERP: AX has no native machine integration; SAP MII/PCo is a separate licensed stack with custom BLS transactions; Plex offers machine connectivity only through its own gateway	Proprietary connectors and point-to-point integration	`iot-edge` (OPC-UA/MQTT) → Kafka CloudEvents; any system subscribes to `shopfloor.machine-events`	Time to connect a new machine 2 weeks → 1 day; integration middleware 0
OEE is computed in spreadsheets or a BI tool from exported confirmations; SAP DM OEE requires its own master data; Epicor Advanced MES OEE updates per shift	No event-level counts in the ERP; ratios averaged incorrectly across shifts	OeeBucket per 15 min from events, ISO 22400 formula, roll-up by summing minutes/counts	OEE visibility per shift → per 15 min with p95 lag < 5 s

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
Pay calculation surprises: AX JmgPayTable overtime depends on profile day types supervisors do not see, so corrections happen after payroll export; SAP time evaluation (RPTIME00) is a batch run with cryptic log	Rules engine hidden from the people approving	PayLine per rule with source registrations shown on the approval screen; recalculation on edit	Post-export corrections 5%/period → < 0.5%; approval time per team 2 h → 15 min

4.25.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Job registration terminal	JmgTermReg (terminal registration form), JmgJobTable, JmgRegistration, D365 production floor execution	SAP MII / Digital Manufacturing shop floor UI, PP-PDC terminals, CO11N	Kiosk PWA, `shopfloor-bff`, TimeRegistration	full
Clock in/out, absence	JmgStampJournalTable (raw), JmgTmpRegistration, JmgAbsenceCode, JmgProfileTable	Time events (CATS/PT), HR time types	Registration kinds clock-in/out, absence; ProfileDay	full
Job bundling	Jmg bundle jobs (JmgJobBundle)	n/a (multi-order confirmation)	bundle_id on registrations, cost split by quantity/hours	full
Feedback (qty/scrap)	JmgJobTable feedback, ProdJournalRoute from Jmg, error cause codes	CO11N yield/scrap/rework, reason for variance (AFRU.GRUND)	job-card journals auto-generated; ScrapReason	full
Pay calculation	JmgPayTable, pay agreements (JmgPayAgreement), overtime/flex, pay-item transfer	HR time evaluation (RPTIME00), wage types	PayLine, PayRule engine	full
Approval and transfer	Jmg calculate → approve → transfer to payroll (JmgPayTransfer)	CATS approval, transfer to HR	Approve + export (w43 payroll)	full
Machine integration	n/a native (IoT Intelligence for D365, Sensor Data Intelligence)	SAP MII PCo/OPC, Plant Connectivity, SAP DM	`iot-edge` connector (OPC-UA/MQTT) → Kafka	improved
OEE	D365 Sensor Data Intelligence (partial)	SAP DM OEE module	OeeBucket per resource × 15 min; ISO 22400 KPIs	full
Downtime reasons	Jmg indirect activities	PM notification/downtime reasons	DowntimeRecord with reason code	full
Andon	n/a	SAP DM andon	AndonAlert via event + kiosk banner	improved
Instructions/drawings	Route notes, document attachments (DocuRef)	PI sheets, DMS documents on operation	Operation documents (w5 attachments) on kiosk	full
Offline kiosk	n/a (requires AOS)	n/a	PWA with IndexedDB queue	improved
Control recipes / process instructions	n/a (route notes, D365 production floor execution instructions)	Control recipe CO53/CO53XT, process instruction categories (O10C/O12C/O13C), control recipe destinations	ControlRecipe generated at batch-order release, sent to kiosk or PCS (FR-25.15)	full
PI sheets / XSteps	n/a	PI sheet CO60/CO60XT/CO60_PI, worklist, standard XSteps repository (CMX, SXS)	PiSheetTemplate + StepLibrary, kiosk PI sheet execution (FR-25.16)	full
Process messages	n/a	Process messages CO54/CO54XT/CO57/CO58, message categories and destinations (O05C/O06C/O07C)	ProcessMessage with categories, destinations and monitor (FR-25.17)	full
PI sheet archive	n/a	CO64 / CO67 archive and print	PDF/A + JSON archive feeding EBR (FR-25.18)	full
Edge connector deployment	D365 IoT Intelligence (Azure IoT Hub based)	SAP Plant Connectivity (PCo) installation, agents, notification processes	`iot-edge` deployable with enrollment, mTLS, ringed rollout (FR-25.19)	improved

4.25.3 Functional requirements

- **FR-25.1 Kiosk login** — Must. The system shall let a worker log in on a shared kiosk by badge scan (GS1 barcode/NFC) or PIN mapped to a Keycloak user, with session timeout 10 min idle and switch-user in ≤ 2 taps.
- **FR-25.2 Clock in/out and absence** — Must. The system shall record clock-in/out and absence registrations with the device id and server timestamp, applying profile rounding (BR-25.2).
- **FR-25.3 Job start/stop and bundling** — Must. The system shall list dispatchable jobs for the worker's resource/work cell (from w23 ScheduledJob, ordered by start), allow start/stop of one job or a bundle, and split bundled time by quantity reported (default) or equally.
  - Notes: A worker may have one open job/bundle at a time; starting another auto-stops the previous. Jobs in status `finished` are hidden unless the supervisor reopens.
- **FR-25.4 Feedback** — Must. The system shall capture good qty, scrap qty with reason code, and "finished" flag per job; on stop it generates a job-card journal (w21) with hours and quantities and posts it (configurable: immediately or at approval).
- **FR-25.5 Quality checks** — Should. The system shall present check items attached to the operation (text/numeric/pass-fail with limits) and record results; a failed mandatory check blocks `finished` until a supervisor override.
- **FR-25.6 Instructions and documents** — Must. The kiosk shall show operation instructions (markdown) and attachments (PDF, images, video ≤ 50 MB) cached for offline use.
- **FR-25.7 Pay calculation** — Must. The system shall calculate PayLines per worker-day from registrations using the worker's profile (day types, shift windows, breaks) and pay agreement rules: base, overtime after daily/weekly thresholds, shift premium, flex balance.
  - Notes: Defaults: overtime > 8.00 h/day at 1.5×, > 40.00 h/week at 1.5×, Sunday 2.0×; rounding per BR-25.2; max 24 h/day validation.
- **FR-25.8 Approval and export** — Must. Supervisors shall approve per worker-day (bulk by team), with edits audited; approved days are locked and exported as `dev.passage.shopfloor.payday.approved.v1` for w43 and as CSV.
- **FR-25.9 IoT ingestion** — Must. The `iot-edge` connector shall subscribe to OPC-UA nodes (via `gopcua`) and MQTT topics (Mosquitto/EMQX, QoS 1), normalize to the MachineEvent schema (BR-25.4), buffer locally (SQLite ring, 24 h), and publish to Kafka topic `shopfloor.machine-events` with idempotent producer and per-machine monotonic sequence.
- **FR-25.10 OEE** — Must. The system shall compute OEE per resource per 15-minute bucket and shift (BR-25.5) from machine events and planned time from the w23 schedule/calendar, with dashboard lag p95 < 5 s.
- **FR-25.11 Downtime and andon** — Must. The system shall open a DowntimeRecord when a machine reports DOWN or no count for > `idle_threshold_s` (default 300), require a reason code within the kiosk, and raise an AndonAlert (kiosk banner + notification) on downtime > 10 min, scrap rate > 5% in a bucket, or quality fail.
- **FR-25.12 Offline kiosk** — Must. The PWA shall queue registrations and feedback in IndexedDB while disconnected (≥ 30 min, ≤ 5,000 actions), replay in order on reconnect with client-generated UUIDs for idempotency, and resolve conflicts per BR-25.7.
- **FR-25.13 Machine-to-job linkage** — Should. Machine counts shall be attributed to the job currently running on that resource (from registrations or the schedule), and may auto-fill good/scrap quantities on the kiosk for operator confirmation.
- **FR-25.14 Supervisor view** — Must. A supervisor workspace shall show who is clocked in, current jobs, open downtimes, OEE tiles, and pending approvals.

- **FR-25.15 Control recipes** — Should. On release of a batch order (w24) or production order whose route operations carry process instructions, the system shall generate a ControlRecipe per destination (kiosk PI sheet, or a process control system through the edge connector) containing the ordered process instructions of each phase with their category (instruction text, process parameter setpoint, process data request, calculation, inspection characteristic, material list, signature request, sequence definition), and shall track its status (created, sent, received, in-execution, completed, error) in a control recipe monitor with resend.
    - Notes: Destination types: `kiosk` (rendered as a PI sheet), `pcs-opcua` (setpoints written to allowlisted OPC-UA nodes through FR-25.19; process data requests become subscriptions), `pcs-mqtt` (JSON payload to a configured topic, ISA-88 recipe structure: procedure → unit procedure → operation → phase). Process instruction categories are tenant master data with characteristic definitions (data type, unit, limits). Control recipes are generated with values scaled to the batch (BR-24.1) and with potency-adjusted quantities (BR-24.2).
- **FR-25.16 PI sheets and step library** — Should. The system shall provide a PI sheet designer and a versioned StepLibrary (reusable standard steps, SAP XSteps equivalent) with step types: instruction (markdown with images), numeric input (unit, limits, mandatory), text/enum input, checklist, calculation (expression over prior inputs and order data), material consumption (posts picking-list lines), yield/RAF report, machine readout (reads an OPC-UA/MQTT tag value via the edge), timer/hold time, signature (FR-24.22 with meaning), and conditional branch; operators execute PI sheets on the kiosk with a worklist of PI sheets per work cell.
    - Notes: Step libraries are versioned and released through ECO (w9); a PI sheet template references step versions, so later library changes do not alter running batches. Out-of-limit inputs require a comment and create an EBR exception (BR-24.15); configured steps can block continuation until a supervisor signs. Steps that post (consumption, yield) generate w21 journals immediately. PI sheets work offline under FR-25.12 except machine readout and signature steps, which queue until reconnect and block completion of the sheet.
- **FR-25.17 Process messages** — Should. The system shall accept ProcessMessages from kiosk PI sheets, from the edge connector (PCS events) and by manual entry, each with a category (phase-start, phase-end, consumption, yield, process-data, quality-result, deviation, order-status, custom) and characteristic values, validate them against the category definition, and deliver them to the category's destinations: production journal posting (w21), quality inspection results (w33), EBR section (w24), Kafka topic `shopfloor.process-messages` for external consumers, or an outbound webhook (w35).
    - Notes: Process message monitor lists messages by status (received, delivered, partially-delivered, error) with per-destination results; failed destinations retry with exponential backoff (1, 5, 15, 60 min) then stay in error for manual reprocess or deletion (with reason). Messages are idempotent by (source, sourceMessageId). Manual creation requires duty *Create process messages*.
- **FR-25.18 PI sheet archive** — Should. On completion of a PI sheet the system shall render it to PDF/A-2b and canonical JSON (inputs, calculated values, timestamps, signatures with manifestation), compute a SHA-256 hash, store both in the w5 document store with the batch order's retention policy, link them to the EBR, and allow print and retrieval by order, batch or date.
- **FR-25.19 Edge connector as a deployable** — Must. The `iot-edge` connector shall ship as a signed OCI image (amd64/arm64) with a Helm chart for the plant k3s node and a single static binary for Windows/Linux industrial PCs, and shall support: enrollment with a one-time token that obtains an mTLS client certificate (issued by the cluster CA via cert-manager, 90-day validity, auto-renew at 30 days), configuration pulled from the shopfloor service (machines, OPC-UA endpoints and node ids, MQTT topics, tag mappings, write allowlist) as versioned documents, heartbeat every 30 s with buffer fill and per-machine status, ringed rollout of connector versions (canary → ring 1 → all, per plant), local admin page on localhost for diagnostics, and write-back (control recipe setpoints) restricted to allowlisted nodes with per-write audit.
    - Notes: OPC-UA security modes None, Sign and SignAndEncrypt with policies Basic256Sha256 and Aes128_Sha256_RsaOaep; server certificate trust list managed from the central UI. MQTT 3.1.1/5.0 with TLS and per-edge credentials. Store-and-forward per FR-25.9 (SQLite ring, 24 h) survives connector restart and OS reboot. Upgrades are atomic (A/B binary swap) with automatic rollback when heartbeat fails within 5 minutes. Supported deployments are documented as certified configurations (k3s 1.30+, Windows Server 2019+/IoT Enterprise, Ubuntu 22.04+). Runs without inbound ports: all traffic is outbound to Kafka (via the shopfloor ingest gateway over HTTPS/2 or Kafka TLS) and the config endpoint.

4.25.4 Data model

Worker (shopfloor projection of Party/Employee w7): id, party_id, badge_id (unique), pin_hash, default_resource_id, work_cell_id, profile_id, pay_agreement_id, cost_rate (numeric 18,4), active.

TimeRegistration: id (client UUID), tenant_id, worker_id, kind (enum: clock-in, clock-out, job-start, job-stop, absence, indirect), job_id (nullable), bundle_id (nullable), qty_good, qty_scrap, scrap_reason_id, started_at, stopped_at (timestamptz), server_received_at, device_id, offline (bool), hours (numeric 10,4, computed), status (enum: raw, calculated, approved, exported), journal_id (w21 job card), note.

ProfileDay: id, profile_id, day_type, shift_start, shift_end, break_windows (jsonb), rounding_minutes (int), flex_allowed (bool), tolerance_before_min, tolerance_after_min.

PayLine: id, worker_id, work_date, pay_type (enum: base, overtime-1.5, overtime-2.0, shift-premium, flex-in, flex-out, absence-paid, absence-unpaid), hours, rate_multiplier, amount (numeric 18,4), currency, source_registration_ids (uuid[]), approved_by, approved_at, export_batch_id.

MachineEvent: id, machine_id, resource_id, seq (bigint), kind (enum: count, state, downtime, alarm, measurement), ts (timestamptz, device), received_at, good_count, reject_count, state (RUNNING/IDLE/DOWN/SETUP/OFF), reason_code, measurement_name, measurement_value, unit, job_id (attributed), payload (jsonb).

OeeBucket: resource_id, bucket_start (15 min), shift_id, planned_minutes, run_minutes, down_minutes, ideal_cycle_s, total_count, good_count, availability, performance, quality, oee (numeric 7,4 each), source_events (int).

DowntimeRecord: id, resource_id, started_at, ended_at, reason_code (nullable until coded), category (planned/unplanned), job_id, worker_id, andon_raised (bool).

Invariants: for each worker at most one open job-start without job-stop; PayLine hours per worker-day ≤ 24.00; OeeBucket.run_minutes + down_minutes ≤ planned_minutes; MachineEvent (machine_id, seq) unique; approved PayLines are immutable (new lines + reversal on correction).

Indexing: TimeRegistration (worker_id, started_at), (job_id), unique id (client UUID); MachineEvent partitioned by month (TimescaleDB-free: native range partitions), index (resource_id, ts); OeeBucket PK (resource_id, bucket_start); retention: raw MachineEvent 90 days in Postgres, forever in Iceberg (w46); OeeBucket 3 years.

ControlRecipe / ProcessInstruction (FR-25.15): ControlRecipe(id, order_id, destination_id, status (created/sent/received/in-execution/completed/error), generated_at, sent_at, payload_hash, error_text, version); ProcessInstruction(id, control_recipe_id, phase_path text (ISA-88 path), sequence int, category_id, characteristic values jsonb, target_node (nullable OPC-UA node id/topic)); ProcessInstructionCategory(id, code, kind, characteristics jsonb [{name, type, unit, min, max}]); RecipeDestination(id, site_id, type (kiosk/pcs-opcua/pcs-mqtt), edge_id, address, active).

PiSheetTemplate / LibraryStep / PiSheetRun / PiStepResult (FR-25.16): LibraryStep(id, code, version, type (enum per FR-25.16), definition jsonb, status (draft/released/obsolete), eco_id); PiSheetTemplate(id, operation_ref (route version + oper), version, steps jsonb [{libraryStepId, version, overrides}]); PiSheetRun(id, order_id, oper_number, template_id, status (open/in-progress/held/completed), started_at, completed_at, archive_pdf_id, archive_json_id, content_hash); PiStepResult(id, run_id, step_seq, value jsonb, out_of_limit bool, comment, recorded_by, recorded_at, signature_id nullable, offline bool).

ProcessMessage / ProcessMessageDelivery (FR-25.17): ProcessMessage(id, source (kiosk/edge/manual), source_message_id, category_code, order_id, phase_path, values jsonb, occurred_at, received_at, status); ProcessMessageDelivery(message_id, destination, status, attempts int, last_error, delivered_at); unique (tenant_id, source, source_message_id).

EdgeNode / EdgeConfigVersion (FR-25.19): EdgeNode(id, site_id, name, platform (k3s/windows/linux), connector_version, ring (canary/ring1/all), cert_serial, cert_expires_at, last_heartbeat_at, buffer_fill_pct, status); EdgeConfigVersion(id, edge_id, version int, document jsonb, published_at, published_by, applied_at); EdgeWriteAudit(id, edge_id, node_id, value, control_recipe_id, actor, written_at, result).

Invariants (additions): every completed PiSheetRun has an archive_json_id whose hash equals content_hash; a ProcessMessage with status delivered has all destinations delivered; an EdgeNode accepts only one applied EdgeConfigVersion at a time and writes only to nodes in that version's allowlist.

4.25.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
POST	/api/v1/shopfloor/sessions:badge	Kiosk login by badge/PIN	n/a	Kiosk login
POST	/api/v1/shopfloor/registrations	Create registration(s), batch of ≤ 500 (offline replay)	client UUID per item	Register time
GET	/api/v1/shopfloor/jobs?workerId&resourceId&status	Dispatch list	n/a	Register time
POST	/api/v1/shopfloor/jobs/{id}:feedback	Qty good/scrap/finished, checks	client UUID	Register time
GET	/api/v1/shopfloor/operations/{id}/instructions	Instructions + attachment URLs (signed, cacheable)	n/a	Register time
POST	/api/v1/shopfloor/pay:calculate	Calculate pay lines for worker-days	Idempotency-Key	Calculate time registrations
POST	/api/v1/shopfloor/pay:approve	Approve worker-days (bulk)	Idempotency-Key	Approve time registrations
POST	/api/v1/shopfloor/pay:export	Export batch (CSV + event)	Idempotency-Key	Export time to payroll
GET	/api/v1/shopfloor/oee?resourceIds&from&to&bucket=15m	OEE series	n/a	View shop floor
POST	/api/v1/shopfloor/downtimes/{id}:code	Assign reason	Idempotency-Key	Register time
GET	/api/v1/shopfloor/andon?siteId	Open alerts	n/a	View shop floor
POST	/api/v1/shopfloor/machines	Register machine → resource mapping, tags	Idempotency-Key	Maintain shop floor setup

Event	Trigger	Payload fields	Consumers
`dev.passage.shopfloor.registration.posted.v1`	registration stored	registrationId, workerId, kind, jobId, hours, qtyGood, qtyScrap, offline	production (job card), analytics
`dev.passage.shopfloor.machine.event.v1`	edge publish	see BR-25.4	shopfloor OEE, production, maintenance (w44)
`passage.shopfloor.oee.bucket-updated.v1`	bucket recomputed	resourceId, bucketStart, availability, performance, quality, oee	dashboards (w46)
`dev.passage.shopfloor.andon.raised.v1`	alert condition	alertId, resourceId, kind, severity, jobId, startedAt	notifications, kiosk
`dev.passage.shopfloor.payday.approved.v1`	approval	workerId, workDate, payLines[{type, hours, multiplier, amount}], approvedBy	payroll (w43)

4.25.6 User experience

Screen	Primary actions	Key fields/columns	Duty required
Kiosk home	Badge in/out, my jobs, start/stop, bundle, report, downtime reason, andon	Worker, clock status, current job, elapsed, qty good/scrap, offline indicator	Kiosk login / Register time
Job detail (kiosk)	View instructions/drawings, checks, report	Operation, order, item, qty planned/reported, checks	Register time
Supervisor board	Who is in, current jobs, downtimes, OEE tiles, approve days	Worker, job, elapsed, resource state, OEE A/P/Q, pending	Approve time registrations
Time approval	Calculate, edit with reason, approve, export	Worker, date, registrations, pay lines, flags (missing clock-out)	Approve time registrations
OEE dashboard	Resource/period filter, drill to downtime and buckets	OEE, A, P, Q, top losses (Pareto)	View shop floor
Machine setup	Map machine → resource, tags, ideal cycle time, thresholds	Machine, resource, protocol, node ids/topics, cycle s	Maintain shop floor setup

Interaction rules: kiosk targets ≥ 48 px, no hover-only affordances, numeric keypad for quantities, high-contrast theme, every action confirmed in ≤ 300 ms (optimistic UI); offline banner shows queued count; supervisor edits require a reason; OEE dashboard uses the w46 dashboard type when available, otherwise the Grafana panel embedded via the shell.

4.25.7 Business rules and edge cases

- **BR-25.1 Time attribution.** Hours for a job registration = (stopped_at – started_at) minus breaks that fall inside per the profile; bundle hours split by Σ qty_good (fallback equal split); hours rounded to 0.01 h on the job-card journal.
- **BR-25.2 Rounding and tolerances.** Clock-in within tolerance_before_min (default 10) of shift start rounds to shift start; clock-out within tolerance_after_min (default 5) rounds to shift end; otherwise round to nearest rounding_minutes (default 1, max 15).
- **BR-25.3 Missing clock-out.** At shift end + 4 h a missing clock-out auto-closes at shift end with flag `missing-clock-out`; the day cannot be approved until a supervisor confirms or edits.
- **BR-25.4 Machine event schema.** CloudEvents envelope `type: dev.passage.shopfloor.machine.event.v1`, `source: urn:passage:iot-edge:<site>:<edgeId>`, `subject: <machineId>`, `id: <machineId>-<seq>`, `time: <device ts RFC 3339>`, `datacontenttype: application/json`, `data: { "machineId": "M-101", "resourceId": "uuid", "seq": 184233, "kind": "count|state|downtime|alarm|measurement", "ts": "2026-10-21T08:15:03.250Z", "goodCount": 12, "rejectCount": 1, "state": "RUNNING", "reasonCode": null, "measurement": {"name": "temp_c", "value": 71.4, "unit": "Cel"}, "jobId": null, "tags": {"line": "L1"} }`. Counts are deltas since the previous count event; absolute counters are converted at the edge with rollover detection (32-bit). Events older than 7 days or with seq ≤ last seen are dropped and counted in a metric.
- **BR-25.5 OEE formula (ISO 22400 aligned).** Availability = run_minutes / planned_minutes; Performance = (ideal_cycle_s × total_count / 60) / run_minutes, capped at 1.0 with an over-rate flag; Quality = good_count / total_count (1.0 if total = 0); OEE = A × P × Q. Planned minutes = scheduled open minutes minus planned downtime (category planned). Example shift: planned 480 min, unplanned down 60 → A = 0.875; ideal cycle 60 s, total 380 → P = 380 / 420 = 0.9048; good 361 → Q = 0.95; OEE = 0.7522. Buckets roll up to shift/day by summing minutes and counts, not by averaging ratios.
- **BR-25.6 Idle detection.** No count event for idle_threshold_s while state = RUNNING flips the bucket to IDLE from the last count; a later count closes the idle gap.
- **BR-25.7 Offline conflict resolution.** Replayed registrations are accepted in client timestamp order; a job-start for a job that was finished server-side while offline is accepted but flagged `job-finished-conflict` for supervisor review; a duplicate client UUID is a no-op; clock skew > 5 min between device and server is corrected by the offset measured at reconnect and recorded.

- **BR-25.8 Pay thresholds.** Weekly overtime counts hours after 40.00 across the pay week (profile-defined start day); daily and weekly overtime do not double-count: hours already paid at 1.5× daily are excluded from the weekly threshold calculation.
- **BR-25.9 Posting to production.** Job-card journals from registrations post at cost_rate of the worker (if set) else the resource's cost category; a registration edited after posting creates a reversing journal and a new one.
- **BR-25.10 Andon de-duplication.** One open AndonAlert per (resource, kind); re-raising extends it; auto-closes when the condition clears for 5 min.
- **BR-25.11 Control recipe resend.** A control recipe in error can be resent up to 5 times; resending after any process message for the order was received requires `force` and a reason, because the PCS may have partially executed it.
- **BR-25.12 PI sheet step completion.** A sheet completes only when every mandatory step has a value, every out-of-limit value has a comment, every signature step has a valid signature, and no queued offline step remains; a held sheet (supervisor hold) cannot accept inputs except a release signature.
- **BR-25.13 Process message validation.** Values are validated against the category's characteristic types and limits; out-of-limit values are accepted with flag and an EBR exception unless the category is `reject-out-of-limit`; unknown order or phase → status error without delivery.
- **BR-25.14 Edge certificate rotation.** Renewal starts when remaining validity < 30 days; if renewal fails for 7 consecutive days an alert pages; an expired certificate stops publishing but buffering continues (24 h ring).
- **BR-25.15 Edge write safety.** A setpoint write requires the node to be on the allowlist, a value within the instruction's limits, and an active control recipe in-execution for the order on that machine; every write and its readback value are audited; a readback mismatch raises a process message of category deviation.

4.25.8 Acceptance criteria

- **AC-25.1** (FR-25.3, 25.4, BR-25.1) Given 6 operators on a shift with the fixture schedule, when they clock jobs on the kiosk (Playwright) and the day is approved, then each production order's labor cost = Σ hours × worker cost rate to the cent.
- **AC-25.2** (FR-25.7) Given a worker registering 09:00–19:30 with a 30-min break on a Tuesday, then pay lines are base 8.00 h and overtime-1.5 2.00 h.
- **AC-25.3** (FR-25.9) Given a simulated machine publishing 10,000 events/min for 60 min with a Kafka broker restart at minute 30, then every seq is present in MachineEvent and no duplicates exist.
- **AC-25.4** (FR-25.10, BR-25.5) Given the BR-25.5 shift example, then the shift OEE reads 0.7522 and the tile updates within 5 s of the last event.
- **AC-25.5** (FR-25.12) Given a kiosk disconnected for 30 min with 40 actions queued, when it reconnects, then all 40 are stored once in order and conflicts are flagged, not lost.
- **AC-25.6** (FR-25.11) Given a machine DOWN for 11 min without a reason, then an andon alert is open, the kiosk shows a banner, and coding the reason closes the downtime but keeps the alert until cleared.
- **AC-25.7** (FR-25.2, BR-25.2) Given shift start 07:00 and clock-in 06:53, then the registration time is 07:00.
- **AC-25.8** (FR-25.8) Given an approved day, when a supervisor edits a registration, then a reversal and a new PayLine are created and the export batch includes both.
- **AC-25.9** (FR-25.5) Given a mandatory numeric check with limits 10–12 and a value 13, then `finished` is blocked until override with reason.
- **AC-25.10** (phase exit) Given the demo plant, when the configured product (w8 configurator) is planned (w22), scheduled (w23), produced through kiosk registrations and machine counts (w25) and ended (w21), then the order's actual cost, variances and WIP reconcile to the journal and the recorded walkthrough is signed off.
- **AC-25.11** (FR-25.15, BR-25.15) Given a released batch order with a phase setpoint of 72.0 °C for node `ns=2;s=Vessel1.TempSP` on the allowlist, when the control recipe is sent to `pcs-opcua`, then the edge writes 72.0, the readback is audited, and the control recipe status is in-execution.
- **AC-25.12** (FR-25.16, BR-25.12) Given a PI sheet with a mandatory numeric step limits 6.5–7.5 and a signature step, when the operator enters 7.8 without a comment, then completion is refused; with a comment and a valid signature it completes and an EBR exception exists.
- **AC-25.13** (FR-25.17) Given a process message of category quality-result with destinations EBR and w33, when the w33 destination is unavailable, then the message is partially-delivered, retried at 1, 5, 15 and 60 min, and finally delivered without duplicating the EBR entry.
- **AC-25.14** (FR-25.18) Given a completed PI sheet, when archived, then a PDF/A-2b and JSON exist in the document store with equal content hash recorded on the run, and the EBR links to them.
- **AC-25.15** (FR-25.19, BR-25.14) Given a new edge node enrolled with a one-time token, when it starts, then it obtains a certificate, pulls config version 1, and heartbeats within 30 s; a canary upgrade whose heartbeat fails rolls back automatically within 5 minutes.

4.25.9 Test plan and fixtures

Fixtures: `shift-6-operators` (schedule, badge ids, profiles, expected pay lines and order costs); `pay-rules-30` (daily/weekly overtime, Sunday, flex, missing clock-out); `iot-sim-10k` (Go simulator producing counts/states with controllable gaps and rollover); `oee-shift-cases` (10 shifts with hand-computed A/P/Q); `offline-replay-40`.

Test	Type	Target	Pass criterion
Pay rules	unit	PayRule engine	30/30
OEE	unit	bucket calc	matches hand-computed to 4 decimals
Event ordering/loss	integration	iot-edge → Kafka → DB	0 lost, 0 dup over 600k events with broker restart
Kiosk shift E2E	Playwright	kiosk + production	labor cost ties
Offline sync	Playwright (offline mode)	PWA queue	40/40 once, in order
Throughput	performance	ingest	10k events/min sustained, consumer lag < 5 s
Accessibility	axe	kiosk screens	WCAG 2.1 AA

Reconciliation: Σ approved hours per order = Σ job-card hours posted; Σ PayLine hours = Σ registration hours per worker-day; Σ MachineEvent good counts attributed to a job = kiosk-confirmed good qty (variance report).

4.25.10 Deployment and operations

Helm: `shopfloor` (Go, 3 replicas; Kafka consumer group `shopfloor-oee`), `shopfloor-bff` (TS, 2 replicas, SSE), `kiosk` (static PWA served by the shell CDN path `/kiosk`), `iot-edge` (Go, deployed per plant; DaemonSet or single-node k3s at the edge; Mosquitto bundled optionally), `shopfloor-db` (CloudNativePG 200 GB, monthly partitions). Config: `SF_IDLE_THRESHOLD_S` (300), `SF_ANDON_DOWNTIME_MIN` (10), `SF_OFFLINE_MAX_ACTIONS` (5000), `IOT_BUFFER_HOURS` (24), `IOT_OPCUA_ENDPOINTS`, `IOT_MQTT_BROKER`. Flags: `shopfloor.iot`, `shopfloor.oee`, `shopfloor.pay-export`. Jobs: auto clock-out (hourly), OEE rollup (every 15 min), MachineEvent partition drop (daily, > 90 days). SLOs: kiosk action p95 < 200 ms server-side; ingest 10k events/min with consumer lag p95 < 5 s; availability 99.9%; edge buffer never exceeds 80% of 24 h. Alerts: consumer lag > 30 s (page), edge offline > 5 min (warn), seq gap detected (warn), andon storm > 50 open (warn). Runbook: "edge offline" — check MQTT/OPC-UA connectivity, buffer fill, restart connector; "seq gap" — replay from edge buffer by seq range. Rollback: prior digest; edge connector version pinned per plant with staged rollout.

4.25.11 Migration from AX / SAP

Source	Passage entity	Notes
JmgEmployee / HR mini-master (PA0001)	Worker	badge ids, default resource, profile
JmgProfileTable, JmgProfileDay / work schedule rules (T508A)	ProfileDay	shifts, breaks, rounding
JmgPayAgreement, JmgPayTable / wage types, time evaluation rules	PayRule config	overtime thresholds and multipliers
JmgAbsenceCode, Jmg error cause codes / absence types, AFRU.GRUND	reason codes	mapped to Passage code lists
JmgStampJournalTable, JmgRegistration (last 90 days) / CATSDB, AFRU	TimeRegistration (history, status exported)	read-only history for balances
Flex balances (JmgFlexTrans) / time accounts (PT_BAL00)	opening flex balance per worker	one opening line

Validation: flex balances per worker equal legacy at cutover; pay lines for the last closed week recomputed in Passage match legacy within 0.01 h per worker. Not migrated: raw terminal logs older than 90 days, machine data (none in AX/SAP core), MII configurations.

4.25.12 Dependencies, risks, open questions

Depends on: w21 job-card journals; w23 scheduled jobs (dispatch list); w24 kanban jobs on the kiosk; w7 employee party; w5 attachments and document service; w4 Kafka/Temporal; w43 payroll (consumer, later).

Risk	Likelihood	Impact	Mitigation
OPC-UA server diversity (security policies, node models)	High	Medium	Support None/Basic256Sha256 and companion-spec-agnostic tag mapping; certify against open62541 and a PLC simulator
Offline conflicts corrupt labor cost	Medium	High	Client UUID idempotency, flagged conflicts, supervisor review before posting option
Phase-exit demo depends on four prior waves' stability	High	High	Freeze w21–24 APIs two weeks before w25 close; rehearsal run weekly

Open questions: (1) Post job cards immediately or at approval? Default immediately with reversal on edit; decide by w25 kickoff. (2) Edge connector as DaemonSet in the plant cluster vs standalone binary? Default standalone k3s node per plant; decide by w25 mid-point. (3) Which OEE loss taxonomy (six big losses vs ISO 22400 element set)? Default six big losses mapped to ISO 22400 KPIs; decide by w25 kickoff.

4.25.13 Parameters and setup

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
Kiosk idle timeout min	site	int	10	1–60	Session logout	Manufacturing execution parameters → Terminal → Log off after	PP-PDC terminal settings
Badge login mode	site	enum	`badge-or-pin`	badge / pin / badge-or-pin	FR-25.1	Manufacturing execution parameters → Terminal → Badge ID	DM/MII user login
Post job card on stop	site	enum	`immediate`	immediate / at-approval	FR-25.4	Manufacturing execution parameters → Production orders → Transfer (route card journal creation)	Confirmation parameters OPK4 (post immediately vs PDC upload)
Bundle split basis	site	enum	`quantity`	quantity / equal	BR-25.1	Job bundle setup (JmgParameters bundle)	n/a
Auto-stop previous job	site	bool	true	true/false	FR-25.3	Manufacturing execution parameters → Auto stop	n/a
Clock-in tolerance before / after min	profile	int / int	10 / 5	0–60	BR-25.2	Profile (JmgProfileTable) flex/tolerance	Work schedule rule tolerances (T550A)
Rounding minutes	profile	int	1	1–15	BR-25.2	Profile rounding	Time evaluation rounding rules
Missing clock-out close after h	site	int	4	1–24	BR-25.3	Calculation → missing clock-out	Time evaluation error message (RPTIME00)
Overtime daily / weekly thresholds	pay agreement	numeric	8.00 / 40.00	0–24 / 0–168	FR-25.7	Pay agreement (JmgPayAgreement)	Wage types / time evaluation schema
Idle threshold s	machine	int	300	30–3,600	BR-25.6	n/a	PCo notification settings
Andon downtime min / scrap %	site	int / numeric	10 / 5	1–240 / 0–100	FR-25.11	n/a	DM andon rules
OEE bucket minutes	tenant	int	15	5 / 15 / 60	FR-25.10	n/a	DM OEE time granularity
Offline max actions	site	int	5,000	100–20,000	FR-25.12	n/a	n/a
Edge buffer hours	edge node	int	24	1–168	FR-25.9	n/a	PCo storage and forward settings
Edge rollout ring	edge node	enum	`all`	canary / ring1 / all	FR-25.19	n/a	PCo agent versioning (manual)
Edge write allowlist	edge node	list	empty	OPC-UA node ids / topics	BR-25.15	n/a	PCo destination system write permissions
Control recipe destination per resource	resource	ref	`kiosk`	RecipeDestination	FR-25.15	n/a	Control recipe destination (O10C)
Process message category destinations	category	list	per category	destinations	FR-25.17	n/a	Message category destinations (O05C/O06C/O07C)
PI sheet hold requires signature	template	bool	true	true/false	BR-25.12	n/a	PI sheet XStep signature settings
Process message retry schedule	tenant	list	1,5,15,60 min	any	FR-25.17	n/a	CO54 send interval

4.25.14 Inquiries and reports

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
Who is clocked in	list inquiry	site, work cell	worker, clock-in time, current job, elapsed	TimeRegistration	Manufacturing execution → Clocked-in workers (JmgTermRegList)	PP-PDC attendance, CATS
Registrations for approval	list inquiry	team, date, flags	worker, date, registrations, pay lines, flags	TimeRegistration × PayLine	Approve (JmgCalcApprove form)	CATS approval (CATS_APPR_LITE)

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
Pay lines / transfer log	list inquiry	export batch, worker	pay type, hours, amount, batch	PayLine	Pay specification (JmgPayEvents), Transfer log	PT_BAL00 / CATS transfer
Job registration history	drill-down	order, operation, worker	start/stop, hours, qty, scrap reason, journal	TimeRegistration	Registrations (JmgStampJournalTrans)	CO14 confirmations (AFRU)
OEE by resource	KPI	resource, period, shift	OEE, A, P, Q, top losses	OeeBucket	n/a (Sensor Data Intelligence)	DM OEE dashboard
Downtime Pareto	operational report	resource, period, category	reason, minutes, count, %	DowntimeRecord	Indirect activity report	PM breakdown analysis (MCI7)
Scrap by reason	operational report	order, resource, period	reason, qty, cost	TimeRegistration scrap	Error cause report (JmgErrorSpecification)	CO11N variance reasons, MCP5
Machine event / sequence gap report	operational report	machine, period	events, gaps, dropped (old/dup), lag	MachineEvent metrics	n/a	PCo logs
Control recipe monitor	list inquiry	status, destination, order	control recipe, status, sent/received, error	ControlRecipe	n/a	CO53 / CO53XT
PI sheet worklist	list inquiry	work cell, status	sheet, order, phase, status, open steps	PiSheetRun	n/a	CO60 / CMX worklist
Process message monitor	list inquiry	status, category, destination	message, category, order, per-destination status, attempts	ProcessMessage	n/a	CO54 / CO54XT
Edge fleet status	list inquiry	site, status	edge, version, ring, last heartbeat, buffer fill, cert expiry	EdgeNode	n/a	PCo management console

4.25.15 Printed and electronic documents

Document	Trigger	Layout elements	Formats	Numbering sequence	Legal / retention requirement
Badge	Worker setup	Name, photo (optional), badge id barcode (Code 128 / NFC encode)	PDF (CR80 card)	none	Personal data — GDPR minimization (photo optional)
Time card / registration summary	Day/week approval	Worker, days, clock-in/out, jobs, hours, pay types, approver	PDF, email	none	Wage-and-hour records: US FLSA 29 CFR 516 — 3 years payroll / 2 years time cards; EU Working Time Directive national rules (e.g., DE ArbZG §16 — 2 years)
Payroll export file	Export	Worker id, date, pay type, hours, amount	CSV, event (w43)	export batch number	Retained with payroll (w43)
PI sheet (executed)	PI sheet completion	Steps, values, limits, comments, signatures with manifestation	PDF/A-2b + JSON	`pi-sheet` per legal entity	Part of EBR (w24 retention)
Control recipe	Release	ISA-88 structure, setpoints, destination	JSON (B2MML-style), PDF	`control-recipe`	Part of EBR for GxP items
OEE shift report	Shift end	Resource, A/P/Q/OEE, downtimes, scrap	PDF, email	none	None
Machine events	Edge publish	CloudEvents (BR-25.4)	JSON	n/a	Postgres 90 days; Iceberg indefinitely

4.25.16 Periodic and batch jobs

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
Auto clock-out	hourly	site	Closes open clock-ins per BR-25.3 once	< 30 s	Retry next hour	Count of auto-closed reported
OEE rollup	every 15 min	resource	Upsert OeeBucket by (resource, bucket_start)	< 60 s	Recompute next run	Lag > 5 min warns
Pay calculation	nightly 02:00 + on edit	worker-day	Recompute non-approved days; approved immutable	1,000 workers < 2 min	Per-worker errors listed	Errors > 0 warn
Payroll export	per pay period (configurable)	legal entity	Export batch id; re-export reuses batch	< 1 min	Retry; batch stays open	Failure pages before payroll cutoff
MachineEvent partition drop	daily 03:30	month partition	Drops partitions > 90 days after Iceberg copy confirmed	< 1 min	Skip if copy unconfirmed	Skip warns
Process message retry	every 1 min	destination	Per-delivery attempts per schedule	< 10 s	Error status after last attempt	Errors > 20 open warn
PI sheet archive sweep	hourly	site	Archives completed runs lacking archive	< 2 min	Retry 5×	Unarchived > 1 h pages
Edge certificate renewal check	daily 04:00	edge node	Renew when < 30 days	< 1 min	Alert after 7 days failing	BR-25.14
Edge rollout promotion	on schedule (ring windows)	site × ring	Promote ring after 24 h healthy	n/a	Halt rollout on failed heartbeat	Rollout halted warns

4.25.17 Security duties and privileges

Duty	Privileges (entry points)	Segregation-of-duties conflicts	Default roles
Kiosk login	sessions:badge, kiosk shell	none	Operator
Register time	registrations, jobs, feedback, instructions, downtime coding, PI sheet execution	with *Approve time registrations* (own registrations)	Operator
Calculate time registrations	pay:calculate	none	Shop floor supervisor
Approve time registrations	pay:approve, edits with reason	with *Register time* for own records — approval of own day blocked	Shop floor supervisor
Export time to payroll	pay:export	with *Approve time registrations* flagged	Payroll clerk
View shop floor	OEE, andon, supervisor board, reports	none	Supervisor, Plant manager
Maintain shop floor setup	machines, thresholds, profiles, pay agreements, reason codes, recipe destinations, message categories	with *Approve time registrations* (pay agreements) flagged	Manufacturing engineer, ERP administrator

Duty	Privileges (entry points)	Segregation-of-duties conflicts	Default roles
Maintain PI sheet templates	step library, templates (ECO-released)	with *Approve batch records* (w24)	Process engineer
Create process messages	manual process message, reprocess/delete with reason	none	Shop floor supervisor
Manage edge fleet	enrollment tokens, config publish, write allowlist, rollout rings	with *Maintain PI sheet templates* (allowlist and recipe content by different people)	OT administrator

4.25.18 Message catalog

Code	Severity	User text	Cause	Remediation	Raised by
SF-0001	error	Badge {badge} is not recognized.	Unknown badge	Contact supervisor	FR-25.1
SF-0002	warning	Previous job {job} was stopped automatically.	One open job rule	none	FR-25.3
SF-0003	warning	Missing clock-out on {date}; closed at shift end.	BR-25.3	Supervisor confirms or edits	BR-25.3
SF-0004	warning	Job {job} was finished on the server while you were offline.	BR-25.7	Supervisor review	BR-25.7 (`job-finished-conflict`)
SF-0005	error	Mandatory check {check} failed; operation cannot be finished.	FR-25.5	Supervisor override with reason	FR-25.5
SF-0006	error	Day cannot be approved: {n} flags open.	Approval precondition	Resolve flags	FR-25.8
SF-0007	error	Hours exceed 24.00 for {worker} on {date}.	PayLine invariant	Correct registrations	FR-25.7
SF-0008	warning	Machine {machine} sequence gap {from}–{to}.	Lost or delayed events	Replay from edge buffer	FR-25.9
SF-0009	info	Andon raised on {resource}: {kind}.	FR-25.11	Respond	FR-25.11
SF-0010	error	Offline queue is full ({n} actions).	FR-25.12 limit	Reconnect device	FR-25.12
SF-0011	error	Control recipe {cr} could not be sent: {reason}.	Destination error	Fix destination; resend	FR-25.15
SF-0012	error	Resend requires force: process messages already received for order {order}.	BR-25.11	Resend with force and reason	BR-25.11
SF-0013	error	PI sheet cannot be completed: {n} mandatory steps open.	BR-25.12	Complete steps	BR-25.12
SF-0014	warning	Value {value} is outside {min}–{max}; comment required.	Out-of-limit input	Enter comment	FR-25.16
SF-0015	error	Process message rejected: unknown order or phase {ref}.	BR-25.13	Correct source mapping	BR-25.13
SF-0016	warning	Process message {id} delivery to {destination} failed (attempt {n}).	Destination unavailable	Automatic retry; reprocess later	FR-25.17
SF-0017	error	Write to node {node} refused: not on allowlist or out of limits.	BR-25.15	Update allowlist via OT admin	BR-25.15
SF-0018	warning	Edge {edge} certificate expires in {days} days; renewal failing.	BR-25.14	Check connectivity to CA	BR-25.14
SF-0019	warning	Edge {edge} rolled back to {version}: heartbeat failed after upgrade.	FR-25.19	Inspect connector logs	FR-25.19
SF-0020	error	Enrollment token is invalid or expired.	FR-25.19	Issue a new token	FR-25.19

4.25.19 Performance budgets and capacity

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation under 3× load
Kiosk action (start/stop/feedback)	500 workers × 40 actions/day; peak 300/min at shift change	60 / 200 / 400 ms server-side	50/s	TimeRegistration 7M rows ≈ 4 GB	(worker_id, started_at), (job_id)	Optimistic UI; queue in PWA
Machine event ingest	200 machines × 50 events/min = 10k/min; peak 30k/min	consumer lag p95 < 5 s	500 events/s sustained	5.3B events/yr → Postgres 90 days ≈ 300 GB rolling; Iceberg ≈ 1 TB/yr compressed	monthly range partitions; (resource_id, ts)	Lag allowed to 60 s; OEE marked stale
OEE bucket recompute	200 resources × 96 buckets/day	< 5 s after last event	n/a	OeeBucket 7M rows/yr ≈ 2 GB	PK (resource_id, bucket_start)	Rollup every 30 min
Offline replay	≤ 5,000 actions per device	40 actions < 5 s; 5,000 < 2 min	100 actions/s per device	n/a	client UUID unique	Batches of 500 throttled
Process message delivery	50,000/day	200 ms / 1 s / 3 s per destination	50/s	ProcessMessage 18M rows ≈ 10 GB	(status, received_at); unique (source, source_message_id)	Retry backlog drained FIFO
PI sheet step save	100,000/day	80 / 250 / 500 ms	50/s	PiStepResult 36M rows ≈ 15 GB; archives ≈ 200 GB object storage	(run_id, step_seq)	Offline queue absorbs
Edge heartbeat / config pull	50 edges × 2/min	50 / 150 / 300 ms	10/s	EdgeNode status history 50M rows ≈ 5 GB (90-day retention)	(edge_id, ts)	Heartbeat interval auto-extends to 120 s

4.25.20 Localization and compliance hooks

- **Working-time law**: pay rules (overtime thresholds, Sunday/holiday premiums, night work) differ by country and collective agreement; launch defaults are US FLSA (40 h/week) — wave 48 country packs ship pay agreement templates (e.g., DE ArbZG 10 h/day maximum, FR 35 h/week, MX LFT) through the `shopfloor.pay-rule` extension point; holiday calendars come from w48.
- **Time-recording obligations**: EU CJEU C-55/18 (CCOO) requires objective time recording; clock registrations are kept as raw records (immutable, corrections as reversals) to satisfy it; retention per country via w48 retention policy (US 2–3 years, DE 2 years, ES 4 years).
- **Privacy and works councils**: badge, PIN hash and registration data are personal data; machine-to-worker attribution (FR-25.13) and OEE per operator are disabled per site with `shopfloor.operator-analytics = false` (default false in DE/AT/NL packs, where works-council agreements typically require it); GDPR erasure pseudonymizes workers after retention.
- **GxP**: PI sheets and process messages become EBR content under 21 CFR Part 11 / EU Annex 11 (w24 FR-24.21/24.22).
- **OT security**: edge connector deployment follows IEC 62443-3-3 zone/conduit guidance (outbound-only, mTLS, allowlisted writes); NIS2 (EU) incident reporting hooks use the w2 security event stream.
- **Language**: kiosk UI and PI sheet content are translatable per site; instruction attachments per language with fallback.
- **Extension points**: `shopfloor.pay-rule`, `shopfloor.process-message.destination`, `iot-edge.protocol-adapter` (adds protocols such as Modbus TCP or MTConnect without core changes).

4.25.21 Coverage closure

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
SAP 13.22 PP-PI — CO53 / CO53XT control recipe monitor [SAP #254]	PARTIAL-25	ADDED as FR-25.15	Destinations kiosk / pcs-opcua / pcs-mqtt; monitor in 4.25.14
SAP 13.22 PP-PI — CO54 / CO54XT / CO57 / CO58 process messages [#255]	PARTIAL-25	ADDED as FR-25.17	Categories, destinations, retry
SAP 13.22 PP-PI — CO60 / CO60XT / CO60_PI / CO64 / CO67 PI sheet [#256]	PARTIAL-25	ADDED as FR-25.16, FR-25.18	Designer, execution, archive
SAP 13.22 PP-PI — CMX / Standard XSteps (CMXSV) / SXS repository [#258]	PARTIAL-25	ADDED as FR-25.16	Versioned StepLibrary via ECO
SAP 13.22 PP-PI Reports — CO54 process message log [#263]	PARTIAL-25	ADDED as FR-25.17	Process message monitor
SAP 13.22 PP-PI Reports — CMX/CO60 PI sheet worklist [#265]	PARTIAL-25	ADDED as FR-25.16	PI sheet worklist per work cell
SAP 13.22 PP-PI Periodic — CO53 send control recipes (batch) [#266]	PARTIAL-25	ADDED as FR-25.15	Sent at release; resend per BR-25.11
SAP 13.22 PP-PI Periodic — CO54 process message processing (batch) [#267]	PARTIAL-25	ADDED as FR-25.17	Retry job in 4.25.16
SAP 13.22 PP-PI Periodic — CO64 / CO67 PI sheet archive [#268]	PARTIAL-25	ADDED as FR-25.18	Archive sweep job
SAP 13.22 PP-PI Customizing — Process management: PI categories (O10C/O12C/O13C), message categories and destinations (O05C/O06C/O07C), PI sheet layouts, XStep settings, signature strategies [#271]	PARTIAL-25	ADDED as FR-25.15, FR-25.16, FR-25.17	Signature strategies from w24 FR-24.22
SAP 13.28 HCM — PP61/PP62/PP63/PP64/PP6I/PP6A shift planning [#325]	PARTIAL-25	DEFERRED to wave 42	Rostering against staffing requirements belongs with HR core; wave 25 keeps profiles and shift windows (ProfileDay)
Coordinator-flagged — OPC-UA/MQTT edge connector as a deployable (AX 12.x Production → IoT, COVERED-25)	COVERED-25 (deployment not specified)	ADDED as FR-25.19	Enrollment, mTLS, config versions, ringed rollout, write allowlist

Related row owned by another wave: SAP #193 EWM Material Flow System (propose 32) reuses the FR-25.19 edge connector and the `iot-edge.protocol-adapter` extension point.

Part 5 — Phase 5: Order-to-Cash (waves 26–30)

5.0 Phase overview

Business outcome at phase exit. At the end of wave 30 a manufacturer runs the complete buy → make → sell → collect loop on Passage. A sales rep quotes and takes an order at a deterministically resolved price; the order is promised against cumulative ATP and checked against credit; the warehouse picks, packs and ships it with a posted packing slip that moves inventory cost to the universal journal; billing posts the invoice with tax and an ASC 606 / IFRS 15 recognition schedule; cash is applied from lockbox, remittance or bank statement; collections runs dunning and disputes; returns flow through RMA to credit note; and every subledger reconciles to the journal by automated check. Wave 30 is the first go-live candidate.

Phase-exit sign-off criteria (each produces an artifact in `reconciliation/phase-5-exit/`):

- One simulated 31-day month (fixture period 2027-03) runs end-to-end on `stage` for demo entities DMF-US (USD) and DMF-DE (EUR): ≥ 200 purchase orders received (Phase 3), ≥ 150 production orders reported as finished (Phase 4), 1,000 sales orders, ≥ 900 shipments, ≥ 950 invoices including ≥ 40 bundles with revenue schedules, 600 customer payments across manual / BAI2 lockbox / camt.053, one dunning run, 30 RMAs, one rebate settlement, inventory close and period close for 2027-03.
- Daily reconciliation passes for all 31 days with zero unexplained differences: AR open items = GL 1200; deferred revenue roll-forward = GL 2400; delivered-not-invoiced = GL 1405; inventory subledger = GL 1400; WIP = GL 1350; rebate accrual = GL 2150; tax payable = tax engine settlement = GL 2300; unapplied cash = GL 1205.
- Trial balance for 2027-03 balances; GL 4000 = Σ posted invoice revenue lines – credit notes – deferrals; GL 5000 = Σ packing-slip cost – return receipts.
- Pricing: 500 scenario fixtures and 10k-request determinism property test green; p95 < 20 ms for a 10-line order.
- Order intake 500 orders/min at p99 < 500 ms; ATP never over-promises (property test over 100 fixtures).
- Cash application ≥ 90% auto-match on the 500-payment fixture with zero false matches; dunning run produces letters for exactly the expected customer set.
- Pick-pack-ship E2E for 1,000 orders with zero inventory mismatch; packing-slip reversal contract tests green.
- Recorded walkthrough (≤ 45 min) and a reconciliation pack signed by a practicing accountant, both linked from the wave 30 issue.

Cross-wave data model summary

Entity	Owning service (Postgres db)	Key relationships
condition_record, pricing_procedure, rebate_agreement, price_journal	pricing (pricing_db, Go)	→ customer/group (w7), product (w8); explain refs consumed by sales/billing
sales_quotation, sales_order(_line), sales_agreement, order_hold, credit_profile, atp_bucket	sales (sales_db, Go)	→ condition_record; supply/demand from w16/w17/w21/w22; production order link (w21)
shipment, container, packing_slip, carrier_shipment	fulfillment (fulfillment_db, Go) + carrier-gateway (TS)	→ sales_order_line; inventory_transaction (w16); journal posting (w11)
invoice(_line), free_text_invoice, credit_note, subscription	billing (billing_db, Go)	→ packing_slip; tax (w13); journal (w11)
revenue_contract, performance_obligation, revenue_schedule	revrec (revrec_db, Go)	→ invoice_line; journal (w11)
open_item, payment, settlement, lockbox_batch, dunning_run, dispute, interest_note, return_order	receivables (receivables_db, Go) + collections-workflows (TS, Temporal)	→ invoice, customer, camt.053 statement, journal
portal_user, payment_intent	customer-portal (portal_db, TS BFF) + payments-gateway (TS)	→ party contact (w7), open_item, Stripe/Adyen adapter

Cross-wave event catalog (CloudEvents on Kafka topics `passage.<domain>`, Avro in schema registry, Debezium outbox)

Event	Producer	Consumers	Payload summary
passage.pricing.condition-record.activated.v1	pricing	sales cache, analytics	id, type, keys, validity, version
passage.pricing.rebate-accrual.posted.v1	pricing	ledger, receivables	agreement, period, amount, journal ref
dev.passage.sales.order.confirmed.v1	sales	planning, fulfillment, credit, analytics	order, customer, lines with confirmed dates, totals
passage.sales.order-hold.applied.v1 / released.v1	sales	fulfillment, collections, portal	order, hold type, reason, actor
passage.fulfillment.packing-slip.posted.v1	fulfillment	billing, inventory, ledger, sales, portal	slip, lines, qty, cost snapshot, journal ref

dev.passage.revrec.schedule.recognized.v1	revrec	ledger, analytics	schedule line, obligation, amount, period
dev.passage.receivables.payment.applied.v1	receivables	ledger, sales (credit), portal	payment, settlements[], residual
passage.receivables.customer-balance.changed.v1	receivables	sales credit, portal	customer, balance, overdue, oldest item days, dunning level
passage.receivables.return-order.dispositioned.v1	receivables	fulfillment, billing, inventory	RMA line, disposition, qty, restocking

Phase-level risks

Risk	Likelihood	Impact	Mitigation	Owner
AX "find next" vs. SAP access-sequence semantics confuse migrated users	High	Medium	Two reference procedures shipped; both in the 500-scenario fixtures	Product
ATP over-promises because a supply source is missed	Medium	High	Projection rebuilt nightly from events and diffed; property test gates release	Engineering
Delivered-not-invoiced drifts from GL 1405	Medium	High	Packing slip and invoice share one cost_snapshot_id; daily check from wave 28 day 1	Engineering
ASC 606 allocation disputed by auditors	Medium	High	40 fixtures reviewed by a practicing accountant; residual-cent rule documented	Product + accountant
False auto-match in cash application	Low	High	Single candidate ≥ 85 with 20-point margin; every auto-match reversible	Engineering
Go-live simulation exposes Phase 3/4 defects late	High	Medium	Dry-run at wave 28 exit with sell/collect stubs	Both owners

5.26 Wave 26: Pricing, Discounts & Trade Agreements

5.26.1 Scope and business context

Every order, quotation, invoice and rebate in Phase 5 depends on a price that is explainable and repeatable. Wave 26 ships the `pricing` service: condition records with validity and quantity breaks, access sequences resolving from the most specific key to the most general, line/multiline/total discounts, surcharges, exclusion groups, rounding rules, campaigns, rebate agreements with accrual, atomic price journals, a simulation/explain API and commission hooks. At wave end a pricing administrator maintains agreements in the Pricing workspace and any caller receives, for a customer/product/date/quantity/currency tuple, a net price plus the ordered list of conditions that produced it. Out of scope: rebate settlement (wave 30), vendor pricing (wave 17), configurator price components beyond attribute-keyed records, storefront promotions. Added from the coverage registers (§5.26.21): vendor rebate, broker and royalty agreements with accrual (claims paid through wave 19 AP), commission transactions and posting, trade promotion funds and promotion planning, commodity pricing, free goods and retroactive accrual.

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
Nobody can say why a line priced at 93.40: AX "Find next" results are invisible on SalesLine; SAP needs the VA01 condition "Analysis" screen per line	Resolution is a side effect inside the order form (PriceDisc class / RV61A formulas), not a queryable function	`POST /pricing/resolve?explain=true` returns the access-by-access trace, stored with the line as `price_explain_ref`	"Why this price": 20–40 min consultant trace → < 10 s self-service; 100% of lines traced
Mass price change is a multi-hour, non-atomic job: PriceDiscAdmTrans posts row by row and leaves half-applied prices on failure; VK12 mass change has no undo	Row loop in X++/ABAP without a transaction boundary across the set	price_journal validates fully, posts in one transaction and reverses with one action	100k prices: 3–6 h plus cleanup → < 120 s; rollback 1 action
Overlapping agreements silently win by insertion order (first PriceDiscTable row found; A-table collisions blocked only per access)	No overlap validation at save	Activation rejects overlapping validity for the same key with 409 naming the conflict	Overlap-caused price disputes: ~10 per 1,000 agreements/month → 0
Rounding differs between order, packing slip and invoice (SalesLine.LineAmount re-rounded per form letter; KPEIN pricing-unit rounding)	Each consuming document re-rounds	Engine rounds once (BR-26.3); consumers reuse the stored net; invoice totals property-tested	Cent-level order/invoice differences: ~0.5% → 0
CPQ tools and storefronts re-implement price lists in middleware because pricing is unreachable outside the form call stack	No stateless pricing API	Resolve API p95 < 20 ms, condition-record events, MCP exposure via wave 46	External lookups: nightly export → live; zero duplicated price lists

5.26.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Sales price agreements	PriceDiscTable (Relation=PriceSales), PriceDiscAdmTable/Trans journal	VK11/VK12/VK13, KONH/KONP, A004/A005/A305, PR00	condition_record type PRICE	full
Line discount	PriceDiscTable (LineDiscSales), PriceDiscGroup	K004/K005/K007, KONP-KBETR	condition_record LINE_DISC	full
Multiline discount	PriceDiscTable (MultiLineDiscSales)	Group condition T685A-KZBZG, K020	MULTILINE_DISC with group key	full
Total discount	PriceDiscTable (EndDiscSales)	Header conditions HI01/RA01	TOTAL_DISC	full
Price/discount groups	PriceDiscGroup; CustTable.PriceGroup/LineDisc/MultiLineDisc/EndDisc; InventTableModule.PriceGroup	KNVV-KONDA/KDGRP, MVKE-KONDM	customer_pricing_group, product_pricing_group	full
Access order / exclusion	PriceDiscParameters, "Find next", "Search again"	V/07 access sequences (T682), V/08 procedure (T683S), exclusion T684	pricing_procedure, access_sequence, exclusion_group	improved (explain)
Smart rounding	PriceDiscRounding, journal rounding	DIFF condition, T001R	rounding_rule	full
Campaigns / promotions	Trade allowance agreements (TAMAgreement)	Sales deals VB21/VB22, promotions VB31 (KONA)	campaign	full
Rebates	PriceDiscRebate / TAMRebateAgreement, D365 Rebate management	VBO1/VBO2 (KONA, BO01–BO06, VBOX); S/4 condition contract WCOCO	rebate_agreement, rebate_accrual	partial (settlement w30)
Commissions	CommissionCalc, CommissionSalesRep, CommissionTrans	VBPA partner function; ICM	commission_rule + event hook	partial
Mass update	Price/discount agreement journals	VK12 mass change, MASS	price_journal (atomic, reversible)	improved
Vendor rebates	PdsRebate* (PI vendor rebate agreements, rebate groups, program types), D365 Rebate management vendor deals, claim journals	Supplier condition contracts (WCOCO purchasing side), settlement documents	rebate_agreement with party_role VENDOR, vendor_rebate_claim → w19 AP	full (claim payment w19)
Broker contracts and royalties	PdsBrokerContractTable, PdsRoyaltyAgreement, broker/royalty claim journals	Settlement management royalty and broker condition contracts	broker_contract, royalty_agreement, claim journal → w19 AP	full
Commission posting	CommissionCalc, CommissionSalesGroup, CommissionCustomerGroup, CommissionItemGroup, CommissionPosting, CommissionTrans	VBPA partner functions VE/PE; settlement management commission contracts; ICM	commission_rule, sales_group, commission_transaction (posted)	full (payout w19/w43)
Trade promotion funds and planning	TAMFund, TAMFundUsage, TAMMerchandisingEvent, TAMPromotionPlanning	CRM TPM; condition contracts with budget	fund, promotion_plan (baseline, lift, actuals)	partial (lift analysis basic)
Free goods	Supplementary items (PriceDiscSuppItem, order-side w27)	VBN1/VBN2/VBN3 NA00, OVKF, KOTN	condition type FREE_GOODS	full
Commodity pricing (PI)	PdsCommodityCostBasis, PdsPricingCalc, PdsPriceMarginTemplate, price calculation run	Condition contracts with index-based conditions	commodity_index, price_calculation → price_journal	full
Retroactive agreements	Rebate management recalculation	VBOF, delta accrual / delta settlement	retroactive recompute with delta posting	full

5.26.3 Functional requirements

- **FR-26.1 Condition types and procedure** — Must. The system shall define condition types (PRICE, LINE_DISC, MULTILINE_DISC, TOTAL_DISC, SURCHARGE, FREIGHT, REBATE_ACCRUAL, ROUNDING) ordered in a versioned pricing procedure per legal entity and sales channel. Notes: reference procedures `AX_STANDARD` and `SAP_RVAA01`; steps 10–990 with optional CEL requirement (≤ 512 chars); activated versions are immutable.
- **FR-26.2 Condition records** — Must. The system shall store records keyed by customer | customer group | all × variant | product | product group | all, with optional site/warehouse/channel/campaign, validity, currency, unit, ≤ 20 strictly increasing quantity breaks, amount and/or two percentages. Notes: overlapping ACTIVE records for the same key and currency are rejected with 409.
- **FR-26.3 Access sequence** — Must. The system shall resolve each condition type by trying accesses in configured order (BR-26.1) and stop at the first access yielding a candidate unless `search_next` is set, in which case it continues and keeps the lower net.

- **FR-26.4 Deterministic resolution with explain** — Must. The system shall return identical outputs for identical (procedure version, records as of pricing_date, request) and an explain trace (≤ 64 KB, content-addressed) listing every access tried, candidates, winner and reason. No wall-clock reads.
- **FR-26.5 Line, multiline and total discounts** — Must. The system shall apply line discounts per line, multiline discounts over summed quantity of lines sharing a group, and total discounts on order net after line discounts; two percentages apply sequentially (1–p1)(1–p2); amount before percentage.
- **FR-26.6 Surcharges** — Should. Fixed or percentage surcharges as separate conditions with their own revenue account; small-order threshold default 250 USD / 200 EUR.
- **FR-26.7 Rounding** — Must. Unit prices at NUMERIC(19,6); line amounts half-even to ISO 4217 minor units (wave 12); smart rounding bands for journals (0–10 → .99, 10–100 → .95, ≥ 100 → whole).
- **FR-26.8 Exclusion groups** — Must. BEST (lowest net) or FIRST (lowest step) among members; an `exclusive` winner suppresses later discount steps.
- **FR-26.9 Price journals** — Must. Mass create/update/delete through a journal that validates fully, posts atomically (100k lines < 120 s) and reverses by one action into a new journal referencing the original.
- **FR-26.10 Campaigns** — Should. Records grouped under a campaign with validity, target groups, budget and kill switch.
- **FR-26.11 Rebate agreements and accrual** — Must. Customer rebate agreements (tiered % or amount per unit; monthly/quarterly/annual; basis net invoiced or quantity) accrue on each posted invoice as Dr 4150 / Cr 2150 via the journal API; retroactive tier crossing recomputes the period and posts the delta.
- **FR-26.12 Commission hooks** — Could. Rules by sales rep × customer group × product group publish `commission.calculated` for Phase 8.
- **FR-26.13 Simulation** — Should. Simulate any tuple without a document and compare two procedure versions.
- **FR-26.14 Performance** — Must. p95 < 20 ms, p99 < 60 ms for a 10-line resolve; in-memory record cache per entity invalidated by `condition-record.activated`.
- **FR-26.15 Vendor rebate agreements** — Should. The system shall support `rebate_agreement.party_role = VENDOR`: tiered percentage or amount per unit on vendor-invoiced net value or received quantity per period, accruing Dr 2160 Vendor rebate receivable / Cr 5100 Purchase rebate income on each `vendor-invoice.posted` (w19). Notes: rebate groups (vendor) and program types BILL_BACK, FREIGHT, MARKETING; lifecycle Cumulate → Approve → Process claim as in AX PdsRebate; a claim per (agreement, period) settles by a w19 AP credit note or deduction from the next vendor payment, journal sequence `RC-`; Σ accruals – Σ claims = GL 2160 daily.
- **FR-26.16 Broker contracts** — Could. The system shall hold broker contracts (broker vendor, customer scope, product scope, rate as % of net or amount per unit, validity) and on `invoice.posted` accrue a broker claim Dr 6210 Broker commission / Cr 2175 Broker payable; claims are processed per period to w19 AP. Notes: credit notes reverse proportionally; claim statement document `BC-`.
- **FR-26.17 Royalty agreements** — Could. The system shall hold royalty agreements (licensor vendor, product or product group, basis net sales or quantity, tiered rates, minimum royalty per period) accruing Dr 6220 Royalty expense / Cr 2176 Royalty payable on `invoice.posted`, with a period claim to w19 AP. Notes: minimum royalty shortfall posts at period close; D365 price-based deals map to the same entity.
- **FR-26.18 Commission transactions and posting** — Should. The system shall define sales groups (reps with share percentages), commission customer groups, commission item groups and commission rules (basis REVENUE or MARGIN, rate) resolved specific → general, and on `invoice.posted` create `commission_transaction` rows posted Dr 6200 Commission expense / Cr 2170 Commission payable per rep. Notes: sales group and rep assignment on the order header (AX SalesTable.CommissionGroup; SAP VBPA VE/PE); credit notes create negative transactions referencing the original; a settlement export per rep and period feeds payroll (w43) or AP (w19); AX Commission report and SAP commission contract settlement list are reproduced by the Commission inquiry (§5.26.14).
- **FR-26.19 Trade promotion funds** — Could. The system shall define funds (type, budget per period, currency, customer scope, owner) whose usage is the sum of campaign accruals, rebate accruals, claims and deductions (w30) attributed to the fund; usage is visible per period and a fund close freezes it. Notes: overspend blocked unless `allow_overspend`; fund budget recalculation nightly.
- **FR-26.20 Promotion planning** — Could. The system shall plan a promotion (merchandising event category and type, campaign, fund, customers, products, dates) with a baseline (average weekly units over the prior 13 weeks), forecast lift % and planned spend; actuals are updated nightly from posted invoices and effectiveness = (actual – baseline) / baseline per product.
- **FR-26.21 Commodity pricing** — Could. The system shall store commodity cost-basis types with dated index values, pricing calculations (index × conversion factor + margin from a price margin template) and run a price calculation that produces a `price_journal` updating the affected trade agreements. Notes: run is previewable; potency pricing (w24) reuses the calculation; index values are versioned.
- **FR-26.22 Free goods** — Should. The system shall support condition type FREE_GOODS with inclusive (1 free within every 10 ordered) and exclusive (1 extra per 10 ordered) variants, calculation rule PROPORTIONAL, UNIT_REFERENCE or WHOLE_UNITS and a minimum quantity; the resolve response returns a zero-priced free-goods line proposal that w27 adds as a supplementary line (FR-27.14).
- **FR-26.23 Retroactive rebate accrual and delta settlement** — Must. The system shall, when an agreement is activated or changed with `valid_from` earlier than today, recompute accruals for invoices already posted in the scope (SAP VBOF) and post the delta per period with `retroactive=true`; settlement after a retroactive change posts only the delta against prior settlements.

5.26.4 Data model

condition_record

Field	Type	Required	Notes
id, tenant_id, legal_entity_id	uuid	Y	PK (v7); RLS
condition_type, key_combination	enum, smallint	Y	FK access_sequence_step
customer_id / customer_group_id	uuid	N	exactly one or null (all)
product_id / product_group_id / variant_dims	uuid / jsonb	N	same rule; dims {color,size,config}
site_id, warehouse_id, sales_channel, campaign_id	uuid/text	N	optional dims
currency, unit	char(3), text	Y	ISO 4217; FK uom (w6)
from_quantity, amount	numeric(19,6)	Y/N	default 0
disc_pct_1, disc_pct_2	numeric(7,4)	N	0–100
valid_from, valid_to	date	Y	inclusive
search_next, exclusive	bool	Y	default false
status, version, journal_id	enum, int, uuid	Y	DRAFT/ACTIVE/EXPIRED/WITHDRAWN

pricing_procedure: id, legal_entity_id, name, version, status, steps[] (step_no, condition_type, requirement_cel, exclusion_group_id, statistical, account_key). **access_sequence_step**: condition_type, seq_no, key_combination, required_fields[].

rebate_agreement: id, customer_id | customer_group_id, product scope, basis (NET_AMOUNT | QUANTITY), period (MONTH | QUARTER | YEAR), tiers[] (from_value, rate_pct | amount_per_unit), currency, accrual_account 2150, expense_account 4150, valid_from/to, status, settlement_method (CREDIT_NOTE | PAYMENT). **rebate_accrual**: id, agreement_id, period_id, invoice_line_id, basis_value, accrued_amount, journal_posting_id, status (ACCRUED | ADJUSTED | SETTLED | REVERSED).

price_journal: id, name, lines[] (op, before/after snapshot), status (OPEN | VALIDATED | POSTED | REVERSED), posted_at, reversed_by_journal_id.

Invariants: no two ACTIVE records share (type, keys, currency, unit, from_quantity) with overlapping validity; every ACTIVE record has a journal_id; resolve is reproducible from (procedure version, pricing_date, request); Σ rebate_accrual per period = GL 2150 movement. Indexing: composite btree (tenant, entity, type, key_combination, customer_id, product_id, currency, valid_from) plus partial indexes per key combination; partition by legal_entity; cache snapshot per (entity, pricing_date), 60 s TTL plus event invalidation.

5.26.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
POST	/api/v1/pricing/resolve	Resolve header + ≤ 500 lines; `?explain=true`	stateless	PricingResolve
POST	/api/v1/pricing/condition-records, …/{id}:activate, :withdraw	Record lifecycle with overlap check	Idempotency-Key	PricingMaintain
GET	/api/v1/pricing/condition-records?customer=&product=&asOf=	Query	—	PricingView
POST	/api/v1/pricing/journals, …/{id}:post, :reverse	Mass update	Idempotency-Key	PricingJournalPost
POST	/api/v1/pricing/procedures, …/versions/{v}:activate	Procedure maintenance	Idempotency-Key	PricingAdmin
POST/GET	/api/v1/pricing/rebates/agreements; /rebates/accruals?period=	Rebates	Idempotency-Key	RebateMaintain
POST	/api/v1/pricing/simulate	Simulation, version comparison	stateless	PricingView

Validation: resolve requires legal_entity_id, customer_id, currency, pricing_date, lines[].product_id/quantity/unit; quantity ≤ 0 or unknown unit → 422. Journal post requires status VALIDATED with zero errors.

Event	Trigger	Payload fields	Consumers
passage.pricing.condition-record.activated.v1	activate / journal post	id, type, keys, currency, validity, version, journal_id, retroactive	sales cache, analytics
passage.pricing.condition-record.withdrawn.v1	withdraw / reverse	id, version, reason	sales cache
dev.passage.pricing.journal.posted.v1	post / reverse	journal_id, line_count, reversed_journal_id	audit
passage.pricing.rebate-accrual.posted.v1	invoice.posted consumed	agreement_id, period_id, invoice_line_id, amount, currency, journal_posting_id	ledger, receivables
dev.passage.pricing.commission.calculated.v1	invoice.posted consumed	invoice_line_id, sales_rep_id, basis, rate, amount	Phase 8

5.26.6 User experience

Screen	Primary actions	Key fields/columns	Duty
Pricing workspace	tiles: expiring in 30 d, draft journals, campaigns, accrual this period	counts	PricingView
Trade agreements grid	create, copy, activate, withdraw, export	type, customer/group, product/group, currency, from qty, amount, %, validity, status	PricingMaintain
Price journal	import CSV (≤ 100k rows), validate, post, reverse	op, before/after, errors	PricingJournalPost
Procedure designer	add step, requirement, exclusion, activate version	step, type, requirement, exclusive	PricingAdmin
Simulation / explain	enter tuple, run, compare versions	per step: access, candidate, winner, amount	PricingView
Rebate agreements	tiers, accruals, close period	customer, basis, tiers, accrued	RebateMaintain

Interaction rules: keyboard row navigation and Ctrl+D duplicate; bulk edit validity and percentage on multi-select; validation on blur and at activate; explain tree navigable by arrow keys; column layouts personalizable (wave 5 shell).

5.26.7 Business rules and edge cases

- **BR-26.1 Resolution algorithm.** For each procedure step in order: (1) evaluate requirement; (2) for the step's condition type iterate accesses by seq_no — PRICE default: 1 customer × variant, 2 customer × product, 3 customer × product group, 4 customer group × product, 5 customer group × product group, 6 customer × all products, 7 all customers × product, 8 all customers × product group, 9 all × all; (3) at each access select ACTIVE records matching keys, currency = document currency (no cross-currency fallback), unit = line unit or convertible via wave 6, valid_from ≤ pricing_date ≤ valid_to, from_quantity ≤ quantity; (4) pick greatest from_quantity, then most dims matched, then lowest net unit price; (5) stop unless winner has search_next, then continue and keep the minimum; (6) no candidate at any access → nothing for discounts, `PRICE_NOT_FOUND` for PRICE unless a manual price exists; (7) exclusion groups evaluated after member steps (BEST lowest net, FIRST lowest step); (8) `exclusive` winner suppresses later discount steps; (9) round per BR-26.3.
- **BR-26.2 Pricing date** = requested ship date by default (AX), configurable to order or delivery date (SAP KOMK-PRSDT).
- **BR-26.3 Rounding.** Net unit = amount × (1−p1/100) × (1−p2/100) at 6 decimals; line net = round_half_even(qty × net unit, minor units); totals are sums of rounded lines; a percentage total discount rounds once on the total.
- **BR-26.4 Multiline grouping** sums quantities of lines with the same group and unit on one document; adding a line re-resolves the group.
- **BR-26.5 Manual override** requires duty PricingOverride, keeps the trace with a reason code, and is excluded from rebate basis when the agreement says `exclude_manual`.
- **BR-26.6 Concurrency.** Activation locks the key hash (`SELECT … FOR UPDATE`); overlap → 409 with the conflicting id.
- **BR-26.7 Retroactive journals** never re-price posted invoices; the event carries `retroactive=true`.
- **BR-26.8 Rebate tiers** evaluate on cumulative period basis; crossing a tier recomputes the whole period and posts the delta on the next invoice or at period end.
- **BR-26.9 State machines.** Record: DRAFT → ACTIVE → EXPIRED (nightly) | WITHDRAWN. Journal: OPEN → VALIDATED → POSTED → REVERSED. No return to DRAFT.
- **BR-26.10 Negative prices** rejected; 100% discount allowed and yields 0.00 with trace.
- **BR-26.11 Vendor rebate basis** = vendor invoice net (default) or received quantity; tier crossing recomputes the period as in BR-26.8; claim amount = Σ accruals − Σ prior claims for the period; a negative claim (over-accrual) creates a w19 vendor invoice instead of a credit note.
- **BR-26.12 Commission resolution** tries (sales group, customer commission group, item commission group) → (sales group, customer group, all) → (sales group, all, item group) → (sales group, all, all); basis REVENUE = line net, MARGIN = line net − cost_snapshot (w20); amount split by rep share %, rounded half-even per rep, residual cent to the first rep; a credit note creates negative transactions referencing the original.
- **BR-26.13 Free goods** inclusive reduces the priced quantity (10 ordered → 9 priced + 1 free); exclusive adds a free line; WHOLE_UNITS truncates; free goods never combine with a 100% discount on the same line and are excluded from rebate and commission basis unless the agreement sets `include_free_goods`.
- **BR-26.14 Retroactive recompute** replays `invoice.posted` for the agreement scope from `valid_from`; delta = recomputed − posted per period, posted as one journal per period; periods closed in w14 post to the first open period with the original period in the reference.
- **BR-26.15 Fund usage** = Σ attributed accruals + claims + deductions; it never exceeds budget unless `allow_overspend`; fund close freezes usage and blocks new attribution with `FUND_CLOSED`.

5.26.8 Acceptance criteria

- **AC-26.1** (FR-26.3) Given C1 in group PG-A with access-2 record 95.00 USD and access-4 record 90.00, when resolved without search_next, then 95.00 and access 4 is shown as not evaluated.
- **AC-26.2** (FR-26.3) Given search_next on the access-2 record, then 90.00 and both accesses appear in the trace.
- **AC-26.3** (FR-26.2) Given breaks 0→10.00, 100→9.50, 500→9.00 EUR, when qty = 500 then 9.00; when 499 then 9.50.
- **AC-26.4** (FR-26.4) Given 10,000 random requests resolved twice on two replicas, then outputs are byte-identical.
- **AC-26.5** (FR-26.5) Given discounts 10%/5% on 100.00 USD × 3, then line net = 256.50.
- **AC-26.6** (FR-26.8) Given exclusion group BEST with LINE_DISC 8% and campaign 12%, then only 12% applies.
- **AC-26.7** (FR-26.9) Given a 100k-line journal with one invalid line, then nothing is written and the error names the line; after correction and post, reversal restores all prior versions.
- **AC-26.8** (FR-26.11) Given a 2% monthly rebate and a 10,000.00 USD invoice, then 200.00 posts Dr 4150 / Cr 2150.
- **AC-26.9** (FR-26.14) Given 50 concurrent callers over the 500 scenarios, then p95 < 20 ms.
- **AC-26.10** (FR-26.7) Given smart rounding ".99 below 10" and a journal raising 7.41 by 5%, then 7.99 is stored.
- **AC-26.11** (FR-26.15) Given a 3% vendor rebate agreement and a 20,000.00 USD vendor invoice posted, then 600.00 posts Dr 2160 / Cr 5100 and the period claim preview shows 600.00.
- **AC-26.12** (FR-26.18) Given reps R1 60% / R2 40% in sales group SG-E and a 5% revenue rule, when a 10,000.00 USD invoice posts, then commission transactions 300.00 and 200.00 post Dr 6200 / Cr 2170 and the credit note of that invoice posts –300.00 / –200.00.
- **AC-26.13** (FR-26.22) Given inclusive free goods 1 per 10 with WHOLE_UNITS and an ordered quantity of 25, then 23 units are priced and 2 are free.
- **AC-26.14** (FR-26.23) Given a 2% agreement activated 2027-03-20 with valid_from 2027-03-01 and 50,000.00 USD invoiced in between, then a 1,000.00 delta posts Dr 4150 / Cr 2150 with retroactive=true.

5.26.9 Test plan and fixtures

Fixtures: `pricing-500` (hand-built from AX trade-agreement and SAP RVAA01 examples, with expected price and trace); `pricing-random-10k` (seeded); `price-journal-100k`; `rebate-tiers-12` (accountant-reviewed).

Test	Type	Target	Pass criterion
Resolver scenarios	unit	resolve	500/500 price and trace
Determinism	property	resolve	identical across 10k runs and replicas
Overlap rejection	unit	activate	100% rejected with 409
Journal atomicity	integration	journals	failure leaves zero rows changed
Rebate accrual = GL	reconciliation	accrual vs ledger	Σ per period = GL 2150 to the cent
Latency	performance	10-line resolve, 50 callers	p95 < 20 ms, p99 < 60 ms
Sales ↔ pricing	contract (Pact)	resolve	green

Reconciliation: Σ rebate_accrual per (agreement, period) = journal postings tagged `source=rebate_accrual`; journal snapshots replay to current record versions.

5.26.10 Deployment and operations

Helm `passage-pricing` (Go, 3 replicas, HPA CPU 70%); CloudNativePG `pricing-db` (3 instances); Atlas migrations from metadata, additive-only. Config: `PRICING_CACHE_TTL=60s`, `PRICING_MAX_LINES=500`, `PRICING_EXPLAIN_MAX_BYTES=65536`. Flags: `pricing.search_next`, `pricing.sap_procedure`, `pricing.commission_hooks`. Temporal jobs: nightly expiry 00:10 entity-local; rebate recompute at period end. SLOs: 99.95% availability, p95 20 ms. Alerts: invalidation lag > 5 s, error rate > 0.5%, journal post > 300 s. Runbook: cache rebuild, journal reversal, procedure version rollback. Rollback: previous image digest via Argo CD.

5.26.11 Migration from AX / SAP

Source	Passage entity	Notes
PriceDiscTable (Relation, AccountCode/Relation, ItemCode/Relation, QuantityAmount, Amount, Percent1/2, Currency, FromDate/ToDate, SearchAgain)	condition_record	Table/GroupId/All → customer/group/all; Relation → type; SearchAgain → search_next
PriceDiscGroup; CustTable price/discount groups	customer_pricing_group, product_pricing_group	one group per AX type
KONH/KONP + A004/A005/A305 (KSCHL, DATAB/DATBI, KBETR, KONWA, KPEIN, KMEIN), KONM scales	condition_record	A-table → key_combination; KONM → breaks; KPEIN normalized to per-unit at 6 decimals
T683S / T682	pricing_procedure, access_sequence_step	map to nearest reference procedure; manual review
KONA (BO01–BO06), VBOX; TAMRebateAgreement	rebate_agreement, opening accrual to 2150	

Validation: 1,000 sampled customer/product pairs resolve to the legacy price (AX PriceDisc::findPrice export, SAP VK13 export) to the cent. Not migrated: records expired > 24 months (archived), commission history, pricing logs, posted PriceDiscAdmTrans (lakehouse).

5.26.12 Dependencies, risks, open questions

- Depends on: w6 units, w7 customers/groups, w8 products/variants/attributes, w11 journal, w12 currencies, w25 (phase order).
- Risks: KPEIN/per-unit mismatch on import → normalize at 6 decimals; cache stampede after a 100k journal → warm cache inside the journal transaction.
- Open questions: (1) Cross-currency fallback? Default no; decide by wave 27. (2) Margin-based commissions before Phase 8? Default no; decide by wave 29.

5.26.13 Parameters and setup

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
price_search_mode	legal entity	enum	FIRST_MATCH	FIRST_MATCH, SEARCH_NEXT	Default for `search_next` on new records (BR-26.1 step 5)	AR parameters → Prices → "Find next" / PriceDiscParameters	V/07 access sequence "Exclusive" flag

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
pricing_date_basis	legal entity	enum	SHIP_DATE	SHIP_DATE, ORDER_DATE, DELIVERY_DATE	Pricing date per BR-26.2	Fixed to requested ship date	VOV8 pricing date default (KOMK-PRSDT)
total_discount_basis	legal entity	enum	AFTER_LINE_DISC	AFTER_LINE_DISC, GROSS	Base for TOTAL_DISC	AR parameters → Prices → "Total discount calculation"	RVAA01 header condition HI01/RA01 step base
smart_rounding_bands	legal entity	table	0–10 → .99; 10–100 → .95; ≥ 100 → whole	ordered bands	FR-26.7 journal rounding	PriceDiscRounding / AR parameters → Prices → Smart rounding	DIFF condition, T001R rounding rules
reference_procedure	legal entity × sales channel	enum	AX_STANDARD	AX_STANDARD, SAP_RVAA01, custom	Procedure determination (FR-26.1)	n/a (PriceDisc class order fixed)	OVKK procedure determination (T683V)
cross_currency_fallback	tenant	bool	false	true/false	Allow records in another currency converted at w12 rate (open question 1)	Trade agreement "Currency" strict	KONP-KONWA conversion in pricing
cache_ttl_seconds	tenant	int	60	10–600	Record cache snapshot lifetime	n/a	n/a (buffering)
max_lines_per_resolve	tenant	int	500	1–2,000	Request size limit	n/a	n/a
explain_max_bytes	tenant	int	65,536	8,192–262,144	Trace size (FR-26.4)	n/a	Condition analysis screen size
small_order_threshold	legal entity	money	250.00 USD / 200.00 EUR	≥ 0	SURCHARGE below threshold (FR-26.6)	Charges codes (MarkupAutoTable)	AMIW / AMIZ minimum value surcharge
rebate_basis_default	legal entity	enum	NET_AMOUNT	NET_AMOUNT, QUANTITY	Default on new rebate agreements	Rebate management "Calculation basis"	KONA rebate basis (subtotal 7)
rebate_accrual_accounts	legal entity	account pair	4150 / 2150	chart (w11)	FR-26.11 postings	Customer rebate posting (TAM/rebate posting profile)	VKOA ERU / ERB account keys

5.26.14 Inquiries and reports

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
Trade agreements	list inquiry	type, customer/group, product/group, currency, validity as-of, status	key fields, from qty, amount, %, validity, version, journal	condition_record	Trade agreements (PriceDiscTable list)	VK13 / VK33 condition display
Price list by customer	operational report	customer, product group, as-of date, currency	product, unit, net price per break	resolve (batch)	SSRS Price list (customer) / by item	V/LD price list report
Price explain	drill-down	document line or tuple	step, access, candidates, winner, reason	explain trace store	n/a (PriceDisc::findPrice has none)	VA01 item condition "Analysis"
Price journal log	list inquiry	journal, date, user, status	op, before, after, reversed_by	price_journal lines	PriceDiscAdmTrans posted journals	VK12 change documents (CDHDR)
Rebate accruals	drill-down	agreement, customer, period, status	basis, accrued, adjusted, settled, journal ref	rebate_accrual	Rebate management → Transactions	VBO3 + VBOX rebate index
Commission transactions	list inquiry	rep, sales group, period, customer, invoice	basis, rate, amount, status, journal ref	commission_transaction	Commission transactions (CommissionTrans) / SSRS Commission report	Settlement management document list
Vendor rebate claims	list inquiry	vendor, agreement, period, status	accrued, claimed, approved, settled	vendor_rebate_claim	Vendor rebate inquiries / SSRS Vendor rebate claim	Supplier condition contract settlement list
Broker and royalty claims	list inquiry	contract, vendor, period	basis, rate, accrued, claimed	broker/royalty claims	Broker/royalty claim inquiries	Settlement documents (royalty)
Fund usage	drill-down	fund, period, customer	budget, usage by source, remaining	fund_usage	Fund usage inquiry / SSRS Fund statement	TPM fund report
Promotion effectiveness	KPI	promotion, product, period	baseline, actual, lift %, spend, ROI	promotion_plan actuals	Promotion effectiveness analysis	n/a

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
Commodity prices	list inquiry	cost basis type, date range	index value, source, version, affected agreements	commodity_index	Commodity price inquiries	n/a
Expiring agreements	KPI	days ahead (30)	count, value of affected open lines	condition_record	Pricing workspace tile	VK13 validity filter

5.26.15 Printed and electronic documents

Document	Trigger	Layout elements	Formats	Numbering sequence	Legal / retention requirement
Customer price list	on demand / price list job	header: customer, currency, as-of date; lines: product, unit, break qty, net price; footer: validity note	PDF, CSV, email	none (report)	none; keep 24 months for dispute support
Rebate agreement statement	period close, on demand	header: agreement, customer, period; lines: invoice, basis, tier, accrued; footer: Σ accrued, Σ settled, open	PDF, email, portal (w30)	none	retain 7 years with accounting records
Commission statement	period close per rep	header: rep, sales group, period; lines: invoice, customer, basis, rate, amount; footer: total, settlement reference	PDF, email, CSV export to payroll/AP	none	7 years (payroll support)
Vendor rebate claim	claim generation	header: vendor, agreement, period, claim number; lines: accruals; footer: claim amount, settlement mode	PDF, email, EDI hook (w35)	`RC–` per legal entity	7 years; forms the basis of the AP credit note
Broker / royalty claim statement	claim generation	header: contract, vendor, period; lines: invoice, basis, rate, amount	PDF, email	`BC–` / `RY–`	7 years
Price journal audit extract	post / reverse	journal header, lines before/after	CSV, JSON	none	audit log retention 10 years (w48)

5.26.16 Periodic and batch jobs

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
Record expiry	00:10 entity-local daily	legal_entity	status transition by (id, version)	< 60 s per 1M records	retry 3×; skipped entity alerted	expiry lag > 1 day
Rebate period recompute	period end + 1 day 02:00; on tier crossing	agreement	journal Idempotency-Key = (agreement, period, run_seq)	< 10 min per 10k agreements	compensate partial journals; rerun	run > 30 min; Σ accrual ≠ GL 2150
Retroactive accrual recompute	event-driven on activation; nightly catch-up 02:30	agreement	checkpoint per invoice id processed	< 5 min per 100k invoices	resume from checkpoint	pending retro > 24 h
Commission calculation	on `invoice.posted`; nightly reconcile 03:00	legal_entity	key = invoice_line_id	< 50 ms per invoice	DLQ with replay	missing commission for posted invoice > 1 h
Vendor rebate cumulate / claim generation	nightly 03:30; claims at period end	agreement	key = (agreement, period)	< 5 min	rerun idempotent	claims not generated 2 days after period end
Promotion actuals update	nightly 04:00	promotion	watermark on invoice posting time	< 10 min	resume from watermark	lag > 1 day
Commodity price calculation run	per calculation schedule (weekly default)	cost basis type	run id; journal post idempotent	< 2 min per 10k agreements	journal stays VALIDATED for review	index older than schedule
Fund budget recalculation	nightly 04:30; fund close manual	fund	key = (fund, period)	< 1 min	rerun	usage > budget when overspend disabled
Cache warm after journal post	inside journal transaction	legal_entity	n/a	< 30 s	journal still POSTED; cache rebuilt lazily	invalidation lag > 5 s

5.26.17 Security duties and privileges

Duty	Privileges (entry points)	Segregation-of-duties conflicts	Default roles
PricingView	GET condition-records, simulate, explain; Pricing workspace, Simulation screen	none	Sales rep, Sales manager, Pricing analyst, Auditor
PricingMaintain	POST condition-records, :activate, :withdraw; Trade agreements grid; campaigns	with PricingJournalPost on the same journal (maker/checker when `journal_four_eyes`)	Pricing analyst
PricingJournalPost	POST journals, :post, :reverse; Price journal screen	with PricingMaintain under four-eyes; with CommodityPriceRun	Pricing manager
PricingAdmin	POST procedures, versions:activate; Procedure designer	with PricingJournalPost	Pricing manager, Application admin
PricingOverride	manual price on order lines (w27) with reason	with CreditRelease (w27)	Sales manager
RebateMaintain	POST rebates/agreements; Rebate agreements screen; accrual inquiry	with RebateSettle (w30)	Pricing analyst, AR manager
RebateView	GET rebates/accruals, claims	none	Controller, Auditor
VendorRebateClaimApprove	approve vendor rebate claims; claim job	with APPaymentPost (w19), with RebateMaintain	Purchasing manager

5.26.19 Performance budgets and capacity

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
resolve (10 lines)	2M per tenant per day; peak 5,000/min	6 / 20 / 60 ms	500 req/s per replica	none (stateless; traces 64 KB × sampled 10%)	in-memory snapshot per (entity, date)	HPA to 9 replicas; explain sampling drops to 1%; p95 ≤ 40 ms
Condition record activate	20k per day	20 / 80 / 200 ms	100/s	1M records × 1 KB = 1 GB	composite btree + partial per key combination; partition by entity	queue activations; overlap check still serialized
Price journal post (100k lines)	5 per day	— / 120 s / 180 s	1k lines/s	50 GB journals (snapshots)	partition journal lines by journal id	single journal at a time per entity; others wait VALIDATED
Rebate accrual on invoice	50k invoices per day	10 / 40 / 100 ms	200/s	20M accrual rows × 300 B = 6 GB	(agreement, period) btree; partition by period	accrual lag alert at 5 min; invoices unaffected
Commission calculation	50k invoices per day	10 / 40 / 100 ms	200/s	5 GB	(rep, period)	same as accrual
Retroactive recompute	1 per day, 100k invoices	— / 5 min / 10 min	500 invoices/s	none	checkpointed	throttled to 50% of a replica
Commodity calculation run	weekly, 10k agreements	— / 2 min / 5 min	—	100 MB	n/a	run queued

5.26.20 Localization and compliance hooks

- Currency rounding to ISO 4217 minor units per currency (w12); JPY and HUF zero-decimal handling in BR-26.3; EUR/USD examples in fixtures.
- Country packs (w48) may inject statutory surcharge conditions (for example packaging or environmental fees surfaced from w28 FR-28.14) as SURCHARGE steps through the procedure extension point `procedure.steps[].country_pack_id`; packs never alter resolution order.
- Rebate, commission, broker and royalty accruals are posted through the w11 journal with tax treatment deferred to settlement (w30 / w19); withholding on royalties (for example DE §50a, IN TDS) is applied by the w19 AP claim, not here.
- Price lists and statements render per customer language (w5 docgen locale) with date and number formats from the entity locale; explain traces are English-only engineering artifacts.
- Privacy: commission transactions reference worker ids (w42) and are subject to the w48 personal-data retention policy (7 years then pseudonymized); rep names never appear in events.
- Retention: condition records and journals 10 years (audit), promotion plans 3 years.
- Extension point: condition type registry accepts country-pack types with a CEL requirement; access sequences per pack are additive and versioned with the procedure.

5.26.21 Coverage closure

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
AX §12.16.1 #54 — Vendor rebates (PI vendor rebate agreements, R3)	GAP	ADDED as FR-26.15	party_role VENDOR on rebate_agreement; accrual 2160/5100

AX §12.18.4 #185 — Funds setup (fund types, budget periods)	PARTIAL-26	ADDED as FR-26.19	fund_allow_overspend
AX §12.18.4 #186 — Merchandising event categories / Event types	PARTIAL-26	ADDED as FR-26.20	
AX §12.23.1 #199 — Commodity pricing (PI link)	PARTIAL-26	ADDED as FR-26.21	
AX §12.23.2 #204 — Commodity price inquiries	PARTIAL-26	ADDED as FR-26.21	§5.26.14 Commodity prices
AX §12.23.3 #207 — Commodity pricing → Price calculation run	PARTIAL-26	ADDED as FR-26.21	§5.26.16 job → price_journal
AX §12.23.4 #209 — Commodity pricing setup (cost basis types, pricing calculations, price margin templates)	PARTIAL-26	ADDED as FR-26.21	
SAP §13.19 #217 — VBN1/VBN2/VBN3 free goods condition records	PARTIAL-26	ADDED as FR-26.22	inclusive/exclusive
SAP §13.19 #227 — OVKF free goods (NA00, NA0001, KOTN)	PARTIAL-26	ADDED as FR-26.22	free_goods_calc_rule
SAP §13.20 #228 — VBOF update billing documents (retroactive accrual)	PARTIAL-26	ADDED as FR-26.23	
SAP §13.20 #230 — Commission contracts (settlement management)	PARTIAL-26	ADDED as FR-26.18	
SAP §13.20 #232 — Royalty / licensing payments (settlement management)	GAP (propose 26)	ADDED as FR-26.17	
SAP §13.20 #233 — VBOF batch retroactive accrual update	PARTIAL-26	ADDED as FR-26.23	§5.26.16 retroactive recompute job
SAP §13.20 #234 — Delta accruals / delta settlement	PARTIAL-26	ADDED as FR-26.23	delta against prior settlements (w30 BR-30.8 reads the delta)
SAP §13.20 #236 — Commission settlement integration (HR/AP)	PARTIAL-26	ADDED as FR-26.18	commission_settlement_target; payout executes in w19 / w43
SAP §13.20 #229 — Supplier condition contracts (purchasing rebates, chargebacks)	PARTIAL-19 (note proposes w26 engine)	ADDED as FR-26.15 (accrual); chargeback claims DEFERRED to wave 30 (FR-30.22)	AP settlement remains wave 19

5.27 Wave 27: Sales Orders, Quotations, ATP & Credit

5.27.1 Scope and business context

Wave 27 ships the `sales` service: quotations with conversion, sales agreements, order types (journal, order, subscription, returned — completed in wave 30), delivery date control against cumulative ATP/CTP, credit management with limits, aging rules, holds and a Temporal release workflow, versioned change management, line-level status and a multi-channel intake API. A sales rep can quote, convert, promise a date and see holds; a credit manager releases orders. Out of scope: picking and shipping (wave 28), invoicing (wave 29), portal UI (wave 30), EDI intake (wave 35). Added from the coverage registers (§5.27.21): supplementary items,

listing/exclusion, product allocation quotas, backorder processing strategies, customer consignment, sales-order special stock, scheduling-agreement releases with cumulative quantities, product proposals, one-time customers and a cost-estimate hook.

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
Promise dates go stale after a planning run: AX ATP is recomputed only when the "Available ship and receipt dates" dialog opens; SAP VBEP dates change only on VA02 re-check or the nightly V_V2 rescheduling batch	ATP computed on demand inside the form; supply changes do not re-promise open lines	atp_bucket projection from inventory/planning events (lag < 30 s); re-promise on `order.changed` and supply cancellation; backward propagation (BR-27.1)	Promise accuracy ~70% → ≥ 95%; re-promise latency nightly → < 30 s
Credit holds are opaque: SalesOrderHold shows a code; OVA8 writes only VBAK-CMGST and the VKM1 list	Rules evaluated inside posting classes; only the final status persists	`credit-check.evaluated` stores every rule, value and threshold; release queue shows the failing rule	Analyst lookup per release 5–8 min (FD32/CustTable) → < 30 s; 2-business-day SLA by timer
Order entry takes 12+ clicks across SalesTable → SalesLine → InventDim → ATP dialog (VA01 overview → item → schedule lines)	Price, ATP and dims live on separate tabs	One grid with inline price and ATP within 300 ms of product + quantity	Clicks per priced, promised line 12 → 2
Channel orders are re-keyed or loaded by nightly AIF/IDoc batches with no idempotency (duplicate ORDERS05 → duplicate VBAK)	Batch integration without a business-key dedup	Intake API with (channel, external_ref) idempotency at 500 orders/min, p99 < 500 ms; `order.confirmed` events for any consumer	Duplicates per 10k channel orders ~5 → 0; latency hours → < 500 ms
Changing a confirmed order loses history (SalesLine overwritten; CDHDR/CDPOS unreadable)	No versioned document	Versions with field-level diff and selective re-pricing/ATP/credit	"What changed and who": 15 min → < 5 s

5.27.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Quotations	SalesQuotationTable/Line, SalesQuotationStatus	VA21/VA22, VBAK VBTYP B; VA11 inquiries	sales_quotation, …:convert	full
Sales orders	SalesTable/SalesLine, SalesStatus, SalesLineStatus, SalesType	VA01/VA02, VBAK/VBAP/VBEP, item categories TAN/TAS	sales_order, sales_order_line, order_schedule_line	full
Sales agreements	SalesAgreementHeader/AgreementLine, release orders	VA31 scheduling agreements, VA41 contracts	sales_agreement with release tracking	full
ATP / delivery date control	InventDim ATP (DlvDateControlType ATP/CTP), ATP time fence, SalesLine.ConfirmedDlv	OVZ9 checking rule, VBEP confirmed lines, CO09	promising module, atp_bucket	full (CTP partial)
Credit limit	CustTable.CreditMax/MandatoryCreditLimit, CustParameters.CreditLimitType, D365 credit management	FD32/UKM_BP (KNKK), OVA8, VKM1 release	credit_profile, CREDIT hold, Temporal release	full
Order holds	SalesOrderHold / hold codes	VBAK-LIFSK delivery block, FAKSK billing block	order_hold (CREDIT, FRAUD, MANUAL, PRICE_REVIEW)	full
Change management	D365 order change approval	VA02 + CDHDR/CDPOS	sales_order.version + change_request	improved
Configured products	PCConfiguration on SalesLine	Variant configuration, KMAT	configuration_id (w8) + production link (w21)	partial
Backorders / alternative items	SalesBackorder; InventTable.AltItemId	V_RA; VB11 substitution	backorder workspace; alternative in ATP fallback	full
Multi-channel intake	AIF SalesSalesOrderService	IDoc ORDERS05, BAPI_SALESORDER_CREATEFROMDAT2	POST /sales/orders with idempotency	improved
Supplementary items	PriceDiscSuppItem, supplementary items prompt on SalesLine	Free goods NA00 (w26), item proposals	supplementary_item_rule + free-goods lines	full
Listing / exclusion	— (customer-specific item blocking via InventTable stopped flags)	VB01/VB02/VB03, OV04 listing/exclusion procedures (T684)	product_listing (ALLOW / DENY per customer, group)	full
Product allocation	—	OVZJ/OVZI product allocation (T190, KOTA), aATP product allocation	allocation_quota per (product, customer/region, period)	full
Backorder processing strategies	SalesBackorder, backorder lines by item	V_V2 rescheduling; aATP BOP strategies win/gain/redistribute/fill/lose, release for delivery	backorder_run with strategy and priority	full
Customer consignment	— (consignment is vendor-side in D365)	VA01 KB/KE/KA/KR, MB58, special stock W	consignment_fill_up / issue / pick_up / return orders with owner dimension (w16)	partial (ownership dimension w16)
Sales-order special stock	Reservation against order (InventTrans marking)	Special stock E (sales order stock), MIE1, OVZG requirements class	sales_order_stock reservation segment; valuation in w21/w39	partial
Scheduling agreement releases	SalesAgreement + release orders; AIF DELFOR (w35)	VA31/VA32 with JIT/forecast delivery schedules, cumulative quantities, DELFOR/DELJIT	sales_agreement.schedule_release with cumulative reconciliation	full (EDI mapping w35)
Cross-selling / product proposal	—	VB41 cross-selling, dynamic product proposal	product_proposal rule	full
One-time customer	One-time customer (CustTable.OneTimeCustomer)	CPD account group, document-level address (OBD2)	one_time party role (w7) + order-level name/address	full

5.27.3 Functional requirements

- **FR-27.1 Quotations** — Must. Priced quotations with expiry (default +30 d) and probability, convertible whole or by line to one order preserving explain refs.
- **FR-27.2 Sales orders** — Must. Header (customer, invoice account, currency, delivery address, terms, procedure) and lines (product, variant dims, qty, unit, site/warehouse, requested dates, price fields). Notes: types JOURNAL, ORDER, SUBSCRIPTION, RETURNED; ≤ 2,000 lines; sequence `SO-`.
- **FR-27.3 Delivery date control** — Must. Confirmed ship/receipt dates per line by NONE, SALES_LEAD_TIME, ATP or CTP, applying transport days and the customer receiving calendar.
- **FR-27.4 Cumulative ATP** — Must. Per (product, dims, site, warehouse): on-hand available + scheduled receipts – scheduled issues within the time fence, with backward propagation of negative periods (BR-27.1). Notes: supply = confirmed POs (w17), released/started production orders (w21), transfers, planned orders optional (default excluded); demand = confirmed sales lines, production BOM lines, transfer issues, optional safety stock.
- **FR-27.5 CTP** — Should. When ATP fails, request a capable-to-promise date from scheduling (w23) using BOM/route lead time and finite capacity, creating a planned order link.
- **FR-27.6 Backorders and partials** — Must. Split lines into schedule lines when partial delivery is allowed; backorder list by promised date.

- **FR-27.7 Credit profile and checks** — Must. Per customer per entity: limit, currency, limit type, tolerance, review date, max dunning level; rules in BR-27.3 evaluated at entry, confirmation, release and invoicing per policy.
- **FR-27.8 Holds and release** — Must. Holds block confirmation/release; Temporal release workflow with approvers by duty and a 2-business-day SLA timer.
- **FR-27.9 Change management** — Must. Version on every post-confirmation change with field-level diff; re-run pricing/ATP/credit for affected lines; optional approval per customer.
- **FR-27.10 Sales agreements** — Should. Blanket commitment by quantity or amount; released orders inherit price and decrement commitment atomically.
- **FR-27.11 Configured products** — Should. Accept a configuration id; on confirmation create the production/planned order linkage for make-to-order items.
- **FR-27.12 Intake API** — Must. External orders with idempotency keys at 500 orders/min, p99 < 500 ms, returning id and holds.
- **FR-27.13 Alternative items** — Could. Offer the configured alternative with its ATP when the ordered product fails inside the requested date.
- **FR-27.14 Supplementary items** — Should. The system shall, at line commit, evaluate supplementary item rules (product or product group × customer or group; MANDATORY or OPTIONAL; quantity per base quantity; free or priced) and w26 FREE_GOODS proposals, add mandatory lines automatically and prompt for optional ones; supplementary lines reference the parent line and are canceled with it. Notes: AX PriceDiscSuppItem semantics; free lines carry unit_price 0.00 and `supplementary_of`.
- **FR-27.15 Listing and exclusion** — Should. The system shall validate every order line against product listings (ALLOW lists) and exclusions (DENY lists) per customer or customer group with validity, rejecting a denied line with 422 `PRODUCT_NOT_LISTED` and an override only with duty SalesOrderApprove. Notes: SAP VB01 listing/exclusion and OV04 procedures map to one `product_listing` entity.
- **FR-27.16 Product allocation** — Could. The system shall hold allocation quotas per (product or group, customer or region, period) consumed by ATP confirmation; when the quota is exhausted the line is confirmed at the next period with source `ALLOCATION`. Notes: SAP OVZJ/OVZI; quota consumption is reversible on cancellation; quota inquiry per period.
- **FR-27.17 Backorder processing strategies** — Should. The system shall run a backorder processing run per (product, site) that re-confirms open lines by strategy WIN (protect confirmed), GAIN (improve), REDISTRIBUTE (by priority), FILL (first-come) or LOSE (deconfirm low priority) with a priority from customer priority class, requested date and order value, and a preview before commit. Notes: replaces SAP V_V2 and aATP BOP; AX backorder workspace is the UI; run results emit `atp.promised` per changed line.
- **FR-27.18 Customer consignment** — Could. The system shall support consignment fill-up (ship to customer-owned location, inventory stays owned by the entity with owner dimension CUSTOMER_LOCATION from w16), consignment issue (customer consumes; invoice created), pick-up (return to own warehouse) and consignment return orders, with a stock-at-customer inquiry (SAP MB58). Notes: depends on the w16 ownership/location dimension; packing slips for fill-up post no COGS (BR-28.1 extension).
- **FR-27.19 Sales-order special stock** — Should. The system shall, for make-to-order lines, segregate supply and demand per order (`sales_order_stock = true` on the w16 reservation segment and on w21 production orders) so that ATP for that line consults only its own supply and the stock cannot be consumed by other orders; valuation of the segregated stock (valuated/non-valuated) remains with w21/w39. Notes: SAP special stock E, requirements class OVZG; AX "marking" of InventTrans.
- **FR-27.20 Scheduling agreement releases** — Should. The system shall accept forecast and JIT delivery schedules against a sales agreement (release number, cumulative received quantity, schedule lines by date, horizon), reconcile cumulative quantities against shipped quantities (BR-27.12), replace the previous release atomically and generate or adjust order schedule lines. Notes: SAP VA31/VA32 with DELFOR/DELJIT; inbound EDI 830/862 mapping arrives in w35 through this API; cumulative-quantity reset at fiscal year change per customer.
- **FR-27.21 Cross-selling and product proposals** — Could. The system shall hold product proposal rules (ordered product → proposed products with reason CROSS_SELL, UP_SELL, ACCESSORY, from w8 related products) and show proposals at line commit without creating lines unless accepted. Notes: SAP VB41, dynamic product proposal; acceptance rate recorded for analytics.
- **FR-27.22 One-time customers** — Should. The system shall allow an order and its invoice for a one-time party (w7 role ONE_TIME, one shared account per entity) with document-level name, address and tax id captured on the order header and carried to the invoice and open item. Notes: SAP CPD account group; AX one-time customer flag; credit check uses `one_time_order_limit` (default 5,000 USD / 4,500 EUR).
- **FR-27.23 Sales order cost estimate hook** — Could. The system shall expose `POST /sales/orders/{id}/lines/{l}:estimate-cost` that calls the w20 cost snapshot (stocked) or the w39 simulation API (configured/MTO) and stores `estimated_cost` and margin on the line for quotation margin display. Notes: SAP CK51N; full sales-order costing is delivered by wave 39.

5.27.4 Data model

sales_order (SalesTable / VBAK)

Field	Type	Required	Notes
id, order_number	uuid, text	Y	SO- sequence, unique per entity
tenant_id, legal_entity_id	uuid	Y	RLS
customer_id, invoice_account_id	uuid	Y	FK party (w7)
order_type, status	enum	Y	see BR-27.5
currency, pricing_procedure_version_id	char(3), uuid	Y	
delivery_address_id, delivery_terms, mode_of_delivery	uuid, text, text	Y	
payment_terms_id, cash_discount_id	uuid	Y/N	w7 terms
requested_ship_date, requested_receipt_date	date	Y	
credit_check_result	jsonb	N	last evaluation
version, etag	int, text	Y	optimistic concurrency
net/discount/tax/gross totals	numeric(19,4)	Y	derived, stored
channel, external_ref, idempotency_key	text	N	unique (tenant, channel, external_ref)

sales_order_line (SalesLine / VBAP): id, order_id, line_no, product_id, variant_dims, quantity, unit, site_id, warehouse_id, unit_price, disc_pct_1/2, line_net, tax_group, delivery_date_control, requested/confirmed ship and receipt dates, line_status (OPEN | RESERVED | PICKED | DELIVERED | INVOICED | CANCELLED), delivered_qty, invoiced_qty, remaining_qty, configuration_id, production_order_id, agreement_line_id, price_explain_ref, multiline_group, reservation_id.
order_schedule_line (VBEP): line_id, seq, qty, confirmed_ship_date, source (atp_bucket id | planned order id).

credit_profile: customer_id, legal_entity_id, credit_limit numeric(19,4), currency, limit_type (NONE | BALANCE | BALANCE_PACKING_SLIP | BALANCE_ALL), tolerance_pct (5), tolerance_amount (1,000.00), oldest_item_days_max (30), max_dunning_level (3), review_date, risk_group, mandatory_check, exposure jsonb (open_orders, delivered_not_invoiced, open_ar, unapplied_cash, updated_at).

order_hold: id, order_id, hold_type, reason_code, status (ACTIVE | RELEASED | CLEARED), applied_by, released_by, workflow_run_id, applied_at, released_at.
atp_bucket (projection): product_id, dims hash, site_id, warehouse_id, bucket_date, supply_qty, demand_qty, period_atp, cumulative_atp, source_refs, computed_at.

Invariants: Σ schedule_line.qty = line.quantity; delivered_qty ≤ quantity; remaining_qty = quantity − delivered_qty (0 after remainder cancellation); order status derives from line statuses; an order with an ACTIVE hold is never released; cumulative_atp[n] = min over k ≥ n of Σ period_atp[0..k]; every ATP-confirmed line references an atp_bucket as of confirmation. Indexing: lines (order_id, line_no); partial index on open line statuses for demand; atp_bucket PK (product, dims, site, warehouse, bucket_date); partition orders by legal_entity.

5.27.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
POST	/api/v1/sales/quotations, …/{id}:send, :convert	Quotation lifecycle	Idempotency-Key	SalesQuotationMaintain
POST	/api/v1/sales/orders	Create (UI or channel)	Idempotency-Key + external_ref	SalesOrderMaintain / ChannelIntake
PATCH	/api/v1/sales/orders/{id}	Change, creates version	If-Match etag	SalesOrderMaintain
POST	/api/v1/sales/orders/{id}:confirm, :cancel; /lines/{l}:cancel-remainder	Price, ATP, credit, confirm; cancellation	Idempotency-Key	SalesOrderConfirm
POST/GET	/api/v1/sales/atp:check; /atp/buckets?product=&site=	Simulate ATP; bucket view (CO09)	stateless	SalesOrderView
POST	/api/v1/sales/orders/{id}/holds, …/holds/{h}:release	Apply / release hold	Idempotency-Key	SalesOrderHold / CreditRelease
GET/PUT	/api/v1/sales/credit-profiles/{customerId}	Credit profile	etag	CreditMaintain
POST	/api/v1/sales/agreements, …/{id}:release-order	Agreements	Idempotency-Key	SalesAgreementMaintain

Validation: confirm rejects unpriced lines (unless manual), quantity ≤ 0, customer status BLOCKED (w7); closed period on order date is a warning only (period control applies at posting).

Event	Trigger	Payload fields	Consumers
dev.passage.sales.order.confirmed.v1	confirm	order_id, customer_id, currency, lines[{line_id, product, dims, qty, site, warehouse, confirmed_ship_date}], totals, version	fulfillment, planning (w22), credit, analytics
dev.passage.sales.order.changed.v1 / cancelled.v1	PATCH / cancel	order_id, version, diff[] or line_ids, reason	fulfillment, planning, portal
dev.passage.sales.atp.promised.v1	confirm with ATP/CTP	line_id, requested, confirmed, bucket_date, source	planning, portal
passage.sales.order-hold.applied.v1 / released.v1	hold lifecycle	order_id, hold_type, reason, actor, workflow_run_id	fulfillment, collections, portal
passage.sales.credit-check.evaluated.v1	any check	customer_id, order_id, rules[{id, result, value, threshold}], outcome	audit, collections
dev.passage.sales.quotation.converted.v1	convert	quotation_id, order_id, lines	analytics, CRM

5.27.6 User experience

Screen	Primary actions	Key fields/columns	Duty
Sales workspace	tiles: on hold, backorders, quotes expiring 7 d, intake errors	counts	SalesOrderView
Quotation detail	add line, price, send PDF, convert, mark lost	customer, lines, expiry, probability, totals	SalesQuotationMaintain
Order entry (header + grid)	add line with ATP badge, price, confirm, hold, cancel, copy	product, qty, unit, site/wh, requested/confirmed dates, price, disc, net, status	SalesOrderMaintain
ATP explorer	pick product/site, view buckets, simulate	bucket date, supply, demand, period ATP, cumulative ATP, sources	SalesOrderView
Credit release queue	view exposure, release/reject with comment	customer, order, amount, exposure vs limit, rule failed, age	CreditRelease
Backorders / change requests	re-promise, split, cancel remainder; approve diff	line, promised date, qty; field, old, new	SalesOrderMaintain / SalesOrderApprove

Interaction rules: Tab/Enter across the grid; product + quantity triggers inline price and ATP within 300 ms; validation at line commit and confirm; bulk re-promise on multi-select; default site/warehouse and column sets personalizable; changes to a confirmed order show the diff before save.

5.27.7 Business rules and edge cases

- **BR-27.1 Cumulative ATP worked example.** FG-100, site S1, warehouse W11, time fence 30 d, on-hand 100 on 2027-03-01. Supply: PO-2001 50 on 03-04; PRD-3001 80 on 03-08. Existing demand: SO-1001 60 on 03-02, SO-1002 40 on 03-05, SO-1003 70 on 03-09. Buckets open at each receipt: bucket 0 (03-01) supply 100, demand 60, period ATP 40; bucket 1 (03-04) 50 − 40 = 10; bucket 2 (03-08) 80 − 70 = 10. Cumulative ATP: 40, 50, 60. A new line of 45 requested 03-01: bucket 0 cumulative 40 < 45; first bucket with cumulative ≥ 45 is bucket 1 → confirmed ship date 2027-03-04 for complete delivery, or schedule lines 40 on 03-01 and 5 on 03-04 if partial delivery is allowed. After confirming 45 on 03-04, bucket 1 period ATP = −35; negative periods propagate backward, so cumulative becomes 5, 5, 15. Had SO-1002 been 60, bucket 1 period ATP −10 would already have reduced bucket 0 cumulative to 30.
- **BR-27.2 Dates.** confirmed_receipt = confirmed_ship + transport days (mode of delivery) rolled to the customer's next receiving day; past requested dates become today with a warning; dates beyond the fence are promised at fence end with source `TIME_FENCE`.
- **BR-27.3 Credit check rules** (any FAIL → CREDIT hold; WARN displayed only): CR-1 exposure + order amount > limit × (1 + tolerance_pct/100) and > limit + tolerance_amount → FAIL, where exposure by limit_type is BALANCE = open AR + unapplied; BALANCE_PACKING_SLIP adds delivered-not-invoiced; BALANCE_ALL adds confirmed open orders; CR-2 oldest open item overdue > oldest_item_days_max → FAIL; CR-3 dunning level ≥ max_dunning_level → FAIL; CR-4 review_date passed or profile missing while mandatory_check → FAIL; CR-5 overdue > 25% of open AR → WARN; CR-6 order > 50,000 USD / 45,000 EUR for a customer younger than 90 days → FAIL. Amounts convert to the profile currency at the wave 12 spot rate on the check date.
- **BR-27.4 Hold precedence.** CREDIT and FRAUD block confirmation and release; MANUAL and PRICE_REVIEW block release only; a CREDIT release is valid 7 days; an amount increase > 5% re-triggers CR-1.
- **BR-27.5 State machines.** Order: DRAFT → OPEN → CONFIRMED → PARTIALLY_SHIPPED → SHIPPED → INVOICED → CLOSED; CANCELLED from DRAFT/OPEN/CONFIRMED. Line: OPEN → RESERVED → PICKED → DELIVERED → INVOICED; CANCELLED from OPEN/RESERVED. Quotation: DRAFT → SENT → CONVERTED | LOST | EXPIRED | CANCELLED.
- **BR-27.6 Concurrency.** PATCH requires If-Match; concurrent confirm and change → later call 409; ATP consumption serialized per (product, dims, site, warehouse) by Postgres advisory lock.
- **BR-27.7 Reservation.** ATP confirmation creates a wave 16 reservation when `reserve_on_confirm` (default true for ORDER); JOURNAL orders never reserve or consume ATP.
- **BR-27.8 Quantities** at 6 decimals; `whole_units` products reject fractions; unit conversion via wave 6 factors, half-even.

- **BR-27.9 Agreements** decrement commitment atomically and may not exceed it beyond overdelivery_pct (default 0); subscription/agreement lines re-price only when the agreement price changes.
- **BR-27.10 Intake duplicates.** Same (channel, external_ref) within 30 days returns the original id with 200; same key with a different payload → 409.
- **BR-27.11 Backorder run.** Lines are ordered by (priority class asc, requested date asc, order value desc); WIN never reduces a confirmed quantity; LOSE may deconfirm only lines with priority class ≥ the run's `lose_threshold`; a run is a preview until committed and commits serialize per (product, dims, site, warehouse) like confirmation.
- **BR-27.12 Cumulative quantities.** A release's cumulative received quantity (customer view) is compared with Σ shipped since the cumulative reset date; a difference beyond `cum_tolerance` (default 0) raises `CUM_QTY_MISMATCH` and the release is held for review; open schedule lines = release cumulative required – Σ shipped; a new release replaces all open lines of the same agreement item in one transaction.
- **BR-27.13 Listing precedence.** DENY at customer level beats ALLOW at group level; an empty ALLOW list means no restriction; validity evaluated on the order date.
- **BR-27.14 Supplementary lines** inherit site, warehouse, dates and delivery address from the parent, cannot be re-promised independently, and are removed when the parent quantity drops below the rule's base quantity.
- **BR-27.15 Allocation consumption** happens at confirmation in requested-period order; cancellation returns quota to the period it consumed; a quota change below consumed quantity is rejected with 409.

5.27.8 Acceptance criteria

- **AC-27.1** (FR-27.4) Given the BR-27.1 fixture, when a 45-unit line requests 2027-03-01 with complete delivery, then confirmed ship date = 2027-03-04 and the promised event references bucket 1.
- **AC-27.2** (FR-27.4) Given any `atp-100` fixture, when all orders confirm, then no cumulative ATP is negative after propagation and total promised ≤ on-hand + included supply (property).
- **AC-27.3** (FR-27.7, FR-27.8) Given limit 10,000 USD, open AR 8,500, tolerance 5% / 1,000, when a 2,000 USD order confirms, then no hold (10,500 within both tolerances) and a WARN; when a 3,000 USD order confirms, then a CREDIT hold applies (11,500 > 10,500 and > 11,000), and release by a CreditRelease user confirms the order and emits `order-hold.released`.
- **AC-27.4** (FR-27.11) Given a make-to-order product with configuration CFG-77, when confirmed, then a wave 21 production order references the line and the confirmed date = scheduled end + transport days.
- **AC-27.5** (FR-27.12) Given 500 orders/min for 10 min through intake, then p99 < 500 ms and all 5,000 orders exist exactly once.
- **AC-27.6** (FR-27.1) Given a sent 3-line quotation, when lines 1 and 3 convert, then one 2-line order exists with matching prices and explain refs and the quotation is CONVERTED.
- **AC-27.7** (FR-27.9) Given a confirmed order, when line 10 changes from 5 to 8, then version increments, the diff is recorded, only line 10 is re-promised and `order.changed` is emitted.
- **AC-27.8** (FR-27.6) Given partial delivery and ATP 40 of 45, then two schedule lines exist and the backorder list shows 5 units on 2027-03-04.
- **AC-27.9** (FR-27.10) Given an agreement of 1,000 units fully released, then the next release is rejected with 422 `AGREEMENT_EXHAUSTED`.
- **AC-27.10** (FR-27.14) Given a mandatory supplementary rule "1 × MANUAL-EN free per 10 × FG-100" and a line of 25 FG-100, then a zero-priced line of 2 MANUAL-EN with `supplementary_of` exists and is canceled when the parent is canceled.
- **AC-27.11** (FR-27.15) Given customer C9 with a DENY listing for FG-120, when a line for FG-120 is committed, then 422 `PRODUCT_NOT_LISTED`; with duty SalesOrderApprove and a reason the line is accepted and the override logged.
- **AC-27.12** (FR-27.17) Given 5 backorder lines for FG-100 with 40 units of new supply and strategy REDISTRIBUTE, when the run commits, then priority-class-1 lines are confirmed first, no cumulative ATP is negative, and `atp.promised` is emitted only for changed lines.
- **AC-27.13** (FR-27.20) Given an agreement item with cumulative shipped 1,200 and a new release stating cumulative received 1,150, then the release is held with `CUM_QTY_MISMATCH` and no schedule line changes; a release stating 1,200 with required 1,500 by 2027-04-15 creates open schedule lines totaling 300.
- **AC-27.14** (FR-27.22) Given a one-time order for "Walk-in Buyer GmbH" with a document address, when invoiced (w29), then the invoice and open item carry that name and address and the one-time account's exposure is checked against `one_time_order_limit`.

5.27.9 Test plan and fixtures

Fixtures: `atp-100` (from SAP OVZ9 and AX ATP examples with expected dates); `credit-40` (profiles plus migrated AR open items); `orders-5k-intake` (generated channel payloads); `quotes-50`; `demo-plant` (wave 25 plant with FG-100…FG-120 stock and open production orders).

Test	Type	Target	Pass criterion
ATP scenarios	unit	promising	100/100 expected dates
Never over-promise	property	promising	Σ promised ≤ supply in every bucket prefix
Credit rules	unit	credit	40/40 outcomes incl. tolerance edges
Hold release	E2E (Temporal)	workflow	released; SLA timer fires at 2 business days
Intake throughput	performance	POST /orders	500/min, p99 < 500 ms, 0 duplicates
Sales ↔ pricing/inventory/production	contract (Pact)	APIs	green
Order entry UI	E2E (Playwright + axe)	shell	flows pass, 0 serious a11y violations

Reconciliation: Σ open confirmed order amounts per customer = credit_profile.exposure.open_orders; wave 16 reservations = Σ RESERVED line quantities; nightly rebuilt ATP projection = incremental projection (diff 0).

5.27.10 Deployment and operations

Helm `passage-sales` (Go, 3 replicas, HPA on RPS); `sales-db`; Temporal namespace `sales`. Config: `ATP_TIME_FENCE_DEFAULT_DAYS=30`, `ATP_INCLUDE_PLANNED_ORDERS=false`, `CREDIT_CHECK_POINTS=confirm,release`, `INTAKE_RATE_LIMIT_PER_KEY=1000/min`. Flags: `sales.ctp`, `sales.alternative_items`, `sales.change_approval`. Jobs: ATP rebuild 01:00 entity-local; quotation expiry hourly; credit review warnings daily. SLOs: create p99 500 ms, 99.95% availability, projection lag < 30 s. Alerts: lag > 120 s, hold queue age > 2 business days, intake 5xx > 0.1%. Runbook: projection rebuild, stuck release workflow, re-promise after supply cancellation. Rollback: previous digest; additive migrations.

5.27.11 Migration from AX / SAP

Source	Passage entity	Notes
SalesTable (SalesId, CustAccount, InvoiceAccount, CurrencyCode, SalesStatus) + SalesLine (ItemId, InventDimId, SalesQty, SalesPrice, LinePercent, RemainSalesPhysical/Financial)	sales_order, lines	open orders only (Backorder, or Delivered with financial remainder); InventDim → dims + site/warehouse

Source	Passage entity	Notes
SalesQuotationTable/Line (Sent); SalesAgreementHeader/Line	sales_quotation; sales_agreement	remaining commitment from released qty
CustTable.CreditMax, MandatoryCreditLimit, CustParameters.CreditLimitType	credit_profile	1:1 type mapping
VBAK/VBAP/VBEP (VBUK-GBSTK ≠ C), VBKD, VBPA	sales_order, lines, schedule lines	TAS → drop-ship flag; VBEP confirmed qty → schedule lines
KNKK (KLIMK, CTLPC), UKM_BP	credit_profile	risk class → risk_group
VBAK VBTYP B / E / G	sales_quotation / sales_agreement	

Validation: count and Σ open value per customer equal the legacy extract; every migrated line re-promises to ≤ legacy confirmed date + 1 day or is flagged. Not migrated: closed orders (lakehouse), CDHDR logs, SAP credit horizon settings (replaced by BR-27.3).

5.27.12 Dependencies, risks, open questions

- Depends on: w26 pricing; w16 on-hand/reservations; w17 PO receipts; w21 production orders; w22 planned orders and demand; w23 scheduling (CTP); w7 customers/terms; w8 configurator; w4 Temporal.
- Risks: projection staleness during planning runs (planning emits a batch-end marker; buckets flagged stale); credit exposure incomplete before waves 29/30 (migrated open AR loaded into `receivables_db.open_item`, schema created this wave).
- Open questions: (1) Default date control for migrated customers, ATP vs. lead time? Default ATP; decide by wave 28. (2) External fraud scoring? Default rule-only in v1; decide by wave 30.

5.27.13 Parameters and setup

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
default_order_type	legal entity	enum	ORDER	JOURNAL, ORDER, SUBSCRIPTION	Type on new orders	AR parameters → General → Sales order type default (SalesType)	VOV8 default sales document type (OR)

Backorder run results	drill-down	run id	line, before, after, strategy reason	backorder_run	Backorder workspace	V_V2 log / aATP BOP results

5.27.15 Printed and electronic documents

Document	Trigger	Layout elements	Formats	Numbering sequence	Legal / retention requirement
Sales quotation	:send	header: quotation number, customer, contact, validity, currency, terms; lines: product, qty, unit, price, discount, net, promised date; footer: totals, tax estimate, probability hidden, T&C block	PDF, email, portal (w30), UBL quotation JSON for w35	`SQ–` per legal entity	none; retain 3 years
Order confirmation	:confirm and on each version with `send_confirmation`	header: order, customer, invoice account, addresses, terms, mode of delivery; lines: product, qty, confirmed ship/receipt date, price, net; footer: totals, holds not shown	PDF, email, EDI ORDRSP/855 hook (w35), portal	`OC–` per legal entity (document copy number per version)	commercial record; retain 7 years with invoice
Sales agreement confirmation	agreement activation	header: agreement, customer, validity, commitment type; lines: product/group, committed qty or amount, price; footer: release terms	PDF, email	`SA–`	7 years
Scheduling agreement release acknowledgment	release accepted	header: agreement item, release number, cum received/shipped; lines: schedule dates and quantities	PDF, EDI (w35)	release number from customer	7 years (automotive audit)
Credit hold notice (internal)	hold applied	customer, order, failing rule, exposure, approver	email, in-app	none	none
Quotation lost / expired notice	status change	quotation, reason	email (internal)	none	none

5.27.16 Periodic and batch jobs

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
ATP projection rebuild	01:00 entity-local daily	(product, site)	full rebuild into shadow table, swap	< 15 min per 1M buckets	keep previous projection; alert	diff incremental vs rebuilt ≠ 0; lag > 120 s
Backorder processing run	05:00 daily per site (after planning w22)	(product, site)	run id; preview persisted; commit idempotent per line version	< 10 min per 100k open lines	partial commit impossible (per-product transaction)	run > 30 min; deconfirmed lines > 5%
Quotation expiry	hourly	legal_entity	status transition by (id, version)	< 30 s	retry	none expired for 2 days while candidates exist
Credit review warnings / profile refresh	06:00 daily	customer	key = (customer, date)	< 5 min	retry	profiles with review_date passed > 100
Credit exposure recompute	event-driven; nightly reconcile 01:30	customer	exposure.updated_at	< 10 min	rerun	Σ open orders ≠ exposure.open_orders
Scheduling release reconciliation	on release receipt; nightly cum check 23:00	agreement item	release number	< 1 min	hold release	CUM_QTY_MISMATCH count > 0
Allocation period roll	first day of period 00:05	product	key = (quota, period)	< 1 min	retry	missing quota period
Intake retry / DLQ replay	every 5 min	channel	(channel, external_ref)	< 1 min	DLQ after 10 attempts	DLQ depth > 50

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
Order auto-close	nightly 02:00	legal_entity	(order, version)	< 5 min	retry	none

5.27.17 Security duties and privileges

Duty	Privileges (entry points)	Segregation-of-duties conflicts	Default roles
SalesOrderView	GET orders, quotations, atp buckets; Sales workspace, ATP explorer	none	Sales rep, Customer service, Warehouse, Finance
SalesQuotationMaintain	POST quotations, :send, :convert; Quotation detail	none	Sales rep
SalesOrderMaintain	POST/PATCH orders, lines, :cancel-remainder; Order entry; backorders	with CreditRelease; with PricingOverride when `four_eyes_override`	Sales rep, Customer service
SalesOrderConfirm	:confirm	with CreditRelease	Sales rep (within limits), Sales manager
SalesOrderApprove	approve change requests; listing override	with SalesOrderMaintain on own orders	Sales manager
SalesOrderHold	POST holds (MANUAL, PRICE_REVIEW, FRAUD)	none	Sales manager, Fraud analyst
CreditRelease	holds:release (CREDIT); Credit release queue	with SalesOrderMaintain, SalesOrderConfirm, CreditMaintain on the same customer	Credit manager
CreditMaintain	PUT credit-profiles	with CreditRelease	Credit analyst
SalesAgreementMaintain	agreements, :release-order, schedule releases	none	Key account manager
ChannelIntake	POST orders via channel client credentials	none	Integration service accounts (w35)
BackorderRun	run and commit backorder processing	with SalesOrderMaintain on affected orders (logged, not blocked)	Order management lead
AllocationMaintain	allocation quotas	with BackorderRun	Demand planner
ConsignmentMaintain	consignment fill-up/issue/pick-up/return	with WarehouseReceive (w28)	Key account manager

5.27.19 Performance budgets and capacity

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
POST /sales/orders (intake, 10 lines)	50k per day; peak 500/min	120 / 300 / 500 ms	20 req/s per replica	20M lines × 1.5 KB = 30 GB	orders partitioned by legal entity; lines (order_id, line_no)	429 with Retry-After per key; HPA; holds evaluated asynchronously if > 1,500/min
Inline price + ATP at line commit	500k per day	80 / 300 / 600 ms	100/s	none	atp_bucket PK lookup	ATP badge shows "pending" after 300 ms; confirm still synchronous
:confirm (10 lines)	50k per day	200 / 600 / 1,200 ms	30/s	events 10 KB each	advisory lock per product	confirm queue; p95 ≤ 2 s

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
ATP projection update	1M events per day	2 / 10 / 30 s lag	1,000 events/s	50M buckets × 200 B = 10 GB	PK (product, dims, site, warehouse, bucket_date)	buckets flagged stale; promise falls back to lead time with warning
Credit check	100k per day	20 / 80 / 200 ms	100/s	evaluations 30 GB (jsonb, 2-year retention)	(customer, evaluated_at)	cached exposure (≤ 60 s) under load
Backorder run (100k lines)	1 per site per day	— / 10 min / 20 min	200 lines/s	run logs 5 GB	per-product batches	run split by product group; preview only
Scheduling release import	5k releases per day	50 / 200 / 500 ms	20/s	2 GB	(agreement_item, release_no)	queue; acknowledgment delayed

5.27.20 Localization and compliance hooks

- Tax ids and VAT validation on one-time orders use the w13 validator per country (VIES for EU, EIN format for US); the document-level address feeds tax determination exactly as a master address.
- Calendars: customer receiving calendars and transport days (BR-27.2) come from the w6 calendar service with country holiday packs (w48); cumulative-quantity reset follows the customer's fiscal year (w14).
- Currency and rounding: credit exposure converts at the w12 spot rate on the check date; quantities at 6 decimals; thresholds in BR-27.3 hold USD/EUR defaults overridable per entity.
- Documents: quotation and confirmation templates per language and entity (w5 docgen); country packs may add mandatory legal footer text (for example EU distance-selling withdrawal notice) through the template `legal_footer` slot.
- Export control and sanctioned-party screening are out of scope here (w48 compliance hooks `order.confirmed` consumer may apply a FRAUD/COMPLIANCE hold through the holds API).
- Privacy: portal and one-time contacts are personal data (w48 retention); order history pseudonymizes contact names after 7 years.
- Automotive packs (DE/US) extend FR-27.20 with EDIFACT DELFOR/DELJIT and VDA 4905/4915 mappings through w35; the cumulative model here is the extension point.

5.27.21 Coverage closure

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
AX §12.3.4 #31 — Trade agreements → Supplementary items (PriceDiscSuppItem)	PARTIAL-26 (proposed 27)	ADDED as FR-27.14	free-goods proposals from w26 FR-26.22
AX §12.17.1 #168 — Sales order → Supplementary items (prompt)	PARTIAL-26 (proposed 27)	ADDED as FR-27.14	supplementary_prompt_optional
AX §12.17.4 #171 — Sales orders → Supplementary items setup	PARTIAL-26 (proposed 27)	ADDED as FR-27.14	rule entity supplementary_item_rule
SAP §13.8 #90 — CK51N / CK53N sales order cost estimate	PARTIAL-27	ADDED as FR-27.23 (hook); full costing DEFERRED to wave 39	estimate stored on line
SAP §13.8 #98 — OVZG sales order costing / valuation of sales-order stock	PARTIAL-27	DEFERRED to wave 21 / 39	segregation itself ADDED as FR-27.19; valuation stays with costing waves
SAP §13.13 #141 — MB58 consignment and returnable packaging stock at customer	PARTIAL-27	ADDED as FR-27.18 (consignment); returnable packaging DEFERRED to wave 28 (FR-28.16)	needs w16 owner dimension
SAP §13.13 #143 — MIE1 / MIW1 / MIV1 physical inventory for sales-order stock and consignment	PARTIAL-27	ADDED as FR-27.18 / FR-27.19 (dimensions); counting itself SUPERSEDED by w16 counting journals on the owner / sales-order segment	
SAP §13.13 #145 — Special stock E / Q (PARTIAL-16, note names wave 27)	PARTIAL-16	ADDED as FR-27.19 for sales-order stock; project stock Q DEFERRED to wave 41	cross-reference
SAP §13.19 #216 — VB01/VB02/VB03 listing/exclusion	PARTIAL-27	ADDED as FR-27.15	
SAP §13.19 #218 — VA01 KB/KE/KA/KR consignment processes	PARTIAL-27	ADDED as FR-27.18	Could; depends on w16
SAP §13.19 #219 — VA31/VA32/VA33/VA35 scheduling agreements with JIT/forecast schedules, DELFOR/DELJIT	PARTIAL-27	ADDED as FR-27.20	EDI mapping in wave 35
SAP §13.19 #222 — VB41 cross-selling, dynamic product proposal	PARTIAL-27	ADDED as FR-27.21	
SAP §13.19 #223 — OVZJ / OVZI product allocation	GAP (propose 27)	ADDED as FR-27.16	allocation_enabled
SAP §13.19 #224 — OVZK / aATP backorder processing strategies, release for delivery	PARTIAL-27	ADDED as FR-27.17	release for delivery = w28 release rules
SAP §13.19 #225 — OVZG/OVZH/OVZI requirements classes / strategy groups	PARTIAL-27	ADDED as FR-27.19 (special stock part); planning strategies remain wave 22	
SAP §13.19 #226 — OV04 listing/exclusion procedures	PARTIAL-27	ADDED as FR-27.15	one entity, precedence BR-27.13
SAP §13.2 #23 / #37 — One-time account (CPD, OBD3) and SAP §13.3 head-office/branch #50 (PARTIAL-7, flagged for order-to-cash)	PARTIAL-7	ADDED as FR-27.22 (one-time orders); head-office/branch SUPERSEDED by sales_order.invoice_account_id (FR-27.2) and open_item.invoice_account_id (FR-30.1)	party roles themselves remain wave 7

5.28 Wave 28: Fulfillment: Picking, Packing & Shipping

5.28.1 Scope and business context

Wave 28 ships the `fulfillment` service and the `carrier-gateway` adapter. Confirmed orders release to the warehouse by rule, are picked (basic wave/batch picking; location directives and RF arrive in wave 31), packed into containers with SSCC labels, rated and labelled through a carrier abstraction, and shipped with a posted packing slip that deducts inventory and posts cost to the universal journal. Drop-ship and partial shipments are supported; tracking is published for the portal. Out of scope: location directives, license plates and mobile RF flows (wave 31), transportation planning and freight reconciliation (wave 34), hazmat and export compliance. Added from the coverage registers (§5.28.21): picking workbench, packaging materials with packaging fees, packing instructions (auto-pack) and returnable transport packaging balances.

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
Delivered-not-invoiced never ties: AX "Cost of units delivered" via InventPosting drifts from CustPackingSlipJour after invoice cancellations; SAP PGI posts COGS at once so revenue and COGS land in different periods	Physical and financial postings decoupled across SalesFormLetter classes; reconciliation is a month-end report	Packing slip and invoice share one cost_snapshot_id; DNI projection reconciled to GL 1405 daily; AX-style and PGI-style matrices by policy	Month-end DNI reconciliation 4–8 h → 0 (daily, diff 0.00)
Packing-slip posting blocks the user 5–20 s and fails opaquely ("Update has been cancelled"; VL02N "posting period closed" after picking)	Synchronous multi-table update with late validation	Pre-validation at PACKED (period, holds, dims, negative stock) and a Temporal saga with compensation	Failures discovered after pick ~3% → < 0.1%; post p95 < 2 s
Each carrier is a project (AX ShipCarrier via desktop add-on; SAP XSI/TM)	No provider abstraction	carrier-gateway rate/label/track contract, reference adapters, `tracking-updated` events	Adding a carrier 4–8 weeks → < 2 days; tracking visible on 100% of shipments
Short picks and partials need manual SalesLine splits or VBEP edits	Schedule lines are not first-class in fulfillment	Schedule lines drive shipments; short pick auto-creates the remainder and releases its reservation	Manual splits per 1,000 orders ~40 → 0
SSCC errors at customer receiving (bad check digit, duplicate on re-print)	SSCC generated by label software, not validated by the ERP	Gap-free SSCC per GS1 prefix with mod-10 check, uniqueness and 12-month no-reuse in the container entity	Label rejections at customer DC ~1% of pallets → 0

5.28.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Release to warehouse	Release to warehouse, SalesLine.ReleaseStatus, InventPickingList	VL01N/VL10, LIKP/LIPS	shipment (release rules)	full
Picking	WMSPickingRoute, WMSOrderTrans, picking list registration	LT03 transfer order (LTAP); EWM warehouse task	pick_work	partial (advanced w31)
Packing / HU	WHSContainerTable, packing station	VEKP/VEPO handling units, HUMO	container (nested)	full
SSCC / labels	WHSContainerTable.LicensePlate	HU external id, GS1-128	container.sscc, PDF/ZPL label	full
Packing slip posting	CustPackingSlipJour/Trans, SalesFormLetter_PackingSlip, InventTrans StatusIssue=Deducted	VL02N post goods issue, MKPF/MSEG 601, LIKP-WBSTK	packing_slip saga	full
COGS posting	InventPosting: cost of units delivered / cost of goods delivered	OBYC GBB-VAX, BSX	matrix BR-28.1	full
Carrier interface	ShipCarrierTable, ShipCarrierShippingRequest	TM / Express Ship Interface	carrier-gateway	improved
Drop-ship	Direct delivery (PurchTable.DirectDelivery)	Third-party item category TAS, statistical GR	drop_ship flow	full
Delivery schedules / ASN	SalesDeliverySchedule; AIF DESADV	VBEP; DESADV IDoc	schedule lines → shipments; ASN event (EDI w35)	partial
Picking workbench	Sales picking workbench (R3), picking routes setup, grouped picking lists	VL10 delivery due list + LT03 grouped transfer orders	pick_workbench (filtered grouped waves)	full
Packaging materials and fees	Packaging materials, packing material fees (EU), PI container types / packaging groups	Packaging material types VHAR, packaging materials (MARA MTART VERP)	packaging_material, packaging_fee, container_type	full
Packing instructions / auto-pack	— (WHS packing policies w31)	POP1/POP2/POP3 packing instructions, POF1 determination, EWM packaging specifications	packing_rule (product → container type, qty per level)	full (EWM-level rules w31)
Returnable transport packaging	—	RTP special stock M/V, MB58	returnable_packaging_balance per customer	partial (balances; charging w30 credit/debit)

5.28.3 Functional requirements

- **FR-28.1 Release rules** — Must. Release confirmed, unheld lines by rule (confirmed ship date ≤ today + horizon, default 2 d; full ATP; priority) into one shipment per (order, warehouse, ship date) unless consolidation is enabled.
- **FR-28.2 Picking** — Must. Pick work by wave (≤ 200 lines or 50 orders) or batch; physical reservation (w16); confirm quantity, batch/serial and location; short picks create a remainder and release the unpicked reservation.
- **FR-28.3 Packing** — Must. Containers (type, tare, dims), nesting pallet → carton, SSCC from the GS1 company prefix with mod-10 check digit.
- **FR-28.4 Packing slip posting** — Must. Record delivered quantities, create inventory issues, post the journal per BR-28.1 at the current cost snapshot, atomically via a Temporal saga; sequence `PS-`.
- **FR-28.5 Cancellation** — Must. Reverse an uninvoiced packing slip with mirror inventory and journal entries referencing the original.
- **FR-28.6 Carrier abstraction** — Must. rate / label / manifest / track through a provider-agnostic contract with EasyPost-style, Shippo-style and `file` adapters; labels as PDF and ZPL; tracking by 30-min poll or webhook.
- **FR-28.7 Drop-ship** — Must. Linked PO (w17) for drop-ship lines; the vendor's ship confirmation triggers the packing slip; COGS at vendor cost without inventory.
- **FR-28.8 Partial shipments** — Must. Ship each schedule line separately; order stays PARTIALLY_SHIPPED until remaining_qty = 0.
- **FR-28.9 ASN** — Should. Emit an ASN with containers, SSCCs and quantities on post for the wave 35 EDI mapper.
- **FR-28.10 Tracking visibility** — Should. Publish tracking changes to portal and order detail.
- **FR-28.11 Mobile pick (basic PWA)** — Should. Pick confirmation with GS1-128 parsing (AI 00, 01, 10, 17, 21, 30, 37) and 5-minute offline tolerance.
- **FR-28.12 DNI reconciliation** — Must. delivered_not_invoiced projection = GL 1405, checked daily.
- **FR-28.13 Picking workbench** — Should. The system shall provide a picking workbench that filters released shipment lines (customer, carrier, ship date range, product group, zone, order priority), groups them by a selectable key (customer, carrier, zone, product) into waves of ≤ `WAVE_MAX_LINES`, previews the grouping and creates pick work in one action. Notes: AX sales picking workbench (R3) semantics; saved filters per user; a line belongs to at most one open wave.
- **FR-28.14 Packaging materials and packaging fees** — Should. The system shall define packaging materials (material code, type, weight, recyclable flag, unit) assigned to products per unit (w8 packaging units) and to container types, compute packaged weight per shipment and post packaging fees (EU packaging duty: fee per kg per material and country) as a statistical line on the packing slip and a FREIGHT/SURCHARGE condition for w29 when `packaging_fee_billable`. Notes: packaging report per period per country (§5.28.14); fee tables are country-pack data (w48).
- **FR-28.15 Packing instructions** — Should. The system shall hold packing rules (product or product group × customer optional → container type, quantity per container, nesting level, max weight) and auto-pack picked lines into containers at the packing station with a one-click accept; manual repack remains available. Notes: SAP POP1/POF1 and EWM packaging specifications; rule determination specific → general like BR-26.1.

- **FR-28.16 Returnable transport packaging** — Could. The system shall track returnable packaging (pallets, crates) shipped to and returned from customers as a balance per (customer, packaging material) from packing slips and return receipts, with an aging inquiry and a hook for w30 to charge unreturned items after `rtp_charge_days`. Notes: SAP special stock M/V; no inventory valuation movement; balances reconciled to Σ container counts.

5.28.4 Data model

shipment

Field	Type	Required	Notes
id, shipment_number	uuid, text	Y	SH- sequence
legal_entity_id, warehouse_id	uuid	Y	one warehouse per shipment
customer_id, delivery_address_id	uuid	Y	
status	enum	Y	BR-28.6
planned_ship_date, actual_ship_date	date, timestamptz	Y/N	
carrier_code, service_level, mode_of_delivery	text	N	
lines[]	shipment_line	Y	order_line_id, schedule_line_id, qty_planned/picked/packed/shipped, dims
consolidation_key, packing_slip_id, carrier_shipment_id, version	text, uuid, uuid, int	N	

container: id, shipment_id, parent_container_id, container_type, sscc char(18), tare_weight, gross_weight, dimensions, uom, lines[] (shipment_line_id, qty, batch, serials[]), label_ref, status (OPEN | CLOSED | SHIPPED).

packing_slip (CustPackingSlipJour/Trans): id, packing_slip_number, shipment_id, order_id, posting_date, posted_at, status (PENDING | POSTED | CANCELLED | INVOICED), lines[] (order_line_id, qty, unit, cost_amount, cost_snapshot_id, inventory_transaction_ids[]), total_cost, journal_posting_id, reversal_of_id, document_ref.

carrier_shipment: id, shipment_id, provider, provider_ref, rate_quote, tracking_number, label_ref, status (QUOTED | LABELLED | MANIFESTED | IN_TRANSIT | DELIVERED | EXCEPTION), events[], cost_amount, currency.

Invariants: Σ container qty per line = qty_packed ≤ qty_picked ≤ qty_planned; packing slip qty = qty_shipped; one journal posting per slip plus one reversal if cancelled; SSCC check digit valid and unique per tenant; Σ cost of uninvoiced slips = GL 1405. Indexing: shipments (warehouse, status, planned_ship_date); packing slips (order_id), (posting_date), partitioned by month; containers unique sscc.

5.28.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
POST	/api/v1/fulfillment/releases:run	Run release rules for a warehouse or orders	Idempotency-Key	WarehouseRelease
POST	/api/v1/fulfillment/waves, …/{id}:confirm-pick	Create wave; confirm picks	Idempotency-Key	WarehousePick
POST	/api/v1/fulfillment/shipments/{id}/containers, …/{cid}:close	Pack; close container (SSCC)	Idempotency-Key	WarehousePack
POST	/api/v1/fulfillment/shipments/{id}:rate, :label, :manifest	Carrier operations	Idempotency-Key	WarehouseShip
POST	/api/v1/fulfillment/shipments/{id}:post-packing-slip; /packing-slips/{id}:cancel	Post / reverse (saga)	Idempotency-Key	PackingSlipPost
GET	/api/v1/fulfillment/shipments/{id}/tracking	Tracking events	—	ShipmentView / Portal
POST	/api/v1/fulfillment/drop-ship/{orderLineId}:vendor-confirm	Vendor confirmation → packing slip	Idempotency-Key	PurchasingConfirm
POST	/webhooks/carriers/{provider}	Tracking webhook (HMAC)	provider event id	system

Validation: post requires status PACKED, no ACTIVE hold, posting date in an open inventory period (w14), and no negative on-hand unless the product policy allows (w16).

Event	Trigger	Payload fields	Consumers
dev.passage.fulfillment.shipment.released.v1	release	shipment_id, order_id, warehouse, lines	sales, analytics
dev.passage.fulfillment.pick.confirmed.v1	pick confirm	wave_id, lines[{order_line_id, qty, dims, location}]	inventory, sales
passage.fulfillment.packing-slip.posted.v1 / cancelled.v1	saga complete / cancel	packing_slip_id, order_id, lines[{order_line_id, qty, cost_amount, cost_snapshot_id}], journal_posting_id, posting_date	billing, sales, inventory, ledger, portal, credit
dev.passage.fulfillment.asn.issued.v1	post	shipment_id, containers[{sscc, lines}], carrier, tracking	EDI (w35)
passage.fulfillment.shipment.tracking-updated.v1	poll / webhook	shipment_id, tracking_number, status, event	portal, sales

5.28.6 User experience

Screen	Primary actions	Key fields/columns	Duty
Fulfillment workspace	tiles: to release, picking, packed not shipped, carrier exceptions, DNI balance	counts	WarehouseView
Release board	run rules, release selected, hold	order, customer, ship date, ATP status, priority	WarehouseRelease
Wave / pick list	print, confirm, short pick, reassign	line, product, location, qty, dims, picker	WarehousePick
Packing station	scan line, add/close container, print label	container, type, weights, lines, SSCC	WarehousePack
Shipment detail	rate, label, manifest, post packing slip, cancel	carrier, service, cost, tracking, journal preview	WarehouseShip / PackingSlipPost
Mobile pick (PWA) / carrier exceptions	scan, confirm, skip; retry, switch provider, manual tracking	location, product, qty, batch/serial; provider error, age	WarehousePick / WarehouseShip

Interaction rules: scan field keeps focus; Enter confirms a line; GS1-128 auto-fills batch/serial; bulk release on multi-select; posting shows the journal preview before confirm; layouts per warehouse personalizable.

5.28.7 Business rules and edge cases

- **BR-28.1 Packing-slip COGS posting matrix** (accounts from the wave 16 posting profile; dimensions from the order line):

Scenario	At packing slip post	At invoice post (wave 29)
Stocked item, physical posting enabled (default, AX-style)	Dr 1405 Delivered-not-invoiced / Cr 1400 Inventory (physical) at cost snapshot	Reverse 1405/1400; Dr 5000 COGS / Cr 1400 Inventory (financial) at settled cost
Stocked item, policy `cogs_at_shipment` (SAP PGI-style)	Dr 5000 COGS / Cr 1400 Inventory	Revenue and AR only
Standard-cost item	Same, at standard; no variance at shipment	Same
Drop-ship line	No posting	Dr 5000 COGS / Cr 2110 GR/IR at PO cost when vendor confirmation posts
Non-stocked / service line	No posting	Revenue only
Catch-weight item	Cost on inventory quantity, not catch-weight quantity	Same
Cancellation	Mirror entries, negative amounts, same dims, reversal_of set	—

- **BR-28.2 Cost snapshot** = running average or FIFO estimate (w20) at posting, stored as cost_snapshot_id; inventory close adjusts 5000/1400, never 1405 after invoicing.
- **BR-28.3 Posting date** = actual ship timestamp in the warehouse time zone; closed inventory period → `PERIOD_CLOSED`, shipment stays PACKED.
- **BR-28.4 Saga.** (1) packing slip PENDING; (2) inventory issues; (3) journal posting with Idempotency-Key = packing_slip_id; (4) POSTED + event. Failure at 3 compensates 2; a retried 3 is a ledger no-op. PENDING > 10 min alerts.
- **BR-28.5 SSCC** = extension digit + GS1 company prefix + serial reference padded to 17 digits + mod-10 check (weights 3,1 from the right); serial from a gap-free sequence per prefix; no reuse for 12 months.
- **BR-28.6 Shipment state machine.** OPEN → RELEASED → PICKING → PICKED → PACKED → SHIPPED → DELIVERED; CANCELLED before SHIPPED (releases reservations); SHIPPED → PACKED on packing-slip cancellation.
- **BR-28.7 Over-pick** rejected; over-ship rejected unless the customer's overdelivery_pct allows.
- **BR-28.8 Consolidation** requires matching customer, address, warehouse, planned date and carrier and no `ship_separately` order.
- **BR-28.9 Carrier failures** retry 3× (2 s, 8 s, 32 s) then land in the exceptions queue; the slip may still post with a manual tracking number.
- **BR-28.10 Tracked items** must carry batch/serial at pick; the slip rejects lines missing tracking dims (w8 tracking dimension group).
- **BR-28.11 Auto-pack** fills containers in rule order (most specific rule first), closes a container when quantity per container or max weight is reached, and never splits a serial-tracked unit; lines without a rule stay unpacked and are flagged.
- **BR-28.12 Packaging fee** = Σ (material weight per unit × shipped units) per material × country rate as of the packing slip date, rounded half-even to minor units per material; fees post statistically (no journal) unless `packaging_fee_billable`, in which case w29 bills them as a SURCHARGE line with its own tax code.
- **BR-28.13 Returnable packaging balance** increases on packing-slip post (containers flagged returnable) and decreases on return receipt (w30 RMA line or standalone return); a negative balance is rejected with `RTP_NEGATIVE`.
- **BR-28.14 Workbench grouping** keeps lines of one shipment in one wave; a wave exceeding `WAVE_MAX_LINES` is split by the group key; preview shows lines per wave before creation.

5.28.8 Acceptance criteria

- **AC-28.1** (FR-28.4) Given 10 units at cost 12.50 USD with physical posting, when the slip posts, then on-hand −10, journal Dr 1405 125.00 / Cr 1400 125.00, and the event carries cost_amount 125.00.
- **AC-28.2** (FR-28.5) Given that slip cancelled before invoicing, then on-hand +10, a mirror posting exists and GL 1405 returns to its prior balance.
- **AC-28.3** (FR-28.3) Given prefix 0614141 and serial 0123456789, then SSCC = 006141410123456789 1 and the GS1-128 label scans back to it.
- **AC-28.4** (FR-28.2) Given a 100-unit line with 90 picked, then qty_picked = 90, 10 remain on backorder and their reservation is released.
- **AC-28.5** (FR-28.7) Given a drop-ship line, when the vendor confirms, then a slip posts with no inventory transaction and Dr 5000 / Cr 2110 at PO cost.
- **AC-28.6** (FR-28.6) Given recorded fixtures for both adapters, when rate/label/track run, then responses match the contract and labels are valid PDF and ZPL.
- **AC-28.7** (FR-28.1) Given 1,000 confirmed orders, when release → pick → pack → post runs, then all are SHIPPED and Σ inventory issues = Σ slip quantities with zero mismatch.
- **AC-28.8** (FR-28.12) Given 50 posted slips of which 20 invoiced, then DNI = cost of the 30 uninvoiced = GL 1405.
- **AC-28.9** (FR-28.11) Given scan `(01)00614141000012(10)LOT7(37)5`, then GTIN, batch LOT7 and qty 5 are filled.
- **AC-28.10** (FR-28.13) Given 60 released lines for carrier UPS across 12 customers, when grouped by customer with WAVE_MAX_LINES 20, then the preview shows waves of ≤ 20 lines, no shipment is split across waves, and one action creates all pick work.
- **AC-28.11** (FR-28.15) Given a rule "FG-100 → carton C12, 12 per carton, max 15 kg" and 30 picked units, when auto-pack runs, then containers of 12, 12 and 6 exist with valid SSCCs and gross weights.
- **AC-28.12** (FR-28.14) Given DMF-DE ships 100 units with 0.2 kg cardboard each at 0.50 EUR/kg, then the packing slip carries a statistical packaging fee of 10.00 EUR and the period packaging report shows 20 kg cardboard for DE.
- **AC-28.13** (FR-28.16) Given 10 returnable pallets shipped to C1 and 4 received back, then the C1 pallet balance is 6 and a return of 7 is rejected with `RTP_NEGATIVE`.

5.28.9 Test plan and fixtures

Fixtures: `warehouse-sim-1k` (1,000 orders, 120 products, 3 warehouses, batch/serial mix); `sscc-200` (GS1 examples, valid/invalid); `carrier-recorded` (HTTP recordings); `dropship-30`; `cogs-matrix-14` (per cell × costing method, accountant-reviewed).

Test	Type	Target	Pass criterion
Posting matrix	contract (ledger)	post / cancel	14/14 balanced; cancel mirrors exactly
Saga compensation	integration (Temporal)	injected ledger failure	no inventory movement remains; slip not POSTED
SSCC / GS1-128	unit, property	check digit, parser	200/200; all AI combinations round-trip
Pick-pack-ship 1k	E2E	simulated warehouse	0 mismatch, all SHIPPED < 60 min
Carrier adapters	contract	recordings	green
DNI = GL 1405	reconciliation	daily job	0.00

Reconciliation: Σ inventory issue cost = Σ journal Cr 1400 from fulfillment; DNI projection = GL 1405; line delivered_qty = Σ slip qty.

5.28.10 Deployment and operations

Helm `passage-fulfillment` (Go), `passage-carrier-gateway` (TS; egress via Envoy, provider secrets in Vault), `fulfillment-db`; PWA served by the shell. Config: `RELEASE_HORIZON_DAYS=2`, `WAVE_MAX_LINES=200`, `GS1_COMPANY_PREFIX` per entity, `COGS_AT_SHIPMENT=false`. Flags: `fulfillment.consolidation`, `fulfillment.asn`,

`fulfillment.mobile_pick`. Jobs: release every 15 min per warehouse; tracking poll 30 min; DNI check 02:00. SLOs: post p95 < 2 s, saga completion 99.9% within 60 s. Alerts: PENDING > 10 min, carrier error rate > 5%, DNI diff ≠ 0. Runbook: resume stuck saga, re-print label, manual tracking. Rollback: previous digest; Temporal workflow versioning lets in-flight sagas finish on old code.

5.28.11 Migration from AX / SAP

Source	Passage entity	Notes
CustPackingSlipJour/Trans with uninvoiced remainder	packing_slip, DNI opening balance	cost from InventTrans.CostAmountPhysical
WMSShipment, WMSPickingRoute (open); WHSContainerTable	shipment, pick_work, container	open picks reset to RELEASED; SSCC retained
LIKP/LIPS not goods-issued (WBSTK ≠ C)	shipment	A/B → RELEASED/PICKING
LIKP/LIPS goods-issued, not billed (FKSTK ≠ C)	packing_slip	cost from MSEG 601 DMBTR
VEKP/VEPO	container	EXIDV SSCC retained

Validation: DNI opening balance = legacy delivered-not-invoiced GL balance to the cent; open shipment quantities = legacy open deliveries. Not migrated: completed shipments, tracking history, carrier configuration (manual).

5.28.12 Dependencies, risks, open questions

- Depends on: w27 orders and holds; w16 inventory transactions/reservations; w20 cost snapshots; w17 POs; w11 journal; w14 period control; w8 tracking dimensions and GS1 ids; w5 PWA shell and document rendering.
- Risks: physical posting unfamiliar to SAP users (policy flag plus documented matrix); carrier sandbox instability (recorded fixtures gate CI; live sandbox nightly only).
- Open questions: (1) Default `cogs_at_shipment` for migrated SAP entities? Default true; decide by wave 29. (2) ASN EDI mapping owned by wave 28 or 35? Default 35; decide at wave 28 close.

5.28.13 Parameters and setup

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
release_horizon_days	warehouse	int	2	0–30	FR-28.1 release window	AR parameters → Updates → "Release to warehouse" / release rules	VL10 delivery creation date horizon (VL10 profile)

5.28.14 Inquiries and reports

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
Shipments list / delivery monitor	list inquiry	warehouse, status, planned date, carrier, customer	shipment, order, customer, status, planned/actual ship, carrier, tracking	shipment	Shipments list page (WMSShipment)	VL06O / VL06F outbound delivery monitor
To release	list inquiry	warehouse, horizon, ATP status, hold	order, line, confirmed date, ATP, priority, hold	sales lines (confirmed, unheld)	Release to warehouse form	VL10 / VL10A delivery due list
Pick work / waves	list inquiry	wave, picker, zone, status	wave, lines, picked/short, picker, age	pick_work	Picking list registration (WMSPickingRoute)	LT22 / LT23 transfer order lists; VL06P
Packed not shipped	list inquiry	warehouse, age	shipment, containers, weight, carrier, label status	shipment (PACKED)	Shipments awaiting ship confirm	VL06G (for goods issue)
Packing slip journal	list inquiry / drill-down	order, customer, date range, status	slip, order, lines, qty, cost, journal ref, reversal	packing_slip	Packing slip journal (CustPackingSlipJour)	VL03N document flow; MB51 movement 601
Delivered not invoiced	operational report	legal entity, as-of, customer	slip, line, qty, cost, days since shipment, GL 1405 diff	DNI projection	Cost of units delivered (InventPosting) / Physical inventory by inventory dimension	VF04 due list value; F.03 recon
Carrier exceptions and cost	list inquiry / KPI	provider, error, age; cost per shipment	shipment, error, retries, cost quoted vs billed	carrier_shipment	Shipping carrier interface log	XSI / TM logs (VT02N)
SSCC register	list inquiry	prefix, date range, customer	sscc, container, shipment, printed_at, reused flag	container	License plate list	HU monitor HUMO
Short picks and backorders created	operational report	warehouse, period	line, planned, picked, remainder, reason	pick_work	Picking list registration log	VL06P picking variance
Packaging weights per material	statutory report (country pack)	legal entity, country, period	material, kg shipped, fee	packaging_fee lines	Packing material fees report	n/a (DE LUCID / FR CITEO exports via w48)
Returnable packaging balances	list inquiry	customer, material, age	balance, last shipped, last returned, days outstanding	returnable_packaging_balance	n/a	MB58
Picking workbench preview	drill-down	filter set, group key	wave, lines, orders, weight	pick_workbench	Sales picking workbench	VL10 grouped selection

5.28.15 Printed and electronic documents

Document	Trigger	Layout elements	Formats	Numbering sequence	Legal / retention requirement
Pick list	wave creation / print	header: wave, warehouse, picker, zone; lines: product, dims, location, qty, barcode; footer: counts	PDF, ZPL (label printer), PWA	wave number `WV–`	none; keep 1 year
Packing slip / delivery note	packing-slip post	header: slip number, order, customer, ship-to, carrier, tracking, date; lines: product, description, qty, unit, batch/serial; footer: container summary, SSCCs, signature block	PDF, email, EDI DESADV/856 (w35), portal	`PS–` per legal entity, gap-free	commercial document; retain 7 years (10 in DE) with the invoice
GS1-128 container label	container close	SSCC (AI 00), GTIN (01), batch (10), qty (37), ship-to postal (420), order ref	ZPL, PDF	SSCC serial per prefix	GS1 General Specifications; no retention beyond SSCC register
Carrier label	:label	carrier-rendered label with tracking barcode	PDF, ZPL (provider payload)	provider tracking number	retain label_ref 1 year
Manifest / end-of-day close	:manifest	carrier, pickup date, package count, weights, tracking list	PDF, provider API	provider manifest id	retain 1 year
ASN	packing-slip post (asn_enabled)	shipment, containers with SSCC hierarchy, lines, quantities, carrier, tracking	JSON event; EDI 856 / DESADV through w35	shipment number	trading-partner agreement; retain 7 years
Bill of lading	shipment with `bol_required`	shipper, consignee, carrier, freight terms, commodity lines, weights	PDF (basic; full BOL w34)	`BOL–`	US carriage record; retain 3 years
Packaging fee statement	period close per country	material, kg, rate, fee	PDF, CSV	none	per country pack (w48)

5.28.16 Periodic and batch jobs

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
Release to warehouse	every 15 min per warehouse	warehouse	key = (warehouse, line, confirmed version)	< 1 min per 10k lines	retry; lines stay confirmed	lines eligible but unreleased > 1 h
Tracking poll	every 30 min	provider	last event timestamp per shipment	< 5 min	provider error → exceptions queue	poll failures > 5%
DNI reconciliation	02:00 daily	legal entity	key = (entity, date)	< 5 min	rerun; diff report	diff ≠ 0.00
Saga watchdog	every 5 min	—	PENDING slips	< 10 s	resume or compensate	PENDING > 10 min
Manifest / end-of-day close	per warehouse cutoff (default 17:00 local)	warehouse × carrier	manifest id per (warehouse, carrier, date)	< 2 min	retry; manual manifest	shipments LABELLED but unmanifested after cutoff
SSCC sequence check	nightly 00:30	prefix	—	< 1 min	alert only	duplicates or check-digit failures > 0
Packaging fee accrual report	first day of month	country	key = (country, period)	< 2 min	rerun	missing rate for material
Returnable packaging aging	nightly 03:00	customer	key = (customer, date)	< 1 min	rerun	balances outstanding > rtp_charge_days

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
Label and document cleanup	weekly	—	—	< 10 min	skip	storage growth > plan

5.28.17 Security duties and privileges

Duty	Privileges (entry points)	Segregation-of-duties conflicts	Default roles
WarehouseView	GET shipments, tracking, DNI; Fulfillment workspace	none	Warehouse worker, Customer service, Finance
WarehouseRelease	releases:run; Release board; Picking workbench	none	Warehouse supervisor
WarehousePick	waves, :confirm-pick; Pick list, Mobile pick	with PackingSlipPost when `pick_post_separation`	Picker
WarehousePack	containers, :close; Packing station; auto-pack	none	Packer
WarehouseShip	:rate, :label, :manifest; Carrier exceptions	none	Shipping clerk
PackingSlipPost	:post-packing-slip, /packing-slips/{id}:cancel	with SalesOrderMaintain on the same order; with InvoicePost (w29) when four-eyes	Shipping clerk (post), Warehouse supervisor (cancel)
PackingRuleMaintain	packing rules, container types, packaging materials	none	Warehouse admin
CarrierAdmin	provider configuration, secrets rotation (Vault reference only)	with WarehouseShip (logged)	Logistics admin
PackagingFeeMaintain	packaging fee rates (country), statements	with InvoiceMaintain (w29)	Compliance / Finance
ReturnablePackagingMaintain	RTP balances adjustments	with WarehouseReceive	Logistics admin

5.28.18 Message catalog

Code	Severity	User text	Cause	Remediation	Raised by
FUL-0001	error	Shipment must be PACKED with no active hold to post	status or hold	Pack lines; release hold	§5.28.5 validation
FUL-0002	error	Inventory period {period} is closed for posting date {date}	BR-28.3	Use an open period or reopen (w14)	BR-28.3
FUL-0003	error	Negative on-hand for {product} at {warehouse}/{location}	w16 policy	Adjust stock or allow negative	§5.28.5 validation
FUL-0004	error	Over-pick: {qty} exceeds planned {planned}	BR-28.7	Reduce quantity	BR-28.7
FUL-0005	error	Over-ship exceeds customer tolerance {pct}%	BR-28.7	Reduce or raise tolerance	BR-28.7
FUL-0006	error	Batch or serial required for {product}	BR-28.10	Scan tracking dims	BR-28.10
FUL-0007	error	SSCC {sscc} failed check digit or already used	BR-28.5	Regenerate label	BR-28.5
FUL-0008	warning	Carrier {provider} failed after 3 retries; shipment moved to exceptions	BR-28.9	Retry, switch provider or enter manual tracking	BR-28.9
FUL-0009	error	Packing slip PENDING for {minutes} min; saga stalled	BR-28.4	Runbook: resume stuck saga	BR-28.4
FUL-0010	error	Cannot cancel: packing slip {id} is invoiced	FR-28.5	Credit note (w29) then cancel	FR-28.5
FUL-0011	error	Consolidation mismatch: {field} differs	BR-28.8	Ship separately	BR-28.8
FUL-0012	warning	No packing rule for {product}; line left unpacked	BR-28.11	Pack manually or add a rule	FR-28.15
FUL-0013	error	Container exceeds max weight {max} kg	BR-28.11	Close container and start a new one	BR-28.11
FUL-0014	error	Packaging fee rate missing for material {material} in {country}	BR-28.12	Load the country rate table	FR-28.14
FUL-0015	error	Returnable packaging balance would become negative for {customer}	BR-28.13	Correct the return quantity	FR-28.16
FUL-0016	info	Workbench created {n} waves from {lines} lines	FR-28.13	none	BR-28.14
FUL-0017	warning	GS1-128 scan could not be parsed: {raw}	FR-28.11	Rescan or enter manually	FR-28.11

5.28.19 Performance budgets and capacity

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
Release run (10k lines)	96 runs per warehouse per day	— / 60 s / 120 s	200 lines/s	shipments 5M × 2 KB = 10 GB	shipments (warehouse, status, planned_ship_date)	runs queue per warehouse; next run skipped if previous running
Pick confirm (line)	500k per day; peak 50/s	50 / 150 / 400 ms	100/s	pick_work 3 GB	(wave, status)	PWA queues offline up to 5 min
Container close (SSCC + label)	200k per day	100 / 300 / 800 ms	50/s	containers 2 GB; labels object store 20 GB	unique sscc	label rendering async; SSCC issued synchronously
Packing-slip post (saga)	100k per day; peak 20/s	600 ms / 2 s / 4 s	20/s per replica	slips 10M × 1 KB + journal refs	partition by month; (order_id)	saga workers scale; slips remain PENDING ≤ 60 s p99 under 3×
Carrier rate / label	100k per day	400 ms / 2 s / 5 s (provider-bound)	provider limit	carrier_shipment 3 GB	(provider, status)	circuit breaker per provider; exceptions queue
Tracking events	1M per day	5 / 30 / 60 s lag	50 events/s	10 GB (events jsonb, 1-year retention)	(shipment_id, event_time)	poll interval doubles; webhooks unaffected
DNI reconciliation	1 per entity per day	— / 5 min / 10 min	—	none	DNI projection (slip, status)	run moved to low-traffic window
Auto-pack (100 lines)	50k per day	100 / 400 / 1,000 ms	20/s	none	packing_rule (product, customer)	manual pack fallback

5.28.20 Localization and compliance hooks

- Packaging fees and extended-producer-responsibility reporting (DE VerpackG/LUCID, FR CITEO, ES RAP) are country-pack data and exports (w48) on top of FR-28.14; the rate table and the period statement are the extension points.
- Delivery note legal content: DE and IT require sequential delivery-note numbering and specific fields (IT DDT reason for transport); the `PS-` sequence is gap-free per entity and the docgen template exposes a `country_fields` slot.
- GS1 prefixes are issued per country member organization; the entity holds one or more prefixes, each with its own gap-free serial.
- Dangerous goods, export declarations (EU AES / US AES) and sanctioned-party screening are explicitly out of scope and arrive through w33/w34/w48 consumers of `shipment.released`.

- Weights and dimensions store SI units; US entities display lb/in through the w6 unit conversion with half-even rounding at 2 decimals.
- Time zones: posting date derives from the warehouse time zone (BR-28.3); carrier cutoffs are warehouse-local.
- Privacy: ship-to contact names and phone numbers on labels are personal data; label artifacts purge after 1 year (w48 retention policy).

5.28.21 Coverage closure

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
AX §12.14.4 #140 — Picking routes setup / Sales picking workbench (R3)	PARTIAL-28	ADDED as FR-28.13	grouped wave creation with preview
AX §12.15.1 #145 — Product → Packaging (packaging materials, PI container packaging)	PARTIAL-28	ADDED as FR-28.14	packaging_material on product units
AX §12.15.4 #149 — Packaging units / Packing material fees setup (EU)	PARTIAL-28	ADDED as FR-28.14	rates per country pack
AX §12.23.1 #200 — Container packaging (PI container types)	PARTIAL-28	ADDED as FR-28.14 / FR-28.15	container_type with packaging material
AX §12.23.4 #210 — Container types, Packaging groups	PARTIAL-28	ADDED as FR-28.15	packaging group = rule scope
SAP §13.17 #207 — OVLS/OVLV packing instructions (POP1/POP2/POP3/POF1), packaging material types, HU number ranges	PARTIAL-28	ADDED as FR-28.15 (packing instructions); SSCC ranges already FR-28.3	
SAP §13.16 #188 — EWM packaging specifications (/SCWM/PACKSPEC) (PARTIAL-31, note proposes 28/31)	PARTIAL-31	ADDED as FR-28.15 (basic rules); multi-level EWM specifications DEFERRED to wave 31	
SAP §13.13 #147 — Returnable transport packaging (special stock M/V)	GAP (propose 28)	ADDED as FR-28.16	balances only; charging via wave 30

5.29 Wave 29: Billing, Invoicing & Revenue Recognition

5.29.1 Scope and business context

Wave 29 ships the `billing` and `revrec` services. Posted packing slips and eligible order lines become invoices (one-off, consolidated, subscription, milestone); free-text invoices and credit notes post directly; layouts render to PDF with an e-invoice document for wave 35. Every posted invoice creates AR open items, tax postings (w13) and journal entries and, where the contract has multiple performance obligations or deferred terms, a revenue contract with standalone selling price allocation and recognition schedules. Out of scope: cash application (wave 30), intercompany invoicing (hook only; wave 40), project billing (wave 41), Peppol transmission (wave 35), metering sources beyond API-posted usage. Added from the coverage registers (§5.29.21): subscription groups, fee categories and indexation; expense deferrals; customer self-billing; bundle (solution) lines; installment terms at post; document delivery routing.

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
Bundle allocation lives in spreadsheets: D365 RevRecSchedule needs revenue prices per item and cannot explain allocation; SAP RAR (FARR_D_*) is a separate engine with its own posting run and FARR_RECON reconciliation	Rev rec bolted on after billing; allocation inputs not on the order	Revenue contract created at post from order lines with SSP order BR-29.2; allocation and schedules visible on the contract and in the invoice trace	Close-time rev rec effort 2–3 days → < 2 h review; 40/40 fixtures reproducible
Invoice totals differ from the order by cents (SalesLine rounding per form letter; MWST vs. BSEG rounding)	Each document re-rounds	Engine net reused; per-line tax; totals property-tested	Cent discrepancies ~0.5% of invoices → 0
Billing is batch: VF04 due list and AX summary update run nightly	Scheduled jobs over document-flow tables	`packing-slip.posted` creates the proposal at once; post p95 < 3 s; consolidation is policy, not batch	Shipment-to-invoice 12–24 h → < 5 min for non-consolidated accounts
Deferred revenue roll-forward rebuilt by hand from GL 2400 and exports	No system roll-forward that ties to GL	`GET /revrec/roll-forward` reconciled nightly to GL 2400 with drill-down	Preparation 1 day → 0; nightly diff 0.00
Credit note on a partially recognized invoice needs manual journals (manual schedule edits; RAR contract change)	Credit notes ignore recognition state	BR-29.6 reverses recognized and deferred portions automatically	Manual rev rec journals per month 10–30 → 0

5.29.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Invoice from shipment	SalesFormLetter_Invoice, CustInvoiceJour/CustInvoiceTrans, summary update	VF01/VF04, VBRK/VBRP, copy control VTFL	invoice (SHIPMENT, CONSOLIDATED)	full
Free-text invoice	CustInvoiceTable/CustInvoiceLine	FB70; order-related billing (DR)	invoice type FREE_TEXT	full
Credit note	Credit note (negative CustInvoiceJour), free-text credit	Credit memo request G2 → VF01, VBRK VBTYP O	credit_note	full
Billing plans / subscriptions	D365 Subscription billing; milestone billing	FPLA/FPLT billing plans; BRIM	subscription, milestone_schedule	partial (usage basic)
AR open item creation	CustTrans / CustTransOpen	BSID / BSAD, BKPF/BSEG	receivables.open_item via invoice.posted	full
Tax	TaxTrans, TaxGroup/TaxItemGroup	FTXP, MWST, BSET	tax engine (w13) at post	full
Revenue recognition	RevRecSchedule, RevRecContract, revenue prices (D365)	RAR: FARR_D_CONTRACT / POBS / DEFITEM	revenue_contract, performance_obligation, revenue_schedule	full
Deferred revenue postings	Deferred revenue posting on item; schedule processing	RAR posting run, contract liability	recognition run to 2400/4000	full
Layout / e-invoice	SSRS SalesInvoice; Electronic reporting	Smart Forms/Adobe Forms; DRC	docgen template + UBL 2.1 document	partial (transmission w35)
Audit trace	CustInvoiceTrans.InventTransId	Document flow VBFA	GET /invoices/{id}/trace	improved
Service subscriptions (AX)	SMASubscriptionTable, subscription groups, fee categories, index rules, subscription periods, fee transactions	Contract billing plans (VF04 periodic), price adjustment via conditions	subscription groups, fee categories, index rules, period templates on `subscription`	full
Expense deferrals	D365 Subscription billing deferral schedules (expense), RED DeferralSchedule	Prepaid expense accruals (ACCR / FBS1 recurring)	expense_deferral schedule from w19 AP invoice lines	full
Customer self-billing	—	VSB1 / VKA self-billing (GSVERF, EDI 820)	self_billing_statement reconciliation	full (EDI mapping w35)

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Solution / bundle orders	Bundle product (kit) on SalesLine	Solution order (bundles), item category group for bundles	bundle line explosion with mixed obligations (FR-29.17)	full
Installment terms	Payment schedule (CustPaymSched) on invoice	OBB9 installment terms (T052R)	installment split at post → N open items	full (terms definition w7)
Document routing	Print management (sales documents), form notes	NAST output determination (VV31), medium per partner	document_delivery_preference per customer × document	partial (conditional routing w46)

5.29.3 Functional requirements

- **FR-29.1 Invoice from shipment** — Must. Proposals from posted packing slips (and order lines for non-stocked items), one invoice per order by default, lines carrying qty, price, discounts, charges and tax codes. Notes: gap-free `INV-` per entity and fiscal year; invoice date ≥ packing slip date.
- **FR-29.2 Consolidated invoices** — Must. Combine slips for the same invoice account, currency, terms and cycle (daily/weekly/monthly).
- **FR-29.3 Posting** — Must. Atomic: journal (Dr 1200 gross; Cr 4000 per line account; Cr 2300 tax; Cr 2400 deferred obligations; COGS/DNI per BR-28.1), open item creation, `invoice.posted`. Totals = Σ line nets + charges + tax after per-currency rounding (property-tested).
- **FR-29.4 Free-text invoices** — Must. Account, dimensions, amount, tax code; recurring templates.
- **FR-29.5 Credit notes** — Must. Reference an original (whole or lines) or standalone; negative open item; reverse revenue, tax and recognition.
- **FR-29.6 Tax** — Must. Call the tax engine at proposal and post; reject post if the result moved > 0.01 without re-review; no silent zero tax when the engine is unavailable.
- **FR-29.7 Revenue contracts** — Must. Performance obligations per order (one per line or bundle templates per product), SSP (explicit, list, % of list, residual), proportional allocation, schedules.
- **FR-29.8 Recognition methods** — Must. POINT_IN_TIME (packing slip or invoice), RATABLE (daily or monthly), MILESTONE (manual/event), USAGE (posted usage); period-end run or event posts Dr 2400 / Cr 4000.
- **FR-29.9 Roll-forward** — Must. Opening, additions, recognized, adjustments, closing per period and contract, tied to GL 2400.
- **FR-29.10 Subscriptions** — Should. Monthly/quarterly/annual, in advance or arrears, daily proration on mid-period start, cancel and plan change, usage lines, daily billing job.
- **FR-29.11 Documents** — Must. PDF per entity and language; UBL 2.1 JSON for wave 35.
- **FR-29.12 Audit trace** — Should. invoice → packing slip → order line → price explain → schedules in one response.
- **FR-29.13 Intercompany hook** — Could. `invoice.posted` carries `intercompany=true` for intercompany parties (wave 40).
- **FR-29.14 Subscription groups, fee categories and indexation** — Should. The system shall extend `subscription` with subscription groups (defaults for cycle, terms, revenue account), fee categories per line (recurring, one-time, usage, index-linked), period templates (calendar month, 4-4-5, anniversary) and index rules (percentage or external index with effective date) that re-price subscription lines on the next bill with an indexation note on the invoice. Notes: AX SMA subscription semantics; an index run previews affected subscriptions; indexation history is kept per line; accrual of subscription revenue uses FR-29.8 RATABLE.
- **FR-29.15 Expense deferrals** — Should. The system shall create deferral schedules for prepaid expenses from w19 vendor invoice lines (or manual), with method STRAIGHT_LINE (daily or monthly) over a term, short-term / long-term split (within 12 months → 1300, beyond → 1310), and a monthly recognition run posting Dr expense account / Cr 1300; schedules are visible on the same roll-forward as revenue (FR-29.9) with `kind = EXPENSE`. Notes: D365 deferral schedule parity; a credit from the vendor reverses remaining schedule lines; roll-forward ties to GL 1300 + 1310.
- **FR-29.16 Customer self-billing** — Could. The system shall import a customer self-billing statement (lines: delivery or packing slip reference, quantity, unit price, amount, tax; EDI 820 / GSVERF via w35 or CSV) and reconcile it line by line against posted or proposed invoices: matching lines mark the invoice as self-billed; price differences within `self_billing_tolerance` post an adjustment credit/debit; other differences are listed for review. Notes: SAP VSB1 / VKA; the customer's document number is stored as `external_invoice_ref`; open items settle against the customer's remittance (w30) by that reference.
- **FR-29.17 Bundle (solution) lines** — Should. The system shall accept a bundle product on an order line (w8 kit/bundle definition) and at invoice proposal explode it into components with mixed revenue types (goods POINT_IN_TIME, service MILESTONE, subscription RATABLE) under one revenue contract (FR-29.7), printing the bundle as one line with components itemized beneath it when `print_components`. Notes: SAP solution order; allocation per BR-29.1; a component shipped later is invoiced when shipped while the contract already exists.
- **FR-29.18 Installment terms** — Should. The system shall, when the invoice's payment terms (w7) carry an installment plan (n installments with percentage and offset days, or fixed dates), create one open item per installment at post with the same invoice number and an installment suffix, each with its own due date and cash-discount date; dunning and aging operate per installment. Notes: SAP OBB9 / T052R and AX payment schedules; Σ installments = gross exactly with residual cents on the last installment; a credit note settles installments latest-first unless specified.
- **FR-29.19 Document delivery routing** — Should. The system shall hold a delivery preference per customer (and optionally per invoice account and document type: invoice, credit note, statement, confirmation, packing slip) with channel EMAIL, PORTAL, PRINT, EDI, NONE, recipients, copies and language, and route generated documents accordingly from the post saga with a delivery log and resend action. Notes: AX print management "per account" destinations and form notes; SAP NAST medium per partner; conditional query-based routing and designer-level overrides arrive with wave 46 and read the same preference entity.

5.29.4 Data model

invoice (CustInvoiceJour / VBRK)

Field	Type	Required	Notes
id, invoice_number	uuid, text	Y	gap-free per entity + fiscal year
legal_entity_id, invoice_account_id, customer_id	uuid	Y	
invoice_type	enum	Y	SHIPMENT, CONSOLIDATED, FREE_TEXT, SUBSCRIPTION, MILESTONE, CREDIT_NOTE
status	enum	Y	PROPOSAL, POSTED, PARTIALLY_SETTLED, SETTLED, REVERSED
invoice_date, posting_date, due_date	date	Y	due from terms
currency, exchange_rate_id	char(3), uuid	Y	three-currency amounts (w12)
net_amount, charge_amount, tax_amount, gross_amount	numeric(19,4)	Y	gross = net + charges + tax
cash_discount_date, cash_discount_amount	date, numeric	N	
journal_posting_id, tax_document_id, original_invoice_id	uuid	Y/N	original for credit notes
document_ref, einvoice_ref	text	N	PDF, UBL

invoice_line (CustInvoiceTrans / VBRP): id, invoice_id, line_no, order_line_id, packing_slip_line_id, product_id, description, qty, unit, unit_price, disc_pct_1/2, line_net, tax_code, tax_amount, revenue_account, dimensions, cost_amount, performance_obligation_id, price_explain_ref.

revenue_contract: id, order_id, customer_id, currency, transaction_price, allocation_method, status (OPEN | COMPLETE | CANCELLED). **performance_obligation**: id, contract_id, product_id | bundle_component, ssp_amount, ssp_source (EXPLICIT | LIST | PCT_OF_LIST | RESIDUAL), allocated_amount, method, term_start, term_end, satisfied_at, deferred_account 2400, revenue_account 4000. **revenue_schedule**: id, obligation_id, period_id, scheduled_date, amount, status (SCHEDULED | RECOGNIZED | REVERSED), journal_posting_id.

subscription: id, customer_id, order_id, plan, billing_cycle, bill_in_advance, start_date, end_date, next_bill_date, proration (DAILY), status (ACTIVE | PAUSED | CANCELLED), lines[] (product, qty, unit_price, usage_based, usage_unit).

Invariants: gross = Σ line_net + charges + tax exactly after per-line rounding; Σ allocated = transaction_price (residual cents to the largest obligation); Σ schedules per obligation = allocated_amount; POSTED invoices are immutable; per period opening + additions − recognized ± adjustments = closing = GL 2400. Indexing: invoices (invoice_account_id, status, due_date), unique number per (entity, fiscal_year), partitioned by posting month; schedules (period_id, status).

5.29.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
POST	/api/v1/billing/proposals	Build from slips / orders / subscriptions with consolidation	Idempotency-Key	InvoiceMaintain
POST	/api/v1/billing/invoices/{id}:post	Post (tax, journal, AR)	key = invoice id	InvoicePost
POST	/api/v1/billing/free-text-invoices, /credit-notes, …/{id}:post	Free-text and credit notes	Idempotency-Key	InvoiceMaintain / CreditNotePost
GET	/api/v1/billing/invoices/{id}/document?format=pdf|ubl; …/trace	Documents; audit trace	—	InvoiceView / Portal
POST	/api/v1/revrec/contracts/{id}:allocate; /milestones/{ob}:satisfy	Allocation; milestones	Idempotency-Key	RevRecMaintain
POST/GET	/api/v1/revrec/recognition-runs; /roll-forward?period=	Period run; roll-forward	key = period	RevRecPost / RevRecView
POST	/api/v1/billing/subscriptions, …/{id}:change, :cancel; /usage	Subscriptions and usage	Idempotency-Key	SubscriptionMaintain

Validation: post rejects closed AR/GL period, lines without revenue account, tax engine unavailable (503 `TAX_UNAVAILABLE`), credit beyond the original's remaining creditable amount.

Event	Trigger	Payload fields	Consumers
dev.passage.billing.invoice.posted.v1	post	invoice_id, number, type, customer, invoice_account, currency, dates, lines[{order_line_id, product, qty, net, tax, revenue_account, obligation_id}], totals, journal_posting_id, intercompany	receivables, revrec, ledger, pricing, portal, sales
passage.billing.credit-note.posted.v1	post	credit_note_id, original_invoice_id, lines, totals, journal_posting_id	receivables, revrec, ledger, portal
dev.passage.revrec.contract.allocated.v1	allocate	contract_id, obligations[{id, ssp, allocated, method}]	analytics, audit
dev.passage.revrec.schedule.recognized.v1	run / event	schedule_id, obligation_id, period_id, amount, journal_posting_id	ledger, analytics
dev.passage.billing.subscription.billed.v1	daily job	subscription_id, invoice_id, period, proration	portal, analytics

5.29.6 User experience

Screen	Primary actions	Key fields/columns	Duty
Billing workspace	tiles: ready to invoice, proposals, failed posts, deferred balance, subscriptions due	counts, amounts	InvoiceView
Billing due list	filter, select, propose, consolidate	customer, slips, amount, cycle	InvoiceMaintain
Invoice proposal / detail	edit charges, review tax, post, print, credit	lines, tax breakdown, totals, obligations	InvoicePost
Free-text invoice	add lines, template, post	account, dims, amount, tax code	InvoiceMaintain
Revenue contract / roll-forward	view allocation, adjust SSP, satisfy milestone; run period, drill	obligation, SSP, allocated, recognized, deferred; opening…closing, GL 2400	RevRecMaintain / RevRecView
Subscriptions	create, change plan, pause, cancel	plan, cycle, next bill, proration preview	SubscriptionMaintain

Interaction rules: proposals show tax and journal preview before post; multi-select post ≤ 500 invoices with per-row results; roll-forward drill-down opens schedules by period; column sets personalizable.

5.29.7 Business rules and edge cases

- **BR-29.1 ASC 606 allocation worked example.** Bundle: hardware (SSP 8,000.00 USD, POINT_IN_TIME at packing slip), installation (SSP 1,500.00, MILESTONE), 12-month support (SSP 2,500.00, RATABLE). Σ SSP 12,000.00; contract price 10,800.00 (10% bundle discount). Factor 10,800 / 12,000 = 0.9 → hardware 7,200.00, installation 1,350.00, support 2,250.00. Invoice at shipment 2027-03-10: Dr 1200 10,800.00 (plus tax), Cr 4000 7,200.00, Cr 2400 3,600.00. Installation satisfied 2027-03-25: Dr 2400 / Cr 4000 1,350.00. Support 2027-03-10 to 2028-03-09 at 2,250.00 / 12 = 187.50 per month; first partial month 22/31 × 187.50 = 133.06; the last period absorbs the residual so Σ = 2,250.00. With a contract price of 10,799.99 the allocation 7,199.99 / 1,349.99 / 2,249.99 sums to 10,799.97; the 0.02 residual goes to the largest obligation (hardware 7,200.01).
- **BR-29.2 SSP determination order.** Explicit SSP per product × customer group → list price (PRICE access 7) → % of list per product group → residual (at most one obligation per contract).
- **BR-29.3 Rounding.** Line net half-even to minor units; tax per line (w13) then summed unless the engine returns document-level rounding; allocation at 2 decimals with residual rule; ratable schedules at 2 decimals, last period absorbs the residual.
- **BR-29.4 Dates.** invoice_date ≥ slip posting date; posting_date in an open AR period; due_date = invoice_date + terms (incl. end-of-month variants, w7); cash discount date per terms.
- **BR-29.5 Consolidation** groups by (invoice_account, currency, terms, cycle, address if `split_by_address`); ≤ 2,000 lines; a slip belongs to at most one invoice.
- **BR-29.6 Credit note on partially recognized revenue** reverses recognized revenue proportionally (Dr 4000) and unrecognized deferred (Dr 2400) in the credit period; later schedules become REVERSED.
- **BR-29.7 State machines.** Invoice: PROPOSAL → POSTED → PARTIALLY_SETTLED → SETTLED; POSTED → REVERSED only same posting date with no settlements. Schedule: SCHEDULED → RECOGNIZED → REVERSED (credit note only).
- **BR-29.8 Proration** is daily: amount × service days / period days, including 29 February; a mid-period plan change credits unused old-plan days and bills new-plan remaining days on one invoice; cancellation effective date ≥ today.
- **BR-29.9 Gap-free numbering.** Two posts of one proposal share the Idempotency-Key and return the same invoice; the number is drawn from a serialized sequence per (entity, fiscal_year) in the saga's final step, after tax and journal succeed, so a failed post consumes no number.
- **BR-29.10 Usage records** accepted up to 45 days after period end; later ones bill in the next period with `late=true`.

- **BR-29.11 Installment split.** Installment i amount = round_half_even(gross × pct_i, minor units); the last installment = gross − Σ previous; due_date_i = invoice_date + offset_i (or the fixed date) rolled per terms rules; tax is reported once on the invoice, not per installment; the installments share one journal posting.
- **BR-29.12 Indexation** applies the index rule on the first bill date ≥ effective date; new unit price = round_half_even(old × (1 + pct/100) or old × index_new / index_base, 6 decimals); the invoice line text shows the old price, factor and new price; indexation never re-prices already-billed periods.
- **BR-29.13 Expense deferral** schedule amount per period = total × days in period / term days (daily) or total / periods (monthly) at 2 decimals with the residual on the last period; the short-term portion is recomputed at each period close as the next 12 months of unrecognized amounts and reclassified 1310 → 1300.
- **BR-29.14 Self-billing reconciliation.** Match key = packing slip or delivery number + product; quantity must equal exactly; price difference ≤ `self_billing_tolerance` (default 0.5% or 5.00) posts an adjustment credit note (customer lower) or debit note (customer higher) referencing the invoice; unmatched statement lines create review tasks; an invoice may be self-billed once.
- **BR-29.15 Document routing** evaluates (customer, invoice account, document type) → (customer, document type) → (customer) → entity default; EDI channel requires an active w35 trading-partner agreement else falls back to EMAIL with a warning; PRINT queues to the w5 print service; delivery failures retry 3× then appear in the Billing workspace tile "undelivered documents".

5.29.8 Acceptance criteria

- **AC-29.1** (FR-29.3) Given 1,000 random invoices in USD, EUR and JPY, then gross = Σ line_net + charges + tax for every invoice (property).
- **AC-29.2** (FR-29.7) Given the BR-29.1 bundle, then obligations are 7,200.00 / 1,350.00 / 2,250.00 and the first postings match the example to the cent.
- **AC-29.3** (FR-29.7, FR-29.8) Given the 40 ASC 606 fixtures, then allocation and recognition per period equal the accountant-reviewed workbook for 40/40.
- **AC-29.4** (FR-29.9) Given 2027-03 additions 3,600.00 and recognized 1,483.06, then closing 2,116.94 = GL 2400.
- **AC-29.5** (FR-29.2) Given 3 slips for one account on a weekly cycle, then one invoice is proposed and each slip becomes INVOICED on post.
- **AC-29.6** (FR-29.5) Given the posted 10,800.00 invoice with installation recognized, when a full credit note posts, then AR −10,800.00, recognized revenue reversed and remaining deferred reversed, with schedules REVERSED.
- **AC-29.7** (FR-29.10) Given a monthly 300.00 EUR subscription starting 2028-02-10 billed in advance, then the first invoice is 300 × 20/29 = 206.90 EUR.
- **AC-29.8** (FR-29.6) Given the tax engine is down, when posting, then 503 `TAX_UNAVAILABLE` and no journal or open item exists.
- **AC-29.9** (FR-29.4) Given a DMF-DE free-text line to 4900 with 19% VAT of 100.00 EUR, then Dr 1200 119.00 / Cr 4900 100.00 / Cr 2300 19.00.
- **AC-29.10** (FR-29.18) Given terms "3 installments 30/30/40 at +0/+30/+60 days" and a gross of 1,000.01 USD invoiced 2027-03-10, then open items of 300.00 (due 03-10), 300.00 (04-09) and 400.01 (05-09) exist with one invoice number and one journal posting.
- **AC-29.11** (FR-29.14) Given a monthly subscription line at 100.00 EUR with a 3% index rule effective 2027-04-01, when the April bill runs, then the line bills 103.00 with the indexation note and March remains 100.00.
- **AC-29.12** (FR-29.15) Given a 12,000.00 USD annual insurance invoice (w19) dated 2027-03-01 deferred monthly, then 1,000.00 recognizes each month Dr 6300 / Cr 1300, and at 2027-03 close the long-term portion is 0.00 and short-term 11,000.00.
- **AC-29.13** (FR-29.16) Given a self-billing statement with 10 lines of which 9 match and one prices 0.3% lower, then 9 invoices are marked self-billed, one adjustment credit note posts for the difference, and no review task exists.
- **AC-29.14** (FR-29.19) Given customer C3 with preference EMAIL for invoices and PORTAL for statements, when an invoice posts, then the PDF is emailed to the two configured recipients within 60 s and the delivery log shows status DELIVERED.
- **AC-29.15** (FR-29.17) Given a bundle product B-1 (hardware, installation, 12-month support) ordered at 10,800.00 USD, when invoiced, then one revenue contract with three obligations exists per BR-29.1 and the PDF prints one bundle line with three itemized components.

5.29.9 Test plan and fixtures

Fixtures: `asc606-40` (bundles with SSPs, discounts, milestones, modifications; workbook `fixtures/revrec/asc606-40.xlsx`); `invoices-random-1k`; `subscription-edges-25` (mid-period, leap day, plan change, cancel); `consolidation-12`; `credit-notes-15`.

Test	Type	Target	Pass criterion
Totals	property	post	gross = Σ components, 3 currencies
ASC 606	unit	revrec	40/40 match workbook
Roll-forward = GL 2400	reconciliation	nightly	0.00
Proration edges	unit	subscription	25/25
Posting saga	integration	billing ↔ tax ↔ ledger ↔ receivables	no partial state on injected failures
Documents	snapshot	docgen templates	PDF text and UBL schema valid
Billing ↔ fulfillment/receivables	contract (Pact)	APIs	green

Reconciliation: Σ POSTED gross − credit notes = AR additions = GL 1200 debits from billing; recognized revenue = GL 4000 credits from billing + revrec; DNI reversals = slip costs invoiced.

5.29.10 Deployment and operations

Helm `passage-billing`, `passage-revrec` (Go); `billing-db`, `revrec-db`; docgen templates in a ConfigMap per entity. Config: `BILLING_MAX_LINES=2000`, `BILLING_BATCH_MAX=500`, `REVREC_RESIDUAL_RULE=largest`, `USAGE_LATE_DAYS=45`. Flags: `billing.consolidation`, `billing.subscriptions`, `revrec.usage`, `billing.einvoice`. Jobs: subscription billing 03:00; recognition run on period-close trigger (w14) plus nightly preview; roll-forward check 02:30. SLOs: post p95 < 3 s, 99.95% availability. Alerts: failed posts > 1% in 15 min, roll-forward diff ≠ 0, run > 30 min. Runbook: re-run proposal, same-day reversal, regenerate document. Rollback: previous digest; recognition run idempotent per period.

5.29.11 Migration from AX / SAP

Source	Passage entity	Notes
CustInvoiceJour/Trans and CustInvoiceTable/Line with open CustTransOpen	invoice (POSTED), lines	header amounts and due dates; lines for trace
RevRecSchedule / RevRecContract (D365)	revenue_contract, obligations, unrecognized schedules	unrecognized = opening 2400
VBRK/VBRP with open BSID	invoice, lines	VBTYP O → CREDIT_NOTE
FARR_D_CONTRACT / POBS / DEFITEM (RAR)	revenue_contract, obligations, schedules	deferred items per POB → schedules
FPLA/FPLT open billing plans	subscription / milestone_schedule	

Validation: Σ migrated open balances = legacy AR trial balance per customer; Σ unrecognized schedules = legacy deferred revenue balance. Not migrated: settled invoices before the current fiscal year (lakehouse), SSRS/Smart Forms layouts (re-templated), RAR posting history.

5.29.12 Dependencies, risks, open questions

- Depends on: w28 packing slips; w27 lines and terms; w13 tax; w11/w12 journal and currencies; w14 period control; w26 explain refs and rebate basis; w5 document rendering and gap-free sequences.
- Risks: gap-free numbering under saga failure (BR-29.9); missing SSP for migrated products (residual method with warning report).
- Open questions: (1) Document- vs. line-level tax rounding per country? Default line level unless the country pack says otherwise; decide by wave 30. (2) Subscription invoices gap-free per entity or per subscription? Default per entity; decide at wave 29 mid-point.

5.29.13 Parameters and setup

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
summary_update_default	customer (w7) with entity default	enum	ORDER	ORDER, INVOICE_ACCOUNT, AUTOMATIC, NONE	FR-29.2 consolidation	AR parameters → Summary update tab (Summary update for invoices)	VOFA billing type collective invoice / VTFL copy control split criteria

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
Failed posts / undelivered documents	KPI / list	date, error	proposal, error code, retries; document, channel, failure	proposal + delivery log	Posting log / print management log	VF04 log, NAST error (V.21)
Invoice register (sales journal)	statutory report	entity, period, tax code	number, date, customer, tax id, net, tax, gross	invoice	SSRS Invoice journal / sales tax transactions	RFBELJ00 / S_ALR_87012357
Credit notes analysis	operational report	reason, customer, period	count, amount, % of revenue, recognized reversed	credit_note	Credit note journal	VF05 filter VBTYP O

5.29.15 Printed and electronic documents

Document	Trigger	Layout elements	Formats	Numbering sequence	Legal / retention requirement
Sales invoice	post	header: entity legal name, address, tax ids, invoice number, date, due date, customer, invoice account, ship-to, order, terms, currency; lines: product, description, qty, unit, unit price, discount, net, tax code; footer: net, charges, tax by rate, gross, installments, cash discount, bank details, legal text	PDF, UBL 2.1 (w35 Peppol), email, portal, print	`INV–` gap-free per entity and fiscal year	statutory: EU VAT Directive art. 226 content; retain 10 years (DE GoBD), 7 years (US)
Free-text invoice	post	as invoice; lines: description, account-driven, tax code	PDF, UBL, email	same `INV–` series (or `FTI–` if `invoice_number_scope = ENTITY_DOC_TYPE`)	as invoice
Credit note	post	as invoice plus original invoice reference and reason	PDF, UBL CreditNote, email	`CN–` gap-free	as invoice; must reference original (art. 219)
Subscription invoice	daily billing job	as invoice plus service period, proration, indexation note	PDF, UBL, email	`INV–`	as invoice
Bundle invoice	post	bundle line with itemized components	PDF, UBL	`INV–`	as invoice
Self-billing adjustment note	reconciliation	statement reference, invoice, difference	PDF, email	`CN–` / `DN–`	as invoice; self-billing agreement on file (EU art. 224)
Revenue contract summary	on demand	obligations, SSP, allocation, schedule	PDF, CSV	none	audit support 7 years
Deferred revenue roll-forward	period close	opening → closing per contract	PDF, XLSX	none	audit workpaper 7 years

5.29.16 Periodic and batch jobs

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
Consolidated billing run	per cycle (daily 22:00, weekly Sunday 22:00, monthly last day 22:00)	invoice account	key = (account, cycle, period)	< 20 min per 50k slips	per-invoice saga; failures listed	failed > 1%
Subscription billing	03:00 daily	subscription	key = (subscription, period)	< 30 min per 100k subscriptions	retry; skip and report	subscriptions due not billed by 06:00
Indexation run	per index effective date, preview 7 days ahead	subscription group	key = (rule, effective date)	< 5 min	preview stays open	index missing
Revenue recognition run	period-close trigger (w14) + nightly preview 01:00	legal entity × period	key = period; per schedule line status	< 30 min per 1M schedule lines	resumable from last schedule id	run > 30 min; diff ≠ 0
Expense deferral recognition	period close + nightly preview	legal entity	key = period	< 10 min	resumable	unrecognized past periods > 0
Roll-forward check	02:30 daily	legal entity	key = (entity, date)	< 5 min	report only	diff ≠ 0.00
Document delivery retry	every 10 min	channel	delivery id	< 1 min	3 retries then workspace tile	undelivered > 50
Self-billing statement import	on file arrival (SFTP poll 15 min)	customer	SHA-256 of file	< 2 min	quarantine malformed	review tasks > 20

5.29.17 Security duties and privileges

Duty	Privileges (entry points)	Segregation-of-duties conflicts	Default roles
InvoiceView	GET invoices, documents, trace; Billing workspace	none	Billing clerk, AR clerk, Sales, Auditor
InvoiceMaintain	proposals, free-text invoices, due list	with ARPaymentPost (w30)	Billing clerk
InvoicePost	:post (single and batch)	with PackingSlipPost (w28) under four-eyes; with CustomerMaintain (w7)	Billing clerk
CreditNotePost	credit notes :post	with ARSettle and with InvoicePost on the same invoice when `credit_note_four_eyes`	Billing supervisor
RevRecMaintain	:allocate, SSP adjustments, milestones	with RevRecPost	Revenue accountant
RevRecPost	recognition runs, expense deferral runs	with RevRecMaintain	Controller
RevRecView	roll-forward, contracts	none	Controller, Auditor
SubscriptionMaintain	subscriptions, :change, :cancel, usage, index rules	with InvoicePost when subscription invoices auto-post	Subscription manager
SelfBillingReconcile	statement import, match, adjustments	with CreditNotePost	Billing supervisor
DocumentDeliveryMaintain	delivery preferences, resend	with CustomerMaintain (bank detail fraud risk on recipients)	AR manager

5.29.18 Message catalog

Code	Severity	User text	Cause	Remediation	Raised by
BIL-0001	error	Tax engine unavailable; invoice not posted	w13 outage	Retry later	FR-29.6 / AC-29.8
BIL-0002	error	Tax changed by {amount} since proposal; review required	tax recheck > tolerance	Re-review and post	FR-29.6
BIL-0003	error	Posting period {period} is closed	BR-29.4	Choose an open period	BR-29.4
BIL-0004	error	Line {n} has no revenue account	posting profile gap	Set account in w16/w11 profile	§5.29.5 validation
BIL-0005	error	Credit exceeds remaining creditable amount {amount}	FR-29.5	Reduce credit	FR-29.5
BIL-0006	error	Invoice date {date} precedes packing slip date {slip_date}	BR-29.4	Correct date	BR-29.4
BIL-0007	error	Consolidation exceeds {max} lines; split into {n} invoices	BR-29.5	none (auto split) or reduce	BR-29.5
BIL-0008	error	Same-day reversal not allowed: invoice has settlements	BR-29.7	Issue a credit note	BR-29.7
BIL-0009	warning	SSP missing for {product}; residual method used	BR-29.2	Maintain SSP	FR-29.7
BIL-0010	warning	Usage record is late; billed next period	BR-29.10	none	BR-29.10
BIL-0011	error	Installment percentages total {pct}%, expected 100%	FR-29.18	Fix terms (w7)	BR-29.11
BIL-0012	warning	Index value for {index} missing for {date}; indexation skipped	FR-29.14	Load index	BR-29.12
BIL-0013	error	Self-billing line {n} does not match any invoice	BR-29.14	Review task	FR-29.16
BIL-0014	error	Invoice {number} already self-billed	BR-29.14	none	FR-29.16
BIL-0015	warning	EDI delivery not configured for {customer}; sent by email	BR-29.15	Activate trading partner (w35)	FR-29.19
BIL-0016	error	Document delivery failed after {n} retries	BR-29.15	Resend or change preference	FR-29.19
BIL-0017	error	Expense deferral term must be ≥ 2 periods	FR-29.15	Post as expense	FR-29.15

5.29.19 Performance budgets and capacity

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
Invoice post (saga, 10 lines)	50k per day; peak 20/s	900 ms / 3 s / 6 s	20/s per replica	12M invoices × 4 KB + lines 60 GB	partition by posting month; (invoice_account_id, status, due_date)	saga workers scale; batch posts throttle to 50%
Proposal from packing slip	100k per day	100 / 400 / 1,000 ms	50/s	proposals purged after 90 days	(slip_id)	event lag allowed to 5 min
PDF render + delivery	60k per day	1 / 4 / 10 s	30/s	object store 300 GB (10-year retention, cold after 1 year)	content hash	rendering queued; post never waits for PDF
Recognition run	1M schedule lines per period	— / 30 min / 45 min	1k lines/s	schedules 200M rows × 150 B = 30 GB	partition by period	run split by contract range
Subscription billing	100k subscriptions per day	— / 30 min / 60 min	60 subs/s	included above	(next_bill_date, status)	finish by 06:00 or alert
Roll-forward query	200 per day	300 ms / 2 s / 5 s	—	none	materialized per (entity, period)	serve last materialization
Trace API	20k per day	80 / 300 / 800 ms	50/s	none	FK lookups	trace depth limited to explain summary

5.29.20 Localization and compliance hooks

- Invoice content and numbering: EU VAT Directive arts. 220–240 (mandatory fields, gap-free sequences, credit-note references, self-billing agreements art. 224); country packs (w48) add fields (IT codice destinatario, ES SII, FR SIREN, DE Leistungsdatum) through the docgen `country_fields` slot and the UBL extension.
- E-invoicing mandates (IT SDI, FR PPF/PDP 2026–2027, DE XRechnung/ZUGFeRD B2B from 2025, PL KSeF, MX CFDI) are transmitted in w35; this wave produces the UBL 2.1 payload and the `einvoice_ref` hook.
- Tax rounding line vs document per country (BR-29.3, open question 1); US sales tax by jurisdiction via the w13 engine; JPY zero-decimal handling.
- Revenue recognition: ASC 606 and IFRS 15 share one model; country GAAP variants (for example local GAAP point-in-time only) are a second ledger posting in w11 parallel ledgers, not a second engine.
- Down-payment invoices and tax on down payments (DE §13 UStG) are generated by w30 FR-30.21 using the invoice document type DOWN_PAYMENT_REQUEST.
- Retention: invoices and credit notes 10 years immutable (GoBD, w48 archive); PDF/A-3 for DE when `einvoice_enabled`.
- Privacy: invoices for one-time customers and individuals contain personal data; erasure requests are refused within the statutory retention period and pseudonymized after it.

5.29.21 Coverage closure

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
AX §12.28.1 #227 — Service subscriptions (SMASubscriptionTable, fee transactions, index)	PARTIAL-29	ADDED as FR-29.14	service agreements link from wave 45
AX §12.28.2 #228 — Subscription inquiries	PARTIAL-29	ADDED as FR-29.14	§5.29.14 Subscriptions and fee transactions
AX §12.28.2 #229 — SSRS Subscription report / Subscription fee transactions	PARTIAL-29	ADDED as FR-29.14	inquiry export (PDF/CSV)
AX §12.28.3 #230 — Create subscription fee transactions / Accrue subscription revenue / Index subscriptions	PARTIAL-29	ADDED as FR-29.14 (fees, index) and FR-29.8 (accrual)	§5.29.16 indexation run
AX §12.28.4 #231 — Subscription groups, fee categories, index rules, subscription periods	PARTIAL-29	ADDED as FR-29.14	
AX §12.37.1 #314 — Deferral schedules (revenue and expense, short/long-term split)	PARTIAL-29	ADDED as FR-29.15	1300 / 1310 split
AX §12.37.3 #315 — Expense deferral recognition	PARTIAL-29	ADDED as FR-29.15	§5.29.16 job
SAP §13.19 #220 — VKA / VSB1 customer self-billing	GAP (propose 29)	ADDED as FR-29.16	EDI GSVERF / 820 mapping in wave 35
SAP §13.19 #221 — Solution orders / bundled sales	PARTIAL-29	ADDED as FR-29.17	
SAP §13.1 #17 — OBB8 / OBB9 terms of payment / installment terms (PARTIAL-7)	PARTIAL-7	ADDED as FR-29.18 (application at invoice post); terms definition remains wave 7	flagged for order-to-cash

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
SAP §13.3 #47 — OBB9 installment terms (customers) (PARTIAL-7)	PARTIAL-7	ADDED as FR-29.18	
SAP §13.2 #35 — OBB9 installment terms (vendors) (PARTIAL-7)	PARTIAL-7	DEFERRED to wave 19	AP invoice installments reuse the w7 terms model
AX §12.3.4 #30 — Form setup (sales documents) / Form notes / Print management	PARTIAL-46	ADDED as FR-29.19 (per-account destinations); query-based conditional routing DEFERRED to wave 46	
AX §12.17.4 #173 — Form setup, form notes, print management (sales), form sorting	PARTIAL-46	ADDED as FR-29.19; form sorting SUPERSEDED by wave 46 document designer	

5.30 Wave 30: Accounts Receivable, Collections, Returns & Customer Portal

5.30.1 Scope and business context

Wave 30 closes the loop. The `receivables` service applies cash (manual, BAI2 lockbox, remittance advice, camt.053 with ML-assisted suggestions) and settles open items; `collections-workflows` (TS on Temporal) runs aging, dunning, interest notes, promises to pay, disputes and risk scoring; return orders flow through RMA dispositions to inventory and credit notes; wave 26 accruals settle; statements are produced; and the customer portal at `customer.<env>.passage.dev` exposes orders, invoices, payments (Stripe/Adyen sandbox), returns and documents. The wave ends with the Phase 5 exit: the demo manufacturer's one-month simulation with reconciled subledgers and stakeholder sign-off. Out of scope: non-customer bank reconciliation and cash forecasting (wave 36), collections-agency integration, portal self-registration beyond invited contacts, bills of exchange (wave 36), generic case management (wave 45). Added from the coverage registers (§5.30.21): SEPA direct debit mandates and pain.008, deductions workbench, minimal collection cases, correspondence framework with email templates, balance confirmations, down payments and security deposits, distributor chargebacks, vendor dunning, GL/intercompany interest, portal guided configuration and returnable packaging charges.

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
Cash application is manual: AX settle open transactions (CustOpenTrans) makes the clerk find invoices per check; SAP F-28 plus FLB2 post-processing lands 30–50% of payments on account	Exact-reference matching only; no scoring, subset-sum or remittance parsing	BR-30.1 scored rules R1–R7, auto-apply ≥ 85, ML-ranked suggestions across lockbox, camt.053, remittance and portal	Auto-match 40–60% → ≥ 90%; clerk time per payment 3 min → < 20 s; false matches 0
Dunning produces wrong letters: F150 MHNK proposals ignore disputes without FSCM; CustCollectionLetterJour cannot skip promised items	Exclusion state not part of selection	Exclusions from open_item.dispute_id/promise_id at issue time; grace, interval and minimum rules (BR-30.2)	Retracted letters ~5% → 0; run preparation 2 h → < 10 min
Returns need three hand-keyed documents (ReturnTable → arrival journal → credit note; RE order → LR delivery → G2 request → VF01)	Separate forms with manual references	One RMA with dispositions (BR-30.3) driving receipt, scrap/repair/replace and credit note in a saga	Clicks per return ~45 → ≤ 8; cycle time 3–5 days → same day after receipt
Customers phone for statements, invoice copies and status; clerks re-send PDFs	No customer-facing surface on live open items	Portal on the same `open-items`, `invoices`, `shipments` APIs with card/ACH payment and return requests	"Copy of invoice/status" requests –80%; DSO –5 days via portal payments
AR-to-GL reconciliation is a month-end exercise (CustTrans vs. LedgerTrans; BSID vs. recon account via F.03)	Subledger and GL updated by different code paths	Every settlement posts through the journal API; Σ open_amount = GL 1200 daily, in the reconciliation pack	Effort 1–2 days/month → 0; diff 0.00 for 31/31 days

5.30.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Payments and settlement	CustPaymJournal (LedgerJournalTrans), CustTrans/CustSettlement, CustPaymModeTable	F-28, F-32, BSID → BSAD, OB41	payment, settlement, open_item	full
Lockbox	CustLockbox (BAI2 import)	FLB2 / FLB1 (BAI2)	lockbox_batch	full
Bank statement auto-match	Advanced bank reconciliation (camt.053)	FF_5 / EBS camt.053 auto-clearing	camt.053 import + matcher	improved (ML suggest)
Aging / collections	CustAgingLegalEntity, Collections workspace, CustCollectionsPool	FBL5N; FSCM Collections (UDM_SPECIALIST)	aging snapshot, worklist, risk score	full
Collection letters / dunning	CustCollectionLetterJour/Line, sequence, grace days	F150 (MHNK/MHND), FBMP procedure	dunning_run, dunning_letter	full
Interest notes	CustInterestJour/Trans	F.24 / F.2B	interest_note	full
Promise to pay / disputes	Collections promise; cases	FSCM dispute (UDM_DISPUTE)	promise_to_pay, dispute (Temporal)	full
Return orders / RMA	ReturnTable (SalesType=ReturnItem), ReturnDispositionCode, ReturnReasonCode	VA01 type RE, LR delivery, G2 credit memo request; S/4 advanced returns	return_order + return receipt + credit_note	full
Rebate settlement	Rebate settlement to credit note / AP	VBO1 settlement, B1/B2 credit memo	rebate_settlement → credit_note or AP payment	full
Statements / portal / card payments	CustAccountStatementExt; D365 Customer portal; Adyen connector	F.27; SAP Commerce; digital payments add-on	statement job; customer-portal; payments-gateway	improved
SEPA direct debit	CustDirectDebitMandate, CustPaymModeTable (SEPA DD), generate payments (pain.008)	FSEPA_M1..M4 mandates, F110 with payment method DD, SEPA_* customizing	dd_mandate, direct_debit_run → pain.008	full
Deductions	TAMDeductionWorkbench, deduction types, denial reasons	FSCM dispute case with residual items (F-32 residual, UDM_DISPUTE)	deduction (from short pay) + deduction workbench	full
Collection cases	CaseDetail (collections category)	FSCM UDM_DISPUTE / collection worklist case	collection_case (minimal case entity; generic cases w45)	partial
Correspondence	Customer payment advice, collection letters, CustAccountStatementExt	FB12 / F.61 / F.64, OB77 correspondence types (T048)	correspondence_type + correspondence_request via docgen	full
Balance confirmations	— (custom SSRS)	F.17 / F.18 (classic), F.99 / F.97	balance_confirmation run with reply tracking	full
Special G/L customer items	Customer prepayments (CustPrepayment), deposit journals	OBXR special G/L indicators A (down payment), H (security deposit), W (BoE)	open_item.special_gl_type DOWN_PAYMENT, SECURITY_DEPOSIT	partial (BoE w36)
Distributor chargebacks	Rebate management deals (D365)	Settlement management chargeback claims, EDI 844/849	chargeback_claim validation against w26 agreements	full (EDI mapping w35)
Vendor dunning	—	F150 for vendors with debit balances	dunning engine over AP debit open items (w19)	full

5.30.3 Functional requirements

- **FR-30.1 Open items and settlement** — Must. Open items from invoices, credit notes, payments and adjustments; full or partial settlement with cash discount, write-off within tolerance and FX gain/loss (w12) posted at settlement.
- **FR-30.2 Manual payments** — Must. Payment journal by mode (CHECK, ACH, WIRE, CARD, CASH): Dr 1000/1010 bank, Cr 1200; unapplied residual to 1205.
- **FR-30.3 Lockbox BAI2** — Must. Import record types 1–9, one payment per check with remittance detail, then match.
- **FR-30.4 Remittance advice** — Should. CSV/JSON/EDI 820 hook attached to payments for matching.
- **FR-30.5 camt.053 auto-match** — Must. Import statements, identify customer credits (CdtDbtInd=CRDT with RmtInf and debtor data), match per BR-30.1; a Python ranker reorders suggestions but never auto-applies on its own.
- **FR-30.6 Aging and worklist** — Must. Nightly aging (current, 1–30, 31–60, 61–90, 91–180, > 180 by due or invoice date) and a worklist ranked by risk score.
- **FR-30.7 Dunning** — Must. Levels, grace days, minimum amounts, blocks and intervals (BR-30.2); letters via docgen; fees posted; item level raised only at issue.
- **FR-30.8 Interest notes** — Should. Annual rate, ACT/365, minimum 5.00 USD / 5.00 EUR, posted as open items.
- **FR-30.9 Promises and disputes** — Must. Promises (amount, date) and disputes (reason, amount, owner, SLA) exclude items from dunning and interest while open; Temporal workflow to resolution (credit, paid, write-off, rejected).
- **FR-30.10 Risk scoring** — Should. 0–100 from overdue ratio, average days to pay, dunning level, disputes and broken promises; published to credit.
- **FR-30.11 Return orders (RMA)** — Must. RMA referencing invoice lines (or blind), 30-day validity, receipt to quarantine/inspection, dispositions (BR-30.3), inventory receipt at return cost, credit note with restocking charges.
- **FR-30.12 Rebate settlement** — Must. Settle wave 26 accruals per agreement period into a credit note (default) or AP payment (w19 hook), reversing 2150.
- **FR-30.13 Statements** — Should. Monthly and on-demand PDF statements and portal view.
- **FR-30.14 Customer portal** — Must. Invited contacts place orders, view invoices/documents, pay by card/ACH via payments-gateway, request returns and track shipments; Keycloak realm `portal`, OPA scoped to the contact's accounts; WCAG 2.1 AA.
- **FR-30.15 Phase-exit simulation** — Must. Harness `sim/phase5-month` drives Phases 3–5 end-to-end and produces the §5.0 reconciliation pack.
- **FR-30.16 SEPA direct debit mandates and collection** — Must. The system shall store SEPA mandates per customer bank account (unique mandate reference ≤ 35 chars, creditor identifier per legal entity, scheme CORE or B2B, signature date, sequence state FRST/RCUR/FNAL/OOFF, status PENDING → ACTIVE → SUSPENDED / CANCELLED / EXPIRED), run a direct-debit proposal over due open items of customers with payment mode SEPA_DD and an active mandate, and generate pain.008.001.08 files through the w19 ISO 20022 generator, creating DD payments that settle the items on collection date. Notes: pre-notification sent ≥ 14 calendar days before collection (configurable down to 2 by agreement); mandates unused for 36 months expire automatically; returns and rejects (pain.002 / camt.054 R-transactions) reopen the items and post the return fee as FEE; AX CustDirectDebitMandate and SAP FSEPA_M1..M4 map 1:1.
- **FR-30.17 Deductions workbench** — Should. The system shall convert the unexplained part of a short payment (R7 short-pay with reason, or a remittance line marked deduction) into a `deduction` open item (source DEDUCTION) with type and reason code, and provide a workbench to match deductions to w26 claims (rebate accruals, promotion fund usage, chargebacks), approve (credit note against the claim), deny (re-bill to the customer as a debit open item with a denial reason), split, or write off within `deduction_write_off_limit`. Notes: AX TAMDeductionWorkbench parity; matched deductions reduce the fund or accrual they consume; aging of deductions is separate from invoice aging; deductions never raise a dunning level while open.
- **FR-30.18 Collection cases** — Should. The system shall group collection work into a `collection_case` (customer, category COLLECTION or DISPUTE or DEDUCTION, owner, priority, status, SLA, linked open items, disputes, promises, activities and notes) with a Temporal timer per SLA. Notes: this is the minimal case entity that the AX/D365 generic case framework (categories, processes, knowledge articles) will replace in wave 45 through a migration of `collection_case` rows into generic cases; the API path `/receivables/cases` stays as a façade.
- **FR-30.19 Correspondence framework** — Should. The system shall define correspondence types (ACCOUNT_STATEMENT, PAYMENT_NOTICE, OPEN_ITEM_LIST, INDIVIDUAL_LETTER, DUNNING_LETTER, INTEREST_NOTE, BALANCE_CONFIRMATION, DD_PRE_NOTIFICATION) each with a docgen template per language and an email template (subject, body with merge fields), and accept correspondence requests on demand (single customer, from any open-item or payment screen) or periodic (job), delivered by the FR-29.19 routing with a delivery log. Notes: SAP FB12 / F.61 / F.64 and OB77; D365 collections email templates; the payment notice is generated automatically after each applied payment when the customer preference says so.
- **FR-30.20 Customer balance confirmations** — Should. The system shall run balance confirmations as of a key date for a selected customer set (balance ≥ threshold, or random sample of n), generate a confirmation letter with the open-item list and a reply form (portal link with a one-time token, or email reply), record replies (AGREED, DISAGREED with customer balance and comment, NO_REPLY) and produce a difference list for audit. Notes: SAP F.99 / F.17 parity; replies are immutable once recorded; a second reminder is sent after `confirmation_reminder_days` (default 14).
- **FR-30.21 Down payments and security deposits** — Should. The system shall record customer down-payment requests (noted item, no GL posting), down payments received (Dr bank / Cr 2190 Customer down payments, tagged to an order), clearing of down payments against the final invoice (Dr 2190 / Cr 1200, with tax on down payment where the country pack requires), and security deposits (Dr bank / Cr 2195, released by refund or offset). Notes: SAP special G/L indicators A, F, H (OBXR); AX customer prepayments; open items carry `special_gl_type` and are excluded from dunning and from credit exposure as a reduction only when `down_payment_reduces_exposure`; bills of exchange (indicator W) are out of scope here (wave 36).
- **FR-30.22 Distributor chargeback claims** — Could. The system shall import chargeback claims from distributors (CSV now; EDI 844 in, 849 response via w35) with lines (end customer, product, quantity, contract price, invoice reference), validate each line against the w26 agreement for the end customer (price, validity, eligibility), accept or reject per line with reason codes, and settle accepted amounts by credit note to the distributor or as deduction match (FR-30.17). Notes: chargeback claim types configurable; accepted amount per line = (distributor acquisition price – contract price) × quantity; duplicates detected by (distributor, claim number, line).
- **FR-30.23 Dunning of vendors with debit balances** — Could. The system shall let a dunning run include vendors (w19) whose net open AP balance is a debit beyond `vendor_dunning_min` (default 100.00 USD / 90.00 EUR) using the same levels and templates. Notes: SAP F150 vendor dunning; no fees and no interest on vendors by default.
- **FR-30.24 Interest on GL and intercompany balances** — Could. The system shall extend the interest engine (FR-30.8) to selected GL accounts and intercompany due-to/due-from balances with balance-based interest (daily balance × rate × days / basis ACT/360 or ACT/365), producing an interest calculation journal for review and post. Notes: SAP F.50 / F.52 and OB46 interest indicators; intercompany pairing completes in wave 40.
- **FR-30.25 Portal guided configuration** — Could. The system shall let portal contacts configure a configurable product through the w8 configurator API (attribute questions, constraint validation, price preview from w26) and add the configuration to a portal order. Notes: SAP CPQ / variant configuration web UI parity; uses the same configuration_id as FR-27.11; constraint errors shown inline.
- **FR-30.26 Returnable packaging charges** — Could. The system shall, for returnable packaging balances (FR-28.16) older than `rtp_charge_days`, propose a free-text invoice charging the deposit price per unit, and credit it when the packaging returns within 365 days.

5.30.4 Data model

open_item (CustTrans/CustTransOpen, BSID)

Field	Type	Required	Notes
id, legal_entity_id, customer_id, invoice_account_id	uuid	Y	RLS

Field	Type	Required	Notes

cash_discount_date, cash_discount_amount	date, numeric	N	
dunning_level, last_dunned_at, dunning_block	smallint, date, bool	Y	defaults 0 / null / false
dispute_id, promise_id	uuid	N	exclusion flags
status	enum	Y	OPEN, PARTIALLY_SETTLED, SETTLED, REVERSED

payment: id, payment_number, customer_id (nullable until identified), payment_mode, amount, currency, received_date, value_date, bank_account_id, source (MANUAL | LOCKBOX | CAMT053 | PORTAL | REMITTANCE), source_ref (unique with source), payer_name, payer_account_hash, remittance[] (reference, amount), status (RECEIVED | SUGGESTED | APPLIED | ON_ACCOUNT | REVERSED), match_score, journal_posting_id. **settlement** (CustSettlement): id, payment_id | credit_item_id, open_item_id, settled_amount, cash_discount_taken, write_off_amount, fx_gain_loss, settled_at, journal_posting_id, reversal_of_id.

dunning_run: id, legal_entity_id, run_date, parameters, status (DRAFT | REVIEWED | ISSUED | CANCELLED). **dunning_letter**: id, run_id, customer_id, level, items[] (open_item_id, open_amount, days_overdue), fee_amount, document_ref, issued_at. **dispute**: id, customer_id, open_item_id, reason_code, disputed_amount, owner, status, sla_due, workflow_run_id.

return_order (ReturnTable): id, rma_number, customer_id, original_invoice_id, return_reason_code, status (BR-30.6), expires_at, lines[] (original_invoice_line_id, product, qty_expected, qty_received, disposition_code, return_cost_method (ORIGINAL_COST | CURRENT_COST | ZERO), restocking_pct, restocking_amount, inventory_receipt_ids[], credit_note_line_id).

Invariants: Σ settlements per item ≤ |amount|; open_amount = 0 ⇔ SETTLED; Σ OPEN open_amount per entity = GL 1200; Σ ON_ACCOUNT = GL 1205; a payment is APPLIED only when Σ settlements + residual = amount; dunning_level never decreases while open; disputed or promised items are excluded from dunning and interest; credited qty ≤ received qty × unit credit. Indexing: open items (customer_id, status, due_date), (document_number); payments (status, received_date), unique (source, source_ref); settlements partitioned by month.

5.30.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
GET	/api/v1/receivables/open-items?customer=&status=&asOf=	Open items (FBL5N)	—	ARView / Portal (own)
POST	/api/v1/receivables/payments, …/{id}:match, :apply, :on-account, :reverse	Payment lifecycle; scored candidates	Idempotency-Key	ARPaymentPost
POST	/api/v1/receivables/lockbox/imports; /bank-statements/imports	BAI2 and camt.053 files	SHA-256 of content	ARImport
POST	/api/v1/receivables/settlements:batch	Settle with credits/payments, discount, write-off	Idempotency-Key	ARSettle
GET	/api/v1/receivables/aging?asOf=&bucketBy=	Aging snapshot	—	ARView
POST	/api/v1/receivables/dunning-runs, …/{id}:review, :issue, :cancel	Dunning	Idempotency-Key	DunningRun
POST	/api/v1/receivables/interest-notes:calculate, :post; /promises; /disputes, …/{id}:resolve	Interest, promises, disputes	Idempotency-Key	InterestPost / CollectionsMaintain
POST	/api/v1/sales/return-orders, …/{id}:authorize; /lines/{l}:receive, :disposition	RMA saga (sales + fulfillment + billing)	Idempotency-Key	ReturnMaintain / WarehouseReceive
POST	/api/v1/pricing/rebates/settlements	Settle accruals for a period	key = (agreement, period)	RebateSettle
GET/POST	/portal/api/v1/{orders,invoices,payments,returns,shipments,documents}	Portal BFF (scoped)	Idempotency-Key	PortalCustomer
POST	/api/v1/payments-gateway/intents; /webhooks/{provider}	Card/ACH intents; signed provider webhooks	provider id	system

Validation: apply requires Σ settlements + on-account residual = payment amount; cross-currency settlement only with FX settlement enabled; dunning issue requires REVIEWED; disposition requires qty_received > 0; portal payments require Σ selected open ≥ amount.

Event	Trigger	Payload fields	Consumers
dev.passage.receivables.payment.received.v1	import / manual / portal	payment_id, source, amount, currency, payer, remittance[]	matcher, analytics
dev.passage.receivables.payment.applied.v1	apply	payment_id, settlements[{open_item_id, amount, discount, write_off, fx}], residual, journal_posting_id	ledger, sales credit, portal, collections
passage.receivables.customer-balance.changed.v1	any open item change	customer_id, balance, overdue, oldest_item_days, dunning_level, risk_score	sales credit, portal
passage.receivables.dunning-letter.issued.v1	issue	run_id, customer_id, level, items[], fee, document_ref	docgen, portal, sales (hold at level 4)
dev.passage.receivables.dispute.opened.v1 / resolved.v1	dispute lifecycle	dispute_id, open_item_id, amount, reason, resolution	collections, billing, analytics
passage.receivables.return-order.authorized.v1 / dispositioned.v1	RMA	rma_id, line, disposition, qty, restocking, credit_note_id	fulfillment, inventory, billing, portal

5.30.6 User experience

Screen	Primary actions	Key fields/columns	Duty
AR workspace	tiles: unapplied cash, overdue by bucket, disputes, dunning due, RMAs awaiting inspection	amounts, counts	ARView
Cash application	import, accept/adjust suggestions, apply, on-account, split	payment, payer, amount, candidates with score and rule ids, residual	ARPaymentPost
Open items / settlement	select, settle, discount, write-off, reverse	document, due, open amount, discount available, level	ARSettle
Collections worklist / dispute detail	log contact, promise, dispute, hold order; assign, evidence, resolve	customer, risk score, overdue, oldest item, promises; amount, reason, SLA, timeline	CollectionsMaintain

Screen	Primary actions	Key fields/columns	Duty
Dunning run	create, preview letters, exclude, issue	customer, level, items, fee, blocks	DunningRun
Return order (RMA)	authorize, receive, inspect, disposition, credit	lines, disposition, restocking, credit preview	ReturnMaintain
Customer portal	place order, view invoices/documents, pay, request return, track	orders, invoices, balance, payments, RMAs, tracking	PortalCustomer

Interaction rules: cash application keyboard flow (J/K candidates, Enter accept, A apply) and bulk accept of all ≥ 85 suggestions; worklist saved filters; dunning preview opens the rendered letter; portal is mobile-first; provider hosted fields so no card data touches Passage.

5.30.7 Business rules and edge cases

- **BR-30.1 Cash application matching rules and scores.** Candidates are open items of the identified customer (all customers when unidentified). Score per candidate set: R1 exact document number in remittance/RmtInf/check memo +60; R2 amount = open amount of one item +30, or = Σ open of a subset of ≤ 5 items (0.00 tolerance) +25; R3 amount = open − available cash discount with discount date ≥ value_date +28; R4 payer bank account hash (MICR/IBAN) matches the customer's bank account +15; R5 payer name Jaro-Winkler ≥ 0.92 to customer or invoice account +10; R6 value_date within 7 days of due date +5; R7 short by < 1% or < 50.00 USD / 45.00 EUR +20 with a mandatory short-pay reason. Decision: auto-apply when exactly one set scores ≥ 85 and the runner-up ≤ winner − 20; 60–84 → SUGGESTED for one-click; < 60 → ON_ACCOUNT (1205) with top-3 suggestions kept. The ML ranker may reorder sets below 85 but cannot raise one above it. Every auto-application is reversible within the open period.
- **BR-30.2 Dunning levels and grace.** Level 1 Reminder: due date + grace days (default 5 per customer group) passed, no fee; Level 2: ≥ 15 days overdue, no fee; Level 3: ≥ 30 days, fee 25.00 USD / 20.00 EUR as open item FEE; Level 4: ≥ 45 days, fee 50.00 USD / 40.00 EUR, legal text, hold recommendation (sales applies CREDIT via CR-3). Rules: minimum letter amount 50.00 USD / 45.00 EUR per customer; ≥ 10 days since the last letter at any level; an item rises at most one level per run; letter level = max item level; items < 1.00 ignored; customers or items with dunning_block, open disputes or unbroken promises (promise date + 2 days) are excluded; a run is DRAFT until reviewed and issued, and only issue posts fees and levels; full payment resets the item, not the customer's history.
- **BR-30.3 RMA dispositions** (ReturnDispositionCode equivalents): CREDIT_ONLY — no physical return, credit at original price less restocking (default 0%); RETURN_TO_STOCK — receipt to the return warehouse at return cost (ORIGINAL_COST default), credit less restocking (default 15%, minimum 25.00 USD / 20.00 EUR); SCRAP — receipt then scrap issue to 5900, credit less restocking; REPAIR — receipt to quarantine, repair order hook (Phase 8), return to customer, no credit; REPLACE — receipt as RETURN_TO_STOCK or SCRAP plus a zero-price replacement order line referencing the RMA, credit offset by the replacement; REJECT_RETURN_TO_CUSTOMER — receipt to quarantine, ship back, no credit. Disposition is per line and immutable after credit; credit = qty received × original net unit price − restocking.
- **BR-30.4 Settlement accounting.** Cash discount within terms → Dr 4100; write-off within tolerance (≤ 5.00 or 0.5% of the item) → Dr 6100; FX difference on foreign-currency items → 7100/7200 at the settlement-date rate; partial settlement leaves PARTIALLY_SETTLED with reduced open_amount.
- **BR-30.5 Interest** = open_amount × annual_rate × days_overdue / 365 from due date + grace to the calculation date, once per item per period, excluded below the minimum and for disputed/promised items.
- **BR-30.6 State machines.** Payment: RECEIVED → SUGGESTED → APPLIED | ON_ACCOUNT → REVERSED; ON_ACCOUNT may later be applied. Dispute: OPEN → UNDER_REVIEW → RESOLVED_CREDIT | RESOLVED_PAID | RESOLVED_WRITE_OFF → CLOSED; REJECTED from OPEN/UNDER_REVIEW. RMA: REQUESTED → AUTHORIZED → RECEIVED → INSPECTED → DISPOSITIONED → CREDITED → CLOSED; REJECTED from REQUESTED; EXPIRED from AUTHORIZED after 30 days.
- **BR-30.7 Concurrency.** Settlement takes a row lock; a second clerk gets 409; imports deduplicated by SHA-256; camt.053 entries unique per (statement id, entry reference).
- **BR-30.8 Rebate settlement** runs after period close: amount = Σ accruals − prior settlements; a REBATE credit note posts Dr 2150 / Cr 1200; over-accrual posts a free-text invoice.
- **BR-30.9 Portal payments** create an intent for selected items; the signed webhook creates a PORTAL payment that auto-applies by R1 (score 100); refunds flow only through credit notes and the provider refund API with duty ARRefund.
- **BR-30.10 Statements** list items as of the statement date and never change balances; the portal reads the same `open-items` endpoint.
- **BR-30.11 SEPA collection date** = max(due date, today + pre-notification days, today + 1 TARGET2 business day); FRST and RCUR share D-1 submission since the 2016 rulebook; a mandate amended to a new debtor bank resets to FRST only if `smndr` indicator applies; an R-transaction within 8 weeks (CORE, no reason) or 13 months (unauthorized) reverses the DD payment, reopens the items and posts the bank return fee (default 3.50 EUR) as FEE.
- **BR-30.12 Deduction lifecycle.** OPEN → MATCHED (to a claim) → APPROVED (credit note posted) | DENIED (debit item re-billed) | SPLIT (children OPEN) | WRITTEN_OFF (Dr 6110 Deductions written off, ≤ `deduction_write_off_limit`, default 50.00 USD / 45.00 EUR); approval cannot exceed the claim's remaining amount; Σ children of a split = parent.
- **BR-30.13 Balance confirmation selection** uses the as-of balance in entity currency; customers with zero balance are included only when `include_zero_balances`; a disagreement creates a collection case of category DISPUTE with the customer's balance attached.
- **BR-30.14 Down payment clearing.** A final invoice for an order with down payments proposes clearing up to min(down payment remaining, invoice gross); tax on down payments posts at receipt only when the country pack sets `tax_on_down_payment` (for example DE, AT) and reverses at clearing.
- **BR-30.15 Chargeback validation.** A claim line is ACCEPTED when an ACTIVE w26 agreement exists for (end customer, product) at the claim's invoice date, contract price ≤ claimed price, and quantity ≤ the distributor's purchased quantity in the prior 12 months; otherwise REJECTED with codes CB-PRICE, CB-NOAGR, CB-QTY, CB-DUP.
- **BR-30.16 Correspondence** is rendered from a snapshot of the data at request time; re-sending reuses the snapshot unless `refresh=true`; every request is logged with its delivery result for 10 years.

5.30.8 Acceptance criteria

- **AC-30.1** (FR-30.3, FR-30.5) Given `cash-app-500`, when matching runs, then ≥ 450 payments auto-apply and zero apply to the wrong items versus the answer key.
- **AC-30.2** (FR-30.1) Given a 1,000.00 USD invoice at 2% 10 net 30 and 980.00 paid on day 8, then the item settles fully with 20.00 to 4100.
- **AC-30.3** (FR-30.7) Given 60 customers (5 blocked, 4 disputed, 3 with promises), when the run issues, then letters exist for exactly the 31 expected customers at expected levels, level-3 fees are 25.00, and disputed items appear on no letter.
- **AC-30.4** (FR-30.7) Given level 2 issued 2027-03-05, when a run executes 2027-03-12, then no letter (10-day interval).
- **AC-30.5** (FR-30.11) Given an RMA of 4 units at 100.00 USD with RETURN_TO_STOCK and 15% restocking, when received and dispositioned, then an inventory receipt of 4 at original cost exists and a credit note posts Dr 4000 400.00 / Cr 4200 Restocking 60.00 / Cr 1200 340.00 plus tax lines.
- **AC-30.6** (FR-30.11) Given SCRAP, then the receipt is followed by Dr 5900 / Cr 1400 at return cost.
- **AC-30.7** (FR-30.12) Given 10,000.00 accrued for 2027-03 on a 2% agreement, when settled, then a REBATE credit note of 10,000.00 posts and GL 2150 for the agreement is 0.00.
- **AC-30.8** (FR-30.14) Given an invited contact paying two invoices totalling 1,250.00 EUR by card in the Stripe sandbox, then a PORTAL payment is created from the webhook and both items are SETTLED within 60 s.
- **AC-30.9** (FR-30.9) Given a dispute on a 500.00 item, then dunning excludes it; when resolved as credit, a credit note posts and the item settles.

- **AC-30.10** (FR-30.15) Given `sim/phase5-month` on stage, then every §5.0 check passes and the reconciliation pack is produced and signed.
- **AC-30.11** (FR-30.16) Given DMF-DE customer C20 with an ACTIVE CORE mandate (FRST) and two items due 2027-03-20 totaling 2,380.00 EUR, when the DD run executes on 2027-03-05, then a pain.008 file with one FRST transaction of 2,380.00 and collection date 2027-03-20 validates against the XSD, a pre-notification is sent, and the mandate moves to RCUR after collection.
- **AC-30.12** (FR-30.16) Given that collection is returned with reason AC04, then the payment reverses, both items reopen and a 3.50 EUR FEE item exists.
- **AC-30.13** (FR-30.17) Given a payment short by 300.00 USD with reason "promo", when the deduction is matched to a promotion fund accrual of 300.00 and approved, then a credit note settles the deduction and the fund usage increases by 300.00.
- **AC-30.14** (FR-30.20) Given 20 customers selected for balance confirmation as of 2027-03-31, when 15 reply AGREED, 2 DISAGREED and 3 do not reply, then the difference list shows 2 rows with both balances and 2 DISPUTE cases exist.
- **AC-30.15** (FR-30.21) Given a 2,000.00 USD down payment on order SO-4000 and a final invoice of 5,000.00, then clearing posts Dr 2190 2,000.00 / Cr 1200 2,000.00 and the open item shows 3,000.00.
- **AC-30.16** (FR-30.22) Given a 10-line chargeback claim where 1 line has no agreement and 1 line duplicates a prior claim, then 8 lines are ACCEPTED, 2 REJECTED (CB-NOAGR, CB-DUP) and one credit note for the accepted total posts.
- **AC-30.17** (FR-30.19) Given a customer preference PAYMENT_NOTICE = EMAIL, when a payment applies, then a payment notice listing the settled items is emailed within 60 s and logged.

5.30.9 Test plan and fixtures

Fixtures: `cash-app-500` (300 BAI2 checks, 150 camt.053 entries, 50 remittances; short pays, discounts, multi-invoice, unidentified payers; answer key); `dunning-60`; `rma-30` (per disposition × costing method); `disputes-20`; `rebate-settle-12`; `portal-e2e` (Stripe and Adyen sandbox recordings); `sim/phase5-month` (generated month for DMF-US and DMF-DE: 200 POs, 150 production orders, 1,000 orders, 600 payments, 30 RMAs).

Test	Type	Target	Pass criterion
Matching	unit	BR-30.1	≥ 90% auto-match, 0 false matches
Subset-sum bound	property	matcher	≤ 5 items, < 50 ms per payment
Dunning	unit / E2E	run	exact letter set and levels
RMA E2E	E2E	sales + fulfillment + billing + inventory + ledger	30/30 balanced
Settlement accounting	contract (ledger)	discount, write-off, FX	balanced
BAI2 / camt.053 parsers	unit / property	importers	spec samples parse; malformed rejected with line numbers
Portal	E2E (Playwright + axe)	order, pay, return	pass; 0 serious a11y violations
Month simulation	E2E + reconciliation	sim/phase5-month	all §5.0 checks; 31/31 daily reconciliations clean

Reconciliation: Σ open_amount = GL 1200; Σ ON_ACCOUNT = GL 1205; daily settlements = GL 1000/1010 debits from receivables; fees = GL 4300; interest = GL 4310; RMA receipts = wave 16 receipts = GL 1400 debits from returns; rebate settlements = GL 2150 debits; deferred revenue, DNI, inventory, WIP, AP and tax checks re-run on simulation data; trial balance balanced.

5.30.10 Deployment and operations

Helm `passage-receivables` (Go), `passage-collections-workflows` (TS, Temporal namespace `collections`), `passage-customer-portal` (React + TS BFF; ingress `customer.<env>.passage.dev`; Keycloak realm `portal`), `passage-payments-gateway` (TS; provider keys in Vault; PCI scope limited to tokens), matcher ranker (Python, CPU). Databases `receivables-db`, `portal-db`. Config: `MATCH_AUTO_THRESHOLD=85`, `MATCH_MARGIN=20`, `DUNNING_INTERVAL_DAYS=10`, `RMA_EXPIRY_DAYS=30`, `WRITE_OFF_TOLERANCE=5.00/0.5%`. Flags: `ar.ml_ranker`, `ar.camt053`, `collections.interest`, `portal.payments`, `portal.returns`. Jobs: aging and risk score 01:30; lockbox/camt.053 SFTP poll every 15 min; dunning proposal weekly (issue manual); statements on the 1st; rebate settlement after period close; interest monthly. SLOs: open-items read p95 < 100 ms, apply p95 < 1 s, portal 99.9%, webhook processing < 60 s. Alerts: unapplied cash > 2% of monthly receipts for 3 days, webhook failures, reconciliation diff ≠ 0, run stuck in DRAFT > 7 days. Runbook: reverse a mis-application, re-import a file, re-issue a letter, rotate provider keys. Rollback: previous digest per deployable; Temporal workflows versioned.

5.30.11 Migration from AX / SAP

Source	Passage entity	Notes
CustTrans + CustTransOpen (open); CustSettlement (current year)	open_item; settlement history	AmountCur/AmountMST → amounts; CollectionLetterCode → dunning_level
CustCollectionLetterJour (last), CustInterestJour (open)	dunning history; open_item INTEREST	
ReturnTable / SalesLine (ReturnStatus not Closed)	return_order	disposition codes → BR-30.3
BSID (open), BSAD (current year)	open_item; settlement history	MANSP → dunning_block; MSCHL/MANST → level
MHNK/MHND (last run); UDM_DISPUTE (open); VBAK RE/LR (open)	dunning history; dispute; return_order	
KONA/VBOX open accruals	rebate_accrual opening	settled in Passage

Validation: Σ open items per customer = legacy AR aging to the cent; open dispute and RMA counts equal; dunning levels per item equal. Not migrated: cleared items before the current fiscal year, collection notes (lakehouse), legacy statements, CustPaymModeTable/lockbox setup (manual).

5.30.12 Dependencies, risks, open questions

- Depends on: w29 invoices and credit notes; w28 receipts for RMAs; w27 credit profile and holds; w26 accruals; w19 AP payments (rebate payout); w16 inventory; w12 FX; w11 journal; w5 documents and Keycloak realms; Phases 3–4 for the simulation.

Risk	Likelihood	Impact	Mitigation
False auto-match in production	Low	High	threshold + margin, reversible, weekly audit sample of 50
Dunning sent to disputed customers	Low	High	exclusions evaluated at issue time
RMA credit without receipt	Medium	Medium	CREDIT_ONLY requires duty ReturnCreditOnly and reason code
PCI scope creep in the portal	Low	High	hosted fields only; tokens stored; annual SAQ-A
Sign-off slips because accountant review is late	Medium	High	accountant engaged from wave 29 fixtures onward
Interim collection_case diverges from the wave 45 generic case model	Medium	Medium	collection_case fields are a subset of the w45 case schema; façade path kept; migration script owned by wave 45

Risk	Likelihood	Impact	Mitigation
SEPA R-transactions reopen items after dunning or statements already issued	Medium	Low	reopened items restart dunning at their prior level; statement shows the reversal on the next cycle

- Open questions: (1) Primary demo payment provider, Stripe or Adyen? Default Stripe sandbox; decide by wave 30 start. (2) Are dunning fees taxable in DMF-DE? Default untaxed in v1 pending the country pack (wave 48); decide at wave 30 mid-point. (3) Does the simulation include DMF-DE → DMF-US intercompany sales? Default no (wave 40); decide at wave 29 close.

5.30.13 Parameters and setup

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
automatic_settlement	legal entity	bool	true	true/false	Apply credits to oldest items automatically on post	AR parameters → Settlement → Automatic settlement	F.13 automatic clearing / OB74 clearing rules

5.30.14 Inquiries and reports

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
Customer open items / line items	list inquiry	customer, status, due as-of, document type, special G/L	document, dates, amount, open, discount, level, dispute/promise flags	open_item	Customer transactions / open transactions (CustTransOpen)	FBL5N / FBL5H
Aged balances	operational report	entity, as-of, basis, buckets, customer group	current, 1–30 … > 180, total, % overdue	aging snapshot	SSRS Customer aging (Aged balances)	S_ALR_87012168 / S_ALR_87012178
Customer balance list with credit limit	operational report	entity, as-of	balance, limit, utilization, overdue	open_item + credit_profile	SSRS Customer balance list with credit limit	S_ALR_87012172 / FD33
Cash application worklist	list inquiry	source, status, score band, date	payment, payer, amount, candidates, score, residual	payment	Payment journal / CustOpenTrans settlement	FEBAN / FLB2 post-processing
Unapplied cash	KPI / list	entity, age	on-account amount, count, oldest	payment (ON_ACCOUNT)	Customer transactions not settled (payments)	FBL5N with payment on account
Dunning proposal and history	drill-down	run, customer, level	letters, items, fees, exclusions with reason	dunning_run, dunning_letter	Collection letter journal (CustCollectionLetterJour)	F150 log / MHNK / MHND
Interest notes	list inquiry	period, customer	item, days, rate, amount, status	interest_note	Interest notes (CustInterestJour)	F.24 / F.2B output
Disputes, promises and cases	list inquiry / KPI	owner, category, SLA status, reason	case, items, amount, age, SLA due, resolution	collection_case, dispute, promise	Collections workspace / Cases	UDM_SPECIALIST worklist, UDM_DISPUTE
Deductions	list inquiry / operational report	type, status, customer, age, claim match	deduction, amount, type, matched claim, decision	deduction	Deduction workbench / SSRS Deductions report	FSCM dispute case list (residual items)
Direct debit mandates and runs	list inquiry	status, sequence, scheme, last used	mandate ref, IBAN masked, scheme, sequence, last collection, expiry	dd_mandate, direct_debit_run	Direct debit mandate inquiry	FSEPA_M4 mandate display / F110 DD log
Customer account statement	operational report	customer, period, cycle	opening, transactions, closing, aging footer	open_item	SSRS Customer account statement	F.27
Balance confirmations	operational report	key date, run	customer, our balance, reply, their balance, difference	balance_confirmation	n/a	F.17 / F.18 / F.99 reply list
Return orders	list inquiry	status, reason, disposition, customer	RMA, lines, received, disposition, credit	return_order	Return orders list (ReturnTable) / SSRS Return acknowledgment	VA05 type RE / advanced returns monitor (MSR_TRAC)
Chargeback claims	list inquiry	distributor, status, period	claim, lines accepted/rejected, amount	chargeback_claim	Rebate management claim inquiry	Settlement management claim list
DSO and collection effectiveness	KPI	entity, period	DSO, best possible DSO, CEI %, average days to pay	open_item history	Collections KPIs (D365 workspace)	FSCM collection KPIs
Lockbox / statement import log	list inquiry	source, date, status	file, hash, items, matched, errors	lockbox_batch	SSRS Lockbox report	FLB2 log / FEBKO / FEBEP

5.30.15 Printed and electronic documents

Document	Trigger	Layout elements	Formats	Numbering sequence	Legal / retention requirement
Customer account statement	monthly job (1st) / on demand / portal	header: customer, statement date, currency; lines: date, document, description, debit, credit, running balance; footer: aging buckets, remittance instructions	PDF, email, portal	none (statement date + customer)	informational; retain 7 years
Dunning / collection letter	dunning run :issue	header: level, letter date, customer, contact; lines: invoice, due date, days overdue, open amount, fee; footer: total due, payment instructions, legal text (level 4)	PDF, email, print, portal	`DL–` per entity	retain 7 years; level-4 text per country pack
Interest note	interest :post	lines: item, period, days, rate, interest	PDF, email	`IN–` gap-free (it is an open item document)	as invoice (10 years DE)
Payment notice / payment advice	payment applied (preference)	payment, date, settled items, discounts, residual	PDF, email	none	7 years
Open item list / individual letter	correspondence request	template-driven	PDF, email	none	7 years
Balance confirmation letter	confirmation run	key date, balance, open items, reply form / portal link	PDF, email	`BCF–` per run	audit evidence; retain 10 years
SEPA pre-notification	DD proposal	mandate ref, creditor id, amount, collection date	email, PDF	none	SEPA rulebook; retain 14 months minimum (with mandate)
SEPA direct debit file	DD run	GrpHdr, PmtInf per sequence type, DrctDbtTxInf with mandate data	pain.008.001.08 XML	message id per run	bank file; retain 10 years
SEPA mandate form	mandate creation	creditor, debtor, IBAN, BIC, mandate ref, scheme, signature	PDF (signed upload)	mandate ref	retain 14 months after last collection (rulebook), longer per w48
RMA authorization / return acknowledgment	:authorize / receipt	RMA number, lines, reasons, ship-to return address, expiry, label	PDF, email, portal	`RMA–`	7 years
Deduction decision (denial / approval)	workbench decision	deduction, claim, decision, reason	PDF, email	none (the re-bill is an invoice)	7 years
Chargeback response	claim decision	lines with ACCEPT/REJECT and reason codes	CSV, EDI 849 (w35)	claim number from distributor	7 years

5.30.16 Periodic and batch jobs

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
Aging snapshot and risk score	01:30 daily	customer	key = (customer, date)	< 10 min per 100k customers	rerun	snapshot missing by 03:00
Lockbox / camt.053 SFTP poll	every 15 min	bank account	SHA-256 of file; entry (statement id, ref)	< 2 min per 1,000 entries	quarantine malformed file with line numbers	import failure; unapplied > 2% for 3 days

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
Dunning proposal	weekly Monday 06:00 (issue manual)	legal entity	run id	< 10 min per 50k items	DRAFT retained	DRAFT > 7 days
Interest calculation	monthly last day 20:00	legal entity	key = (item, period)	< 10 min	rerun idempotent	none calculated while overdue items exist
Statements	1st of month 04:00	customer	key = (customer, period)	< 30 min per 50k statements	retry delivery	undelivered > 1%
SEPA DD proposal and file	daily 07:00 (business days)	creditor id	run id; transaction end-to-end id	< 5 min per 20k items	file not released until reviewed	DD items due without active mandate
SEPA mandate expiry / R-transaction import	nightly 00:45; camt.054 with statements	mandate	(mandate, date); R-transaction ref	< 2 min	reverse idempotent	returns > 2% per run
Rebate settlement	after period close (w14 event)	agreement	key = (agreement, period)	< 10 min	per-agreement retry	accruals unsettled 5 days after close
Balance confirmation reminders	daily 08:00	run	key = (run, customer, reminder n)	< 1 min	retry	runs with no replies after 30 days
Case SLA timers	Temporal timers per case	case	workflow id	n/a	escalation to manager	SLA breach count > 0
AR to GL reconciliation	02:15 daily	legal entity	key = (entity, date)	< 5 min	report	Σ open ≠ GL 1200; ON_ACCOUNT ≠ GL 1205
RMA expiry	hourly	legal entity	status transition	< 1 min	retry	none

5.30.17 Security duties and privileges

Duty	Privileges (entry points)	Segregation-of-duties conflicts	Default roles
ARView	GET open-items, aging, statements; AR workspace	none	AR clerk, Collector, Controller, Auditor
ARPaymentPost	payments, :match, :apply, :on-account, :reverse	with InvoicePost (w29); with CustomerMaintain bank details (w7)	Cash application clerk
ARImport	lockbox / bank-statement imports	with ARPaymentPost when `import_apply_separation`	Treasury clerk
ARSettle	settlements:batch, write-off, discount	with CreditNotePost; write-off above tolerance needs ARWriteOffApprove	AR clerk
ARWriteOffApprove	write-offs above tolerance, deduction write-offs above limit	with ARSettle on the same item	AR manager
ARRefund	provider refunds, customer refunds via w19	with ARPaymentPost; with VendorMaintain (w7)	AR manager
DunningRun	dunning-runs, :review, :issue, :cancel	with ARSettle (letter suppression via dunning_block is logged and reviewed)	Collections manager
InterestPost	interest-notes :calculate, :post	with DunningRun under four-eyes	AR manager
CollectionsMaintain	promises, disputes, cases, contact log	none	Collector
DeductionMaintain	deduction workbench match, split, deny	with RebateSettle (w26/w30) and FundMaintain for the same fund	Deductions analyst
DirectDebitRun	mandates, DD proposal, file release	with CustomerMaintain bank details; with ARPaymentPost	Treasury clerk
ReturnMaintain / ReturnCreditOnly	return-orders, :authorize, :disposition; CREDIT_ONLY	ReturnCreditOnly with WarehouseReceive	Customer service; Returns supervisor
RebateSettle	rebates/settlements	with RebateMaintain (w26)	AR manager
BalanceConfirmationRun	confirmation runs, reply recording	with ARSettle (auditor independence)	Controller / external auditor read-only
PortalCustomer	/portal/api/v1/* scoped to own accounts	n/a (external)	Invited customer contacts

5.30.18 Message catalog

Code	Severity	User text	Cause	Remediation	Raised by
AR-0001	error	Settlements plus residual must equal the payment amount	apply validation	Adjust settlements or residual	§5.30.5 validation
AR-0002	error	Item {doc} is locked by another user	BR-30.7 row lock	Retry later	BR-30.7
AR-0003	error	File already imported ({hash})	duplicate import	none	BR-30.7
AR-0004	error	Line {n}: malformed BAI2 record type {type}	parser	Fix file and re-import	FR-30.3
AR-0005	warning	Payment placed on account; top suggestion score {score}	BR-30.1 < 60	Apply manually	BR-30.1
AR-0006	error	Write-off {amount} exceeds tolerance {tol}	BR-30.4	Request ARWriteOffApprove	BR-30.4
AR-0007	error	Dunning run must be REVIEWED before issue	FR-30.7	Review the run	BR-30.2
AR-0008	info	{n} customers excluded: dispute, promise or block	BR-30.2	none	BR-30.2
AR-0009	error	Disposition requires received quantity > 0	§5.30.5 validation	Receive first	BR-30.3
AR-0010	error	Credit-only return requires reason code and ReturnCreditOnly	risk control	Add reason / duty	BR-30.3
AR-0011	error	No active SEPA mandate for {customer} / {iban_masked}	FR-30.16	Activate mandate or change payment mode	BR-30.11
AR-0012	error	Mandate {ref} expired after 36 months without collection	FR-30.16	Obtain a new mandate	FR-30.16
AR-0013	warning	Collection returned ({reason}); items reopened and fee posted	R-transaction	Contact customer	BR-30.11
AR-0014	error	Deduction approval {amount} exceeds claim remaining {remaining}	BR-30.12	Split or deny remainder	FR-30.17
AR-0015	error	Chargeback line rejected: {code}	BR-30.15	Correct claim and resubmit	FR-30.22
AR-0016	warning	Balance confirmation disagreed by {customer}: difference {amount}	BR-30.13	Investigate case	FR-30.20
AR-0017	error	Down payment clearing exceeds remaining down payment {amount}	BR-30.14	Reduce clearing	FR-30.21
AR-0018	error	Case SLA breached for {case}	FR-30.18 timer	Escalate	FR-30.18
AR-0019	error	Portal payment amount exceeds selected open items	BR-30.9	Adjust selection	FR-30.14
AR-0020	error	Provider webhook signature invalid	payments-gateway	Check provider secret rotation	BR-30.9

5.30.19 Performance budgets and capacity

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
Open-items read (FBL5N-style, 200 rows)	500k per day; portal peak 100/s	30 / 100 / 250 ms	300/s	open items 30M rows × 500 B = 15 GB	(customer_id, status, due_date); partition by legal entity	portal served from read replica; staleness ≤ 5 s
Payment match (scored)	30k per day	20 / 50 / 120 ms	100/s	match logs 3 GB	candidates via (customer, open_amount)	ML ranker bypassed; rule score only
Payment apply	30k per day	200 ms / 1 s / 2 s	30/s	settlements partitioned by month, 5 GB	(open_item_id)	queue per customer; 409 on conflict
camt.053 / BAI2 import (5,000 entries)	50 files per day	— / 60 s / 120 s	100 entries/s	raw files object store 20 GB	(source, source_ref) unique	files processed sequentially per bank account
Dunning run (50k items)	weekly	— / 10 min / 20 min	100 items/s	letters 1 GB + PDFs	(customer, dunning_level)	proposal only; issue throttled
SEPA DD file (20k transactions)	daily	— / 3 min / 6 min	200 tx/s	2 GB XML	(mandate, collection_date)	split into multiple PmtInf / files of 10k
Portal page (dashboard)	50k sessions per day	150 / 400 / 800 ms	200 req/s	portal_db 2 GB	BFF cache 30 s	degrade to list views; payments remain available
Webhook to settled	5k per day	5 / 30 / 60 s	20/s	—	provider event id unique	queue; SLO 60 s at p99 under 3×

5.30.20 Localization and compliance hooks

- SEPA (EU/EEA): SDD Core and B2B rulebooks, pain.008.001.08 and pain.002 / camt.054 R-transactions; creditor identifier per country format; mandate retention 14 months after last collection; UK Bacs Direct Debit and US ACH debit (NACHA PPD/CCD with authorization records) are country-pack variants on the same mandate entity (w48).
- Dunning and interest: statutory late-payment interest (EU Directive 2011/7/EU: reference rate + 8 pp B2B; DE §288 BGB 40.00 EUR flat fee; FR 40.00 EUR indemnity and mandatory penalties text) set by country pack interest rules; dunning fee taxability (open question 2).
- Statements and confirmations: language, date and number formats per customer locale; balance confirmations support audit standards (ISA 505 external confirmations) with immutable replies.
- Bills of exchange (IT RiBa, ES pagaré, FR LCR, JP tegata) are not supported in v1; wave 36 adds treasury instruments and country packs enable them.
- Down payments: tax on advance payments (EU art. 65 VAT Directive) enabled per pack; DE requires a down-payment invoice with tax.
- Privacy and PCI: card data never touches Passage (SAQ-A); IBANs are stored encrypted and displayed masked; collection notes and case activities are personal data subject to w48 retention (7 years, then pseudonymized); portal contacts can export their data.
- Retention: open-item history and settlements 10 years (GoBD); dunning letters 7 years; R-transaction evidence 13 months minimum.
- Extension points: correspondence template slots, dunning procedure legal-text slot, interest rule provider, payment-file format registry (w19) and the chargeback EDI mapper (w35).

5.30.21 Coverage closure

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
AX §12.3.1 #18 — Customer → Direct debit mandates (SEPA, CustDirectDebitMandate)	PARTIAL-30	ADDED as FR-30.16	
AX §12.3.1 #19 — Collections → Cases (collection cases)	PARTIAL-30	ADDED as FR-30.18 (minimal collection_case); generic case framework DEFERRED to wave 45	migration of collection_case to generic cases in 45
AX §12.3.2 #22 — Direct debit mandate inquiry	PARTIAL-30	ADDED as FR-30.16	§5.30.14 Direct debit mandates and runs
AX §12.3.3 #24 — Payments → Generate direct debit (pain.008)	PARTIAL-30	ADDED as FR-30.16	w19 ISO 20022 generator

Part 6 — Phase 6: Warehouse, Quality & Logistics (waves 31–35)

6.0 Phase overview

Business outcome at phase exit. At the end of wave 35 the demo manufacturer (live since wave 30) runs its warehouses on location-directed work executed from handheld scanners, inspects inbound, in-process and outbound inventory under rule-generated quality orders, plans and rates outbound freight against real carrier rate cards, reconciles carrier invoices and lands freight into inventory cost, and exchanges purchase orders, ASNs and invoices with a demo distributor over X12 EDI and Peppol. Every one of those flows posts into the wave-16 inventory ledger and the wave-11 universal journal through the existing posting APIs; Phase 6 adds no new financial truth, only new operational sources of it. The Phase 6 services are `wms` (Go, `wms_db`), `wms-mobile` BFF (TypeScript), `quality` (Go, `quality_db`), `tms` (Go, `tms_db`) with a Python `tms-optimizer` sidecar (OR-Tools), and `integration-hub` plus `edi` (TypeScript, `integration_db`). All run on the ADR-0001 stack; nothing in this phase introduces new infrastructure.

Phase-exit sign-off criteria

- Demo distributor ↔ demo manufacturer exchange PO (850/ORDERS) → ASN (856/DESADV) → invoice (810/INVOIC and Peppol UBL) end-to-end with zero manual re-keying; the invoice lands as a wave-19 vendor invoice at the distributor and matches 3-way.
- 100 location-directive fixtures resolve to the expected location; 500-order wave release creates work and replenishment with no deadlocks and p95 task assignment under 1 s.
- Mobile E2E inbound-to-outbound run on an emulated Zebra device using scanned GS1-128 labels passes in CI; 200 queued offline transactions sync without loss or duplicate.
- Quality property test: no pick, ship or consume succeeds against a quant with `quality_status = BLOCKED` across 10,000 randomized attempts; AQL sample sizes equal ANSI/ASQ Z1.4 Table I/II-A for every lot-size class.
- VRP solutions on Solomon C1/R1/RC1 instances are feasible and within 10% of best-known distance; 200 rating fixtures produce expected charges to the cent; landed cost allocation sums to the carrier invoice exactly.
- Daily reconciliation: `wms` on-hand by location sums to the wave-16 inventory ledger on-hand per item/warehouse; freight accruals in `tms` tie to journal account 2150 (accrued freight) to the cent.

Cross-wave data model summary

Entity	Owning service	Key relationships
Location, Zone, LocationProfile	wms	Warehouse (wave 6); capacity used by Work and Quant
LicensePlate (nested)	wms	Parent LP; Quant; Load; ShipmentContainer (wave 28)
Quant (on-hand by item × dims × location × LP)	wms	Projection of inventory ledger (wave 16); carries `quality_status`
LocationDirective, WorkTemplate, WaveTemplate, ReplenishmentTemplate	wms	Metadata; evaluated by the directive engine
Work, WorkLine, Wave, Load, DockAppointment	wms	Sales shipment (wave 28), purchase receipt (wave 18), production order (wave 21), TMS Load
MobileFlow, MobileMenu, DeviceSession, OfflineTransaction	wms-mobile	Work; WorkUser (Keycloak subject)
Test, TestGroup, SamplingPlan, QualityAssociation	quality	Item/product (wave 8); Party (wave 7)
QualityOrder, QualityResult, UsageDecision	quality	Quant (blocking), PurchaseReceipt, ProductionOrder, Shipment
Nonconformance, Correction (CAPA), Instrument	quality	QualityOrder; Vendor; Temporal workflow id
Carrier, CarrierService, RateCard, Accessorial, FuelIndex	tms	Party (wave 7)
Shipment, Route, Load (TMS view), Tender, TrackingEvent	tms	wms Load; Sales shipment (wave 28)
FreightBill, CarrierInvoice, LandedCostVoyage	tms	Vendor invoice (wave 19); inventory cost (wave 20); journal (wave 11)
TradingPartner, EDIProfile, Map, Interchange, Message, Acknowledgment	edi	Party; PurchaseOrder, SalesOrder, Shipment, Invoice
ApiClient, Subscription (webhook/Kafka), DeliveryAttempt, Quota	integration-hub	Keycloak client; Kafka topics
CrossDockTemplate, CrossDockLink, SortTemplate, SortPosition, VasOrder, PackagingSpec	wms	Work; Shipment (wave 28); kit BOM (wave 9); added by FR-31.13–FR-31.17
LaborStandard, LaborLine, PerformanceDocument	wms	Work, WorkUser; payroll export (wave 42); FR-31.18
HazmatProfile, SegregationMatrix, FireContainmentSection	wms	Item (wave 8); LocationProfile; read by tms DG checks (FR-34.15); FR-31.19
AutomationChannel, TelegramProfile, CommunicationPoint, TransportOrder	wms	Location; Work; edge gateway (wave 25); FR-32.12
Printer, DeviceType, PrintQueue, RoutingRule	print service	PrintJob; FR-32.13
ComplianceList, ItemComposition, ComplianceResult, SafetyDataSheet, SdsDelivery	quality	Item, BOM (wave 9), Shipment (wave 28); FR-33.13–FR-33.14
IncomingCertificate, PhysicalSample, SpecificationSet, InspectionPoint	quality	QualityOrder; PO line (wave 17); production operation (wave 21); FR-33.15, FR-33.19–FR-33.22
StabilityStudy, PullPoint, Audit, QuestionList, Finding, Fmea, ControlPlan	quality	Batch (wave 16); Nonconformance/CAPA; TestGroup; FR-33.16–FR-33.18
VoyageLeg, ShippingContainer, Folio, GoodsInTransitOrder	tms	LandedCostVoyage; PO lines (wave 17); in-transit warehouse (wave 16); FR-34.12
YardLocation, TransportUnit, YardMove, DriverVisit, GateEvent	tms	DockAppointment (wave 31); Load; Carrier; FR-34.13–FR-34.14
DgCheckResult, Vehicle, Driver, FreightRfq, LoadPlan, ScreeningResult	tms	HazmatProfile (wave 31); RFQ (wave 17); Party (wave 7); FR-34.15–FR-34.19
PunchoutCatalog, PunchoutSession, SelfBillingDocument, ConnectorConfig	integration-hub / edi	Requisition (wave 17); customer invoice (wave 29); ECR (wave 9); FR-35.13–FR-35.16

Phase-level risks

Risk	Likelihood	Impact	Mitigation	Owner
Directive engine performance collapses on large location sets (50k bins)	Medium	High	Indexed candidate pre-filter per zone/profile; benchmark at 50k locations in wave 31 CI; p95 < 200 ms per line	wms lead
Scanner hardware variance (Zebra DataWedge vs Honeywell) breaks scan capture	Medium	Medium	Keyboard-wedge fallback plus intent API adapters; emulator E2E for both profiles	mobile lead
Quality blocking is bypassed by a path not covered by the property test	Low	High	Blocking enforced in `inventory` ledger reservation, not only in `wms`; property test enumerates all transaction types	quality lead
VRP solver time exceeds planning window on 1,000-stop problems	Medium	Medium	Time-limited local search (60 s) with feasible first solution guaranteed by sweep heuristic	tms lead
EDI partner specifics (implementation guides) diverge from base maps	High	Medium	Partner-level map overrides; simulator fixtures per partner; 997/CONTRL negative tests	integration lead
Peppol access point certification delays	Medium	Medium	Certified third-party AP (SMP/AS4) adapter first; own AS4 endpoint deferred to v1.x	integration lead

6.31 Wave 31: Advanced Warehouse Management

6.31.1 Scope and business context

Wave 28 ships sales orders from simple warehouses (item × location on-hand, manual pick lists). Wave 31 replaces that with the D365 WHS / SAP EWM model: a location hierarchy with capacity and profiles, license plates (LP) nested to any depth, and work that the system creates and directs by rule. After this wave a warehouse manager configures put-away and pick location directives, work templates and wave templates in metadata; releasing sales, transfer and production orders to the warehouse creates work with explicit from/to locations; replenishment runs on min/max, demand or wave triggers; loads are built and docks scheduled; receiving is ASN-driven with LPs. Out of scope: mobile execution (wave 32 — in wave 31 work is confirmed from the web workspace), quality blocking (wave 33), carrier rating (wave 34), cross-docking and catch-weight work (v1.x), labor standards (v1.x).

Scope amendment (coverage closure). The AX and SAP gap registers (coverage-ax §12.99, coverage-sap §13.99) move four items into this wave that the paragraph above lists as v1.x or does not name: planned and opportunistic cross-docking (FR-31.13), outbound sorting (FR-31.14), value-added services and kitting (FR-31.15), and engineered labor standards with planned-vs-actual reporting (FR-31.18). Transfer-order warehouse flows (FR-31.16), packaging specifications (FR-31.17) and hazardous-material storage compatibility (FR-31.19) are now explicit requirements. Catch-weight work and incentive pay calculation stay out of scope. Yard management moves to wave 34 (FR-34.13). §6.31.21 lists every register row and its disposition.

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
D365 location directives (WHSLocationDirective form) fail silently: work is created with blank put location or "no location found" only visible in the work details after wave processing; debugging requires the "Location directive failures" log (10.0.x) or SQL on WHSWorkLine	Directive evaluation is a batch-side X++ class with no trace; query ranges are opaque	`/location-directives:simulate` returns a rule-by-rule trace; blocked work has status `BLOCKED_NO_LOCATION` with the failing step on the wave	Time to diagnose a directive miss: 30–60 min (consultant with SQL) → < 1 min from the trace; 0 silent blanks
EWM put-away bin determination (/SCWM/T333 storage type search sequence + bin type + storage section) spans 6 IMG nodes; a change needs a transport and a test cycle	Configuration split across customizing tables with cross-dependencies	One LocationDirective entity with ordered lines/actions, versioned metadata, simulate-before-save	Setup clicks for a new put-away rule: ~40 across 6 transactions → ≤ 8 in one designer; change lead time days → minutes
D365 wave processing (WHSWaveProcessing batch) runs every 5–15 min; pickers wait; a failed wave leaves partial work and the wave in "Held" with a generic infolog	Batch framework polling; non-atomic processing per order	Temporal `WaveReleaseWorkflow` starts on release, per-order activities with per-line failure reasons	Order release to assignable work: 5–15 min batch → < 5 s p95 for a 50-order wave; failures itemized 100%
EWM /SCWM/MON and D365 "Work details" cannot show capacity or why a location is full; over-capacity bins happen because capacity check is advisory (D365 `Location stocking limits`)	Capacity is a soft check in some paths	Capacity is an invariant: creation and confirmation both enforce it; property-tested	Over-capacity incidents: tolerated today → 0 (test-enforced)
On-hand by LP in AX (WHSInventOnhand vs InventSum) drifts and is reconciled manually by inventory journals	Two on-hand tables maintained by separate code paths	Quants are a projection of the single inventory ledger; daily automated reconciliation with alert	Monthly reconciliation effort: 4–8 h → 0 h; drift detected within 24 h

6.31.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Location master	WMSLocation, WHSLocationProfile, WHSZone, WHSLocationFormat; form WHSLocation	/SCWM/LAGP storage bins, /SCWM/T301 storage types, sections /SCWM/T302, bin types /SCWM/T303	wms.Location, Zone, LocationProfile	full
License plates / HUs	WHSLicensePlate, WHSContainerTable	/SCWM/HUHDR, /SCWM/HUITM, packaging material	wms.LicensePlate (nested), Quant	full
Put-away/pick strategy	WHSLocationDirective, WHSLocationDirectiveLine, WHSLocationDirectiveAction; form WHSLocationDirective	Put-away strategies (/SCWM/T333 storage type search, bin determination), stock removal strategies (FIFO/LIFO/partial)	wms.LocationDirective with ordered rules	full
Work templates	WHSWorkTemplateTable, WHSWorkTemplateLine, WHSWorkTransType	Warehouse process types /SCWM/TPROCTY, warehouse order creation rules /SCWM/WOCR	wms.WorkTemplate	full
Work / tasks	WHSWorkTable, WHSWorkLine; form WHSWorkTable	/SCWM/ORDIM_O warehouse tasks, /SCWM/WHO warehouse orders	wms.Work, WorkLine	full
Wave management	WHSWaveTemplateTable, WHSWaveTable, WHSWaveLine; class WHSWaveProcessing	/SCWM/WAVE, /SCWM/WAVEHDR, /SCWM/WAVEITM; wave templates /SCWM/WAVETMP	wms.WaveTemplate, Wave; Temporal `WaveReleaseWorkflow`	full
Replenishment	WHSReplenishmentTemplate, WHSReplenishmentTemplateLine; class WHSReplenishmentProcess	Replenishment control (/SCWM/REPL, planned/order-related/automatic)	wms.ReplenishmentTemplate	full
Loads / dock	WHSLoadTable, WHSLoadLine, WHSDockAppointment (appointment scheduling)	Yard management, door/transportation units /SCWM/TU, /SCWM/DOOR	wms.Load, DockAppointment	full
ASN receiving	WHSASNItem, WHSUOMStructure, packing structure import	Inbound delivery /SCWM/INB (EWM delivery), expected goods receipt	wms.AsnPackingStructure → LP receiving	full
Cycle counting	WHSCycleCountPlan, WHSCycleCountThreshold, WHSCountingWork	Physical inventory /SCWM/PI_DOCUMENT, cycle counting indicator	wms.CountPlan, counting Work (web in 31, mobile in 32)	full
Slotting	WHSSlottingTemplate (D365 10.0.x)	EWM slotting (/SCWM/SLOT)	wms.SlottingRun (ABC by picks, recommendations)	partial — recommendations only, no auto-move
Labor management	n/a (ISV)	EWM labor management	—	dropped: v1.x
Cross-docking	WHSCrossDocking, cross-docking templates, planned cross docking (D365 10.0.x), opportunistic cross docking on work policies	LE-WM LXDCA/LXDCK cross-docking monitor; EWM planned and opportunistic cross-docking (push deployment, pick from goods receipt)	wms.CrossDockTemplate, CrossDockLink; work type CROSS_DOCK	full
Outbound sorting	Outbound sorting templates and sort positions (D365 10.0.x)	EWM consolidation groups, sorter integration, /SCWM/PACK staging	wms.SortTemplate, SortPosition	full
VAS and kitting	Kit orders (D365 10.0.x), BOM journals for assembly	/SCWM/VASEXEC VAS orders, kit-to-order / kit-to-stock	wms.VasOrder; work type VAS; kit BOM (wave 9)	full
Packaging specifications	Unit sequence groups, WHSPhysDimUOM, container types, container build templates (WHSContainerBuildTemplate)	/SCWM/PACKSPEC packaging specifications with condition-based determination	wms.PackagingSpec	full
Labor management (revised)	n/a (ISV); work audit and workload visualization only	EWM labor management /SCWM/LM: engineered labor standards, planned vs actual, performance documents	wms.LaborStandard, LaborLine, PerformanceDocument	partial — standards and reports; incentive pay calculation out of scope (replaces the "dropped: v1.x" row above)
Hazardous-material storage	Hazardous material item flags; product compliance (D365 PI)	LE-WM hazardous material storage (LX06 fire-containment sections, LX24 hazmat list); EWM hazardous substance storage checks (storage class, water hazard class)	wms.HazmatProfile, SegregationMatrix, FireContainmentSection	full
Transfer order warehouse flow	WHS transfer order shipping and receiving with LP; release to warehouse	Stock transport order with EWM outbound/inbound delivery (/SCWM/PRDO, /SCWM/PRDI)	Work types TRANSFER_ISSUE/TRANSFER_RECEIPT with LP identity across sites	full

6.31.3 Functional requirements

- **FR-31.1 Location hierarchy with profiles** — Must. The system shall model locations as `warehouse / zone / aisle / rack / shelf / bin` with a LocationProfile that defines capacity (weight, volume, LP count, item count), mixing rules and allowed LP behavior.
  - Notes: capacity limits are checked when work is created and again at confirmation; a location with `allow_mixed_items = false` rejects a second item; location name is generated from a LocationFormat (`A-01-02-03` → aisle 1, rack 2, shelf 3); maximum 1,000,000 locations per warehouse.
- **FR-31.2 Nested license plates** — Must. The system shall track inventory on license plates that nest (pallet → case → inner) to depth 5, with a single move of a parent moving all children atomically.
  - Notes: LP id is an SSCC-18 when generated by Passage (extension digit 0, GS1 company prefix from wave 8 config); external LPs are accepted up to 40 characters; an LP can be at exactly one location or in transit on one Work.
- **FR-31.3 Location directives** — Must. The system shall resolve a destination (put-away) or source (pick) location for each work line by evaluating ordered directives, lines and actions as specified in BR-31.1.
  - Notes: directive scope = work order type × warehouse × optional query on item/customer/vendor; strategies: `consolidate`, `fifo`, `lifo`, `fefo`, `empty_location`, `match_packing_quantity`, `round_up_to_lp`; evaluation p95 < 200 ms per line at 50,000 locations.
- **FR-31.4 Work templates** — Must. The system shall create Work from templates whose lines define pick/put pairs, work class, stop-after-line and max lines/LPs per work header.
  - Notes: templates have a query (e.g., `shipping_method = LTL`); `work_break` rules split by customer, shipment or load; work class restricts which users may execute.
- **FR-31.5 Wave templates and release** — Must. The system shall group released order lines into waves by template (query, max lines 5,000, max weight, scheduled or manual release), create work and replenishment on release, and lock or allow late additions.
  - Notes: release runs as Temporal `WaveReleaseWorkflow` with per-order activities; automatic wave release on schedule (cron) or on order release; failed lines are listed on the wave with reason codes.
- **FR-31.6 Replenishment** — Must. The system shall create replenishment work by min/max (per location × item), by demand (wave shortage) and by load demand, from configured source zones.

    - Notes: min/max runs every 15 minutes by default; demand replenishment is created inside the wave before pick work; replenishment work carries priority 10 (higher than picks at 50) and must complete before the dependent pick is assignable.
- **FR-31.7 Work execution and exceptions** — Must. The system shall assign work by priority, work class and user filter; support short pick with reason, skip location, over-pick within tolerance and cancel-with-reversal.
    - Notes: short pick re-queues remaining qty as new work after a configurable retry; assignment is pessimistic (`SELECT … FOR UPDATE SKIP LOCKED`) so two users never receive the same work; p95 assignment < 1 s under 10k lines/day simulation.
- **FR-31.8 Loads and dock appointments** — Must. The system shall build loads from shipments (manual, rule, or by route), confirm loads, and schedule dock appointments with 15-minute slot granularity per door.
    - Notes: load confirmation posts packing slips via the wave-28 API; dock doors have calendars (wave 6); overlapping appointments on one door are rejected.
- **FR-31.9 ASN-driven receiving** — Must. The system shall import an ASN packing structure (from EDI 856 in wave 35, or JSON API now) and receive by scanning/selecting the pallet LP, creating quants per nested LP.
    - Notes: receipt without ASN remains supported (item + qty + LP); variance to ASN produces a receipt discrepancy with tolerance ±2% default.
- **FR-31.10 Cycle counting** — Should. The system shall generate count work by plan (location set, frequency), threshold (on-hand ≤ n) and ad hoc; count differences post via the wave-16 counting journal after supervisor approval above a tolerance.
    - Notes: tolerance default 1% of value or 5 units; blind counts hide expected qty.
- **FR-31.11 Slotting analysis** — Could. The system shall compute ABC velocity by picks/30 days and recommend item-to-location moves to forward pick zones.
    - Notes: output is a recommendation list; applying generates movement Work.
- **FR-31.12 Warehouse KPIs** — Should. The system shall expose lines picked per hour, work aging, dock utilization, replenishment lead time, short-pick rate via the Cube semantic layer.
    - Notes: materialized hourly; lag ≤ 60 s per PRD §8.
- **FR-31.13 Cross-docking (planned and opportunistic)** — Must. The system shall move inbound quantity from a receiving location to an outbound staging or shipping location without put-away to storage, either planned (a CrossDockTemplate links an expected supply — PO line, ASN or transfer receipt — to a released demand line before arrival) or opportunistic (at receipt registration, released demand with an open shortage for the item is found and CROSS_DOCK work is created instead of put-away).
    - Notes: allocation per BR-31.11; demand priority `SHIP_DATE`, `ORDER_PRIORITY` or `FIFO_RELEASE`; supply window default 48 h before the demand ship date; partial cross-dock splits the receipt (remainder follows put-away directives); CROSS_DOCK work uses PUT directives with the new strategy `outbound_staging`; the reservation moves from supply to demand in the wave-16 ledger so ATP never counts the quantity twice.
- **FR-31.14 Outbound sorting** — Should. The system shall sort picked LPs or cartons at a sortation area into sort positions defined by a SortTemplate (criteria: shipment, load, customer, route or carrier) and close a position into an outbound LP when it is full, when the last expected LP arrives, or on demand.
    - Notes: position capacity by LP count, weight and volume; scanning at the sort station returns the target position (p95 < 300 ms); closing prints the shipping label through the wave-32 print service and builds the LP hierarchy used by the 856 (BR-35.2).
- **FR-31.15 Value-added services and kitting** — Should. The system shall create VAS orders from sales-order line requirements or customer-item VAS profiles (labeling, tagging, gift wrap, repack, kit assembly) and run them as VAS work steps between pick and pack; kit-to-order assembles a kit BOM (wave 9 BOM type `KIT`) in the warehouse and kit-to-stock receives finished kits into inventory.
    - Notes: VAS work targets a VAS station location; assembly posts per BR-31.12; disassembly reverses the posting; VAS step time feeds labor standards (FR-31.18) and customer VAS charges (wave 29 charge code `VAS`).
- **FR-31.16 Transfer order warehouse flow** — Must. The system shall release transfer orders (wave 16) to the warehouse, create TRANSFER_ISSUE work, ship LPs to the in-transit warehouse, and receive the same LP ids at the destination with TRANSFER_RECEIPT work, applying the transfer order's under- and over-delivery tolerances.
    - Notes: LP identity is preserved across sites; an LP not on the transfer shipment is rejected (BR-31.16); in-transit quants belong to the in-transit warehouse in the ledger; a line within under-delivery tolerance (default 0%) closes on receipt.
- **FR-31.17 Packaging specifications** — Should. The system shall define packaging specifications per item or item group, optionally per customer: levels (each, inner, case, pallet) with quantity per level, packaging material item, LP type, label template and stacking limit. Work creation, the `round_up_to_lp` strategy, cartonization at pack and VAS repack use the specification found by most-specific match.
    - Notes: determination order item+customer → item → item group+customer → item group → none; packaging material consumption posts through wave 16 when `consume_material = true`; replaces D365 unit sequence groups plus container build templates and SAP /SCWM/PACKSPEC.
- **FR-31.18 Labor standards and performance** — Should. The system shall compute an engineered labor standard (planned seconds) per work line from formulas over travel distance, quantity, LP count, weight and fixed setup time, capture actual time from work confirmations and wave-32 step telemetry, and report performance (Σ planned ÷ Σ actual × 100) per user, work class, shift and warehouse.
    - Notes: formula per BR-31.14, written in the wave-3 expression engine and effective-dated; travel distance from location coordinates (x, y, z), Manhattan by default; indirect activities (wave 32 indirect activity codes) are included or excluded per setting; PerformanceDocuments are immutable once the shift closes; incentive pay is not calculated here — closed documents export to payroll (wave 42) as a time type; named per-user views require WMS_LABOR_VIEW and `labor_personal_visibility = NAMED` (§6.31.20).
- **FR-31.19 Hazardous-material storage compatibility** — Should. The system shall hold a HazmatProfile per item (UN number, proper shipping name, class/division, packing group, storage class per TRGS 510 or NFPA 30 hazard category, water hazard class, flash point in °C, net explosive mass) and enforce storage compatibility: location profiles declare allowed storage classes and a fire-containment section, and the directive engine excludes locations where the line would sit next to an incompatible class or exceed a section quantity limit.
    - Notes: segregation per BR-31.15 against a reference-data matrix (allowed / separate / prohibited per class pair); section limits in kg or L; hazmat inventory per section is an inquiry (LX06/LX24 equivalent); wave 34 reuses the same profile for transport DG checks (FR-34.15), and wave 33 links it to SDS versions (FR-33.14).

6.31.4 Data model

Location

Field	Type	Required	Notes
location_id	uuid	yes	PK
warehouse_id	uuid	yes	FK warehouse (wave 6)
name	text	yes	unique per warehouse, generated from LocationFormat
zone_id	uuid	yes	FK Zone
profile_id	uuid	yes	FK LocationProfile
aisle, rack, shelf, bin	text	no	parsed components; indexed for sort order
max_weight_kg, max_volume_m3, max_lps, max_items	numeric(18,6)/int	no	null = unlimited
pick_sequence	int	yes	travel-path ordering within zone

Field	Type	Required	Notes
status	enum	yes	ACTIVE, BLOCKED_IN, BLOCKED_OUT, BLOCKED, INACTIVE

LicensePlate

Field	Type	Required	Notes
lp_id	text(40)	yes	PK; SSCC-18 when generated
warehouse_id	uuid	yes	FK
parent_lp_id	text(40)	no	FK LicensePlate; depth ≤ 5 (trigger-enforced)
location_id	uuid	no	null only when on an in-progress Work
in_transit_work_id	uuid	no	FK Work; mutually exclusive with location_id
lp_type	enum	yes	PALLET, CASE, TOTE, INNER, CONTAINER
gross_weight_kg, volume_m3	numeric(18,6)	no	computed from children when nested
created_at	timestamptz	yes	

Work / WorkLine

Field	Type	Required	Notes
work_id	uuid	yes	PK; number sequence WRK-* (wave 5)
warehouse_id	uuid	yes	FK
work_type	enum	yes	PURCHASE_PUTAWAY, SALES_PICK, TRANSFER_ISSUE, TRANSFER_RECEIPT, PRODUCTION_PICK, RAF_PUTAWAY, REPLENISHMENT, MOVEMENT, COUNT, RETURN
status	enum	yes	see BR-31.3 state machine
priority	smallint	yes	1 (highest)–99; default by template
work_class_id	uuid	yes	FK; filters eligible users
wave_id, load_id, order_ref	uuid/text	no	FK Wave, Load; polymorphic order ref
assigned_user_id, locked_at	text/timestamptz	no	pessimistic lock
line_no, line_type (PICK/PUT), item_id, dims jsonb, qty, uom, from_location_id, to_location_id, lp_id, target_lp_id, line_status	—	yes	WorkLine; line_status OPEN/IN_PROGRESS/COMPLETED/SKIPPED/CANCELLED

LocationDirective

Field	Type	Required	Notes
directive_id	uuid	yes	PK
sequence	int	yes	evaluation order; unique per (work_type, warehouse, direction)
work_type, direction	enum	yes	direction PUT or PICK
warehouse_id	uuid	yes	
query	jsonb	yes	metadata query (wave 3 query model) against order line
lines	jsonb[]	yes	each: seq, from_qty, to_qty, uom, locate_packing_qty bool, restrict_by_uom
actions	jsonb[]	yes	per line: seq, strategy, fixed_location bool, location_query, allow_negative
multiple_sku	bool	yes	true = directive used for multi-SKU LPs

Invariants: Σ quant qty per (item, dims, warehouse) in `wms_db` equals inventory ledger physical on-hand for that warehouse at every ledger commit (eventual, reconciled daily and after each work completion); an LP is at exactly one location or on exactly one Work; location capacity ≥ Σ (quants + inbound in-progress work) at all times (property test); a WorkLine PUT always follows its PICK in `line_no` order within the same work. Indexing: `quant(warehouse_id, item_id, dims_hash, location_id)`; partial index `work(warehouse_id, priority, created_at) WHERE status = 'OPEN'`; `location(zone_id, pick_sequence)`; `license_plate(parent_lp_id)`. `wms_db` is partitioned by `tenant_id` list partitions over RLS.

6.31.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
POST	/wms/v1/locations:bulk	Create/update locations from format	Idempotency-Key header, 24 h	WMS_SETUP_MAINTAIN
POST	/wms/v1/location-directives	Create directive	key	WMS_SETUP_MAINTAIN
POST	/wms/v1/location-directives:simulate	Evaluate directives for a hypothetical line; returns trace	n/a (read)	WMS_SETUP_VIEW
POST	/wms/v1/waves/{id}:release	Release wave (starts Temporal workflow)	key; second call returns workflow id	WMS_WAVE_RELEASE
POST	/wms/v1/work:assign	Assign next work for user by filter	key per user+device	WMS_WORK_EXECUTE
POST	/wms/v1/work/{id}/lines/{n}:confirm	Confirm pick/put with actual qty, LP, location	key	WMS_WORK_EXECUTE
POST	/wms/v1/work/{id}:exception	Short pick, skip, cancel with reason	key	WMS_WORK_EXECUTE
POST	/wms/v1/receipts:from-asn	Register receipt from ASN packing structure	key = ASN id	WMS_RECEIVE
POST	/wms/v1/loads/{id}:confirm-shipment	Confirm load, post packing slips	key	WMS_SHIP_CONFIRM
GET	/wms/v1/quants?item=&location=&lp=	On-hand inquiry	—	WMS_INQUIRY
POST	/wms/v1/replenishment:run	Run min/max for a warehouse	key = warehouse+minute	WMS_REPLENISH
POST	/wms/v1/cross-dock-templates	Create or version a cross-dock template	key	WMS_SETUP_MAINTAIN
POST	/wms/v1/sort-stations/{id}:scan	Return the sort position for a scanned LP	—	WMS_WORK_EXECUTE
POST	/wms/v1/vas-orders	Create a VAS or kit order	key	WMS_VAS_MAINTAIN
POST	/wms/v1/labor/standards	Create or version a labor standard formula	key	WMS_LABOR_ADMIN
GET	/wms/v1/labor/performance?user=&shift=	Performance by user, work class or shift	—	WMS_LABOR_VIEW
POST	/wms/v1/hazmat-profiles	Maintain a hazmat profile	key	WMS_HAZMAT_MAINTAIN

Commands (CQRS): `CreateWorkFromOrderLines` validates all lines belong to one warehouse and are released; `ConfirmWorkLine` validates qty ≤ open qty + over-pick tolerance, LP exists or is new at a PUT, location status allows direction, capacity; `ReleaseWave` validates template limits before starting the workflow.

Event	Trigger	Payload fields	Consumers
dev.passage.wms.work.created.v1	Work header committed	work_id, work_type, warehouse_id, priority, wave_id, lines[]	wms-mobile, analytics
dev.passage.wms.work.completed.v1	last line confirmed	work_id, lines[{item, dims, qty, from, to, lp}], user, duration_s	inventory (post transfer), sales-fulfillment, production
dev.passage.wms.wave.released.v1	workflow finished	wave_id, orders, work_count, replenishment_count, failures[]	analytics, sales-fulfillment
dev.passage.wms.load.shipped.v1	load confirmed	load_id, shipment_ids, lp_ids, carrier_id, ship_datetime	tms, edi, sales-fulfillment
dev.passage.wms.receipt.registered.v1	receipt committed	receipt_id, po_line_refs, lp_ids, qty by item	purchasing, quality

6.31.6 User experience

Screen	Primary actions	Key fields/columns	Duty
Warehouse setup workspace	Locations grid, profiles, zones, formats; generate locations	name, zone, profile, capacity, status	WMS_SETUP_MAINTAIN
Location directive designer	Order directives, add lines/actions, simulate	sequence, work type, query, strategy, trace	WMS_SETUP_MAINTAIN
Wave workbench	Create/release/hold waves, view failures	wave id, template, lines, weight, status, failures	WMS_WAVE_RELEASE
Work list	Filter, reassign, change priority, cancel	work id, type, status, user, age, lines	WMS_WORK_SUPERVISE
Load planning workbench	Build loads from shipments, assign door, confirm	load, shipments, weight/volume, door, appointment	WMS_SHIP_CONFIRM
Receiving workspace	Receive from ASN/PO, create LPs, print	PO, ASN, LP, item, qty, discrepancy	WMS_RECEIVE
On-hand by location/LP	Inquiry, movement, LP tree	item, dims, location, LP, qty, status	WMS_INQUIRY

Interaction rules: grids support keyboard range selection and bulk priority change (max 500 rows per action); directive designer validates on save and shows a simulation trace (rule hit/miss per step); personalization (column sets, saved filters) per user from wave 5 shell; destructive actions (cancel work with inventory in transit) require a reason code and confirmation.

6.31.7 Business rules and edge cases

- **BR-31.1 Location directive evaluation algorithm.** For a work line (item, dims, qty, uom, order attributes), evaluate: (1) select directives where `work_type`, `direction`, `warehouse` match and `query` is true, ordered by `sequence`; (2) within a directive, select the first line where `from_qty ≤ qty_in_line_uom < to_qty` (uom converted via wave 6 conversions; `locate_packing_qty` uses the item's packing hierarchy); (3) evaluate actions of that line in `seq` order: each action produces candidate locations = locations matching `location_query` ∩ status allows direction ∩ (for PUT) capacity remaining ≥ line qty/weight/volume ∩ profile mixing rules; the strategy orders candidates (`consolidate`: locations already holding item+dims, then by pick_sequence; `empty_location`: empty only; `fifo`/`fefo` for PICK: quants by receipt date / expiry ascending, tie-break pick_sequence; `round_up_to_lp`: full-LP quantities first); (4) the first action yielding ≥ 1 candidate wins and the top candidate is returned; (5) if no action of the matched line yields a candidate, continue with the next *directive* (lines within a directive are mutually exclusive by quantity band, so no other line of the same directive is tried); (6) if no directive yields a location, the line is created with `to_location = null` and work status `BLOCKED_NO_LOCATION`, and the wave lists it as a failure. Worked example: PUT line, item `BOLT-M8`, 1,200 EA, packing 100/case, 12 cases/pallet. Directives for PURCHASE_PUTAWAY in `WH1`: seq 10 query `item_group = FASTENERS`; seq 20 catch-all. Directive 10 lines: L1 0–99 EA (actions: A1 consolidate in zone `FWD`), L2 100–1199 EA (A1 consolidate zone `CASE`, A2 empty_location zone `CASE`), L3 1200–∞ EA (A1 empty_location zone `RESERVE` fixed pallet locations, A2 empty_location zone `OVERFLOW`). Qty 1,200 falls in L3. A1 candidates: RESERVE locations with status ACTIVE, 0 LPs, max_weight ≥ 1,200 × 0.012 kg = 14.4 kg → `R-05-02-01` (pick_sequence 5021) wins. If RESERVE were full, A2 would choose the first empty OVERFLOW location; if none, directive 20 is tried; if it also fails, the line is BLOCKED_NO_LOCATION.
- **BR-31.2 Capacity arithmetic.** Remaining capacity = max − Σ(quant) − Σ(in-progress PUT lines targeting the location). Rounding: weight and volume to 6 decimals; LP count and item count are integers. A location with remaining weight 0.000001 kg does not accept a 0.000002 kg line.
- **BR-31.3 Work state machine.** `OPEN → ASSIGNED → IN_PROGRESS → COMPLETED`; `OPEN|ASSIGNED → CANCELLED` (only if no line confirmed); `IN_PROGRESS → PARTIALLY_COMPLETED` (short pick; remainder re-queued as new OPEN work with `parent_work_id`); `ASSIGNED → OPEN` on unassign or lock timeout (default 30 min idle); `BLOCKED_NO_LOCATION → OPEN` after a re-evaluation succeeds. No transition out of COMPLETED; reversal creates compensating MOVEMENT work.
- **BR-31.4 Wave creation state machine.** `CREATED → RELEASING → RELEASED` or `→ RELEASE_FAILED` (any line failed and template `fail_whole_wave = true`) or `→ RELEASED_WITH_ERRORS`; `RELEASED → HELD → RELEASED`; `CREATED|RELEASED_WITH_ERRORS → CANCELLED` reverses all unstarted work.
- **BR-31.5 Replenishment precedence.** Pick work whose source location has insufficient quant after replenishment demand is created carries `depends_on_work_id`; it is not assignable until the dependency is COMPLETED. Dependency cycles are impossible because replenishment sources are restricted to zones not used as pick zones in the same directive.
- **BR-31.6 FEFO with equal expiry** breaks ties by receipt timestamp then pick_sequence; expiry is compared as a date in the warehouse's time zone.
- **BR-31.7 Over-pick tolerance** default 0%; max configurable 10%; over-pick never applies to serial-tracked items or to PICK lines sourcing from a quant with `quality_status ≠ ACCEPTED` (wave 33).
- **BR-31.8 Concurrency.** Work assignment uses `FOR UPDATE SKIP LOCKED` on the open-work partial index; quant updates use optimistic `version` with retry 3×; two confirmations of the same line with the same idempotency key return the first result; with different keys the second fails `409 LINE_ALREADY_CONFIRMED`.
- **BR-31.9 Nested LP moves** are a single transaction updating `location_id` on the root only; children derive location from the root (`location_id` null on children with a parent). Un-nesting a child sets its own location to the parent's current location.
- **BR-31.10 ASN variance.** Received qty outside ±2% (configurable) of ASN qty creates a `ReceiptDiscrepancy` with reason; receipt still posts actual qty.
- **BR-31.11 Cross-dock allocation.** At receipt registration of quantity R for item i: candidate demand D = released outbound lines for i in the same warehouse with `ship_date ≤ receipt_date + window` and open unpicked quantity > 0, ordered by template priority, then ship date, then order line id; allocate greedily; cross-dock quantity X = min(R, Σ D_open); R − X follows put-away directives. Planned links are consumed before opportunistic allocation. Supply with `quality_status ≠ ACCEPTED` (wave 33) is never cross-docked; its CROSS_DOCK work is created after the accepting usage decision if the demand is still open.
- **BR-31.12 Kit assembly posting.** One ledger transaction issues every component at BOM quantity × kit quantity (BOM scrap % applied, rounded up to the component UoM decimals) and receives the kit; failure of any component issue rolls back the whole posting; kit cost = Σ component cost + VAS labor at standard rate (wave 20).
- **BR-31.13 Packaging specification freeze.** The specification is determined at work creation and stored on the work line (`packaging_spec_id`, `version`); changing a specification does not alter open work.
- **BR-31.14 Labor standard formula.** planned_s = setup_s + travel_m × s_per_m + qty_base_uom × s_per_unit + lps × s_per_lp + weight_kg × s_per_kg, rounded to 0.1 s; actual_s = confirmed_at − started_at minus pauses longer than `labor_indirect_threshold_s`, which are logged as indirect time; a line with actual_s < 0.2 × planned_s or > 5 × planned_s is an outlier and excluded from performance.
- **BR-31.15 Hazmat segregation.** For a PUT candidate location L in section S: reject if any quant in S has class c with matrix(c, c_new) = prohibited; reject if matrix = separate and L is in the same location group (rack) as such a quant; reject if Σ hazmat quantity in S + line quantity > section limit. Each rejection appears in the simulation trace, e.g. `hazmat: class 3 vs 5.1 prohibited in FCS-02`.

- **BR-31.16 Transfer LP integrity.** TRANSFER_RECEIPT confirms only LPs on the shipped transfer; quantity variance per LP beyond tolerance creates a ReceiptDiscrepancy under BR-31.10; the in-transit quant is relieved exactly once.

6.31.8 Acceptance criteria

- **AC-31.1** (FR-31.3) Given the 100-scenario directive fixture, when each line is simulated via `/location-directives:simulate`, then every result equals the expected location and the trace shows the expected winning directive/line/action.
- **AC-31.2** (FR-31.1, BR-31.2) Given a location with max_lps = 1 holding one LP, when a PUT line targets it, then the action skips it and the simulation trace states `capacity: lps 1/1`.
- **AC-31.3** (FR-31.5, FR-31.6) Given 500 released sales orders (2,300 lines) and the demo directives, when the wave is released, then 2,300 pick lines and the expected 41 replenishment works are created, no work is BLOCKED_NO_LOCATION, and the wave is RELEASED within 120 s.
- **AC-31.4** (FR-31.7, BR-31.8) Given 50 concurrent users calling `work:assign`, when 1,000 open works exist, then no work id is returned to two users and p95 latency < 1 s.
- **AC-31.5** (FR-31.7, BR-31.3) Given an IN_PROGRESS pick of 10 EA, when the user short-picks 6 with reason `EMPTY`, then the work becomes PARTIALLY_COMPLETED, a new OPEN work for 4 EA exists with parent reference, and the inventory ledger shows a 6 EA transfer only.
- **AC-31.6** (FR-31.2, BR-31.9) Given a pallet LP with 12 case LPs, when the pallet is moved, then all 13 LPs report the new location and one `work.completed` event is emitted.
- **AC-31.7** (FR-31.9) Given an ASN with 3 pallets, when the receiver confirms pallet 2 with qty 95 of 100, then a discrepancy of –5 (–5%) is recorded and quants exist for pallet 2 only.
- **AC-31.8** (FR-31.8) Given door D1 with an appointment 09:00–09:45, when a second appointment 09:30–10:00 is requested, then it is rejected with `DOOR_SLOT_OVERLAP`.
- **AC-31.9** (property) For 10,000 generated work and confirmation sequences, location capacity is never exceeded and LP location/transit exclusivity holds.
- **AC-31.10** (FR-31.13, BR-31.11) Given a released sales line of 40 EA shipping tomorrow and an ASN pallet of 100 EA arriving today, when the pallet is received, then one CROSS_DOCK work of 40 EA to outbound staging and one put-away work of 60 EA exist and ATP counts the 40 EA once.
- **AC-31.11** (FR-31.14) Given a sort template by shipment with 12 positions, when 30 cartons for 8 shipments are scanned, then each carton is directed to its shipment's position and closing a position creates one outbound LP containing exactly those cartons.
- **AC-31.12** (FR-31.15, BR-31.12) Given a kit BOM of 3 components and a kit-to-order line of 10, when the VAS work is confirmed, then one ledger transaction issues 30 component units and receives 10 kits; with one component short, nothing posts and WMS-0114 is shown.
- **AC-31.13** (FR-31.18, BR-31.14) Given the labor formula fixture and 1,000 confirmed lines, when the shift closes, then planned seconds per line equal the fixture to 0.1 s and performance per user equals Σ planned ÷ Σ actual over non-outlier lines.
- **AC-31.14** (FR-31.19, BR-31.15) Given section FCS-02 holding class 5.1 oxidizers, when a class 3 flammable-liquid PUT line is simulated, then FCS-02 locations are excluded and the trace states the segregation reason.
- **AC-31.15** (FR-31.16, BR-31.16) Given a transfer of 3 LPs shipped from WH1, when WH2 receives 2 of them and scans an LP that is not on the transfer, then the foreign LP is rejected with WMS-0117, the 2 LPs are received with unchanged ids, and the third remains in transit.

6.31.9 Test plan and fixtures

Fixtures: `wms-demo-warehouse` (1 warehouse, 4 zones, 8,000 locations, generated from format), `directive-scenarios-100.json` (hand-authored, reviewed against D365 demo data USMF behavior), `wave-500-orders` (generated from wave-28 order fixtures), `asn-3-pallet.json`, `sim-10k-lines-day` (synthetic order stream for the simulation harness).

Test	Type	Target	Pass criterion
Directive resolution	unit/table-driven	100 scenarios	100% expected location
Capacity invariant	property (rapid/Go)	10k sequences	zero violations
Work state machine	unit	all transitions	illegal transitions rejected
Wave release	E2E (Playwright + API)	500 orders	work counts, < 120 s
Assignment contention	performance (k6)	50 VUs	p95 < 1 s, no duplicates
Simulation	performance	10k lines/day × 3 days	no deadlocked work, no BLOCKED_NO_LOCATION
Directive perf	performance	50k locations	p95 < 200 ms/line
Nested LP	contract	API	depth 6 rejected

Reconciliation: Σ quant per item/warehouse = inventory ledger on-hand; Σ in-transit on Work = ledger "in transit" status; load shipped quantities = packing slip quantities (wave 28).

6.31.10 Deployment and operations

Helm chart `passage-wms` (deployments `wms-api`, `wms-directive-engine`, `wms-worker` for Temporal activities; HPA 2–10 on CPU 70%); CloudNativePG cluster `wms-db` (3 instances, 100 GB); Atlas migrations generated from entity metadata; config: `WMS_LOCK_TIMEOUT_MIN=30`, `WMS_REPLENISH_INTERVAL_MIN=15`, `WMS_MAX_WAVE_LINES=5000`. Feature flags: `wms.advanced` per warehouse (off = wave-28 simple mode), `wms.slotting`. Scheduled jobs (Temporal schedules): min/max replenishment, automatic wave release, count plan generation (daily 02:00 warehouse-local), KPI materialization hourly. SLOs: assignment p95 < 1 s; directive simulate p95 < 200 ms; wave release of 5,000 lines < 10 min; availability 99.9%. Alerts: `WmsWorkBlockedNoLocation > 50 in 15 min`, `WmsAssignmentP95 > 2 s`, `WmsQuantLedgerDrift ≠ 0 after daily reconciliation`, `WmsWaveWorkflowFailed`. Runbook: re-evaluate blocked work; release stuck locks; reconcile drift (compare `quant` vs ledger projection, apply correction journal with approval). Rollback: Argo CD to previous digest; migrations are additive within a wave; flag `wms.advanced=false` returns a warehouse to simple mode only if no OPEN work exists.

6.31.11 Migration from AX / SAP

Source	Passage entity	Transformation
WMSLocation, WHSLocationProfile, WHSZone, WHSLocationFormat	Location, LocationProfile, Zone, LocationFormat	parse name by format; capacity from profile; status from `WHSLocationStatus`
/SCWM/LAGP, /SCWM/T301, /SCWM/T302, /SCWM/T303	Location, Zone (storage type/section), LocationProfile (bin type)	LGTYP → zone, LGBER → sub-zone attribute; capacity from LAGP `MAX_WEIGHT/MAX_CAPA`
WHSLicensePlate, WHSInventOnhand by LP	LicensePlate, Quant	parent LP via `WHSLicensePlate.ParentLicensePlateId`
/SCWM/HUHDR, /SCWM/HUITM, /SCWM/AQUA	LicensePlate, Quant	HU nesting via `HUHDR.TOP/HIGHER_LEVEL`; quants from AQUA by LGPLA
WHSLocationDirective/Line/Action	LocationDirective	strategy enum mapped 1:1; AX queries translated to metadata query

Source	Passage entity	Transformation
WHSWorkTemplateTable/Line, WHSWaveTemplateTable, WHSReplenishmentTemplate	WorkTemplate, WaveTemplate, ReplenishmentTemplate	direct
EWM put-away/removal strategies (/SCWM/T333, /SCWM/T334)	LocationDirective	storage type search sequence → ordered actions
WHSWorkTable/Line (status Open/In process), /SCWM/ORDIM_O	Work, WorkLine	only open work migrated at cutover; completed work is history (not migrated)
WHSLoadTable/Line (not shipped)	Load	open loads only

Validation: location count and names match; on-hand by location/LP equals source on-hand snapshot (wave-16 reconciliation extended by location); open work count matches. Not migrated: closed work history (WHSWorkTable confirmed, /SCWM/ORDIM_C) — kept in the wave-46 lakehouse as archived source data; labor standards; EWM yard data (v1.x).

6.31.12 Dependencies, risks, open questions

Depends on: wave 30 (go-live baseline), wave 28 (shipments, packing slips), wave 18 (purchase receipts), wave 21 (production picking/RAF), wave 16 (inventory ledger, reservations, counting journal), wave 8 (GS1 company prefix, packing hierarchy), wave 6 (warehouses, calendars, UoM), wave 4 (Temporal, outbox).

Risk	Likelihood	Impact	Mitigation
Directive semantics differ subtly from D365 and confuse migrating customers	Medium	Medium	Simulation trace; parity fixtures from D365 USMF; documented differences
Quant/ledger drift under high concurrency	Low	High	Single posting path through inventory ledger; daily reconciliation alert

Open questions: (1) Should quants be owned by `wms` or remain a projection of `inventory`? Proposed: projection with `wms` as the only writer of location/LP dims; decide by wave 31 design review. (2) SSCC extension digit per warehouse or per tenant? Proposed: per warehouse; decide by wave 32.

6.31.13 Parameters and setup

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
wms.advanced_enabled	warehouse	bool	false	true / false	Switches the warehouse from wave-28 simple mode to directed work	Warehouse form: "Use warehouse management processes" (InventLocation.WHSEnabled)	SPRO EWM › Master Data › Assign Warehouse Numbers (/SCWM/T300_MD)
lp_number_sequence	warehouse	sequence ref	SSCC-18 per warehouse	SSCC / custom pattern	Format of generated LP ids	Warehouse management parameters › Number sequences › License plate	SPRO EWM › Master Data › Define Number Ranges for Handling Units
sscc_extension_digit	warehouse	int	0	0–9	First digit of generated SSCCs	Warehouse management parameters › General › SSCC / GS1 setup	GS1 company prefix and SSCC number range (HU number range object)
lock_timeout_min	warehouse	int	30	5–240	Idle ASSIGNED work returns to OPEN (BR-31.3)	Work user session expiry	Resource type logon timeout (/SCWM/TRSRC_TYP)
max_wave_lines	wave template	int	5,000	1–20,000	Wave size cap (FR-31.5)	Wave template › Wave threshold	Wave template capacity profile (/SCWM/WAVETMP)
fail_whole_wave	wave template	bool	false	true / false	RELEASE_FAILED vs RELEASED_WITH_ERRORS (BR-31.4)	Wave template "Process wave at release" plus held wave status	Wave release method in wave template
over_pick_tolerance_pct	warehouse, item	numeric(5,2)	0	0–10	Over-pick limit (BR-31.7)	Mobile device menu item "Allow over-picking" with product over-pick %	Warehouse process type (/SCWM/T333) over-pick indicator
replenishment_interval_min	warehouse	int	15	5–1,440	Min/max run frequency (FR-31.6)	Replenishment batch job recurrence (WHSReplenishmentSchedule)	/SCWM/REPL background job variant
asn_variance_tolerance_pct	warehouse, vendor	numeric(5,2)	2	0–20	ReceiptDiscrepancy threshold (BR-31.10)	PurchLine over/under delivery %	Inbound delivery tolerance (MM tolerance keys T169G)
count_approval_tolerance	warehouse	value % / units	1% or 5 units	≥ 0	Count differences above it need approval (FR-31.10)	Cycle count thresholds and approval parameters (WHSCycleCountThreshold)	SPRO EWM › Physical Inventory › Define Tolerance Groups for Difference Analyzer
blind_count	warehouse	bool	true	true / false	Hides expected quantity on count work	Mobile device menu item "Display expected quantity"	Physical inventory procedure without book quantity (/SCWM/PI)
capacity_dimensions	location profile	set	{weight, volume, lps, items}	any subset	Which dimensions BR-31.2 enforces	Location profile "Use volumetrics" and location stocking limits	Storage type capacity check method (/SCWM/T331)
directive_trace_retention_days	tenant	int	30	1–365	Retention of simulate/evaluation traces	Warehouse management parameters › Location directive failures logging	Application log retention (SLG1 object /SCWM/)
crossdock_opportunistic	warehouse	bool	false	true / false	Enables opportunistic cross-dock at receipt (FR-31.13)	Work policy "Opportunistic cross docking"	SPRO EWM › Cross-Process Settings › Cross-Docking › Opportunistic Cross-Docking › Activate
crossdock_supply_window_h	cross-dock template	int	48	0–336	Supply-to-demand window (BR-31.11)	Cross docking template "Re-plan frequency" and demand window	Opportunistic cross-docking settings for inbound (time horizon)
crossdock_demand_priority	cross-dock template	enum	SHIP_DATE	SHIP_DATE / ORDER_PRIORITY / FIFO_RELEASE	Demand ordering (BR-31.11)	Cross docking template "Demand requirement prioritization"	Push deployment strategy

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
sort_position_close_rule	sort template	enum	MANUAL	MANUAL / FULL / LAST_LP	When a sort position closes (FR-31.14)	Outbound sorting template "Close position"	Consolidation group completion rule
vas_station_location	warehouse	location ref	none	locations of type VAS	Default target of VAS work (FR-31.15)	Kit order location	SPRO EWM › Value-Added Services › Define Work Center for VAS (/SCWM/TWORKST)
packaging_spec_required	warehouse	bool	false	true / false	Blocks work creation when no specification matches (FR-31.17)	Unit sequence group mandatory on WHS items	Packaging specification determination procedure (condition technique)
labor_travel_metric	warehouse	enum	MANHATTAN	MANHATTAN / EUCLIDEAN / GRAPH	Travel distance method (BR-31.14)	n/a	SPRO EWM › Labor Management › Travel Distance Calculation settings
labor_indirect_threshold_s	warehouse	int	120	30–900	Pause length counted as indirect (BR-31.14)	n/a	Indirect labor task settings (/SCWM/LM)
labor_personal_visibility	legal entity	enum	AGGREGATE_ONLY	AGGREGATE_ONLY / NAMED	Whether performance is shown per named user (FR-31.18)	n/a	Authorization for employee performance documents (/SCWM/LM)
hazmat_segregation_matrix	tenant	reference data version	TRGS510-2023	TRGS510 / NFPA30 / custom	Matrix used by BR-31.15	Product compliance / hazardous material setup	SPRO EWM › Master Data › Hazardous Substances › Define Storage Classes and storage type checks

6.31.14 Inquiries and reports

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
On-hand by location / LP	list inquiry	warehouse, item, dims, location, LP, status	qty, reserved, available, LP tree, quality status	`quant`	On-hand by location, WHSInventOnhand	LS24/LS26, LX02, /SCWM/MON stock node
Work list and work audit	list inquiry	status, work type, user, age, wave	work id, lines, from/to, user, duration	`work`, `work_line`	All work list page, work audit templates	LT22–LT28, /SCWM/MON warehouse orders/tasks
Wave status and failures	drill-down	wave, template, status, date	lines, work count, replenishment count, failures by reason	`wave`	Wave details (WHSWaveTable)	/SCWM/WAVE, LT41/LT42
Location capacity and empty bins	operational report	zone, profile, utilization %	used/max per dimension, empty flag	`location` + `quant`	Location load, location stocking limits inquiry	LX01, LX04, /SCWM/MON storage bins
Directive failure trace	drill-down	work, wave, date range	directive, line, action, rejection reason	directive trace store	Location directive failures (D365)	Application log SLG1 (no dedicated report)
Cycle count variances	operational report	warehouse, period, counter	expected, counted, difference qty and value, approver	count work	Cycle count work approval, SSRS count sheets	LX17, LX18, LI20
Quant–ledger reconciliation	operational report	warehouse, date	Σ quant vs ledger on-hand, drift per item	reconciliation job output	Manual InventSum vs WHS comparison	LX23 stock comparison IM–WM, EWM–ERP stock comparison
Cross-docking report	operational report	warehouse, date, template	supply, demand, qty cross-docked, dwell minutes, missed opportunities	`crossdock_link`	SSRS Cross docking report	LXDCA cross-docking monitor, /SCWM/MON cross-docking node
Sort position status	list inquiry	sort station, status	position, LPs, fill %, open/closed, target shipment	`sort_position`	Outbound sorting position inquiry	/SCWM/MON consolidation groups
VAS order backlog	list inquiry	station, status, due date	order, steps, estimated vs actual time	`vas_order`	Kit orders list	/SCWM/VASEXEC worklist
Labor performance	KPI	warehouse, shift, work class, user (duty-gated)	planned s, actual s, performance %, indirect %, outliers	`labor_line`	Warehouse workload visualization (no standards)	/SCWM/MON labor management nodes, performance documents
Hazmat inventory by fire-containment section	operational / statutory report	warehouse, section, class	qty kg/L vs limit, classes present, emergency contact	`quant` + `hazmat_profile`	Product compliance regulated products inquiry	LX06, LX24
Warehouse KPIs	KPI	warehouse, hour/day	lines/h, dock-to-stock min, pick accuracy %, short-pick rate, replenishment lead time	Cube	Warehouse management workspace tiles	Fiori Warehouse KPIs, LX47

6.31.15 Printed and electronic documents

Document	Trigger	Layout elements	Formats	Numbering sequence	Legal / retention requirement
Pick list (work document)	Work created or printed on demand	Header: work id barcode, wave, priority, warehouse; lines: sequence, from location, item, lot, qty, to location; footer: line count, total weight	PDF; ZPL variant	WRK-* (wave 5)	Operational, 90 days
Load manifest	Load confirmed	Shipper, consignee, carrier SCAC, LPs/SSCCs, weights, hazmat lines with proper shipping names (FR-31.19)	PDF	Load id	Kept with the shipment record (wave 28 retention)
Count sheet	Count work created	Location, item, lot, expected qty (blank for blind counts), counted qty field	PDF	COUNT-*	Count adjustments are ledger records (wave 16 retention, 10 years)
Cross-dock tag	CROSS_DOCK work created	Outbound order, ship date, door, SSCC	ZPL	none	None
Kit assembly ticket	VAS order released	Kit BOM, component locations, VAS steps, kit LP	PDF	VAS-*	Operational, 90 days
Hazmat section inventory list	On demand and daily	Section, classes, qty vs limit, emergency contact	PDF / CSV	none	Supplied to fire authority on request; kept 1 year
Labor performance document	Shift close	User, planned, actual, performance, indirect time	PDF / CSV export to payroll	LPD-*	Employee data retention per wave 42, default 2 years

6.31.16 Periodic and batch jobs

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
Min/max replenishment	Every 15 min	warehouse	Key warehouse + minute	< 30 s at 50,000 locations	Retry 3×, then skip to next interval	WmsReplenishRunFailed
Automatic wave release	Per wave template cron	wave template	Temporal workflow id per wave	500 orders < 120 s	Per-line failures; RELEASED_WITH_ERRORS	WmsWaveWorkflowFailed
Count plan generation	Daily 02:00 warehouse-local	warehouse × plan	plan id + date	< 5 min	Resume from last generated location	Zero works generated for an active plan
Quant–ledger reconciliation	Daily 03:00	warehouse × 16 item-hash partitions	snapshot timestamp	< 15 min for 2 M quants	Report only; corrections need approval	WmsQuantLedgerDrift ≠ 0
Planned cross-dock re-plan	Every 30 min	warehouse	link version	< 60 s	Keep previous links on failure	WmsCrossDockReplanFailed
Labor shift close	Shift end + 30 min	warehouse × shift	shift id	< 2 min	Idempotent rerun	Shift not closed after 2 h
KPI materialization	Hourly	warehouse	hour bucket	< 2 min	Recompute bucket	KPI lag > 60 min
Empty LP and work history cleanup	Weekly Sunday 01:00	warehouse	LP id / work id	< 30 min	Resume by id	none (log)
Directive trace purge	Daily 04:00	tenant	trace date	< 5 min	Retry next day	none (log)

6.31.17 Security duties and privileges

Duty	Privileges (entry points)	Segregation-of-duties conflicts	Default roles that include it
WMS_SETUP_MAINTAIN	/wms/v1/locations:bulk, /location-directives, /cross-dock-templates; setup workspace; directive designer	WMS_COUNT_APPROVE (could change locations, then approve the resulting differences)	Warehouse administrator
WMS_SETUP_VIEW	/location-directives:simulate; setup screens read-only	none	Warehouse manager, supervisor
WMS_WAVE_RELEASE	/waves/{id}:release; wave workbench	none	Warehouse supervisor, warehouse manager
WMS_WORK_EXECUTE	/work:assign, /lines/{n}:confirm, /work/{id}:exception, /sort-stations/{id}:scan	WMS_COUNT_APPROVE on the same count document (approver ≠ counter, enforced)	Warehouse worker
WMS_WORK_SUPERVISE	Work list reassign, priority change, cancel, blocked-work re-evaluation	none	Warehouse supervisor
WMS_RECEIVE	/receipts:from-asn; receiving workspace	AP_INVOICE_APPROVE (wave 19): receiving and approving the same vendor's invoice	Receiving clerk
WMS_SHIP_CONFIRM	/loads/{id}:confirm-shipment; load planning workbench	none in wave; flagged with CUST_CREDIT_RELEASE (wave 26)	Shipping clerk
WMS_COUNT_APPROVE	Count approval screen; counting journal post	WMS_WORK_EXECUTE on same count; WMS_SETUP_MAINTAIN	Inventory controller
WMS_REPLENISH	/replenishment:run	none	Warehouse supervisor
WMS_VAS_MAINTAIN	/vas-orders; VAS backlog	none	VAS lead
WMS_LABOR_ADMIN	/labor/standards; formula designer	WMS_WORK_EXECUTE (could tune the standard for own work)	Labor analyst
WMS_LABOR_VIEW	/labor/performance with named users	none; available only where `labor_personal_visibility = NAMED`	Warehouse manager
WMS_HAZMAT_MAINTAIN	/hazmat-profiles; segregation matrix; section limits	none	EHS officer
WMS_INQUIRY	GET /wms/v1/quants and all inquiries above except labor	none	All warehouse roles

6.31.18 Message catalog

Code	Severity	User text	Cause	Remediation	Raised by
WMS-0101	error	No location found for {qty} {uom} of {item}; work {work} is blocked.	No directive action yielded a candidate (BLOCKED_NO_LOCATION)	Run simulate, adjust directive or free capacity, then re-evaluate	BR-31.1
WMS-0102	error	Location {loc} capacity exceeded: {dimension} {used}/{max}.	PUT would exceed remaining capacity	Choose another location or split the LP	BR-31.2
WMS-0103	error	Location {loc} does not allow mixed items.	Profile `allow_mixed_items = false`	Use an empty or same-item location	FR-31.1
WMS-0104	error	License plate nesting would exceed 5 levels.	Nest depth 6 attempted	Un-nest an intermediate level	FR-31.2
WMS-0105	error	Line {n} of work {work} is already confirmed.	Second confirmation with a different key (409 LINE_ALREADY_CONFIRMED)	Refresh the work	BR-31.8
WMS-0106	error	Quantity {qty} exceeds open quantity plus over-pick tolerance {tol}%.	Over-pick beyond tolerance or serial item	Confirm the open quantity	BR-31.7
WMS-0107	warning	Received {qty} differs from ASN {asn_qty} by {pct}%; discrepancy recorded.	Variance beyond ASN tolerance	Review the discrepancy with purchasing	BR-31.10
WMS-0108	error	Door {door} is already booked {from}–{to}.	Overlapping appointment (DOOR_SLOT_OVERLAP)	Pick another slot or door	FR-31.8
WMS-0109	info	Pick work {work} waits for replenishment {repl}.	Dependency on open replenishment	None; work becomes assignable automatically	BR-31.5
WMS-0110	error	Transition {from} → {to} is not allowed for work {work}.	Illegal state change	Use cancel or compensating movement	BR-31.3
WMS-0111	warning	Count difference {diff} exceeds tolerance; supervisor approval required.	Above count tolerance	Approve or recount	FR-31.10
WMS-0112	info	{qty} cross-docked to {loc} for order {order}; {rest} to put-away.	Cross-dock allocation	None	BR-31.11
WMS-0113	warning	Supply is under quality hold; cross-dock deferred to usage decision.	Supply not ACCEPTED	Wait for usage decision	BR-31.11
WMS-0114	error	Kit component {item} short by {qty}; kit assembly not posted.	Component issue failed	Replenish component or reduce kit qty	BR-31.12

Code	Severity	User text	Cause	Remediation	Raised by
WMS-0115	error	Storage class {c1} cannot be stored with {c2} in section {fcs}.	Segregation matrix prohibits	Use another fire-containment section	BR-31.15
WMS-0116	error	Section {fcs} limit {limit} {uom} would be exceeded.	Section quantity limit	Move stock or use another section	BR-31.15
WMS-0117	error	License plate {lp} is not on transfer shipment {ship}.	Foreign LP scanned at transfer receipt	Receive against the correct transfer	BR-31.16
WMS-0118	warning	Labor line {line} excluded as outlier (actual {a} s vs planned {p} s).	Outside 0.2×–5× planned	Review standard or confirmation	BR-31.14
WMS-0119	error	Daily reconciliation found drift for {n} item/warehouse pairs.	Quant ≠ ledger on-hand	Run drift runbook; approve correction journal	§6.31.10

6.31.19 Performance budgets and capacity

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
Directive evaluation	10,000 lines/day; peak 500 lines/min	40 / 200 / 350 ms per line	50 lines/s per directive-engine pod	Traces ≈ 3 GB (30-day rolling)	Candidate pre-filter by zone and profile; `location(zone_id, pick_sequence)`	Wave workflow queues lines; release time grows; no line dropped
Work assignment	50 concurrent users; 3,000 assigns/h	80 / 400 / 1,000 ms	200 assigns/s	—	Partial index on OPEN work	SKIP LOCKED keeps correctness; alert at p95 > 2 s
Line confirmation	30,000/day; peak 1,200/min	60 / 250 / 600 ms	100/s per pod	Work + lines ≈ 15 GB	Monthly range partitions on `created_at` inside tenant list partitions	HPA to 10 pods; beyond, 429 with Retry-After (mobile queues offline)
Wave release	50 waves/day, ≤ 5,000 lines each	2,300 lines < 120 s; 5,000 lines < 10 min	40 lines/s	—	Per-order Temporal activities	Task-queue backlog; scheduled waves start late; alert at 15 min delay
Cross-dock allocation at receipt	2,000 receipts/day	+50 / 150 / 300 ms on receipt	30/s	Links ≈ 0.5 GB	`demand(warehouse_id, item_id, ship_date) WHERE open`	Falls back to put-away and records a missed opportunity
Sort scan	20,000 cartons/day; 30/min per station	40 / 150 / 300 ms	20/s per station	—	In-memory position map per station	Correct but slower; latency shown on the station screen
Labor shift close	3 shifts × 200 users	< 2 min per shift	—	Performance documents ≈ 1 GB	`labor_line` monthly partitions	Close delayed; no data loss
Quant reconciliation	2 M quants	< 15 min	16 parallel partitions	Reports < 100 MB	Hash on item id	Runtime grows linearly; alert only on drift

6.31.20 Localization and compliance hooks

- **Hazardous-material storage.** Segregation and quantity limits differ by jurisdiction: Germany TRGS 510 storage classes (LGK 1–13) with water hazard classes under AwSV; United States NFPA 30, International Fire Code chapter 57 and OSHA 29 CFR 1910.106 for flammable liquids; United Kingdom HSG71 and DSEAR. Country packs (wave 48) supply the segregation matrix and section limits through the `WarehouseCompliancePack` extension point (versioned reference data; BR-31.15 is regulation-neutral).
- **Labor monitoring.** Per-person performance data is personal data under GDPR (Art. 88; DPIA under Art. 35); Germany requires works-council co-determination (BetrVG §87(1) no. 6); France requires CSE consultation. EU legal entities default to `labor_personal_visibility = AGGREGATE_ONLY`; the country pack sets defaults and an OPA policy bundle (`LaborPrivacyPolicy`) gates the named view.
- **Physical inventory.** Statutory stock-take rules (Germany HGB §241(2) permanent inventory requires each item counted at least once per fiscal year) are checked by a count-plan coverage report supplied by the country pack (`InventoryCountPolicy`).
- **GS1 and units.** SSCC company prefixes come from the GS1 member organization of the legal entity; weights and volumes are stored in SI and displayed in kg/lb and m³/ft³ by user locale (wave 5).
- **Retention.** Work, count and transfer records that support inventory valuation follow the wave-46 archive policy (10 years default; Germany GoBD/HGB §257, United States 7 years typical).
- **Calendars and time zones.** FEFO date comparison (BR-31.6), shift close and count plans use the warehouse time zone and wave-6 calendars.

6.31.21 Coverage closure

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
AX PARTIAL #217 — §12.26.1 Outbound → Cross docking (WHSCrossDocking)	PARTIAL-31	ADDED as FR-31.13	Planned and opportunistic; BR-31.11, AC-31.10
AX PARTIAL #218 — §12.26.1 WHS → Transfer order WHS flow (ship/receive with LP)	PARTIAL-31	ADDED as FR-31.16	Transfer order document itself is wave 16; BR-31.16, AC-31.15
AX PARTIAL #219 — §12.26.2 SSRS: Cross docking report	PARTIAL-31	ADDED as FR-31.13	"Cross-docking report" in §6.31.14
AX PARTIAL #220 — §12.26.3 Cross docking → Planned cross docking processing	PARTIAL-31	ADDED as FR-31.13	"Planned cross-dock re-plan" job in §6.31.16
AX PARTIAL #221 — §12.26.4 Outbound → Cross docking templates	PARTIAL-31	ADDED as FR-31.13	`crossdock_*` parameters in §6.31.13
AX PARTIAL #222 — §12.26.4 Outbound → Outbound sorting (sort positions)	PARTIAL-31	ADDED as FR-31.14	AC-31.11
SAP #187 — §13.16 LXDCA / LXDCK planned cross-docking	GAP (propose 31)	ADDED as FR-31.13	Directive strategy `outbound_staging` as the register proposed
SAP #188 — §13.16 /SCWM/PACK, /SCWM/PACKSPEC, /SCWM/PSSTAGE packaging specifications	PARTIAL-31	ADDED as FR-31.17	Packing station flow stays FR-32.4 with wave-28 containers
SAP #189 — §13.16 /SCWM/VASEXEC VAS orders	GAP (propose 31)	ADDED as FR-31.15	Work type VAS; charge code `VAS` to wave 29
SAP #190 — §13.16 /SCWM/LM labor management	PARTIAL-31	ADDED as FR-31.18	Incentive pay calculation OUT-OF-SCOPE: performance documents export to payroll (wave 42)
SAP #191 — §13.16 /SCWM/YM_* yard management	PARTIAL-31	DEFERRED to wave 34	ADDED there as FR-34.13; AX register also proposes wave 34
SAP #194 — §13.16 EWM kit-to-stock / kit-to-order	GAP (propose 31)	ADDED as FR-31.15	BR-31.12, AC-31.12

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
SAP #196 — §13.16 LX06 / LX07 fire-containment sections / check storage	PARTIAL-31	ADDED as FR-31.19	LX07 consistency check is covered by quant–ledger reconciliation (§6.31.16)
SAP #197 — §13.16 /SCWM/LM labor reports (planned vs actual)	PARTIAL-31	ADDED as FR-31.18	"Labor performance" in §6.31.14
SAP #198 — §13.16 Labor management period close (/SCWM/LM)	PARTIAL-31	ADDED as FR-31.18	"Labor shift close" job in §6.31.16
SAP #200 — §13.16 EWM yard management customizing	PARTIAL-31	DEFERRED to wave 34	Yard parameters in §6.34.13
SAP #202 — §13.16 Labor management: formulas, ELS, incentive	PARTIAL-31	ADDED as FR-31.18	Formulas and ELS added (BR-31.14); incentive OUT-OF-SCOPE as for #190

6.32 Wave 32: Mobile Warehouse Execution (Scanners, RF, Voice)

6.32.1 Scope and business context

Wave 31 creates work; wave 32 lets warehouse workers execute it on handheld scanners. This replaces the D365 Warehouse Management mobile app (mobile device menus, menu items and steps) and the SAP EWM RF framework (/SCWM/RFUI, ITSmobile). After this wave a worker signs in on a Zebra or Honeywell Android device (or any PWA-capable browser), picks from a configured menu, scans GS1-128 labels that the system parses into LP/GTIN/lot/expiry/serial/weight, and completes receive, put-away, pick, pack, move, count and inquiry flows with offline tolerance. An administrator changes flows without an app release. Label printing (ZPL) ships through a print service. Out of scope: full voice-directed picking (adapter interface only; a voice vendor integration is v1.x), RFID portal reads beyond the EPC ingest endpoint, iOS native shell (PWA covers iOS).

Scope amendment (coverage closure). The gap registers add two items to this wave: an automation adapter that exchanges telegrams with material flow systems (AS/RS, conveyors, sorters) through the wave-25 edge gateway (FR-32.12), and management of printers and output queues, covering device types, queue failover and browser printing beyond labels (FR-32.13). §6.32.21 lists the dispositions.

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
D365 mobile menu items (WHSRFMenuItemTable) expose ~60 option fields per item; a flow change (e.g., add a lot confirmation step) needs a consultant, a config move across environments and a device re-login; D365 "mobile device steps configuration" cannot add a new step, only hide/rename	Flows are hard-coded X++ step classes parameterized by options	Flow designer with versioned step graphs, simulate, publish; devices pick up the version in ≤ 60 s	Flow change lead time: 1–3 days → < 30 min; 0 app releases per flow change
Both D365 mobile app and EWM RF (/SCWM/RFUI, ITSmobile) stop dead without Wi-Fi; workers in freezers, yards and trailers lose scans	Request/response screens with no client state	Offline queue with ordered, idempotent replay and a supervisor conflict queue	Lost transactions on disconnect: every one → 0; worker wait on reconnect: re-key → 0 keystrokes
GS1-128 labels must be scanned AI by AI in older D365 and ECC RF screens (one scan for GTIN, one for lot, one for expiry); mis-typed expiry dates reach the batch master	No composite-barcode parsing in the RF screen	GS1 parser (AI 00/01/10/17/21/310n…) fills all expected fields from one scan with check-digit verification	Scans per inbound case: 3–4 → 1; expiry/lot keying errors: ~1% of receipts → 0 (no keying)
Label printing via D365 document routing (WHSDocumentRoutingLayout) depends on the Document Routing Agent Windows service; failures are invisible on the device	Printing routed through a client-side agent with no status feedback	In-cluster print service with job status, retries and device-visible failure	Print failure detection: minutes to hours (someone notices) → < 2 s on device
EWM RF screen layouts (/SCWM/TPRES) and ITSmobile templates need ABAP/HTML work for scanner model differences	Screen rendering coupled to device generation	Responsive PWA from 320 px, DataWedge/Honeywell intent bridge, keyboard-wedge fallback	New scanner model onboarding: weeks of template work → same day (profile only)

6.32.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Mobile menu	WHSMobileAppMenu, WHSRFMenuTable, WHSRFMenuLine	/SCWM/TMENU, /SCWM/T_RF_MENU (RF menu manager /SCWM/RFUI)	wms-mobile.MobileMenu	full
Menu items / flows	WHSRFMenuItemTable (WHSRFMenuItem), work creation vs existing work modes	Logical transactions /SCWM/TLOGTR, steps /SCWM/T_RF_STEP	MobileFlow (step graph)	improved — visual designer, versioned
Detours / field config	Mobile device steps configuration (D365 10.0.x), WHSRFDetour	Presentation profile /SCWM/TPRES, personalization	FlowStep config, detours	full
Scanner integration	DataWedge via app; GS1 parsing (D365 10.0.21+)	RF barcode profiles, GS1 parsing in /SCWM/RFUI	GS1 parser service, DataWedge/Honeywell intents	full
Work user / session	WHSWorkUser, WHSWorkUserSessionState	Resource /SCWM/RSRC, /SCWM/TRSRC queue	DeviceSession, WorkUser (Keycloak)	full
Offline	n/a (online only)	n/a (online only)	OfflineTransaction queue	improved
Label printing	Document routing layouts (WHSDocumentRoutingLayout) to ZPL printers	Smart Forms / Adobe Forms via /SCWM/PRINT condition technique	PrintJob, ZPL templates	full
Voice	ISV	SAP EWM voice (ISV)	VoiceAdapter interface	partial — adapter only
RFID	n/a (ISV)	SAP AII / EWM RFID	EPC read endpoint	partial
Packing station	WHSPackingStation, container packing	Packing work center /SCWM/PACK	Pack flow + ShipmentContainer (wave 28)	full
Material flow system (automation)	Warehouse automation integration via business events and ISV warehouse control systems	EWM MFS /SCWM/MFS_*: PLC communication channels, telegram structures, communication points, conveyor segments, MFS monitor	wms.AutomationChannel, TelegramProfile, CommunicationPoint, TransportOrder	full
Output devices and queues	Network printers, Document Routing Agent, print management setup (PrintMgmtDocInstance)	SPAD output devices, device types (e.g. LB_ZEB for ZPL), access methods, spool SP01/SP02, front-end printing	Printer, DeviceType, PrintQueue, RoutingRule; browser print	full

6.32.3 Functional requirements

- **FR-32.1 Mobile app shell** — Must. The system shall provide a PWA and an Android native shell (WebView + scanner intent bridge) that run the same flow runtime, with login via Keycloak device flow and PIN re-auth after 8 h.

    - Notes: supports screen widths from 320 px; large-target mode; app updates are flow metadata, not binaries; shell release only for scanner bridge changes.
- **FR-32.2 Flow designer** — Must. The system shall let an administrator compose flows from step types (`scan`, `input`, `select`, `confirm`, `display`, `branch`, `call`), with validations, scan pattern expectations and error handling, versioned and published per warehouse.
    - Notes: a step declares expected scan classes (LP, GTIN, LOCATION, ANY); publishing validates the graph (no unreachable steps, every branch terminates); devices fetch new versions on next menu load (≤ 60 s).
- **FR-32.3 GS1 parsing** — Must. The system shall parse GS1-128 and GS1 DataMatrix element strings into application identifiers per BR-32.1, and route values to the expected step fields.
    - Notes: symbology identifiers `]C1`, `]d2`, `]Q3` accepted; FNC1 as GS (0x1D); passes the GS1 AI test suite in CI.
- **FR-32.4 Core flows** — Must. The system shall ship flows: Receive (PO/ASN/transfer), Put-away (system-directed and user-directed), Pick (work-directed, cluster to 8 orders, zone), Pack, Move (LP/qty), Count (planned/spot), Inquiry (item/location/LP).
    - Notes: all flows call the wave-31 work APIs; cluster picking assigns up to 8 works to positions on a cart with per-position LP.
- **FR-32.5 Offline queue** — Must. The system shall queue confirmations locally when offline (max 500 transactions or 24 h), replay them in order on reconnect with per-transaction idempotency keys, and surface conflicts to the user.
    - Notes: queue persisted in IndexedDB encrypted with a device key; replay uses `Idempotency-Key = device_id:seq`; conflict policy per BR-32.4.
- **FR-32.6 Device and session management** — Must. The system shall register devices, show active sessions, force sign-out, and bind a device to warehouses and menus.
    - Notes: device heartbeat every 30 s; session idle timeout 30 min aligned to the work lock.
- **FR-32.7 Label printing** — Must. The system shall render ZPL from templates (LP, location, shipping, item labels) and print via a print service supporting IPP/raw TCP 9100 printers and printer selection by step/user/location.
    - Notes: templates are Handlebars-style with GS1-128 (`^BC`) and DataMatrix (`^BX`) helpers; print service retries 3× and reports status.
- **FR-32.8 Exceptions on device** — Must. The system shall let users short pick, skip, report damaged, and request supervisor override by PIN on device.
    - Notes: override reasons configurable; all exceptions logged with user, device, location, timestamp.
- **FR-32.9 Voice and RFID integration points** — Could. The system shall expose a `VoiceAdapter` interface (prompt/response per step) and an EPC ingest endpoint mapping EPC SGTIN/SSCC to GTIN/LP.
    - Notes: EPC URI parsing for `urn:epc:id:sgtin` and `urn:epc:id:sscc`; reads deduplicated in a 2 s window.
- **FR-32.10 Scanner hardware integration** — Must. The system shall receive scans from Zebra DataWedge intents and Honeywell Data Collection intents in the native shell and from keyboard wedge in the PWA.
    - Notes: a scan is accepted only on the focused scan step; symbology prefix enabled in DataWedge profile provisioned by the shell.
- **FR-32.11 Telemetry** — Should. The system shall record per-step timing and error counts per device and user for the KPI layer.
    - Notes: OpenTelemetry spans per step; retention 90 days.
- **FR-32.12 Automation adapter (AS/RS, conveyors, sorters)** — Should. The system shall exchange work with material flow systems: send transport orders (LP, source point, destination point, priority) as telegrams to a PLC or warehouse control system, receive handshake, arrival, scan-result and fault telegrams, and confirm or raise exceptions on wms work lines accordingly.
    - Notes: transports through the wave-25 edge gateway on site: OPC UA method calls, MQTT 5 (Sparkplug B payloads optional) or raw TCP fixed-length telegrams with an EWM-style header (sender, receiver, sequence, telegram type, handshake flag); telegram layouts are versioned metadata (field, offset, length, type, padding); communication points map to wms locations; LIFE telegram every 10 s, channel DOWN after 3 missed; an LP failing scan or contour check at an identification point is routed to the reject point and raises MOB-0116.
- **FR-32.13 Printer and output-queue management** — Should. The system shall register output devices per site with a device type (ZPL II, PDF over IPP, PCL 6; 203/300/600 dpi; media sizes), group them into queues with failover, route every document type (labels and office documents such as pick lists, CoAs and bills of lading) by rule, and offer browser printing of PDF documents to users without a routed printer.
    - Notes: routing precedence per BR-32.12; a queue fails over to the next device after 2 failed attempts; job log kept 30 days; reprints carry `reprint_of` (BR-32.8); printers on site networks are reached by the site print-service pod only (no inbound connections to the cluster).

6.32.4 Data model

MobileFlow (versioned)

Field	Type	Required	Notes
flow_id	uuid	yes	PK
code	text	yes	unique per tenant (e.g., `PICK_CLUSTER`)
version	int	yes	increments on publish
status	enum	yes	DRAFT, PUBLISHED, RETIRED
steps	jsonb	yes	array of {id, type, prompt, expected_scan[], validations[], next{}}
entry_step_id	text	yes	
warehouses	uuid[]	yes	scope
published_at, published_by	timestamptz/text	no	

DeviceSession

Field	Type	Required	Notes
session_id	uuid	yes	PK
device_id	text	yes	FK Device (serial or generated)
user_id	text	yes	Keycloak subject
warehouse_id	uuid	yes	
menu_id	uuid	yes	
current_work_id	uuid	no	FK wms.Work
last_seen_at	timestamptz	yes	heartbeat
state	jsonb	yes	step pointer and field values

OfflineTransaction

Field	Type	Required	Notes
idempotency_key	text	yes	PK `device_id:seq`

Field	Type	Required	Notes
device_id, session_id	text/uuid	yes	
seq	bigint	yes	monotonic per device
command	text	yes	e.g., `ConfirmWorkLine`
payload	jsonb	yes	
captured_at	timestamptz	yes	device clock + server skew
replay_status	enum	yes	PENDING, APPLIED, CONFLICT, REJECTED
conflict_reason	text	no	

PrintJob: job_id, template_id, printer_id, zpl text, status (QUEUED/SENT/PRINTED/FAILED), attempts, created_by.

Invariants: a device has at most one active session; `seq` is strictly increasing per device and gaps are rejected; a PUBLISHED flow version is immutable. Indexing: `offline_transaction(device_id, seq)`; `device_session(user_id) WHERE state_active`.

6.32.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
POST	/mobile/v1/sessions	Start session (device, warehouse, menu)	key = device_id	WMS_WORK_EXECUTE
GET	/mobile/v1/menus/{id}	Menu with published flow versions	—	WMS_WORK_EXECUTE
POST	/mobile/v1/flows/{code}/steps/{id}:submit	Submit step input (scan or value)	key	WMS_WORK_EXECUTE
POST	/mobile/v1/scan:parse	Parse a barcode into AI map	—	WMS_WORK_EXECUTE
POST	/mobile/v1/offline:replay	Replay a batch of queued transactions	per-item keys	WMS_WORK_EXECUTE
POST	/mobile/v1/flows	Create/update draft flow	key	WMS_MOBILE_ADMIN
POST	/mobile/v1/flows/{id}:publish	Validate and publish	key	WMS_MOBILE_ADMIN
POST	/print/v1/jobs	Render template and print	key	WMS_PRINT
POST	/rfid/v1/reads	Ingest EPC reads	key = reader+epc+ts	WMS_RFID_INGEST
POST	/wms/v1/automation/channels	Define an MFS channel, telegram profile and communication points	key	WMS_AUTOMATION_ADMIN
POST	/wms/v1/automation/telegrams	Inbound telegram relayed by the edge gateway	key = channel + sequence	edge service account
POST	/wms/v1/automation/transport-orders/{id}:resend	Resend a pending transport order	key	WMS_AUTOMATION_OPERATE
POST	/print/v1/printers	Register a printer, device type and queue	key	WMS_PRINT_ADMIN
POST	/print/v1/routing-rules	Create a document routing rule	key	WMS_PRINT_ADMIN

Event	Trigger	Payload fields	Consumers
dev.passage.mobile.flow.published.v1	publish	flow_id, code, version, warehouses	devices (push via SSE), analytics
dev.passage.mobile.session.started.v1 / ended.v1	session lifecycle	session_id, device_id, user_id, warehouse	analytics
dev.passage.mobile.offline.conflict.v1	replay conflict	idempotency_key, command, reason	supervisor queue
dev.passage.print.job.completed.v1	printer ack	job_id, printer, status	wms

6.32.6 User experience

Screen	Primary actions	Key fields	Duty
Device login / menu	Sign in, pick warehouse/menu	user, warehouse, menu items	WMS_WORK_EXECUTE
Flow runner (device)	Scan, enter, confirm, exception	prompt, expected scan class, context (work, location, LP)	WMS_WORK_EXECUTE
Flow designer (web)	Build graph, validate, simulate, publish	steps, branches, validations, versions	WMS_MOBILE_ADMIN
Device management	Register, assign, force sign-out	device id, model, last seen, session	WMS_MOBILE_ADMIN
Offline conflicts	Resolve, re-apply, reject	key, command, reason	WMS_WORK_SUPERVISE
Print management	Printers, templates, job log	printer, template, status	WMS_PRINT

Interaction rules: device UI uses one input per screen; Enter/scan advances; hardware back returns one step; audio and haptic feedback on success/error; font ≥ 16 px; no mouse-only actions; designer simulation runs a flow in a browser with a virtual scanner.

6.32.7 Business rules and edge cases

- **BR-32.1 GS1 AI parsing rules.** Input begins with an optional symbology identifier (`]C1` GS1-128, `]d2` DataMatrix, `]Q3` QR), then element strings. Parse left to right: read the AI (2–4 digits per the GS1 AI table), then its data per the table; fixed-length AIs have no separator, variable-length AIs end at FNC1 (GS, 0x1D) or end of string. Supported in this wave: **AI 00** SSCC, fixed 18 numeric, check digit (mod-10, weights 3/1) verified; **AI 01** GTIN, fixed 14 numeric, check digit verified, GTIN-12/13 zero-padded on lookup; **AI 10** batch/lot, variable ≤ 20 characters (GS1 AI encodable set 82); **AI 11** production date and **AI 17** expiry, fixed 6 numeric `YYMMDD` where `DD = 00` means last day of month, century by GS1 rule (year within –49/+50 of current year); **AI 21** serial, variable ≤ 20; **AI 310n** net weight kg, fixed 6 numeric with `n` implied decimal places (`3102000125` → 1.25 kg); **AI 37** count, variable ≤ 8 numeric; **AI 400** PO number, variable ≤ 30; **AI 410/412** GLN, fixed 13; **AI 91–99** company-internal, variable ≤ 90. Unknown AI → parse error `GS1_UNKNOWN_AI` with position. Example: `]C1010950123456789310123ABC` + GS + `17261231` + `21SN0007` → {01: 09501234567893, 10: 123ABC, 17: 2026-12-31, 21: SN0007}. A barcode without symbology identifier is parsed as GS1 only if it starts with a valid AI and the step expects a GS1 class; otherwise it is a plain value.
- **BR-32.2 Scan routing.** A `scan` step expecting `LP` accepts AI 00 or a plain value matching the LP format; expecting `GTIN` accepts AI 01 or an item barcode (wave 8 item barcodes); a mismatch shows "Expected location, scanned LP" and does not advance.
- **BR-32.3 Offline ordering.** Replay applies transactions in `seq` order; the first failure stops replay for that device and marks the rest PENDING until resolved, because later steps may depend on it.
- **BR-32.4 Conflict policy.** If a replayed `ConfirmWorkLine` targets a line that was cancelled or completed by another user, the transaction is CONFLICT; a supervisor may "apply as movement" (inventory moves as scanned, order link dropped) or reject. Timestamps use the captured device time corrected by the measured server skew at the last heartbeat.
- **BR-32.5 Cluster picking** assigns at most 8 works; a cart position is bound to one order's LP; scanning the wrong position is rejected; a short pick on one position does not release the others.

- **BR-32.6 Session lock.** A device session holds the work lock; heartbeat loss > 30 min releases the lock and sets the session to STALE; resuming re-locks if the work is still OPEN.
- **BR-32.7 PIN override** authorizes exactly one action within 60 s and is logged with the supervisor's subject.
- **BR-32.8 Print idempotency.** A print job with the same key within 10 min is not re-rendered; "print again" creates a new job with `reprint_of`.
- **BR-32.9 Flow publish** requires the simulation of each core path to succeed (designer runs a smoke script attached to the flow); devices mid-flow on the previous version finish on it.
- **BR-32.10 Expiry date** `DD=00` resolves to the last calendar day of the month; `YYMMDD` with an invalid month is a parse error.
- **BR-32.11 Telegram sequencing and handshake.** Each channel keeps send and receive sequences 1–9,999 that wrap; a telegram without handshake acknowledgment after `mfs_resend_timeout_s` (default 2 s) is resent up to 3 times, after which the channel is DOWN and open transport orders show `MFS_PENDING`; a duplicate receive sequence is acknowledged and ignored; a transport order confirms the wms work line only on the arrival telegram at its final destination, never on send.
- **BR-32.12 Print routing precedence.** Rules match most specific first: user + document type → zone + document type → warehouse + document type → document-type default; ties go to the lowest rule sequence; with no match, PDF documents fall back to browser printing and ZPL jobs fail with MOB-0112.

6.32.8 Acceptance criteria

- **AC-32.1** (FR-32.3, BR-32.1) Given the GS1 AI test suite vectors (fixed and variable, with and without symbology identifiers), when parsed, then 100% match expected AI maps and check-digit failures are reported.
- **AC-32.2** (FR-32.4) Given the emulated-device Playwright suite, when a receive → put-away → pick → pack → ship flow is run with scanned GS1-128 labels from the ASN fixture, then the load ships and the inventory ledger reflects each move.
- **AC-32.3** (FR-32.5, BR-32.3) Given a device offline with 200 queued confirmations, when it reconnects, then all 200 are APPLIED exactly once, in order, and replaying the same batch again changes nothing.
- **AC-32.4** (FR-32.2) Given a published flow change adding a lot-confirmation step, when a device loads the menu, then the new version runs within 60 s with no app update.
- **AC-32.5** (FR-32.7) Given an LP label template, when a receive step completes, then a ZPL job with `^BC` SSCC is sent to the step's printer and status PRINTED is recorded.
- **AC-32.6** (BR-32.4) Given a queued confirmation for a line cancelled meanwhile, when replayed, then it is CONFLICT and appears in the supervisor queue.
- **AC-32.7** (FR-32.10) Given a Zebra DataWedge intent with `]C1` prefix, when received on a non-scan step, then it is ignored and logged.
- **AC-32.8** (FR-32.6, BR-32.6) Given a session with no heartbeat for 31 min, when another user requests work, then the stale session's work is assignable.
- **AC-32.9** (FR-32.12, BR-32.11) Given a simulated conveyor PLC on the edge gateway, when 100 LPs are routed to an AS/RS induction point and the PLC drops 5 acknowledgments, then each affected transport order is resent, no LP is confirmed before its arrival telegram, and all 100 work lines complete.
- **AC-32.10** (FR-32.13, BR-32.12) Given a queue of two printers with the first offline, when 20 LP labels print, then all 20 complete on the second printer and the job log records the failover.

6.32.9 Test plan and fixtures

Fixtures: `gs1-ai-vectors.json` (GS1 test suite plus 60 Passage vectors for edge cases), `labels-asn-3-pallet.zpl` rendered to PNG for the emulator's camera-free scan injection, `offline-200.json`, `flows-core-v1` (seven flows), device profiles `zebra-tc52`, `honeywell-ct45`.

Test	Type	Target	Pass criterion
GS1 parser	unit	parser	100% vectors
Flow graph validation	unit	designer	unreachable/non-terminating graphs rejected
Offline replay	property	queue	exactly-once under random disconnects
Device E2E	E2E (Playwright, Android emulator)	7 flows	inbound-to-outbound passes on both device profiles
Replay throughput	performance	1,000 devices × 50 tx	all applied < 5 min
ZPL rendering	snapshot	templates	byte-identical to golden ZPL
Scan latency	performance	step submit	p95 < 300 ms

Reconciliation: Σ mobile confirmations per day = Σ work line confirmations in `wms`; print jobs PRINTED = labels confirmed on device.

6.32.10 Deployment and operations

Helm `passage-wms-mobile` (BFF, SSE push, 2–8 replicas), `passage-print` (print service with printer registry; one per site network, outbound TCP 9100/IPP), PWA assets served by the shell CDN path; Android shell signed APK distributed via MDM (SOTI/Workspace ONE) or sideload. Config: `MOBILE_OFFLINE_MAX_TX=500`, `MOBILE_SESSION_IDLE_MIN=30`, `PRINT_RETRY=3`. Flags: `mobile.offline`, `mobile.voice_adapter`. SLOs: step submit p95 < 300 ms; menu load < 1 s; print job dispatched < 2 s; offline replay 200 tx < 30 s. Alerts: offline conflicts > 10/h per warehouse; print failures > 5/15 min per printer; stale sessions > 20. Runbook: printer unreachable (check print service pod on site, re-queue jobs); device clock skew > 5 min (block replay, instruct re-sync). Rollback: flow versions are retained — republish the previous version; BFF rollback via Argo CD.

6.32.11 Migration from AX / SAP

Source	Passage entity	Transformation
WHSMobileAppMenu, WHSRFMenuTable, WHSRFMenuLine	MobileMenu	hierarchy preserved
WHSRFMenuItemTable (mode, work class, directed/user-directed, detours)	MobileFlow draft	generated from the menu item's options into the equivalent core flow with configured branches; requires manual review
WHSWorkUser	WorkUser attributes on Keycloak user	user id mapping from wave 2
WHSDocumentRoutingLayout, printers	Print templates, printers	ZPL layouts imported as-is where ZPL; others re-authored
/SCWM/TMENU, /SCWM/T_RF_MENU, /SCWM/TLOGTR	MobileMenu, MobileFlow draft	logical transaction → core flow mapping table
/SCWM/RSRC, /SCWM/TRSRC	WorkUser, device bindings	resource type → work class

Not migrated: RF screen layouts (/SCWM/TPRES) and D365 step field layouts — Passage flows are redesigned; mobile session state; print spool history.

6.32.12 Dependencies, risks, open questions

Depends on: wave 31 (work APIs, LPs), wave 25 (shop-floor PWA offline pattern and service-worker library), wave 8 (item barcodes, GS1 prefix), wave 2 (Keycloak device flow), wave 28 (containers/packing).

Risk	Likelihood	Impact	Mitigation
Offline replay creates subtle inventory errors	Medium	High	Strict ordering, conflict queue, property tests; offline off by default for count flows
Android WebView versions on older scanners	Medium	Medium	Minimum WebView 100; PWA fallback

Open questions: (1) Native iOS shell — proposed: no, PWA only; decide by wave 33. (2) Voice vendor for v1.x reference adapter (Honeywell Voice vs Lydia) — proposed: defer; decide by wave 35.

6.32.13 Parameters and setup

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
session_idle_timeout_min	warehouse	int	30	5–240	Session goes STALE and releases the work lock (BR-32.6)	Work user session expiry (Warehouse app settings)	RF presentation device logon timeout (/SCWM/RFUI)
pin_reauth_hours	tenant	int	8	1–24	PIN re-authentication interval (FR-32.1)	Warehouse app authentication (device code, user PIN)	ITS session timeout (SICF service settings)
offline_enabled	warehouse × flow	bool	true for pick/put, false for count	true / false	Allows offline queueing for the flow (FR-32.5)	n/a (online only)	n/a (online only)
offline_max_tx	device	int	500	50–2,000	Queue cap (FR-32.5)	n/a	n/a
offline_max_age_h	device	int	24	1–72	Oldest transaction allowed in queue	n/a	n/a
flow_publish_four_eyes	tenant	bool	false	true / false	Production publish needs a second approver	Mobile device menu item change via data management (no approval)	Transport of logical transactions (SE01/STMS)
gs1_require_symbology_id	warehouse	bool	false	true / false	Unprefixed strings parsed as plain values when true (BR-32.1)	Mobile device barcode setup › GS1 symbology prefix	RF barcode verification profile
gs1_fnc1_substitute	warehouse	char	GS (0x1D)	GS / `~` / `	`	Separator accepted for FNC1	Mobile device barcode setup › FNC1 character
scanner_profile	device model	enum	ZEBRA_DATAWEDGE	ZEBRA_DATAWEDGE / HONEYWELL_DC / KEYBOARD_WEDGE	Scan capture bridge (FR-32.10)	Warehouse app device settings	ITSmobile device template
cluster_max_positions	menu / flow	int	8	1–24	Cluster pick positions (BR-32.5)	Cluster profile "Number of positions"	Multiple-order picking positions in RF
heartbeat_interval_s	tenant	int	30	10–120	Device heartbeat (FR-32.6)	n/a	n/a
print_retry_count	site	int	3	0–10	Retries before failover (FR-32.7)	Document routing agent retry	Spool retry settings (SPAD)
print_job_dedupe_min	tenant	int	10	0–60	Duplicate-key window (BR-32.8)	n/a	n/a
label_default_dpi	printer	enum	203	203 / 300 / 600	Template rendering resolution	Document routing layout printer DPI	SPAD device type (LB_ZEB 203 dpi Zebra)
browser_print_fallback	warehouse	bool	true	true / false	PDF fallback when no device routed (BR-32.12)	Print to screen / user default printer	Front-end printing (access method F/G)
mfs_heartbeat_s	automation channel	int	10	5–60	LIFE telegram interval (FR-32.12)	n/a	SPRO EWM › Material Flow System › Define PLC communication channel (life telegram)
mfs_resend_timeout_s	automation channel	int	2	1–30	Handshake timeout (BR-32.11)	n/a	MFS channel resend settings
mfs_reject_point	communication point	location ref	none	locations of type REJECT	Target for failed identification	n/a	MFS communication point "NIO" exception point
telemetry_retention_days	tenant	int	90	30–365	Step telemetry retention (FR-32.11)	n/a	n/a

6.32.14 Inquiries and reports

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
Active sessions and devices	list inquiry	warehouse, model, last seen	device, user, menu, current work, app version	`device_session`	Work user sessions	LRF1 RF monitor, /SCWM/MON resources
Offline conflict queue	list inquiry	warehouse, reason, age	key, command, captured_at, conflict reason	`offline_transaction`	n/a	n/a
Flow version history	drill-down	flow code	version, published by/at, step diff	`mobile_flow`	Mobile device menu item change history (database log)	Transport history of /SCWM/TLOGTR (SE03)
Step timing by user and flow	KPI	flow, step, user (duty-gated), date	median s, p95 s, error count	telemetry rollup	Work user activity inquiry	LRF2 queue/resource statistics
Scan error log	operational report	error type, device, date	masked raw value, AI, error position	parser log	n/a	Application log SLG1 (/SCWM/RFUI)
Print job log	list inquiry	printer, status, template, user	job, attempts, reprint_of, duration	`print_job`	Document routing job history	SP01 spool requests
Printer status	operational report	site, queue	online, queue depth, last error	printer registry	Document routing agent status	SPAD/SP01 output device status

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
MFS channel monitor	operational report	channel, communication point	state, last telegram, pending transport orders, faults	`automation_channel`	n/a	MFS monitor nodes in /SCWM/MON
Device fleet health	KPI	warehouse	step submit p95, replay backlog, stale sessions	telemetry	n/a	n/a

6.32.15 Printed and electronic documents

Document	Trigger	Layout elements	Formats	Numbering sequence	Legal / retention requirement
LP label	Receive or LP build	SSCC barcode (`^BC` , AI 00), human-readable SSCC, item, qty, lot, expiry, ship-from	ZPL; PDF preview	SSCC from LP sequence	GS1 logistic label guideline
Location label	On demand	Location barcode, check characters, direction arrow	ZPL	none	None
Item / GTIN label	On demand or VAS	GTIN-14 (AI 01), lot (AI 10), expiry (AI 17), serial (AI 21)	ZPL / PDF	none	Regulated serialization labels (EU FMD, US DSCSA) when item is flagged
GS1 carton shipping label	Pack or sort position close	Ship-from/to, carrier, SSCC, PO (AI 400), ship-to postal code (AI 420)	ZPL 4 × 6 in	SSCC	Partner label specifications (wave 35 partner profile)
Routed office documents	Rule match (BR-32.12)	Pick list, count sheet, CoA, BOL from their owning waves	PDF via IPP or browser	per document	per owning wave
Offline conflict report	Daily	Conflicts by reason, resolution, supervisor	PDF / CSV	none	Audit evidence, 1 year

6.32.16 Periodic and batch jobs

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
Stale session sweep	Every 1 min	warehouse	session `last_seen_at`	< 5 s	Releases locks; idempotent	Stale sessions > 20
Offline replay drain	Event-driven on reconnect; backlog sweep every 30 s	device_id	`device_id:seq`	200 tx < 30 s per device	Stops at first failure per device (BR-32.3)	Conflicts > 10/h per warehouse
Print queue retry and failover	Every 15 s	printer	job id + attempt	< 2 s per job	Fail over after 2 attempts	Print failures > 5/15 min per printer
MFS channel heartbeat check	Every 10 s	channel	channel id	< 100 ms	DOWN status, pending transport orders listed	MfsChannelDown
Telemetry rollup	Hourly	warehouse	hour bucket	< 1 min	Recompute bucket	Rollup lag > 2 h
Telemetry purge	Daily 01:00	tenant	day partition	< 5 min	Retry next day	none (log)
Device app-version audit	Daily 06:00	warehouse	device id	< 1 min	Report only	Devices below minimum shell version

6.32.17 Security duties and privileges

Duty	Privileges (entry points)	Segregation-of-duties conflicts	Default roles that include it
WMS_WORK_EXECUTE (mobile)	/mobile/v1/sessions, /menus/{id}, /steps/{id}:submit, /scan:parse, /offline:replay	WMS_COUNT_APPROVE on the same count	Warehouse worker
WMS_MOBILE_ADMIN	/mobile/v1/flows, /flows/{id}:publish; device management	Second approver required when `flow_publish_four_eyes = true`	WMS administrator
WMS_WORK_SUPERVISE	Offline conflict resolution, PIN override, force sign-out	Overriding own work is blocked (BR-32.7)	Warehouse supervisor
WMS_PRINT	/print/v1/jobs	none	Warehouse worker, receiving and shipping clerks
WMS_PRINT_ADMIN	/print/v1/printers, /print/v1/routing-rules; print management	none	WMS administrator, site IT
WMS_RFID_INGEST	/rfid/v1/reads	Service accounts only; never assigned to people	Reader service account
WMS_AUTOMATION_ADMIN	/wms/v1/automation/channels; telegram profile designer	WMS_AUTOMATION_OPERATE in production (change and operate the same channel)	Automation engineer
WMS_AUTOMATION_OPERATE	MFS monitor: resend, block communication point, clear fault	none	Control-room operator

6.32.18 Message catalog

Code	Severity	User text	Cause	Remediation	Raised by
MOB-0101	error	Expected {expected}, scanned {actual}.	Scan class mismatch	Scan the requested object	BR-32.2
MOB-0102	error	Check digit invalid for AI {ai}.	SSCC/GTIN check digit failure	Rescan or relabel	BR-32.1
MOB-0103	error	Unknown GS1 application identifier at position {pos}.	GS1_UNKNOWN_AI	Check label against GS1 AI table	BR-32.1
MOB-0104	error	Invalid date {value} for AI {ai}.	Bad YYMMDD (month 13 etc.)	Relabel	BR-32.10
MOB-0105	warning	Offline: {n} transactions queued; {remaining} left before the limit.	Device offline	Move to coverage when possible	FR-32.5
MOB-0106	error	Offline queue is full; reconnect to continue.	500 transactions or 24 h reached	Reconnect	FR-32.5
MOB-0107	warning	Transaction {key} conflicts: line was {status} by {user}.	Replay CONFLICT	Supervisor resolves	BR-32.4
MOB-0108	error	Sequence gap on device {device}: expected {n}, received {m}.	Missing offline transaction	Device resync; support ticket	BR-32.3
MOB-0109	error	Wrong cart position: scanned {pos}, expected {exp}.	Cluster pick mismatch	Place item in the correct position	BR-32.5
MOB-0110	error	Supervisor PIN expired or already used.	Override outside 60 s or reused	Request a new override	BR-32.7
MOB-0111	error	Printer {printer} unreachable after {n} attempts.	Network or device failure	Check printer; job fails over	FR-32.7
MOB-0112	error	No printer routed for {document} at {location}.	No routing rule match for ZPL	Add routing rule	BR-32.12
MOB-0113	error	Flow {code} v{n} failed validation: step {id} is unreachable.	Graph validation	Fix the flow graph	FR-32.2
MOB-0114	warning	Device clock skew {s} s exceeds 300 s; replay blocked.	Device clock drift	Resync device time	§6.32.10
MOB-0115	error	Automation channel {ch} is down; transport order {to} pending.	3 missed handshakes or LIFE telegrams	Check PLC link; resend after recovery	BR-32.11

Code	Severity	User text	Cause	Remediation	Raised by
MOB-0116	warning	LP {lp} rejected at identification point {cp}: {reason}.	Scan or contour check failed	Correct LP at reject point and re-induct	FR-32.12
MOB-0117	info	Session resumed on flow version {n}.	Device was mid-flow during publish	None	BR-32.9

6.32.19 Performance budgets and capacity

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
Step submit	1,000 devices; 300,000 steps/day; peak 6,000/min	80 / 300 / 600 ms	100/s per BFF pod	Telemetry ≈ 40 GB (90-day rolling)	Telemetry daily partitions	Offline-capable flows queue locally; others show "busy, retry"
Scan parse	400,000/day	2 / 10 / 20 ms (in-process)	2,000/s per pod	—	—	CPU-bound; HPA adds pods
Offline replay	1,000 devices × 50 tx after an outage	200 tx < 30 s per device; fleet < 5 min	300 tx/s	Offline log 90 days ≈ 2 GB	`offline_transaction(device_id, seq)`	Replay throttled per device; ordering preserved
Menu load	20,000/day	150 / 600 / 1,000 ms	50/s	—	Published flows cached per warehouse	Cached version served; publish propagation may exceed 60 s
Print dispatch	50,000 labels/day; peak 300/min	300 ms / 1.2 s / 2 s to printer acknowledgment	20 jobs/s per site service	Job log 30 days ≈ 1 GB	`print_job(printer_id, created_at)`	FIFO backlog per printer; failover to queue peers
MFS telegram round-trip	100,000 telegrams/day; peak 50/s per site	20 / 80 / 200 ms gateway ↔ wms	200/s per site	Telegram log 30 days ≈ 3 GB	`transport_order(channel_id, status)`	Dedicated worker pool keeps automation ahead of manual traffic

6.32.20 Localization and compliance hooks

- **Language and layout.** Device UI strings come from wave-5 i18n bundles per user locale; the PWA supports right-to-left layouts (Arabic, Hebrew); voice prompts (FR-32.9) use the adapter's language model per locale.
- **Regulated serialization.** EU Falsified Medicines Directive (Delegated Regulation 2016/161) requires 2D DataMatrix with AI 01, 21, 10, 17 and national reimbursement numbers (AI 710–715); US DSCSA requires interoperable serialized traceability (EPCIS). Country packs (wave 48) add AI validation and label templates through `LabelTemplatePack`; the EPC ingest (FR-32.9) carries SGTIN data.
- **Character sets.** ZPL templates use `^CI28` (UTF-8) for non-Latin scripts; human-readable dates on labels follow locale while barcode data stays `YYMMDD`.
- **Privacy.** Per-user step telemetry is personal data (GDPR); retention 90 days; named per-user timing reports follow the wave-31 `LaborPrivacyPolicy`; works-council rules as §6.31.20.
- **Device and radio rules.** Scanner hardware certification is the device vendor's responsibility; Passage stores no location data from devices beyond the warehouse and session.

6.32.21 Coverage closure

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
SAP #193 — §13.16 EWM /SCWM/MFS* Material Flow System (PLC interface, conveyors, AS/RS)	GAP (propose 32)	ADDED as FR-32.12	On the wave-25 edge gateway as the register proposed; BR-32.11, AC-32.9
SAP #201 — §13.16 EWM MFS customizing (PLC communication channels, telegrams)	GAP (propose 32)	ADDED as FR-32.12	`mfs_*` parameters in §6.32.13; telegram profiles are versioned metadata
SAP #346 — §13.30 Printing: device types, output devices, access methods (SPAD), front-end printing, print queues (TSP03*)	PARTIAL-32	ADDED as FR-32.13	Device types, queues with failover, routing, browser printing; BR-32.12, AC-32.10

6.33 Wave 33: Quality Management & Nonconformance

6.33.1 Scope and business context

Wave 33 replaces AX quality management (test groups, quality associations, quality orders, nonconformances, corrections) and SAP QM (inspection plans, inspection lots, results recording, usage decisions, quality notifications, vendor evaluation). After this wave, quality orders are generated by association rules at purchase receipt, production report-as-finished and before shipment; samples are sized by AQL plans; results are recorded (variable and attribute); a usage decision releases or rejects inventory that was blocked from the moment the order was created; nonconformances drive corrections/CAPA through a Temporal 8D workflow; certificates of analysis print on shipment; supplier scorecards and SPC charts are computed from results; instruments have calibration schedules. Out of scope: stability studies, audit management (ISO 19011), FMEA, and the SAP QM-PM calibration order integration (Passage tracks calibration due dates and blocks results from overdue instruments).

Scope amendment (coverage closure). The gap registers move into this wave items that the paragraph above excludes or does not name: product compliance with regulated and restricted lists (FR-33.13), safety data sheets (FR-33.14), incoming vendor certificates (FR-33.15), stability studies (FR-33.16), audit management (FR-33.17), FMEA and control plans (FR-33.18), source inspection (FR-33.19), physical sample management (FR-33.20), multiple specifications (FR-33.21) and in-process inspection points (FR-33.22). The SAP QM-PM calibration-order integration stays out of scope; Instrument due-date tracking (BR-33.8) remains the Passage mechanism. §6.33.21 lists the dispositions.

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
AX quality order blocking (InventQualityOrderTable → InventBlockingTable) blocks only the quantity registered on the receipt; production and sales paths can still pick inventory registered under a different dimension set, and "Inventory blocking" is bypassed by movement journals	Blocking is a reservation-like record checked by some, not all, transaction types	Hold lives in the inventory ledger reservation path and is checked by every transaction type; property test enumerates all	Movements of held stock: occasional (audit findings) → 0 across 10,000 randomized attempts
SAP usage decision (QA11) is a separate transaction from results recording (QE01), each 8–12 clicks with stock posting on a third tab; partial accept/reject needs manual quantity split and MIGO 321/322 follow-up	Inspection lot, results and stock posting are separate objects with separate screens	Results and decision on one order; quantity split posts both ledger legs automatically	Clicks per decision: ~25 across QE01/QA11/MIGO → ≤ 5; follow-up postings keyed manually: 2 → 0
AQL sampling in AX is fixed qty or % (InventTestItemSampling); Z1.4 tables are kept in spreadsheets and sample sizes keyed by hand; SAP QDP1 sampling procedures require master data per AQL/level combination	No standard sampling tables in the product	Z1.4 Tables I and II-A/B/C as versioned reference data with switching rules	Sample-size keying errors: ~2% of lots (spreadsheet) → 0; sampling setup per item: 15 min → 0 (plan reuse)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
SAP quality notification 8D (QM01/QM02 tasks) has no timers; overdue corrective actions are found by report ZQM or not at all; effectiveness checks are forgotten	Notification tasks are static records without workflow timers	Temporal 8D workflow with due-date timers, escalations and an automatic 90-day effectiveness-check task	Overdue CAPA actions discovered: weeks later via report → escalated within 1 business day; effectiveness checks executed: ~50% → 100%
CoA generation (AX CoA report / SAP QC21) prints whatever results exist; amended results after shipment produce inconsistent certificates	Certificate is a report over mutable results, not a versioned document	CoA generated from the accepting decision, revisioned with `supersedes`	Inconsistent certificates reported by customers: tolerated → 0 (immutable revision chain)

6.33.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Tests and groups	InventTestTable, InventTestGroup, InventTestGroupTest (lines), InventTestVariable/Outcome	Master inspection characteristics QPMK (QS21), inspection plans QP01 (PLKO/PLPO/PLMK), catalogs QPCT	quality.Test, TestGroup, Characteristic catalog	full

Cost of quality	n/a	QM-CO appraisal costs	CostOfQuality projection	improved
Product compliance	Product compliance (D365 process industries): regulated products, restricted lists, reporting lists	S/4 Product Compliance (product marketability checks), EHS Product Safety and Stewardship	quality.ComplianceList, ItemComposition, ComplianceResult	full
Safety data sheets	Safety data sheets with validity and send-on-sales (D365 PI)	EHS report shipping (CVD1), SDS distribution	quality.SafetyDataSheet, SdsDelivery	full
Incoming certificates	n/a (attachments on product receipts)	QC51/QC52/QC53 certificate receipt, QC55 overview; certificate type in QI01	quality.IncomingCertificate	full
Stability study	n/a	QST01–QST07 stability study (storage conditions, testing schedule)	quality.StabilityStudy, PullPoint	full
Audit management	n/a	PLMD_AUDIT audit plans, question lists, findings, corrective actions	quality.Audit, QuestionList, Finding	full
FMEA / control plan	n/a	S/4 QM FMEA (FMEA cockpit), control plans	quality.Fmea, ControlPlan	full
Source inspection	n/a (quality orders only after receipt)	Source inspection flag in QI01, QI07 trigger, inspection type 0101	QualityOrder trigger SOURCE_INSPECTION	full
Sample management	Item sampling quantity only (InventTestItemSampling)	QPR1–QPR7 physical samples, sample-drawing procedures, sample types	quality.PhysicalSample	full
Multiple specifications	One test group per item/association	S/4 Multiple Specifications (customer, country, pharmacopeia objects)	quality.SpecificationSet	full
In-process inspection points	Quality associations on route operations (before/after)	Inspection points (TQ79), lot origin 03, QE11 results per point	InspectionPoint on production operations	full

6.33.3 Functional requirements

- **FR-33.1 Tests, instruments and test groups** — Must. The system shall define tests (variable with UoM, target, min/max; attribute with outcome catalog), instruments, and test groups with sequence, sampling, and acceptance per test.
  - Notes: variable results compare to tolerances with 6-decimal precision; test group versions are effective-dated; a test marked `destructive` reduces sample qty on completion.
- **FR-33.2 Sampling plans** — Must. The system shall size samples by fixed quantity, percentage, or ANSI/ASQ Z1.4 single sampling (normal, tightened, reduced) at general inspection level II by default.
  - Notes: table excerpt and switching rules in BR-33.1/BR-33.2; sample qty is capped at lot qty; percentage rounding up.
- **FR-33.3 Quality associations** — Must. The system shall generate quality orders when a trigger matches: purchase receipt (registration or product receipt), production RAF (before/after put-away), sales order (at pick/before packing slip), transfer receipt, quarantine, and manual.
  - Notes: association scope = item / item group / all × vendor/customer / group / all × site; most specific wins (BR-33.3); one order per source line per event.
- **FR-33.4 Quality orders and results** — Must. The system shall record results per test per sample, compute pass/fail per test and order, and support retest and partial sampling.
  - Notes: results recorded with instrument id and user; a result from an instrument overdue for calibration is rejected; order status per BR-33.4.
- **FR-33.5 Inventory blocking** — Must. The system shall block the inspected quantity from pick, ship, consume and transfer-out when the quality order is created and release it only on an accepting usage decision; rejection moves qty to a quarantine location or blocked status.
  - Notes: enforcement lives in the inventory ledger reservation path (wave 16), not only in `wms`; blocked qty is visible as "quality hold" in ATP (wave 27) as unavailable.
- **FR-33.6 Usage decision** — Must. The system shall record a usage decision (accept, reject, accept-with-deviation, rework, return-to-vendor, scrap) with partial quantities, and post consequential transactions.
  - Notes: reject → nonconformance auto-created; return-to-vendor → wave-18 return order draft; scrap → wave-16 scrap journal with reason.
- **FR-33.7 Nonconformance** — Must. The system shall create nonconformances (sources: customer, vendor, internal, production, service request) with problem type, severity, quarantine action, related quality order and quantity.
  - Notes: statuses NEW → APPROVED → IN_CORRECTION → CLOSED, or REFUSED; attachments and photos from the mobile app.

- **FR-33.8 Correction / CAPA workflow** — Must. The system shall run an 8D correction workflow (D1 team … D8 close) on Temporal with root cause, containment, corrective action, due dates, approvals and an effectiveness check after a configurable period (default 90 days).
  - Notes: overdue actions escalate per wave-4 workflow escalation; effectiveness check task auto-created by a Temporal timer.
- **FR-33.9 Certificates of analysis** — Must. The system shall generate CoA documents per shipment/batch from accepted results using a template per customer/item, with PDF output and e-mail/portal delivery.
  - Notes: CoA shows result, specification, method, instrument; signature block from the usage-decision user.
- **FR-33.10 Supplier quality scorecard** — Should. The system shall compute per vendor: lots inspected, lot acceptance rate, PPM defective, NCR count by severity, on-time delivery (from wave 18), and a weighted score 0–100.
  - Notes: weights configurable; monthly materialization; exposed to the wave-20 supplier portal.
- **FR-33.11 SPC charts** — Should. The system shall compute X-bar/R (variable) and p/np (attribute) charts with Western Electric rules 1–4 flagged.
  - Notes: subgroup size from sampling plan; control limits from the last 25 subgroups.
- **FR-33.12 Cost of quality** — Could. The system shall tag inspection labor (wave 24 time), scrap, rework and returns to prevention/appraisal/internal/external failure categories for reporting.
  - Notes: amounts sourced from journal entries by dimension `coq_category`.
- **FR-33.13 Regulated and restricted product lists** — Should. The system shall maintain compliance lists (regulated regions; restricted-substance lists such as REACH SVHC, RoHS Annex II, California Proposition 65, TSCA; reporting lists with thresholds) and item compositions (substance, CAS number, concentration % w/w), evaluate every item against every applicable list per BR-33.11, and block or warn on sales order lines, shipments and purchase receipts to or from regions where the item is restricted.
  - Notes: composition rolls up through the wave-9 BOM by mass fraction; results are versioned per (item, list version); block or warn per list (`compliance_block_mode`); a reporting extract per period lists quantities sold per region for reporting lists (e.g. REACH Art. 33 communication, SCIP notification data).
- **FR-33.14 Safety data sheets** — Should. The system shall store SDS versions per item × language × region (GHS 16-section reference, PDF, version, issue date, validity), record which version each customer received, and send the current SDS with the first shipment and after every new version per BR-33.12.
  - Notes: shipment confirmation (wave 28) checks `sds_required`; missing SDS holds or warns per `sds_missing_action`; validity default 1,095 days; an expiry job creates review tasks 60 days ahead; the delivery log is the distribution evidence.
- **FR-33.15 Incoming vendor certificates** — Should. The system shall require certificates (certificate of analysis, certificate of conformance, EN 10204 type 3.1 inspection certificate) per item × vendor through the quality association, record their receipt (upload, EDI attachment or supplier portal), check certificate values against the specification, and keep the quality order from acceptance until the certificate is received and accepted (BR-33.13).
  - Notes: certificate types are required or optional; a receipt without a required certificate sets `certificate_status = MISSING`; waivers need QM_USAGE_DECISION and a reason; the supplier portal (wave 20) offers upload against the ASN or PO line.
- **FR-33.16 Stability studies** — Could. The system shall plan stability studies (item, batch, protocol), storage conditions (e.g. 25 °C/60 % RH long-term, 40 °C/75 % RH accelerated per ICH Q1A(R2)), pull points (0, 3, 6, 9, 12, 18, 24, 36 months) with a test group per pull point, and create stability quality orders on schedule from retained samples (FR-33.20).
  - Notes: one Temporal workflow per study schedules pulls (BR-33.14); status PLANNED → ACTIVE → COMPLETED or TERMINATED; out-of-specification results raise an NCR and, after approval, can shorten the batch shelf life (wave 16 batch expiry).
- **FR-33.17 Audit management** — Could. The system shall plan audits (internal, supplier, customer; ISO 9001 clause references), maintain weighted question lists, record answers and findings, and convert findings into NCRs and CAPA (FR-33.8); supplier audit scores feed the scorecard (FR-33.10).
  - Notes: status PLANNED → IN_PROGRESS → REPORTED → CLOSED; score = Σ weighted answer points ÷ maximum × 100; finding severity MAJOR, MINOR or OBSERVATION; closure requires a CAPA for every major finding; an auditor cannot audit their own org unit.
- **FR-33.18 FMEA and control plans** — Could. The system shall maintain design and process FMEAs in the AIAG-VDA (2019) structure — structure, function, failure analysis, and risk analysis with severity, occurrence and detection 1–10 and action priority H/M/L — and control plans per item × routing operation whose characteristics generate test group lines and in-process inspection points (FR-33.22).
  - Notes: action priority from the AIAG-VDA AP table held as reference data (BR-33.15); RPN shown for legacy comparison only; control plan phases PROTOTYPE, PRE_LAUNCH, PRODUCTION; a control plan revision versions the linked test group; a PPAP element checklist is stored as a document set on the item.
- **FR-33.19 Source inspection** — Should. The system shall create a quality order with trigger SOURCE_INSPECTION for a PO line or ASN a configurable lead time before the confirmed delivery date, let an inspector or the vendor (portal) record results, and on acceptance mark the inspected batches so that their receipt skips receiving inspection (BR-33.16).
  - Notes: lead time default 5 days; rejection notifies purchasing and blocks the ASN; non-matching batches at receipt get the normal receipt association.
- **FR-33.20 Physical sample management** — Should. The system shall record physical samples drawn for a quality order — primary, pooled and reserve/retention samples — with sample id, quantity, container, storage location and condition, label (ZPL through wave 32) and retention expiry, under a sample-drawing procedure.
  - Notes: retention default 1 year past batch expiry (21 CFR 211.170); destructive consumption posts per BR-33.5; a daily job marks expired retention samples DUE_FOR_DISPOSAL and creates a disposal task; pooled samples reference their primary samples.
- **FR-33.21 Multiple specifications** — Should. The system shall allow specification sets per test group (default, customer, country/region, pharmacopeia) with their own limits per test, evaluate results against every applicable set, and record per set whether the lot conforms; the CoA and usage decision use the set that applies to the customer or destination (BR-33.17).
  - Notes: a lot conforms to set S if and only if every required test passes under S's limits; the lot carries `spec_conformance[]`, which wave-27 ATP uses to allocate the lot only to customers whose set it meets.
- **FR-33.22 In-process inspection points** — Should. The system shall define inspection points on production route operations by time interval (e.g. every 2 h), quantity interval (e.g. every 500 units) or free definition, generate result slots per point during production from wave-21/25 operation feedback, and halt the operation when a critical characteristic fails if configured.
  - Notes: point id = (order, operation, point number, time or quantity stamp); results are recorded on the shop-floor PWA (wave 25); a critical failure sets the operation to HALTED_QUALITY and notifies the supervisor; output since the last good point can be dispositioned as a partial lot; missed points per BR-33.18.

6.33.4 Data model

QualityOrder

Field	Type	Required	Notes
quality_order_id	uuid	yes	PK; number sequence QO-*
trigger	enum	yes	PURCHASE_RECEIPT, PRODUCTION_RAF, SALES_PICK, TRANSFER_RECEIPT, QUARANTINE, MANUAL
source_ref	jsonb	yes	{type, id, line} polymorphic
item_id, dims	uuid/jsonb	yes	batch/serial dims

Field	Type	Required	Notes
site_id, warehouse_id	uuid	yes	
lot_qty, sample_qty, uom	numeric(18,6)/text	yes	
test_group_id, test_group_version	uuid/int	yes	
sampling_plan_id, inspection_severity	uuid/enum	yes	NORMAL/TIGHTENED/REDUCED
status	enum	yes	BR-33.4
block_ref	uuid	no	inventory ledger hold id
created_at, closed_at	timestamptz	—	

QualityResult

Field	Type	Required	Notes
result_id	uuid	yes	PK
quality_order_id, test_id, sample_no	uuid/uuid/int	yes	unique together with `retest_no`
value_numeric	numeric(18,6)	no	variable tests
outcome_id	uuid	no	attribute tests
passed	bool	yes	computed
instrument_id	uuid	no	must be in calibration
recorded_by, recorded_at	text/timestamptz	yes	
retest_no	int	yes	default 0

Nonconformance

Field	Type	Required	Notes
ncr_id	uuid	yes	PK; NCR-*
source	enum	yes	CUSTOMER, VENDOR, INTERNAL, PRODUCTION, SERVICE
item_id, dims, qty	—	yes	
problem_type_id, severity	uuid/enum	yes	severity MINOR/MAJOR/CRITICAL
quality_order_id, vendor_id, customer_id, production_order_id	uuid	no	
status	enum	yes	NEW, APPROVED, REFUSED, IN_CORRECTION, CLOSED
quarantine_order_id	uuid	no	
correction_workflow_id	text	no	Temporal workflow id

SamplingPlan: plan_id, method (FIXED/PERCENT/AQL), fixed_qty, percent, aql (numeric 3,2), inspection_level (S1–S4, I–III), severity default, switching_enabled.
Instrument: instrument_id, calibration_interval_days, last_calibrated_at, due_at, status.

Invariants: a quant with an open QualityOrder referencing it has `quality_status ∈ {PENDING, BLOCKED}`; `Σ accept_qty + reject_qty + deviation_qty` of a usage decision = lot_qty; a QualityOrder is CLOSED only with a usage decision; a result cannot reference an instrument whose `due_at < recorded_at`. Indexing: `quality_order(status, site_id)`, `quality_result(quality_order_id, test_id, sample_no, retest_no)` unique, `nonconformance(vendor_id, created_at)`.

6.33.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
POST	/quality/v1/test-groups	Create/version test group	key	QM_SETUP_MAINTAIN
POST	/quality/v1/associations	Create association	key	QM_SETUP_MAINTAIN
POST	/quality/v1/sampling-plans:size	Compute sample size for lot qty/plan	—	QM_VIEW
POST	/quality/v1/quality-orders	Create manual order	key	QM_ORDER_MAINTAIN
POST	/quality/v1/quality-orders/{id}/results	Record results (batch)	key per batch	QM_RESULTS_RECORD
POST	/quality/v1/quality-orders/{id}:usage-decision	Post decision with quantities	key	QM_USAGE_DECISION
POST	/quality/v1/nonconformances	Create NCR	key	QM_NCR_MAINTAIN
POST	/quality/v1/nonconformances/{id}/corrections	Start CAPA workflow	key	QM_CAPA_MAINTAIN
POST	/quality/v1/coa:generate	Generate CoA for shipment/batch	key = shipment+batch	QM_COA
GET	/quality/v1/scorecards/vendors/{id}?period=	Scorecard	—	QM_VIEW
POST	/quality/v1/compliance-lists	Create or version a compliance list	key	QM_COMPLIANCE_MAINTAIN
POST	/quality/v1/items/{id}/sds	Upload an SDS version	key	QM_COMPLIANCE_MAINTAIN
POST	/quality/v1/quality-orders/{id}/certificates	Record an incoming certificate	key	QM_RESULTS_RECORD
POST	/quality/v1/stability-studies	Create a study and generate its schedule	key	QM_STABILITY_MAINTAIN
POST	/quality/v1/audits	Plan an audit	key	QM_AUDIT_MAINTAIN
POST	/quality/v1/fmeas	Create or version an FMEA or control plan	key	QM_FMEA_MAINTAIN
POST	/quality/v1/samples	Register a physical sample	key	QM_RESULTS_RECORD

Commands: `CreateQualityOrderFromTrigger` validates association match and that the source line is in the required state; `PostUsageDecision` validates all required tests have results (or `allow_incomplete` with deviation reason) and quantity split sums to lot qty.

Event	Trigger	Payload fields	Consumers
dev.passage.quality.order.created.v1	order created	quality_order_id, trigger, source_ref, item, dims, lot_qty, sample_qty	inventory (hold), wms, analytics
dev.passage.quality.result.recorded.v1	result batch	quality_order_id, results[]	SPC projection
dev.passage.quality.usagedecision.posted.v1	decision	quality_order_id, decision, accept_qty, reject_qty, deviation_qty, user	inventory (release/hold), wms, purchasing, production
dev.passage.quality.nonconformance.created.v1	NCR	ncr_id, source, severity, item, vendor_id	vendor scorecard, workflow
dev.passage.quality.capa.closed.v1	8D closed	ncr_id, effectiveness_result	analytics

6.33.6 User experience

Screen	Primary actions	Key fields	Duty
Quality setup	Tests, groups, sampling plans, associations, instruments	test, type, tolerance, AQL, trigger scope	QM_SETUP_MAINTAIN
Quality order workbench	List by status/site, open, record, decide	order, item, trigger, sample, due, status	QM_ORDER_MAINTAIN
Results recording (web + mobile step)	Enter values per sample/test, attach	test, sample, value, outcome, instrument	QM_RESULTS_RECORD
Usage decision	Split quantities, choose decision, reason	accept/reject/deviation qty, disposition	QM_USAGE_DECISION
Nonconformance / 8D	Create, approve, run 8D, close	NCR, severity, D1–D8 tasks, due dates	QM_NCR_MAINTAIN
Supplier scorecard	Period filter, drill to NCRs	vendor, score, PPM, acceptance rate	QM_VIEW
SPC dashboard	Chart per item/test, rule violations	subgroups, limits, rule hits	QM_VIEW

Interaction rules: results grid is keyboard-first (Tab/Enter down a sample column); out-of-tolerance values highlight immediately on blur; usage decision disabled until required results exist; CoA preview before release.

6.33.7 Business rules and edge cases

- **BR-33.1 AQL table (ANSI/ASQ Z1.4, general inspection level II, single sampling, normal inspection) — excerpt used by the sizing function.**

Lot size	Code	Sample n	AQL 1.0 Ac/Re	AQL 2.5 Ac/Re	AQL 4.0 Ac/Re
2–8	A	2	use E (13): 0/1	use D (8): 0/1	use C (5): 0/1
9–15	B	3	use E: 0/1	use D: 0/1	use C: 0/1
16–25	C	5	use E: 0/1	use D: 0/1	0/1
26–50	D	8	use E: 0/1	0/1	use E (13): 1/2
51–90	E	13	0/1	use F (20): 1/2	1/2
91–150	F	20	use G (32): 1/2	1/2	2/3
151–280	G	32	1/2	2/3	3/4
281–500	H	50	2/3	3/4	5/6
501–1,200	J	80	3/4	5/6	7/8
1,201–3,200	K	125	5/6	7/8	10/11
3,201–10,000	L	200	7/8	10/11	14/15
10,001–35,000	M	315	10/11	14/15	21/22
35,001–150,000	N	500	14/15	21/22	21/22
150,001–500,000	P	800	21/22	21/22	21/22
500,001+	Q	1,250	21/22	21/22	21/22

Arrow cells ("use X") follow the Z1.4 rule: when the table points to another sample size, use that sample size and its Ac/Re; if it exceeds lot size, inspect 100%. The full Table I (code letters for levels S-1…S-4, I–III) and Tables II-A/B/C (normal/tightened/reduced) are stored as versioned reference data `z14_table` and tested cell by cell.

- **BR-33.2 Switching rules.** Normal → tightened when 2 of 5 consecutive lots are rejected; tightened → normal after 5 consecutive accepted; normal → reduced after 10 consecutive accepted (and switching enabled); reduced → normal on a rejection. Severity is tracked per (item, vendor, test group).
- **BR-33.3 Association specificity.** Score = 4·(item match) + 2·(party match) + 1·(site match); highest score wins; ties resolved by lowest `sequence`; `item group` counts as item match with weight 3. Exactly one order per source line per trigger event; a re-triggered event (e.g., second receipt line) creates a separate order.
- **BR-33.4 Quality order state machine.** `CREATED → OPEN (sample drawn) → RESULTS_IN_PROGRESS → PENDING_DECISION → CLOSED`; `CREATED|OPEN → CANCELLED` (only if source reversed; hold released); `PENDING_DECISION → RESULTS_IN_PROGRESS` on retest request; CLOSED is final; a decision can be *amended* only by a new NCR referencing the order.
- **BR-33.5 Blocking semantics.** The hold is placed synchronously in the same transaction as source line registration (receipt registration / RAF) through the inventory ledger `PlaceHold` API; if the hold cannot be placed the source transaction fails. Hold qty = lot qty (not sample qty). Destructive test consumption posts a scrap journal for the destroyed sample qty at decision time.
- **BR-33.6 Variable test evaluation** passes if `min ≤ value ≤ max` inclusive after rounding to the test's declared decimals (half-up); attribute passes if the outcome is flagged `pass`. Order passes if every test marked `required` passes on every sample within Ac/Re for AQL plans.
- **BR-33.7 Partial decisions.** Accept 90, reject 10: accepted qty released; rejected qty moved to the quarantine location with `quality_status = REJECTED`; both legs are ledger transactions with the quality order as reference.
- **BR-33.8 Instrument calibration.** `due_at = last_calibrated_at + interval`; results are rejected if `due_at < now` with error `INSTRUMENT_OVERDUE`; a 14-day warning is raised.
- **BR-33.9 CAPA timers.** D3 containment due in 2 business days, D5 corrective action in 30 days, effectiveness check at 90 days after D7 close; business days from the site calendar.
- **BR-33.10 CoA** includes only results from the accepting decision; amended results require a new CoA revision with `supersedes`.
- **BR-33.11 Compliance evaluation.** For item i and list L, the concentration c_s of substance s = Σ over BOM components (mass fraction of the component × c_s in the component), applied recursively; i is restricted under L in region r if any s on L has c_s > threshold_s (strictly greater) and L applies to r; evaluation reruns on BOM, composition or list-version change and stores a new result version.
- **BR-33.12 SDS dispatch.** On shipment confirmation for an item with `sds_required`: select the SDS with region = ship-to country (or its region group), language = customer language else region default, status VALID; if the customer has not received that version, attach it and log the delivery; if none is valid, hold (default) or warn per `sds_missing_action`.
- **BR-33.13 Certificate gating.** A usage decision ACCEPT requires `certificate_status ∈ {RECEIVED_OK, WAIVED}` when the association demands a certificate; certificate values outside the specification set `certificate_status = RECEIVED_NOK` and create an NCR with source VENDOR.
- **BR-33.14 Stability pull scheduling.** Pull date = study start + pull-point months (same day of month; clamped to month end); the quality order is created `stability_lead_days` (default 7) before the pull date; a pull recorded more than `stability_pull_window_days` (default 3) late is flagged as a deviation.
- **BR-33.15 FMEA action priority.** Action priority = AP(S, O, D) from the AIAG-VDA reference table; an FMEA cannot be released while any H item lacks an action with owner and due date.
- **BR-33.16 Source-inspection skip.** A receipt skips receiving inspection if and only if (PO line, batch) has an accepted source inspection whose accepted quantity ≥ received quantity; excess quantity gets a normal quality order.
- **BR-33.17 Specification set precedence.** customer > country > pharmacopeia > default; conformance is computed for all sets; the CoA prints the limits of the set used for the customer.

- **BR-33.18 Inspection point frequency.** Time-based points fall due every interval from operation start in the plant time zone; quantity-based points fall due when cumulative good quantity crosses k × interval; a point without a result after a grace of `inspection_point_grace_pct` (default 25 %) of the interval is missed, and when `block_on_missed_point = true` RAF of output since the last recorded point is blocked.

6.33.8 Acceptance criteria

- **AC-33.1** (FR-33.3, BR-33.3) Given the trigger fixture of 60 receipts and 40 RAFs with overlapping associations, when posted, then exactly the expected 73 quality orders exist with the expected test groups.
- **AC-33.2** (FR-33.2, BR-33.1) Given lot sizes {5, 50, 51, 500, 501, 3200, 10001, 600000} at AQL 2.5 normal level II, when sized, then sample sizes are {5, 8, 20, 50, 80, 125, 315, 1250} (lot 51 → code E, whose AQL 2.5 cell points down to F, n = 20) and Ac/Re are {0/1, 0/1, 1/2, 3/4, 5/6, 7/8, 14/15, 21/22}, matching the Z1.4 reference cells.
- **AC-33.3** (FR-33.5) Given 10,000 random attempts to pick, ship, consume or transfer quants with open quality orders, when executed, then every attempt fails with `QUALITY_HOLD` and no inventory transaction is written.
- **AC-33.4** (FR-33.6, BR-33.7) Given a lot of 100 with results, when the decision is accept 90 / reject 10, then 90 are available, 10 sit in quarantine as REJECTED, and an NCR exists for 10.
- **AC-33.5** (FR-33.8, BR-33.9) Given an NCR with a started 8D workflow, when D7 closes and 90 days elapse (Temporal time-skipping test), then an effectiveness-check task is created and the workflow completes on its approval.
- **AC-33.6** (FR-33.4, BR-33.8) Given an instrument overdue since yesterday, when a result references it, then the request is rejected with `INSTRUMENT_OVERDUE`.
- **AC-33.7** (FR-33.9) Given an accepted batch shipped to a customer with a CoA template, when the shipment is confirmed, then a PDF CoA with every required test appears on the shipment and the customer portal.
- **AC-33.8** (BR-33.2) Given 5 consecutive lots of which 2 are rejected, when the 6th order is created, then its severity is TIGHTENED.
- **AC-33.9** (FR-33.10) Given 12 months of decisions and NCRs, when the scorecard is computed, then PPM = rejected units / inspected units × 10^6 and score matches the weighted formula fixture.
- **AC-33.10** (FR-33.13, BR-33.11) Given an item whose BOM yields 0.12 % w/w of an SVHC, when a sales order line ships to an EU customer, then the REACH Art. 33 warning QM-0121 appears and the item is on the period reporting extract; at 0.09 % w/w neither happens.
- **AC-33.11** (FR-33.14, BR-33.12) Given an item with an English SDS only and a German customer with `sds_missing_action = HOLD`, when the shipment is confirmed, then it is held with QM-0124; after a valid German SDS is uploaded the shipment releases with the SDS attached and logged.
- **AC-33.12** (FR-33.15, BR-33.13) Given an association requiring an EN 10204 3.1 certificate, when the receipt posts without one, then ACCEPT is rejected with QM-0125; after an in-specification certificate is recorded, ACCEPT succeeds.
- **AC-33.13** (FR-33.16, BR-33.14) Given a 36-month study starting 2026-01-31 with pull points 0/3/6/…/36, when the schedule is generated, then pull dates are 2026-01-31, 2026-04-30, 2026-07-31 and so on, and quality orders appear 7 days before each (Temporal time-skipping test).
- **AC-33.14** (FR-33.19, BR-33.16) Given an accepted source inspection for batch B of 1,000 units, when 1,000 units of B are received, then no receiving quality order is created; when 1,000 units of batch C arrive, a normal quality order is created.
- **AC-33.15** (FR-33.21, BR-33.17) Given a lot that meets default limits but fails customer X's tighter limit, when ATP allocates, then the lot is not allocated to customer X and remains allocatable to other customers.
- **AC-33.16** (FR-33.22, BR-33.18) Given a 2-hour inspection point and `block_on_missed_point = true`, when no result exists 2.5 h after operation start, then RAF of output since the last point is blocked and the supervisor receives QM-0130.
- **AC-33.17** (FR-33.18, BR-33.15) Given an FMEA line with S = 10, O = 8, D = 7 and no action, when release is attempted, then action priority is H and release fails with QM-0127.
- **AC-33.18** (FR-33.20) Given a retention sample whose retention expiry is today, when the daily job runs, then the sample is DUE_FOR_DISPOSAL and a disposal task exists.
- **AC-33.19** (FR-33.17) Given an audit with 2 major findings and one CAPA, when closure is attempted, then it is rejected with QM-0131.

6.33.9 Test plan and fixtures

Fixtures: `z14-tables.json` (full Z1.4 Tables I, II-A/B/C transcribed and double-checked), `quality-triggers-100.json`, `results-variable-attribute.json`, `instruments-12.json`, `ncr-8d-sample`, `vendor-scorecard-12m`.

Test	Type	Target	Pass criterion
AQL sizing	unit	every cell of II-A/B/C	equals transcribed table
Association precedence	unit	100 triggers	expected orders
Blocking property	property	inventory ledger + wms	0 successful movements on held quants
8D workflow	Temporal replay/time-skip	CAPA	completes with effectiveness check
Usage decision quantities	unit	splits	sum invariant
CoA rendering	snapshot	PDF	matches golden
Results throughput	performance	1,000 results batch	< 2 s

Reconciliation: Σ quality-held qty in ledger = Σ lot_qty of open orders; rejected qty in quarantine = Σ reject_qty of decisions – dispositions.

6.33.10 Deployment and operations

Helm `passage-quality` (api, worker, 2–6 replicas), CloudNativePG `quality-db` (3 instances, 50 GB). Config: `QM_DEFAULT_INSPECTION_LEVEL=II`, `QM_EFFECTIVENESS_DAYS=90`, `QM_INSTRUMENT_WARN_DAYS=14`. Flags: `quality.enabled` per site, `quality.spc`. Scheduled: scorecard materialization monthly (1st, 03:00), instrument due scan daily, SPC recompute hourly. SLOs: order creation added to receipt latency < 100 ms p95; results batch p95 < 2 s; decision posting p95 < 500 ms. Alerts: orders PENDING_DECISION > 5 days; held qty vs open orders drift; instrument overdue with results attempted. Runbook: release orphan holds (order cancelled but hold remains); reprocess association for a trigger event. Rollback: `quality.enabled=false` stops new orders; existing holds remain until decided (never auto-release on rollback).

6.33.11 Migration from AX / SAP

Source	Passage entity	Transformation
InventTestTable, InventTestVariable, InventTestVariableOutcome	Test, outcome catalog	type Integer/Fraction → variable; Option → attribute
InventTestGroup + lines, InventTestItemSampling	TestGroup, SamplingPlan	fixed/percent plans direct; AQL plans created new
InventTestAssociationTable	QualityAssociation	event type mapping (Registration/Product receipt/RAF/Pick)
InventQualityOrderTable/Line/LineResults (open)	QualityOrder, QualityResult	open orders only; holds recreated via ledger API

Source	Passage entity	Transformation
InventNonConformanceTable, InventNonConformanceCorrection (open)	Nonconformance, Correction	statuses mapped; closed NCRs loaded as read-only history (last 24 months)
QPMK, PLKO/PLPO/PLMK	Test, TestGroup	one group per plan usage; characteristics by `MERKNR`
QDPS/QDS1, QMAT	SamplingPlan, QualityAssociation	SAP sampling procedure type → method; `QMAT` lot origin → trigger
QALS (open, no UD), QAMR/QASR	QualityOrder, QualityResult	lot origin 01→PURCHASE_RECEIPT, 04→PRODUCTION_RAF, 10→SALES_PICK, 89→MANUAL
QMEL/QMFE/QMMA/QMSM (open)	Nonconformance, Correction tasks	notification type Q1/Q2/Q3 → source
ELBK/ELBM/ELBP	SupplierScorecard history	last 12 months of scores only

Not migrated: closed inspection lots with UD (history to lakehouse), SAP control chart history (recomputed), certificate print history.

6.33.12 Dependencies, risks, open questions

Depends on: wave 32 (mobile results step), wave 31 (quarantine locations, work), wave 28 (shipment hooks for sales trigger and CoA), wave 21 (RAF hook), wave 18 (receipt hooks, return orders), wave 16 (ledger hold API — extended in this wave), wave 4 (Temporal).

Risk	Likelihood	Impact	Mitigation
Z1.4 transcription error	Low	High	Two independent transcriptions diffed; spot-check against the ASQ tables
Hold placement adds latency to receipts	Medium	Low	Synchronous but local DB call via ledger API; measured in CI

Open questions: (1) Should sales-pick quality orders block the *order line* or the *quant*? Proposed: quant; decide by wave 33 design review. (2) Cost of quality category as a journal dimension or a tag? Proposed: dimension `coq_category`; decide by wave 37 (cost accounting).

6.33.13 Parameters and setup

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
quality.enabled	site	bool	false	true / false	Activates quality orders for the site	Inventory and warehouse management parameters › Quality management › "Use quality management"	QM activation per plant; material master QM view (QCC0)
default_inspection_level	tenant	enum	II	S-1…S-4, I–III	Default Z1.4 inspection level (FR-33.2)	Item sampling (no AQL levels)	Sampling scheme (QDP1)
switching_enabled	sampling plan	bool	true	true / false	Normal/tightened/reduced switching (BR-33.2)	n/a	Dynamic modification rule (QDB1)
block_on_order_create	site	bool	true	true / false	Hold placed at order creation (BR-33.5)	Quality order blocking parameters / association "Event blocking"	QM control key "post to inspection stock" (TQ08)
auto_ncr_on_reject	site	bool	true	true / false	NCR created on reject decision (FR-33.6)	Nonconformance defaults	Usage decision follow-up action "create notification"
effectiveness_check_days	site	int	90	30–365	CAPA effectiveness timer (BR-33.9)	n/a	Notification task follow-up (effectiveness check)
capa_calendar	site	calendar ref	site calendar	wave-6 calendars	Business days for CAPA due dates	Quality management parameters "Hours per day"	Notification priority response times (T356)
instrument_warn_days	site	int	14	0–90	Calibration warning horizon (BR-33.8)	Test instruments	Maintenance plan call horizon (IP10)
results_decimals	test	int	per test	0–6	Rounding before evaluation (BR-33.6)	Test "Precision"	MIC decimal places (QS21)
coa_auto_on_shipment	customer	bool	false	true / false	CoA generated at ship confirmation (FR-33.9)	Certificate of analysis "Print with packing slip"	Quality info record sales (QV51) + output determination application QC
scorecard_weights	tenant	jsonb	quality 40 / delivery 30 / NCR 20 / audit 10	Σ = 100	Scorecard formula (FR-33.10)	Vendor evaluation criteria (VendEvaluationCriterion)	Weighting keys and criteria (T147*)
compliance_block_mode	compliance list	enum	BLOCK	BLOCK / WARN	Line behavior on restriction (FR-33.13)	Restricted list "Restricted" vs "Warning"	Product marketability check rule result
sds_validity_days	item × region	int	1,095	30–3,650	SDS expiry (FR-33.14)	Product compliance › SDS parameters › "Product safety data sheet validity" / MSDS validity days	Product compliance SDS validity
sds_missing_action	legal entity	enum	HOLD	HOLD / WARN / NONE	Shipment behavior without valid SDS (BR-33.12)	SDS "Send on sales" check	EHS report shipping check in delivery (CVD1)
certificate_required_default	quality association	enum	NONE	NONE / COA / COC / EN10204_31	Certificate demand (FR-33.15)	n/a	QI01 certificate type; QM control key "certificate required"
source_inspection_lead_days	vendor × item	int	5	0–60	Source inspection trigger (FR-33.19)	n/a	QI01 source inspection indicator with QI07 lead time
retention_sample_years_after_expiry	site	int	1	0–10	Retention sample expiry (FR-33.20)	n/a	Sample type retention period (sample management customizing)
stability_lead_days	site	int	7	0–30	Order creation ahead of pull (BR-33.14)	n/a	Stability study scheduling parameters (QST)

Parameter	Scope	Type	Default	Allowed values	Effect	AX equivalent	SAP equivalent
stability_pull_window_days	study	int	3	0–14	Late pull deviation threshold (BR-33.14)	n/a	Stability study customizing
inspection_point_grace_pct	operation	int	25	0–100	Missed-point grace (BR-33.18)	n/a	Inspection point identification (TQ79)
block_on_missed_point	operation	bool	false	true / false	RAF block on missed point (BR-33.18)	n/a	Inspection point completion requirement
fmea_ap_table_version	tenant	reference data	AIAG-VDA-2019	versioned	Action priority lookup (BR-33.15)	n/a	FMEA customizing: risk evaluation catalog
four_eyes_decision	site	bool	false	true / false	Decision user ≠ results user	n/a	Digital signature / UD authorization (QM)

6.33.14 Inquiries and reports

Name	Type	Filters & parameters	Columns / measures	Source projection	AX equivalent	SAP equivalent
Quality order worklist	list inquiry	status, site, trigger, age, item	order, lot qty, sample, due, status	`quality_order`	Quality orders list page	QA32 / QA33
Results worklist	list inquiry	characteristic, work center, status	open result slots, inspection point, due	`quality_result`	Quality order line results	QE51N
Results history by item and test	drill-down	item, test, vendor, period	value, limits, pass/fail, instrument	`quality_result`	Test result statistics	QGA3, QE03
NCR and CAPA status	list inquiry	source, severity, status, overdue	NCR, current D-step, due date, owner	`nonconformance` + workflow	Nonconformances list, corrections inquiry	QM10–QM12
Supplier quality scorecard	KPI	vendor, period	lots, acceptance rate, PPM, NCRs, audit score, total	scorecard	Vendor evaluation, SSRS vendor quality performance	ME6H, QGA2
SPC control chart	KPI	item, test, plant	X̄/R or p/np, limits, rule violations	SPC projection	n/a	QGC1–QGC3
Cost of quality	KPI	period, category, site	prevention, appraisal, internal and external failure	journal by `coq_category`	SSRS cost of quality	QM order cost reports (KOB1)
Quality hold reconciliation	operational report	site	held qty in ledger vs open orders	reconciliation job	n/a	QA32 with MMBE inspection stock
Certificate receipt overview	list inquiry	vendor, item, status	required, received, waived, NOK	`incoming_certificate`	n/a	QC55
Regulated and restricted product hits	list inquiry	list, region, item	substance, % w/w, threshold, action	`compliance_result`	Product compliance inquiries (regulated items)	Product marketability workbench
SDS due and distribution log	operational report	item, region, expiry window	version, valid_to, customers sent, pending	`safety_data_sheet`, `sds_delivery`	SDS due inquiry, SSRS Safety data sheet	CVD1 report shipping orders
Stability study plan	drill-down	study, condition	pull points, status, result trend	`stability_study`	n/a	QST03
Audit findings	list inquiry	audit, severity, status	finding, clause, CAPA link	`audit`	n/a	PLMD_AUDIT
Instrument calibration due	list inquiry	due within n days, site	instrument, due_at, status	`instrument`	Test instruments	IP19 / IP24 scheduling overview

6.33.15 Printed and electronic documents

Document	Trigger	Layout elements	Formats	Numbering sequence	Legal / retention requirement
Certificate of analysis	Ship confirmation or accepting decision	Header: customer, PO, item, batch, manufacturing and expiry dates; lines: test, method, limits of the applicable specification set (FR-33.21), result, unit; footer: signer, revision, supersedes	PDF/A-2; email; customer portal; EDI attachment	COA-*	Retained ≥ 1 year past batch expiry (21 CFR 211.180) or 10 years, configurable
Quality order and sampling instruction	Order created	Lot, sample qty, tests, sample-drawing procedure	PDF	QO-*	Operational, per quality record retention
Sample label	Sample registered	Sample id barcode, order, storage condition, retention expiry	ZPL	SMP-*	None beyond sample record
Nonconformance report / NC tag	NCR created	NCR id, source, severity, qty, quarantine location	PDF; ZPL tag	NCR-*	Quality record, 10 years default
8D report	CAPA closed	D1–D8 contents, effectiveness check result	PDF	NCR id	Customer deliverable; IATF 16949 retention per customer
Safety data sheet	First shipment and each new version (BR-33.12)	GHS 16 sections	PDF attached to shipment email or portal	SDS version	REACH Art. 36: information kept 10 years
Stability study report	Pull point and study completion	Conditions, pull points, results, trend, conclusion	PDF	STB-*	Product registration file retention
Audit report	Audit REPORTED	Scope, criteria, findings, score	PDF	AUD-*	ISO 9001 §7.5 documented information
FMEA and control plan	Release	AIAG-VDA form, control plan columns	PDF / XLSX	Version	PPAP submission
Supplier scorecard	Monthly	Score components, trend, NCRs	PDF via supplier portal	none	None

6.33.16 Periodic and batch jobs

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
Scorecard materialization	Monthly, 1st 03:00	vendor	period	< 10 min	Rerun period	Scorecard missing on 2nd
Instrument due scan	Daily 05:00	site	date	< 1 min	Rerun	Overdue instrument with results attempted
SPC recompute	Hourly	item × test	last result id	< 5 min	Resume from last id	Lag > 3 h
Compliance re-evaluation	On BOM/list change; full run nightly 01:00	item hash range	(item, list version)	50,000 items < 30 min	Resume by hash range	Failed items > 0

Job	Schedule default	Partitioning key	Idempotency / checkpoint	Typical runtime target	Failure handling	Monitor / alert
SDS expiry and redistribution	Daily 04:00	item × region	SDS version	< 5 min	Rerun	SDS expiring in < 60 days without review task
Stability pull scheduling	Temporal timer per study	study	workflow id	n/a	Workflow retry	Missed pull deviation
Retention sample disposal	Daily 06:00	site	sample id	< 1 min	Rerun	none (tasks)
Source inspection trigger	Daily 06:00	vendor	PO line + due date	< 2 min	Rerun	Orders not created for due lines
Quality hold reconciliation	Daily 02:30	site	snapshot	< 5 min	Report only	Held qty ≠ open lot qty

6.33.17 Security duties and privileges

Duty	Privileges (entry points)	Segregation-of-duties conflicts	Default roles that include it
QM_SETUP_MAINTAIN	/quality/v1/test-groups, /associations, specification sets, sampling plans	QM_USAGE_DECISION (change limits, then accept against them)	Quality administrator
QM_ORDER_MAINTAIN	/quality-orders (manual); workbench	none	Quality inspector
QM_RESULTS_RECORD	/quality-orders/{id}/results, /certificates, /samples	QM_USAGE_DECISION on the same order when `four_eyes_decision = true`	Lab technician, inspector
QM_USAGE_DECISION	/quality-orders/{id}:usage-decision; certificate waiver	QM_SETUP_MAINTAIN	QA release officer
QM_NCR_MAINTAIN	/nonconformances	none	Quality engineer
QM_CAPA_MAINTAIN	/nonconformances/{id}/corrections	Effectiveness check must be approved by another user	Quality engineer
QM_COA	/coa:generate	none	QA clerk
QM_COMPLIANCE_MAINTAIN	/compliance-lists, /items/{id}/sds	SALES_ORDER_MAINTAIN (wave 26): clearing a block on own order	Product steward / EHS
QM_STABILITY_MAINTAIN	/stability-studies	none	Stability coordinator
QM_AUDIT_MAINTAIN	/audits	Auditor may not audit own org unit (checked)	Internal auditor
QM_FMEA_MAINTAIN	/fmeas, control plans	none	Quality planner
QM_VIEW	/sampling-plans:size, /scorecards, SPC, all inquiries	none	All quality roles, purchasing

6.33.18 Message catalog

Code	Severity	User text	Cause	Remediation	Raised by
QM-0101	error	{item} is on quality hold (order {qo}); {action} not allowed.	QUALITY_HOLD on quant	Wait for usage decision	FR-33.5
QM-0102	error	Instrument {inst} is overdue for calibration since {date}.	INSTRUMENT_OVERDUE	Calibrate or use another instrument	BR-33.8
QM-0103	warning	Instrument {inst} calibration is due in {n} days.	Warning horizon reached	Schedule calibration	BR-33.8
QM-0104	error	Decision quantities {sum} do not equal lot quantity {lot}.	Split mismatch	Correct the split	FR-33.6
QM-0105	error	Required test {test} has no result.	Decision before results	Record result or deviate with reason	§6.33.5 commands
QM-0106	error	Inventory hold could not be placed; source transaction rolled back.	Ledger PlaceHold failed	Retry; check ledger health	BR-33.5
QM-0107	info	Inspection severity changed to {sev} for {item}/{vendor}.	Switching rule fired	None	BR-33.2
QM-0108	warning	Value {v} is outside {min}–{max} for {test}.	Out of tolerance	Retest or record failure	BR-33.6
QM-0109	error	Order {qo} is closed; amend through a nonconformance.	Change on CLOSED order	Create NCR	BR-33.4
QM-0110	warning	CAPA step {d} is {n} business days overdue; escalated.	Timer expired	Complete step	BR-33.9
QM-0121	warning	{item} contains {substance} at {c} % (threshold {t} %); {list} duty applies in {region}.	Reporting threshold exceeded	Issue required communication	BR-33.11
QM-0122	error	{item} is restricted in {region} under {list}; line blocked.	Restricted substance above limit	Change source or destination	BR-33.11
QM-0123	info	SDS {version} attached to shipment {ship}.	New version for customer	None	BR-33.12
QM-0124	error	No valid SDS for {item} in {language}/{region}; shipment held.	Missing SDS	Upload SDS	BR-33.12
QM-0125	error	Certificate {type} is required before acceptance.	Missing or NOK certificate	Obtain certificate or waive with reason	BR-33.13
QM-0126	warning	Stability pull {n} for study {s} is {d} days late.	Late pull	Record deviation	BR-33.14
QM-0127	error	FMEA {f} has high-priority items without actions.	H items without action	Add actions	BR-33.15
QM-0128	info	Batch {b} was source-inspected; receiving inspection skipped.	Accepted source inspection	None	BR-33.16
QM-0129	warning	Lot does not conform to specification set {set}.	Fails set limits	Allocate elsewhere or rework	BR-33.17
QM-0130	error	Inspection point {p} missed on operation {op}; RAF blocked.	No result within grace	Record result; supervisor review	BR-33.18
QM-0131	error	Audit cannot close: {n} major findings without CAPA.	Missing CAPA	Create CAPA	FR-33.17

6.33.19 Performance budgets and capacity

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
Quality order creation in receipt path	2,000 receipts/day; peak 200/min	+20 / 60 / 100 ms on receipt	40/s	Orders ≈ 1 GB	`quality_order(status, site_id)`	Hold stays synchronous; order body completes via outbox
Results batch	50,000 results/day; batches of 1,000	400 ms / 2 s / 3 s per 1,000	2,000 results/s	Results ≈ 8 GB	`quality_result` monthly partitions	Batch accepted asynchronously with status polling
Usage decision posting	1,500/day	120 / 500 / 900 ms	20/s	—	—	Queued per order; no partial postings
Compliance evaluation	50,000 items × 40 lists	20 / 80 / 200 ms per item; full run < 30 min	50 items/s	Results ≈ 2 GB	`compliance_result(item_id, list_version)`	Incremental runs continue; full run deferred to night
SDS check at shipment	5,000 shipments/day	5 / 20 / 40 ms (cached)	100/s	SDS PDFs ≈ 5 GB in object storage	`safety_data_sheet(item_id, region, language, status)`	Cache serves; holds still applied
SPC recompute	2,000 item × test series	< 5 min per hour	—	Chart points ≈ 1 GB	Series key	Recompute interval stretches to 2 h

Operation	Volume assumption	Latency target (p50 / p95 / p99)	Throughput target	Storage growth per year	Index / partition strategy	Degradation behavior under 3× load
Inspection point due evaluation	500 active operations	1-min resolution	—	Points ≈ 0.5 GB	`inspection_point(operation_id, due_at)`	Evaluation lag ≤ 3 min; RAF block decision waits for evaluation

6.33.20 Localization and compliance hooks

- **Regulated quality.** US 21 CFR Part 11 (electronic records and signatures: usage decisions, CoA signatures and CAPA approvals re-authenticate with the meaning of signature and keep an audit trail), 21 CFR 211.166 (stability), 211.170 (reserve samples), 211.180 (record retention); EU GMP Annex 11 and Annex 16 (Qualified Person certification); medical devices 21 CFR 820 and ISO 13485; automotive IATF 16949 with AIAG-VDA FMEA and PPAP. The `RegulatedQualityPack` extension point (wave 48) sets signature policies, four-eyes defaults and retention.
- **Stability conditions.** ICH climatic zones I, II, III, IVa (30 °C/65 % RH) and IVb (30 °C/75 % RH) are reference data selected by country pack for the target market.
- **Product compliance lists.** EU REACH and CLP, RoHS; UK REACH; US TSCA and California Proposition 65; China RoHS. Lists arrive through `ComplianceListProvider` (country pack or subscription feed). SDS language follows the destination member state (REACH Art. 31) and the GHS revision adopted by each jurisdiction.
- **Certificates.** EN 10204 types 2.1, 2.2, 3.1 and 3.2 are reference data; country packs may add national forms.
- **Retention.** Batch records and CoAs: US 1 year past expiry; EU GMP 1 year past expiry or 5 years after QP certification, whichever is longer; configured per pack through the wave-46 archive.
- **Units and formats.** Results are stored with declared decimals; decimal separator and unit display follow user locale.
- **Privacy.** Audit participants, CAPA owners and inspectors are personal data under GDPR; quality records keep names under the legal-obligation basis for the retention period.

6.33.21 Coverage closure

Register row (inventory section + AX form or SAP T-code)	Status before	Disposition	Note
AX GAP #48 — §12.15.1 Released product → Product compliance (regulated products, restricted lists, reporting details, SDS with validity and send on sales)	GAP (propose 33)	ADDED as FR-33.13 and FR-33.14	BR-33.11, BR-33.12
AX GAP #49 — §12.15.2 Product compliance inquiries (regulated items, SDS due)	GAP (propose 33)	ADDED as FR-33.13 and FR-33.14	Inquiries in §6.33.14
AX GAP #50 — §12.15.2 SSRS: Safety data sheet	GAP (propose 33)	ADDED as FR-33.14	Document in §6.33.15
AX GAP #51 — §12.15.3 Product compliance → Expire SDS / Reporting	GAP (propose 33)	ADDED as FR-33.14 and FR-33.13	Jobs in §6.33.16
AX GAP #52 — §12.15.4 Product compliance setup (regulated regions, restricted lists, reporting lists, SDS parameters, MSDS validity days)	GAP (propose 33)	ADDED as FR-33.13 and FR-33.14	Parameters in §6.33.13
AX GAP #66 — §12.23.1 Process manufacturing: Product compliance / SDS (link)	GAP (propose 33)	ADDED as FR-33.14	Same mechanism as #48
AX GAP #67 — §12.23.2 SSRS: Safety data sheet (link)	GAP (propose 33)	ADDED as FR-33.14	Same document as #50
AX GAP #68 — §12.23.3 Compliance → SDS expiry / regulated product reporting	GAP (propose 33)	ADDED as FR-33.14 and FR-33.13	Same jobs as #51
AX GAP #70 — §12.23.4 Product compliance → regulated/restricted lists, reporting lists, SDS setup	GAP (propose 33)	ADDED as FR-33.13 and FR-33.14	Same parameters as #52
AX GAP #72 — §12.25.4 Quality management → Product compliance (link)	GAP (propose 33)	ADDED as FR-33.13	Owned by `quality` service
AX GAP #80 — §12.29.1 Organization administration: Product safety data sheets (link)	GAP (propose 33)	ADDED as FR-33.14	Same mechanism as #48
AX GAP #87 — §12.29.4 Product safety data sheets setup (link)	GAP (propose 33)	ADDED as FR-33.14	Same parameters as #52
SAP #282 — §13.24 QC51 / QC52 / QC53 / QC55 certificate receipt	PARTIAL-33	ADDED as FR-33.15	BR-33.13, AC-33.12
SAP #283 — §13.24 QST01–QST07 stability study	GAP (propose 33)	ADDED as FR-33.16	BR-33.14, AC-33.13
SAP #284 — §13.24 PLMD_AUDIT audit management	PARTIAL-33	ADDED as FR-33.17	Was out of scope in §6.33.1; scope amended
SAP #285 — §13.24 FMEA (QM-FMEA, S/4), control plan	GAP (propose 33)	ADDED as FR-33.18	BR-33.15, AC-33.17
SAP #286 — §13.24 Source inspection (QI01 flag, QI07)	PARTIAL-33	ADDED as FR-33.19	BR-33.16, AC-33.14
SAP #287 — §13.24 Sample management (QPR1–QPR7)	PARTIAL-33	ADDED as FR-33.20	AC-33.18
SAP #288 — §13.24 Multiple specifications	PARTIAL-33	ADDED as FR-33.21	BR-33.17, AC-33.15
SAP #289 — §13.24 QC55 certificate receipt overview	PARTIAL-33	ADDED as FR-33.15	"Certificate receipt overview" in §6.33.14
SAP #290 — §13.24 QST stability schedule generation	GAP (propose 33)	ADDED as FR-33.16	"Stability pull scheduling" job
SAP #291 — §13.24 TQ79 inspection points (time/quantity/free), partial lots	PARTIAL-33	ADDED as FR-33.22	BR-33.18, AC-33.16
SAP #292 — §13.24 Stability study customizing	GAP (propose 33)	ADDED as FR-33.16	`stability_*` parameters
SAP #293 — §13.24 FMEA / control plan customizing (S/4)	GAP (propose 33)	ADDED as FR-33.18	`fmea_ap_table_version`
SAP #294 — §13.24 Audit management customizing (audit types, question lists)	PARTIAL-33	ADDED as FR-33.17	Question lists are versioned metadata
SAP #295 — §13.24 Multiple specifications customizing	PARTIAL-33	ADDED as FR-33.21	Specification set types reference data
SAP #296 — §13.24 Sample management customizing (sample types, sample-drawing procedures)	PARTIAL-33	ADDED as FR-33.20	`retention_sample_years_after_expiry`

6.34 Wave 34: Transportation Management & Freight

6.34.1 Scope and business context

Wave 28 integrated parcel carriers for labels; wave 34 adds full transportation management replacing D365 TMS and SAP TM: shipments consolidated into loads and routes, rated against carrier rate cards with accessorials and fuel surcharges, rate-shopped, tendered to carriers with timeouts, tracked by EDI 214 or carrier APIs, and reconciled against carrier freight invoices with variance disputes and accruals. Freight and duties are allocated to inventory as landed cost feeding wave-20 costing. VRP route optimization runs on OR-Tools in the Python `tms-optimizer`. Out of scope: own-fleet driver apps and ELD, ocean booking, customs filing (hooks only), multi-leg international routing guides beyond two legs.

Scope amendment (coverage closure). The gap registers add the following to this wave: landed-cost voyages with shipping containers, folios and goods-in-transit orders (FR-34.12, extending FR-34.9); yard management with transportation units (FR-34.13); driver check-in/out with a gate log (FR-34.14); dangerous-goods checks for transport (FR-34.15); own-fleet resources as planning constraints (FR-34.16); lane RFQs for strategic freight procurement (FR-34.17); layer-based load stacking (FR-34.18); and foreign-trade document and screening hooks (FR-34.19). Driver mobile apps and ELD/tachograph integration stay out of scope. Customs filing, preference determination and the denied-party screening provider are wave 48 country and compliance pack content behind the hooks in FR-34.19. §6.34.21 lists the dispositions.

Pain points solved (10x lens)

Pain point in AX/SAP today	Root cause	Passage answer in this wave	Measurable 10x target
D365 rate route workbench (TMSRateRouteWorkbench) shows a total per carrier with no breakdown; a wrong rate (missing rate base assignment, fuel index not loaded) is found when the carrier invoice arrives weeks later	Rate engines (TMSRateEngineBase subclasses) return totals; no explain	Rating returns an explain trace per charge step; `NO_VALID_RATE_CARD` is explicit	Rate errors detected: at invoice (2–6 weeks) → at rating (< 300 ms); rating disputes caused by setup: ~5% of invoices → < 0.5%
SAP TM carrier selection and tendering (freight order subcontracting) require TM configuration plus PI/PO for EDI 204/990; tender timeouts are monitored manually in the transportation cockpit	Tendering is a status field, not a durable process	Temporal `TenderWorkflow` with cascade, timeouts and carrier portal/EDI responses	Planner interventions per 100 tenders: ~30 (watching expiry) → < 3; tender-to-acceptance: hours of chasing → automatic cascade within the timeout
D365 freight reconciliation (TMSFreightBill ↔ TMSCarrierInvoice) is matched by hand per detail line; D365 lacks EDI 210 intake; accrual reversal needs a separate periodic job and often double-counts	Matching is a form, not a rule set; accrual lifecycle disconnected from the match	Rule-based line matching with tolerances, state machine to AP, accrual/reversal/invoice share one journal reference	Reconciliation effort: ~10 min per invoice → < 30 s for in-tolerance invoices (≥ 80% auto); account 2150 ties to zero per bill, 100%
Landed cost allocation (D365 Landed cost module voyages; SAP delivery-cost conditions FRA1/FRB1 on PO lines) rounds per line and leaves cent residuals in a variance account; multi-PO containers need manual apportionment	Per-line rounding without residual assignment; cost types not linked to receipts across POs	Allocation with residual to the highest-value line; voyage spans POs; estimated/actual variance rules by on-hand	Allocation residual: cents per voyage in variance → 0; time to land a 3-PO container: 1–2 h → < 5 min
Route planning in D365 is manual load building; SAP TM VSR optimizer requires PP/DS-style setup and licensing	No general VRP in D365; SAP optimizer is a separate engine with heavy configuration	OR-Tools VRP with explicit constraints, 60 s limit, planner override	Multi-stop planning time: 30–60 min per day of loads → < 1 min; route distance vs manual: −10% or better

6.34.2 AX / SAP parity map

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Carriers / services	TMSCarrier, TMSCarrierService, TMSCarrierServiceGroup	Business partner carrier role, /SCMTMS/ means of transport	tms.Carrier, CarrierService	full
Rate cards	TMSRateMaster, TMSRateBase, TMSRateBaseAssignment, TMSRateEngine classes (TMSRateEngineBase)	Freight agreements, rate tables, calculation sheets (/SCMTMS/TCM, /SCMTMS/TCCS)	RateCard, RateTable, CalcSheet	full
Accessorials / fuel	TMSAccessorialMaster, TMSAccessorialAssignment, TMSFuelIndex, TMSFuelIndexRegion	Charge types, fuel surcharge index tables	Accessorial, FuelIndex	full
Rate shopping / routing	Rate route workbench (TMSRateRouteWorkbench), TMSRoutePlan, TMSRouteGuide, TMSRouteSegment	Carrier selection (/SCMTMS/CAR_SEL), transportation cockpit	RateShop, RouteGuide	full
Loads / freight orders	WHSLoadTable (TMS fields), load building strategies	Freight units, freight orders /SCMTMS/TOR (TOR_ROOT/TOR_ITEM/TOR_STOP), freight bookings	Shipment, Load, Route	full
Tendering	Load tendering (manual/EDI 204, TMSLoadTender status)	Tendering (freight order subcontracting, EDI 204/990 via SAP TM)	Tender workflow (Temporal)	full
Tracking	n/a (ISV, driver check-in)	Event management (EM) / TM execution tracking	TrackingEvent (EDI 214/API)	improved
Freight reconciliation	TMSFreightBill, TMSFreightBillDetail, TMSCarrierInvoice, TMSCarrierInvoiceDetail, freight bill matching	Freight settlement document (/SCMTMS/SFIR), ERS/MIRO	FreightBill, CarrierInvoice, Match	full
Landed cost	Landed cost module (voyage, cost type, allocation)	Delivery costs on PO (FRA1/FRB1 conditions), actual costing	LandedCostVoyage, allocation to inventory	full
Route optimization	n/a (ISV)	PP/DS-based VSR optimizer	VRP (OR-Tools)	improved
Dock scheduling	WHSDockAppointment (wave 31)	Yard	wms.DockAppointment	full (wave 31)
Landed cost voyages, containers, folios, goods in transit	Landed cost module: voyages (ITMVoyage*), shipping containers, folios, cost types and auto costs, goods-in-transit orders, voyage tracking	Delivery cost conditions FRA1/FRB1, MRDC settlement, inbound delivery with transportation units, stock in transit (S/4 SIT)	LandedCostVoyage + VoyageLeg, ShippingContainer, Folio, GoodsInTransitOrder	full
Yard management	D365 yard management (yard locations, trailers, yard moves)	EWM yard management /SCWM/YM_* (yard bins, checkpoints, TU/vehicle), /SCWM/TU, /SCWM/VEH	tms.YardLocation, TransportUnit, YardMove; wms work type YARD_MOVE	full
Driver check-in / gate	Driver check-in and check-out (appointment scheduling)	EWM check-in/check-out at checkpoints (/SCWM/CICO)	DriverVisit, GateEvent	full
Dangerous goods	Hazardous material flags (limited); product compliance	EHS-DG: DG master, DG check methods and profiles in SD/LE/TM, DG documents	HazmatProfile (wave 31) + DgCheckResult at rating, load building, tender, ship	full
Fleet resources	n/a (ISV)	TM resources: vehicles, trailers, drivers, resource calendars	tms.Vehicle, Trailer, Driver as VRP constraints	partial — planning only; no driver app or ELD
Strategic freight procurement	n/a	TM strategic freight procurement (freight RFQ, bid analysis, award to freight agreements)	FreightRfq on the wave-17 RFQ engine → RateCard	full

Capability	AX 2012 / D365 F&SCM	SAP ECC / S/4	Passage equivalent	Parity
Load plan stacking	Load building templates (weight/volume only)	TM load planning (package building, 3D load plan)	LoadPlan in tms-optimizer (layer heuristic)	partial — layer stacking, no free-form 3D carton packing
Foreign trade documents and screening	Foreign trade parameters (Intrastat only)	SAP GTS: customs declarations, export control, sanctioned-party list screening, preference	Customs data on shipments, commercial invoice, `ComplianceScreeningProvider` and `CustomsFilingProvider` hooks	partial — hooks; filing and preference in wave 48

6.34.3 Functional requirements

- **FR-34.1 Shipments and loads** — Must. The system shall create TMS shipments from sales/transfer/purchase (inbound freight) shipments and consolidate them into loads by rule (same ship-from, ship-to region, mode, date window) or manually.
  - Notes: load capacity by weight, volume, pallet positions; load types TL, LTL, PARCEL, INTERMODAL; inbound loads for vendor-collect freight.
- **FR-34.2 Route planning with VRP** — Must. The system shall plan multi-stop routes with OR-Tools under the constraints in BR-34.1 and return feasible routes within 60 s for ≤ 500 stops.
  - Notes: distance/time matrix from OSRM (self-hosted) or stored lanes; first solution by parallel cheapest insertion; guided local search until the time limit.
- **FR-34.3 Rating engine** — Must. The system shall compute charges per BR-34.2 from rate cards (lane-based, zone-based, distance-based, weight-break, per pallet, per container), accessorials and fuel surcharges, with an explain trace.
  - Notes: rate cards effective-dated with currency; minimum charge; rounding to cents half-up; deterministic given the same inputs.
- **FR-34.4 Rate shopping and route guides** — Must. The system shall rate a shipment across eligible carriers/services and rank by cost, transit time or a weighted score; route guides pre-select carriers by lane with fallbacks.
  - Notes: eligibility by service area, mode, hazmat flag, max weight; results cached 10 min per input hash.
- **FR-34.5 Tendering** — Must. The system shall tender loads to carriers (e-mail/portal, EDI 204 via wave 35, API) with accept/decline/timeout, cascading to the next carrier by route guide rank.
  - Notes: Temporal `TenderWorkflow` per load; default timeout 2 h; broadcast tendering option (first accept wins).
- **FR-34.6 Tracking and POD** — Must. The system shall ingest status events (EDI 214 codes AF/X1/X3/D1 etc., carrier APIs, driver check-in) and proof of delivery (signature/photo), and expose expected vs actual per stop.
  - Notes: late-delivery alerts when ETA > window end; POD attaches to the sales shipment for wave-29 invoicing holds if required.
- **FR-34.7 Freight bills and reconciliation** — Must. The system shall create a freight bill (expected charges) at ship confirmation, match carrier invoices (EDI 210 or manual/API) line by line with tolerances, and route variances to dispute.
  - Notes: tolerance default $5 / 2% per charge; match states per BR-34.4; matched invoices create a vendor invoice in wave 19 AP.
- **FR-34.8 Freight accrual** — Must. The system shall post freight accruals (Dr freight expense or inventory-in-transit, Cr accrued freight 2150) at ship confirmation and reverse on invoice match through the universal journal.
  - Notes: journal postings via the wave-11 posting API with idempotency key = freight bill id; customer-billed freight creates a wave-29 invoice charge line.
- **FR-34.9 Landed cost** — Must. The system shall allocate freight, duty, brokerage and insurance to purchase receipt lines by weight, volume, value, quantity or equal split, and post the allocation to inventory cost (wave 20) as a cost adjustment.
  - Notes: voyage groups multiple POs/containers; estimated cost at receipt, actual on invoice with variance posting; allocation residual cents go to the highest-value line.
- **FR-34.10 Carrier portal** — Should. The system shall let carriers accept tenders, update status and upload POD via the wave-20 supplier portal framework.
  - Notes: carrier users are Keycloak external identities scoped to their loads.
- **FR-34.11 Transportation KPIs** — Should. The system shall report cost per shipment/cwt/mile, on-time pickup/delivery, tender acceptance rate, invoice variance rate.
  - Notes: Cube metrics; daily materialization.
- **FR-34.12 Landed cost voyages, containers, folios and goods in transit** — Must. The system shall track inbound international shipments as voyages with legs (origin port → destination port → warehouse), shipping containers (ISO 6346 number with check digit per BR-34.12, type 20GP/40GP/40HC/45HC/reefer, seal number), folios grouping containers per vendor or forwarder, and goods-in-transit orders that move ownership to an in-transit warehouse at the Incoterm transfer event (BR-34.11) and receive at the destination warehouse.
  - Notes: voyage status ESTIMATED → IN_TRANSIT → ARRIVED → RECEIVED → COSTED; estimated costs per cost type come from auto-cost templates (freight % of value or per container, duty from HS-code rate, insurance %) and post at goods-in-transit; actuals post at invoice with BR-34.6 variance rules; cost type codes map to accrual and clearing accounts (wave 11); goods-in-transit value sits on the wave-20 in-transit inventory account; voyage tracking stages (shipped, departed, arrived port, customs cleared, arrived warehouse) come from TrackingEvent; allocation per FR-34.9 can run per container first, then per line.
- **FR-34.13 Yard management** — Should. The system shall model yard locations (parking slots, door waiting lanes, checkpoints), transportation units (trailer, container, swap body) and vehicles, track TU position and status (EMPTY, LOADED, SEALED; reefer setpoint), and create yard-move work (wms work type YARD_MOVE) between slot and dock door, executed on the wave-32 mobile app.
  - Notes: TU ↔ load link from tender acceptance; door assignment respects DockAppointment (wave 31); slot capacity is one TU; dwell time per TU drives detention (BR-34.13, accessorial DETENTION after free time, default 2 h); a yard check is a count work over yard slots.
- **FR-34.14 Driver check-in/out and gate log** — Should. The system shall check drivers in at the gate or a kiosk against the dock appointment (appointment id or carrier SCAC + trailer/container number), capture seal number, driver name and license id, assign a yard slot or door, and check out with seal verification, recording each event in an append-only gate log.
  - Notes: matching and tolerance per BR-34.14 (default ±60 min); walk-ins allowed per site setting; check-out blocked if the load is not confirmed or the seal does not match; driver PII kept 90 days, then pseudonymized; check-in emits `dev.passage.tms.gate.checkedin.v1`, which releases the door work in wms.
- **FR-34.15 Dangerous goods checks in transport** — Should. The system shall use the wave-31 HazmatProfile to check DG compliance at rating, load building, tendering and ship confirmation: mode-specific regulation (49 CFR, ADR, RID, IMDG, IATA DGR), carrier-service DG eligibility, mixed-load segregation (49 CFR 177.848, ADR 7.5.2), ADR 1.1.3.6 quantity thresholds and limited-quantity rules, and produce DG shipping-paper lines and placard requirements.
  - Notes: result PASS/WARN/FAIL with rule ids (BR-34.15); FAIL blocks tender and ship confirmation when `dg_check_mode = BLOCK`; a 24-hour emergency response phone from legal-entity setup is mandatory before a DG shipment; DG lines print on the BOL with UN number, proper shipping name, class, packing group and quantity.
- **FR-34.16 Fleet resources** — Could. The system shall define own-fleet vehicles (weight/volume/pallet capacity, equipment type, depot, cost per km and per hour, availability calendar), trailers and drivers (qualifications such as hazmat endorsement or ADR certificate with expiry, availability calendar, hours-of-service rule set) and pass them to the VRP as heterogeneous fleet and driver-hours constraints (BR-34.16).
  - Notes: dispatch assigns vehicle + driver to a route; telematics positions ingest as TrackingEvent with source TELEMATICS; driver apps, ELD and tachograph download remain out of scope.
- **FR-34.17 Strategic freight procurement (lane RFQ)** — Could. The system shall run a freight RFQ on the wave-17 RFQ engine with lanes (origin and destination zones, mode, equipment, annual volume, weight bands) as lines, collect carrier bids through the carrier portal (FR-34.10) or spreadsheet upload,

compare bids by scenario, and award lanes into effective-dated RateCards and route-guide ranks (BR-34.18).
    - Notes: bid cost = Σ lane annual volume × bid rate + fuel at the current index; scenarios: lowest cost per lane, maximum carriers per lane, minimum incumbent share; awarded cards are drafts that need TMS_RATE_APPROVE.
- **FR-34.18 Load plan stacking** — Could. The system shall compute a load plan for a trailer or container with layer-based stacking (pallet footprint and height, maximum stack weight, stackable flag, orientation lock, load sequence in reverse stop order) and show a top view with layers, floor positions used and an axle-weight estimate.
    - Notes: first-fit decreasing by footprint with layer building in `tms-optimizer`; non-stackable pallets and DG segregation respected; < 5 s for 60 pallets; free-form 3D carton packing is not in scope.
- **FR-34.19 Foreign-trade document and screening hooks** — Should. The system shall carry customs data on shipments and loads (commodity code per item and country such as HS/HTS/Schedule B, country of origin, export classification such as ECCN, Incoterms 2020 rule with named place, customs value and currency), generate commercial invoice and customs packing list documents, call a `ComplianceScreeningProvider` for denied-party and sanctions screening at load release, tender and ship confirmation (BR-34.17), and call a `CustomsFilingProvider` (e.g. US AES/EEI, EU export declaration) at ship confirmation.
    - Notes: screening result CLEAR / POTENTIAL_MATCH / BLOCKED / SCREENING_PENDING; with no provider configured, cross-border shipments carry `NOT_SCREENED` and warning TMS-0134; provider implementations, preference/origin determination (USMCA, EU origin) and filing rules ship in wave 48.

6.34.4 Data model

Load (TMS)

Field	Type	Required	Notes
load_id	uuid	yes	PK; shared id with wms.Load
mode, equipment	enum/text	yes	TL/LTL/PARCEL/INTERMODAL; `53FT_DRY`, `REEFER`
ship_from_site_id	uuid	yes	
carrier_id, service_id	uuid	no	set on tender accept
status	enum	yes	PLANNED, RATED, TENDERED, ACCEPTED, DISPATCHED, IN_TRANSIT, DELIVERED, CLOSED, CANCELLED
total_weight_kg, total_volume_m3, pallet_positions	numeric/int	yes	
planned_pickup_start/end	timestamptz	yes	window
route_id	uuid	no	FK Route
shipments	uuid[]	yes	via LoadShipment

RateCard / RateTable

Field	Type	Required	Notes
rate_card_id	uuid	yes	PK
carrier_id, service_id	uuid	yes	
basis	enum	yes	LANE, ZONE, DISTANCE, WEIGHT_BREAK, PER_PALLET, PER_CONTAINER, FLAT
currency	char(3)	yes	
valid_from, valid_to	date	yes	no overlap per carrier/service/basis
minimum_charge	numeric(18,2)	no	
rows	jsonb	yes	[{origin, destination, break_from, break_to, rate, unit}]
fuel_index_id	uuid	no	FK FuelIndex
accessorial_ids	uuid[]	no	

FreightBill / CarrierInvoice

Field	Type	Required	Notes
freight_bill_id	uuid	yes	PK
load_id, carrier_id	uuid	yes	
expected_lines	jsonb	yes	[{charge_code, amount, currency, basis_trace}]
expected_total	numeric(18,2)	yes	
accrual_journal_id	uuid	no	
match_status	enum	yes	UNMATCHED, MATCHED, VARIANCE, DISPUTED, APPROVED, SETTLED
carrier_invoice_id	uuid	no	FK CarrierInvoice (number, date, lines, total, source EDI210/MANUAL)
variance_total	numeric(18,2)	no	
ap_invoice_id	uuid	no	wave-19 vendor invoice

Tender: tender_id, load_id, carrier_id, rank, sent_at, expires_at, response (PENDING/ACCEPTED/DECLINED/EXPIRED), rate_quoted. **LandedCostVoyage**: voyage_id, cost lines (type, amount, currency, allocation_method), receipt lines, status (ESTIMATED/ACTUAL/POSTED). **TrackingEvent**: load_id, stop_no, code (EDI 214 status), occurred_at, location, source.

Invariants: a load has at most one ACCEPTED tender; Σ allocated landed cost per voyage cost line = cost line amount (to the cent); a freight bill's accrual is reversed exactly once; shipments on a load share ship-from site and mode. Indexing: `load(status, planned_pickup_start)`, `rate_card(carrier_id, service_id, valid_from, valid_to)`, `freight_bill(match_status)`, `tracking_event(load_id, occurred_at)`.

6.34.5 APIs and events

Method	Path	Purpose	Idempotency	Auth duty
POST	/tms/v1/loads:build	Build loads from shipments by rule	key	TMS_PLAN
POST	/tms/v1/routes:optimize	VRP over loads/stops; returns routes	key = request hash	TMS_PLAN
POST	/tms/v1/shipments/{id}:rate	Rate across carriers, return ranked with explain	— (cached)	TMS_RATE
POST	/tms/v1/loads/{id}:tender	Start tender workflow	key	TMS_TENDER
POST	/tms/v1/tenders/{id}:respond	Carrier accept/decline	key	TMS_CARRIER_RESPOND

Method	Path	Purpose	Idempotency	Auth duty
POST	/tms/v1/tracking-events	Ingest events (214/API)	key = source+ref	TMS_TRACK_INGEST
POST	/tms/v1/carrier-invoices	Register carrier invoice; triggers match	key = carrier+invoice no	TMS_RECONCILE
POST	/tms/v1/freight-bills/{id}:approve	Approve variance / release to AP	key	TMS_RECONCILE_APPROVE
POST	/tms/v1/landed-cost/voyages/{id}:allocate	Allocate and post	key	TMS_LANDED_COST
GET	/tms/v1/loads/{id}/tracking	Timeline	—	TMS_VIEW
POST	/tms/v1/voyages	Create a voyage with legs, containers and folios	key	TMS_LANDED_COST
POST	/tms/v1/goods-in-transit/{id}:ship	Post goods in transit at the transfer event	key	TMS_LANDED_COST
POST	/tms/v1/gate/check-in	Driver and TU check-in	key = appointment + timestamp	TMS_GATE
POST	/tms/v1/gate/check-out	Check-out with seal verification	key	TMS_GATE
POST	/tms/v1/yard-moves	Create yard-move work	key	TMS_YARD
POST	/tms/v1/loads/{id}:dg-check	Run DG checks for a load	—	TMS_PLAN
POST	/tms/v1/loads/{id}:screen	Run trade-compliance screening	—	TMS_PLAN
POST	/tms/v1/freight-rfqs/{id}:award	Award lanes into rate cards	key	TMS_RATE_APPROVE

Event	Trigger	Payload fields	Consumers
dev.passage.tms.shipment.rated.v1	rating	shipment_id, options[{carrier, service, total, transit_days}], chosen	sales (freight charge), analytics
dev.passage.tms.tender.accepted.v1 / declined.v1 / expired.v1	tender response	load_id, carrier_id, rank, rate	wms, edi (204/990), analytics
dev.passage.tms.tracking.event.v1	ingest	load_id, stop_no, code, occurred_at	sales-fulfillment, customer portal
dev.passage.tms.freightbill.matched.v1	match	freight_bill_id, carrier_invoice_id, variance, lines[]	AP, costing
dev.passage.tms.landedcost.posted.v1	allocation posted	voyage_id, receipt_lines[{line, amount}]	costing (wave 20)

6.34.6 User experience

Screen	Primary actions	Key fields	Duty
Transportation workspace	Shipments to plan, loads, tenders pending, exceptions	shipment, weight, window, status	TMS_VIEW
Load planning workbench	Drag shipments to loads, optimize routes, map view	load, stops, capacity bars, route distance/time	TMS_PLAN
Rate shop	Compare carriers, explain, select	carrier, service, charges, transit, score	TMS_RATE
Tender board	Tender, cascade, override	load, carrier rank, expires, response	TMS_TENDER
Tracking	Timeline, map, POD	event code, time, location, ETA	TMS_VIEW
Freight reconciliation	Match, dispute, approve, release to AP	expected vs invoiced per charge, variance	TMS_RECONCILE
Landed cost voyages	Add costs, allocate, post	cost type, amount, method, allocation	TMS_LANDED_COST

Interaction rules: planning workbench supports keyboard move (Alt+arrow) and multi-select; capacity bars turn red above 100%; route map uses self-hosted tiles; reconciliation grid highlights lines outside tolerance.

6.34.7 Business rules and edge cases

- **BR-34.1 VRP constraints.** Model as capacitated VRP with time windows and pickup/delivery (OR-Tools `RoutingModel`): (1) vehicle capacity dimensions weight_kg, volume_m3, pallets (hard); (2) stop time windows [earliest, latest] with soft lateness penalty $50/min up to 60 min, hard beyond; (3) max route duration 11 h driving + service times, max 14 h on-duty; (4) depot start/end per vehicle; (5) pickup-before-delivery precedence for milk runs; (6) heterogeneous fleet (equipment type must match shipment requirement, e.g., reefer); (7) vehicle-location compatibility (dock height, hazmat ban); (8) max stops per route 25; (9) objective = Σ distance cost + Σ time cost + fixed vehicle cost + lateness penalties; (10) time limit 60 s, first solution strategy `PARALLEL_CHEAPEST_INSERTION`, metaheuristic `GUIDED_LOCAL_SEARCH`. Infeasible stops are dropped with penalty 10,000 and reported, never silently.
- **BR-34.2 Rating algorithm.** For each eligible (carrier, service): select the rate card valid on ship date; compute base charge by basis (weight-break: find row with `break_from ≤ chargeable_weight < break_to`, charge = max(rate × weight, next-break deficit rule: compare with next break's minimum and take the lower); zone: origin/destination zone lookup; distance: miles × rate); chargeable weight = max(actual, dimensional weight = volume_in³ / DIM factor 139 for parcel, class-based for LTL); apply minimum charge; add accessorials (flat or % of base); add fuel surcharge = base × index % effective on ship date (weekly index); convert to shipment currency at the wave-12 rate type `FREIGHT`; round each charge to cents half-up; total = Σ charges. Explain trace lists each step with inputs.
- **BR-34.3 Tender cascade.** Rank from route guide; send to rank 1; on DECLINED or EXPIRED (timeout) send to next; after the last, status `TENDER_FAILED` and a planner task is created; a late acceptance after expiry is rejected with `TENDER_EXPIRED`.
- **BR-34.4 Match state machine.** `UNMATCHED → MATCHED` (all lines within tolerance) `→ APPROVED → SETTLED` (AP invoice posted); `UNMATCHED → VARIANCE → DISPUTED → (MATCHED | APPROVED with adjustment)`; a carrier invoice without a freight bill creates an `UNEXPECTED_INVOICE` exception and is never auto-approved. Duplicate carrier invoice numbers per carrier are rejected.
- **BR-34.5 Accrual and reversal.** Accrual posts on `load.shipped` with amount = expected total; on APPROVED, post reversal of the accrual and the AP invoice for the invoiced amount; variance to freight variance account 5250. All three postings share the freight bill id in the journal reference.
- **BR-34.6 Landed cost allocation.** Allocate each cost line by chosen method; compute each receipt line's share = round(cost × weight_i / Σ weight, 2); residual = cost – Σ shares assigned to the line with the highest value (ties: lowest line number). Estimated vs actual differences post to inventory if the item is still on hand (proportional to remaining qty) else to a purchase price variance account 5260 (wave 20 rules).
- **BR-34.7 Time windows** are stored in UTC with the stop's time zone; VRP uses the stop's local calendar; a window spanning midnight is valid.
- **BR-34.8 Load capacity exceeded** on manual planning is a warning (planner override logged); on rule-based building it is a hard split into a second load.
